

C.S0005-A v6.0

Date: February 2002

*Upper Layer (Layer 3) Signaling Standard for
cdma2000 Spread Spectrum Systems – Release
A Addendum 2*

CONTENTS

1	FOREWORD	xl
2	NOTES	xlii
3	REFERENCES	xliv
4	1. GENERAL	1-1
5	1.1 Terms and Numeric Information	1-1
6	1.1.1 Terms	1-1
7	1.1.2 Numeric Information	1-24
8	1.1.2.1 Reserved.....	1-24
9	1.1.2.2 CDMA Numeric Information	1-24
10	1.2 Signaling Architecture.....	1-45
11	1.3 Signaling and Functionality.....	1-45
12	1.3.1 General Architecture	1-45
13	1.3.2 Interface to Layer 2.....	1-45
14	1.3.2.1 Message Control and Status Block (MCSB)	1-45
15	1.3.2.2 Interface Primitives.....	1-46
16	1.3.3 Reserved	1-48
17	1.3.4 Functional Description	1-48
18	1.3.5 PDU Transmission and Reception	1-48
19	2. REQUIREMENTS FOR MOBILE STATION CDMA OPERATION	2-1
20	2.1 Reserved.....	2-1
21	2.2 Reserved.....	2-1
22	2.3 Security and Identification	2-1
23	2.3.1 Mobile Station Identification Number	2-1
24	2.3.1.1 Encoding of IMSI_M_S and IMSI_T_S.....	2-3
25	2.3.1.2 Encoding of IMSI_M_11_12 and IMSI_T_11_12	2-6
26	2.3.1.3 Encoding of the MCC_M and MCC_T	2-6
27	2.3.1.4 Mobile Directory Number	2-6
28	2.3.2 Electronic Serial Number.....	2-6
29	2.3.3 Station Class Mark	2-6
30	2.3.4 Registration Memory.....	2-7
31	2.3.5 Access Overload Class	2-8

CONTENTS

1	2.3.6 Public Long Code Mask	2-9
2	2.3.7 Reserved	2-9
3	2.3.8 Home System and Network Identification	2-9
4	2.3.9 Local Control Option	2-9
5	2.3.10 Preferred Operation Selection	2-9
6	2.3.10.1 Preferred System	2-9
7	2.3.10.2 Preferred CDMA or Analog	2-10
8	2.3.11 Discontinuous Reception	2-10
9	2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice Privacy	2-10
10	2.3.12.1 Authentication	2-10
11	2.3.12.1.1 Shared Secret Data (SSD)	2-10
12	2.3.12.1.2 Random Challenge Memory (RAND)	2-11
13	2.3.12.1.3 Call History Parameter (COUNT _{s-p})	2-11
14	2.3.12.1.4 Unique Challenge-Response Procedure	2-11
15	2.3.12.1.5 Updating the Shared Secret Data (SSD)	2-12
16	2.3.12.2 Signaling Message Encryption	2-15
17	2.3.12.2.1 Encrypted Messages on the f-dsch	2-16
18	2.3.12.2.2 Encrypted Messages on the r-dsch	2-19
19	2.3.12.2.3 Voice Privacy	2-21
20	2.3.12.4 Extended Encryption for Signaling Message and User Information	2-22
21	2.3.12.4.1 Extended Encryption for Signaling Messages	2-22
22	2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch	2-23
23	2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch	2-24
24	2.3.12.4.1.3 Signaling Encryption/Decryption Procedures	2-24
25	2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field	2-27
26	2.3.12.4.1.5 Duplicate Detection of Encrypted Messages	2-28
27	2.3.12.4.2 Extended Encryption for User Information	2-29
28	2.3.12.4.2.1 User Information Encryption/Decryption Procedures	2-30
29	2.3.12.4.2.3 Interface to the Encryption Algorithms	2-30
30	2.3.12.4.4 Encryption Negotiation	2-35
31	2.3.12.4.5 Computation of ENC_SEQ_H_SIG	2-37

CONTENTS

1	2.3.13 Lock and Maintenance Required Orders	2-37
2	2.3.14 Mobile Station Revision Identification.....	2-38
3	2.3.15 Temporary Mobile Station Identity.....	2-38
4	2.3.15.1 Overview.....	2-38
5	2.3.15.2 TMSI Assignment Memory.....	2-39
6	2.4 Accumulated Statistics.....	2-40
7	2.4.1 Monitored Quantities and Statistics	2-40
8	2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel	
9	Statistics	2-40
10	2.5 Reserved.....	2-40
11	2.6 Layer 3 Processing	2-41
12	2.6.1 Mobile Station Initialization State	2-43
13	2.6.1.1 System Determination Substate	2-45
14	2.6.1.1.1 Custom System Selection Process	2-51
15	2.6.1.1.2 System Selection Using Current Redirection Criteria	2-51
16	2.6.1.1.3 System Selection Using System Reselection Criteria	2-52
17	2.6.1.1.4 Acquiring the Selected System.....	2-53
18	2.6.1.2 Pilot Channel Acquisition Substate.....	2-53
19	2.6.1.3 Sync Channel Acquisition Substate.....	2-53
20	2.6.1.4 Timing Change Substate	2-57
21	2.6.2 Mobile Station Idle State	2-59
22	2.6.2.1 Idle Procedures	2-61
23	2.6.2.1.1 Forward Channel Monitoring Procedures	2-61
24	2.6.2.1.1.1 General Overview	2-61
25	2.6.2.1.1.1.1 General Overview for Individually Addressed Messages	2-62
26	2.6.2.1.1.1.1.1 Overview of Stopping Monitoring via the General Page	
27	Message	2-63
28	2.6.2.1.1.1.1.2 Overview of Stopping Monitoring via the Universal Page	
29	Message	2-65
30	2.6.2.1.1.1.2 Overview of Broadcast Messages on Paging Channel	2-65
31	2.6.2.1.1.1.2.1 Method 1: Multi-Slot Broadcast Message Transmission	2-65
32	2.6.2.1.1.1.2.2 Method 2: Periodic Broadcast Paging	2-66

CONTENTS

1	2.6.2.1.1.1.3 Overview of Broadcast Messages on Broadcast Control Channel.....	2-67
2	2.6.2.1.1.1.3.1 Method 1: Multi-Slot Enhanced Broadcast Paging.....	2-67
3	2.6.2.1.1.1.3.2 Method 2: Periodic Enhanced Broadcast Paging.....	2-68
4	2.6.2.1.1.2 Non-Slotted Mode Requirements.....	2-68
5	2.6.2.1.1.3 Slotted Mode Requirements.....	2-68
6	2.6.2.1.1.3.1 Monitoring Assigned Slots.....	2-69
7	2.6.2.1.1.3.2 Determination of the Slot Cycle Index	2-71
8	2.6.2.1.1.3.3 Slot Cycles for Broadcast Message Transmission	2-72
9	2.6.2.1.1.3.3.1 Slot Cycles for Broadcast Message Transmission on the Paging Channel.....	2-72
10	2.6.2.1.1.3.3.2 Slot Cycles for Broadcast Message Transmission on the Forward Common Control Channel.....	2-72
11	2.6.2.1.1.3.4 Monitoring Paging Channel Broadcasts	2-73
12	2.6.2.1.1.3.5 Support of Broadcast Delivery Options on the Paging Channel	2-74
13	2.6.2.1.1.3.6 Monitoring the Forward Common Control Channel for the Enhanced Broadcast Page	2-74
14	2.6.2.1.1.3.7 Support of Broadcast Delivery Options on the Forward Common Control Channel/Broadcast Control Channel.....	2-75
15	2.6.2.1.1.4 Common Channel Supervision	2-75
16	2.6.2.1.2 Quick Paging Channel Monitoring Procedures	2-75
17	2.6.2.1.2.1 Overview.....	2-75
18	2.6.2.1.2.2 Requirements	2-78
19	2.6.2.1.3 Registration	2-80
20	2.6.2.1.4 Idle Handoff.....	2-80
21	2.6.2.1.4.1 Pilot Search	2-80
22	2.6.2.1.4.2 Idle Handoff Procedures	2-82
23	2.6.2.1.5 Primary Broadcast Control Channel Monitoring.....	2-92
24	2.6.2.1.5.1 General Overview.....	2-92
25	2.6.2.1.5.2 Requirements	2-92
26	2.6.2.1.6 System Reselection Procedures	2-92
27	2.6.2.1.7 Slotted Timer Expiration	2-93

CONTENTS

1	2.6.2.2 Response to Overhead Information Operation	2-93
2	2.6.2.2.1 System Parameters Message.....	2-97
3	2.6.2.2.1.1 Stored Parameters	2-97
4	2.6.2.2.1.2 Paging Channel Assignment Change	2-101
5	2.6.2.2.1.3 RESCAN Parameter	2-101
6	2.6.2.2.1.4 Roaming Status.....	2-101
7	2.6.2.2.1.5 Registration.....	2-101
8	2.6.2.2.1.6 Slot Cycle Index.....	2-101
9	2.6.2.2.1.7 PACA Disable for SID Change	2-102
10	2.6.2.2.1.8 Retry Delay Disable for Packet Zone ID or SID/NID Change.....	2-102
11	2.6.2.2.1.9 Encryption key reset for SID/NID Change	2-102
12	2.6.2.2.2 Access Parameters Message.....	2-102
13	2.6.2.2.3 Neighbor List Message.....	2-104
14	2.6.2.2.4 CDMA Channel List Message	2-105
15	2.6.2.2.5 Extended System Parameters Message.....	2-106
16	2.6.2.2.6 Global Service Redirection Message	2-111
17	2.6.2.2.7 Extended Neighbor List Message.....	2-112
18	2.6.2.2.8 General Neighbor List Message	2-113
19	2.6.2.2.9 User Zone Identification Message.....	2-117
20	2.6.2.2.10 Private Neighbor List Message.....	2-118
21	2.6.2.2.11 Extended Global Service Redirection Message	2-119
22	2.6.2.2.12 Extended CDMA Channel List Message Overview	2-120
23	2.6.2.2.12.1 Extended CDMA Channel List Message on Paging Channel.....	2-120
24	2.6.2.2.12.2 Extended CDMA Channel List Message on Primary Broadcast	
25	Control Channel.....	2-121
26	2.6.2.2.13 ANSI-41 System Parameters Message.....	2-123
27	2.6.2.2.13.1 Stored Parameters	2-123
28	2.6.2.2.13.2 Roaming Status.....	2-126
29	2.6.2.2.13.3 Registration.....	2-126
30	2.6.2.2.13.4 PACA Disable for SID Change	2-126
31	2.6.2.2.14 MC-RR Parameters Message	2-126
32	2.6.2.2.14.1 Stored Parameters	2-127

CONTENTS

1	2.6.2.2.14.2 Slot Cycle Index	2-132
2	2.6.2.2.14.3 Forward Common Control Channel Assignment Change.....	2-132
3	2.6.2.2.15 Enhanced Access Parameters Message	2-132
4	2.6.2.2.16 ANSI-41 RAND Message	2-138
5	2.6.2.2.17 Universal Neighbor List Message	2-138
6	2.6.2.3 Mobile Station Page Match Operation.....	2-142
7	2.6.2.4 Mobile Station Order and Message Processing Operation	2-144
8	2.6.2.5 Mobile Station Origination Operation	2-154
9	2.6.2.6 Mobile Station Message Transmission Operation	2-154
10	2.6.2.7 Mobile Station Power-Down Operation	2-155
11	2.6.2.8 Mobile Station PACA Cancel Operation	2-155
12	2.6.3 System Access State.....	2-155
13	2.6.3.1 Access Procedures	2-156
14	2.6.3.1.1 Access Attempts	2-156
15	2.6.3.1.2 Reserved.....	2-157
16	2.6.3.1.3 Handoffs.....	2-157
17	2.6.3.1.3.1 Pilot Search	2-158
18	2.6.3.1.3.2 Access Handoff	2-158
19	2.6.3.1.3.3 Access Probe Handoff.....	2-160
20	2.6.3.1.4 System Access State Exit Procedures.....	2-161
21	2.6.3.1.5 Reserved.....	2-162
22	2.6.3.1.6 Full-TMSI Timer	2-162
23	2.6.3.1.7 Monitoring Pilots	2-162
24	2.6.3.1.7.1 Generation of the Initial Access Handoff List.....	2-162
25	2.6.3.1.7.2 Update of the Access Handoff List.....	2-163
26	2.6.3.1.7.3 Generation of the Other Reported List	2-163
27	2.6.3.1.7.4 Update of OTHER_REPORTED_LIST	2-163
28	2.6.3.1.8 Paging Channel and Forward Common Control Channel/ Primary Broadcast Control Channel Monitoring	2-164
30	2.6.3.2 Update Overhead Information Substate	2-165
31	2.6.3.3 Page Response Substate	2-169
32	2.6.3.4 Mobile Station Order/Message Response Substate	2-201

CONTENTS

1	2.6.3.5 Mobile Station Origination Attempt Substate	2-206
2	2.6.3.6 Registration Access Substate	2-243
3	2.6.3.7 Mobile Station Message Transmission Substate	2-249
4	2.6.3.8 PACA Cancel Substate	2-256
5	2.6.4 Mobile Station Control on the Traffic Channel State	2-261
6	2.6.4.1 Special Functions and Actions	2-263
7	2.6.4.1.1 Forward Traffic Channel Power Control.....	2-263
8	2.6.4.1.1.1 Forward Traffic Channel Power Control Initialization	2-266
9	2.6.4.1.1.2 Processing the Power Control Parameters Message	2-266
10	2.6.4.1.1.3 Processing the Power Control Message	2-267
11	2.6.4.1.2 Service Configuration and Negotiation	2-269
12	2.6.4.1.2.1 Use of Variables	2-274
13	2.6.4.1.2.1.1 Maintaining the Service Request Sequence Number	2-274
14	2.6.4.1.2.1.2 Maintaining the Service Negotiation Indicator Variable.....	2-274
15	2.6.4.1.2.1.3 Maintaining the Service Option Request Number	2-274
16	2.6.4.1.2.2 Service Subfunctions.....	2-274
17	2.6.4.1.2.2.1 Normal Service Subfunction	2-277
18	2.6.4.1.2.2.2 Waiting for Service Request Message Subfunction.....	2-279
19	2.6.4.1.2.2.3 Waiting for Service Response Message Subfunction	2-281
20	2.6.4.1.2.2.4 Waiting for Service Connect Message Subfunction	2-284
21	2.6.4.1.2.2.5 Waiting for Service Action Time Subfunction	2-286
22	2.6.4.1.2.2.6 SO Negotiation Subfunction	2-290
23	2.6.4.1.3 Ordering of Messages	2-293
24	2.6.4.1.4 Processing the In-Traffic System Parameters Message	2-293
25	2.6.4.1.5 Message Action Times	2-294
26	2.6.4.1.6 Long Code Transition Request Processing	2-295
27	2.6.4.1.7 Power Up Function (PUF).....	2-296
28	2.6.4.1.7.1 Processing the Power Up Function Message.....	2-297
29	2.6.4.1.7.2 Power Up Function Procedures	2-298
30	2.6.4.1.7.2.1 PUF Probe On Serving Frequency	2-298
31	2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency.....	2-299

CONTENTS

1	2.6.4.1.7.3 Processing the Power Up Function Completion Message	2-300
2	2.6.4.1.8 Forward Traffic Channel Supervision.....	2-301
3	2.6.4.1.9 Processing the Extended Release Message and the Extended Release Mini Message	2-301
4		
5	2.6.4.1.10 Processing the Resource Allocation Message and Resource Allocation Mini Message.....	2-302
6		
7	2.6.4.1.11 Reserved.....	2-303
8	2.6.4.1.12 Processing the Service Configuration Record.....	2-303
9	2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record.....	2-305
10	2.6.4.1.14 Processing the Security Mode Command Message.....	2-314
11	2.6.4.2 Traffic Channel Initialization Substate	2-315
12	2.6.4.3 Traffic Channel Substate	2-326
13	2.6.4.4 Release Substate	2-341
14	2.6.5 Registration	2-349
15	2.6.5.1 Forms of Registration	2-349
16	2.6.5.1.1 Power-Up Registration	2-350
17	2.6.5.1.2 Power-Down Registration	2-351
18	2.6.5.1.3 Timer-Based Registration.....	2-351
19	2.6.5.1.4 Distance-Based Registration	2-352
20	2.6.5.1.5 Zone-Based Registration	2-352
21	2.6.5.1.6 Parameter-Change Registration.....	2-354
22	2.6.5.1.7 Ordered Registration.....	2-355
23	2.6.5.1.8 Implicit Registration	2-355
24	2.6.5.1.9 Traffic Channel Registration.....	2-355
25	2.6.5.1.10 User Zone Registration.....	2-356
26	2.6.5.1.11 Encryption Re-sync Required Registration	2-356
27	2.6.5.2 Systems and Networks	2-356
28	2.6.5.3 Roaming	2-357
29	2.6.5.4 Registration Timers and Indicators	2-359
30	2.6.5.5 Registration Procedures.....	2-359
31	2.6.5.5.1 Actions in the Mobile Station Initialization State.....	2-359

CONTENTS

1	2.6.5.5.1.1 Power-Up or Change to a Different Operating Mode, Band Class, Serving System, or Frequency Block	2-359
2		
3	2.6.5.5.1.2 Timer Maintenance.....	2-360
4	2.6.5.5.1.3 Entering the Mobile Station Idle State.....	2-360
5	2.6.5.5.2 Actions in the Mobile Station Idle State.....	2-360
6	2.6.5.5.2.1 Idle Registration Procedures	2-360
7	2.6.5.5.2.2 Processing the Registration Fields of the System Parameters Message and ANSI-41 System Parameters Message	2-362
8		
9	2.6.5.5.2.3 Ordered Registration	2-362
10	2.6.5.5.2.4 Power Off	2-362
11	2.6.5.5.2.5 Full-TMSI Timer Expiration	2-363
12	2.6.5.5.3 Actions in the System Access State.....	2-363
13	2.6.5.5.3.1 Successful Access, Registration, or Implicit Registration.....	2-363
14	2.6.5.5.3.2 Unsuccessful Access.....	2-365
15	2.6.5.5.3.3 Power Off	2-366
16	2.6.5.5.4 Actions in the Mobile Station Control on the Traffic Channel State	2-366
17	2.6.5.5.4.1 Traffic Channel Initialization.....	2-366
18	2.6.5.5.4.2 Timer Maintenance.....	2-366
19	2.6.5.5.4.3 Processing the Mobile Station Registered Message	2-367
20	2.6.5.5.4.4 Power Off	2-368
21	2.6.6 Handoff Procedures	2-368
22	2.6.6.1 Overview	2-368
23	2.6.6.1.1 Types of Handoff	2-368
24	2.6.6.1.2 Pilot Sets	2-369
25	2.6.6.2 Requirements	2-370
26	2.6.6.2.1 Pilot Search	2-370
27	2.6.6.2.2 Pilot Strength Measurements.....	2-373
28	2.6.6.2.3 Handoff Drop Timer.....	2-374
29	2.6.6.2.4 Pilot PN Phase.....	2-375
30	2.6.6.2.5 Handoff Messages	2-375
31	2.6.6.2.5.1 Processing of Forward Traffic Channel Handoff Messages	2-375
32	2.6.6.2.5.1.1 Processing of the Forward Supplemental Burst Assignment ...	2-449

CONTENTS

1	2.6.6.2.5.1.2 Processing of the Reverse Supplemental Burst Assignment.....	2-452
2	2.6.6.2.5.2 Processing of Reverse Traffic Channel Handoff Messages.....	2-457
3	2.6.6.2.6 Set Maintenance.....	2-460
4	2.6.6.2.6.1 Maintenance of the Active Set.....	2-460
5	2.6.6.2.6.2 Maintenance of the Candidate Set	2-461
6	2.6.6.2.6.3 Maintenance of the Neighbor Set	2-461
7	2.6.6.2.7 Soft Handoff	2-463
8	2.6.6.2.7.1 Forward Traffic Channel Processing.....	2-463
9	2.6.6.2.7.2 Reverse Traffic Channel Power Control During Soft Handoff.....	2-463
10	2.6.6.2.7.3 Starting Periodic Search following Soft Handoff.....	2-464
11	2.6.6.2.8 CDMA-to-CDMA Hard Handoff	2-464
12	2.6.6.2.8.1 Hard Handoff without Return on Failure.....	2-464
13	2.6.6.2.8.2 Hard Handoff with Return on Failure.....	2-465
14	2.6.6.2.8.2.1 Restoring the Configuration	2-470
15	2.6.6.2.8.3 Search of Pilots on the CDMA Candidate Frequency.....	2-473
16	2.6.6.2.8.3.1 CDMA Candidate Frequency Single Search.....	2-473
17	2.6.6.2.8.3.2 Candidate Frequency Periodic Search	2-474
18	2.6.6.2.8.3.3 Candidate Frequency Pilot Measurements	2-478
19	2.6.6.2.8.3.4 Aborting CDMA Candidate Frequency Periodic Search	2-481
20	2.6.6.2.9 CDMA-to-Analog Handoff	2-481
21	2.6.6.2.10 Search of Analog Frequencies.....	2-481
22	2.6.6.2.10.1 Analog Frequencies Single Search	2-482
23	2.6.6.2.10.2 Analog Frequencies Periodic Search.....	2-483
24	2.6.6.2.10.3 Analog Frequency Measurements	2-486
25	2.6.6.2.10.4 Aborting Analog Frequencies Periodic Search	2-488
26	2.6.6.2.11 Processing of Reverse Supplemental Code Channels and Reverse Supplemental Channels.....	2-488
28	2.6.6.2.12 Periodic Serving Frequency Pilot Report Procedure.....	2-489
29	2.6.6.3 Examples	2-490
30	2.6.7 Hash Functions and Randomization	2-496
31	2.6.7.1 Hash Function	2-496
32	2.6.7.2 Pseudorandom Number Generator	2-497

CONTENTS

1	2.6.8 CODE_CHAN_LIST _s Maintenance.....	2-498
2	2.6.9 CDMA Tiered Services.....	2-500
3	2.6.9.1 Overview	2-500
4	2.6.9.1.1 Definition.....	2-500
5	2.6.9.1.2 Types of User Zones	2-500
6	2.6.9.2 Requirements	2-501
7	2.6.9.2.1 User Zone Operation in the Mobile Station Idle State:.....	2-501

1 **ADDENDUM INTRODUCTION**

2 This addendum is provided to correct errors and omissions in the published version of
3 3GPP2 C.S0005 A. This addendum replaces 3GPP2 C.S0005 A.

4 Revisions are indicated by change bars located in the left or right hand margins, and also
5 by specific markings applied to the text.

6 New text is underlined, as shown below.

7 Deleted text is crossed out, as shown below.

8 This is how deleted text is identified.

9 A modified figure is marked similarly to modified text. A new figure is underlined; a deleted
10 figure is crossed out through the middle of the figure.

11 The table of contents does not identify revisions to any section heading, table, or figure.

FOREWORD

2 **1. General.** This section defines the terms and numeric indications used in this
3 document. This section also describes the ~~time reference used in the CDMA system and the
4 tolerances used throughout the document~~ general signaling architecture.

5 **2. Requirements for Mobile Station CDMA Operation.** This section describes the
6 requirements for CDMA-analog dual-mode mobile stations operating in the CDMA mode. A
7 mobile station complying with these requirements will be able to operate with CDMA base
8 stations complying with this document.

9 **3. Requirements for Base Station CDMA Operation.** This section describes the
10 requirements for CDMA base stations. A base station complying with these requirements
11 will be able to operate in the CDMA mode with mobile stations complying with this
12 document.

13 | Annex A. Reserved.

14 | Annex B. CDMA Call Flow Examples. This informative annex provides examples of simple
15 call flows in the CDMA system.

16 | Annex C. Reserved.

17 | **Annex D. CDMA Constants.** This normative annex contains tables that give specific
18 values for the constant identifiers found in Section 2 and Section 3.

19 | **Annex E. CDMA Retrievable and Settable Parameters.** This normative annex describes
20 the mobile station parameters that the base station can set and retrieve.

21 | **Annex F. Mobile Station Database.** This informative annex describes a database model
22 that can be used for dual-mode mobile stations complying with this document.

23 | **Annex G. Encryption Call Flows.** This informative annex provides examples of extended
24 encryption call flows in the CDMA system.

1 No text.

NOTES

1. Compatibility, as used in connection with cdma2000, is understood to mean: any cdma2000 mobile station is able to place and receive calls in cdma2000 and IS-95 systems. Conversely, any cdma2000 system is able to place and receive calls for CDMAcdma2000 and IS-95 mobile stations.
 2. The term “dual-mode mobile station” indicates a mobile station capable of both analog (FM) and spread spectrum (CDMA) operation.
 3. This compatibility specification is based upon spectrum allocations that have been defined by various governmental administrations.
 4. Each mobile station is assigned a single unique 32-bit binary serial number (ESN) that cannot be changed by the subscriber without rendering the mobile station inoperative (see 2.3.2).
 5. “Base station” refers to the functions performed in the fixed network. These functions typically distributed among cells, sectors, and mobile switching centers.
 6. This standard uses the following verbal forms: “Shall” and “shall not” identify requirements strictly to be followed in order to conform with the standard and from which no deviation is permitted. “Should” and “should not” indicate that one of several possibilities is recommended as particularly suitable, without mentioning or excluding others; that a certain course of action is preferred but not necessarily required; or that (in the negative form) a certain possibility or course of action is discouraged but not prohibited. “May” and “need not” indicate a course of action permissible within the limits of the standard. “Can” and “cannot” are used for statements of possibility and capability, whether material, physical, or causal.
 7. Footnotes appear at various points in this specification to elaborate and further clarify items discussed in the body of the specification.
 8. Unless indicated otherwise, this document presents numbers in decimal form. Binary numbers are distinguished in the text by the use of single quotation marks.
 9. The following operators define mathematical operations:
 - × indicates multiplication.
 - $\lfloor x \rfloor$ indicates the largest integer less than or equal to x: $\lfloor 1.1 \rfloor = 1$, $\lfloor 1.0 \rfloor = 1$.
 - $\lceil x \rceil$ indicates the smallest integer greater or equal to x: $\lceil 1.1 \rceil = 2$, $\lceil 2.0 \rceil = 2$.
 - $|x|$ indicates the absolute value of x: $|-17| = 17$, $|17| = 17$.
 - \oplus indicates exclusive OR (modulo-2 addition).
 - $\min(x, y)$ indicates the minimum of x and y.
 - $\max(x, y)$ indicates the maximum of x and y.

1 $x \bmod y$ indicates the remainder after dividing x by y : $x \bmod y = x - (y \times \lfloor x/y \rfloor)$.

- 2 10. While communication between Layer 3 and Layer 2 is specified, there is no
3 requirement to implement layering.

1

1 **1. GENERAL**

2 This section defines the terms and numeric indications used in this document. This section
 3 also describes the time reference used in the CDMA system and the tolerances used
 4 throughout the documentthe general signaling architecture.

5 **1.1 Terms and Numeric Information**

6 **1.1.1 Terms**

7 **Abbreviated Alert.** An abbreviated alert is used to remind the mobile station user that
 8 previously selected alternative routing features are still active.

9 **AC.** See Authentication Center.

10 **Access Attempt.** The entire process of sending one message and receiving (or failing to
 11 receive) an acknowledgment for that message, consisting of one or more access sub-
 12 attempts. See also Access Probe, Access Probe Sequence, and Access Sub-attempt.

13 **Access Channel.** A Reverse CDMA Channel used by mobile stations for communicating to
 14 the base station. The Access Channel is used for short signaling message exchanges such
 15 as call originations, responses to pages, and registrations. The Access Channel is a slotted
 16 random access channel.

17 **Access Channel Message.** The information part of an access probe consisting of the
 18 message body, length field, and CRC.

19 **Access Channel Message Capsule.** An Access Channel message plus the padding.

20 **Access Channel Preamble.** The preamble of an access probe consisting of a sequence of
 21 all-zero frames that are sent at the 4800 bps rate.

22 **Access Channel Request Message.** An Access Channel message that is autonomously
 23 generated by the mobile station. See also Access Channel Response Message.

24 **Access Channel Response Message.** A message on the Access Channel generated to reply
 25 to a message received from the base station.

26 **Access Channel Slot.** The assigned time interval for an access probe. An Access Channel
 27 slot consists of an integer number of frames. The transmission of an access probe is
 28 performed within the boundaries of an Access Channel slot.

29 **Access Entry Handoff.** The act of transferring reception of the Paging Channel from one
 30 base station to another, when the mobile station is transitioning from the *Mobile Station Idle*
 31 *State* to the *System Access State*.

32 **Access Handoff.** The act of transferring reception of the Paging Channel from one base
 33 station to another, when the mobile station is in the *System Access State* after an Access
 34 Attempt.

35 **Access Overload Class.** See Overload Class.

36 **Access Probe.** One Access Channel transmission consisting of a preamble and a message.
 37 The transmission is an integer number of frames in length and transmits one Access

1 Channel message. See also Access Probe Sequence, Access Sub-attempt, and Access
2 Attempt.

3 **Access Probe Handoff.** A handoff that occurs while the mobile station is performing an
4 Access Attempt in the *System Access State*.

5 **Access Probe Sequence.** A sequence of one or more access probes on the Access Channel.
6 Other than the reported pilot information, the same Access Channel message content is
7 transmitted in every access probe of an access sub-attempt. See also Access Probe, Access
8 Sub-attempt, and Access Attempt.

9 **Access Sub-attempt.** A sequence of one or more access probe sequences on the Access
10 Channel transmitted to one pilot, containing the same message content other than the
11 reported pilot information. See also Access Probe, Access Probe Sequence, and Access
12 Attempt.

13 **Acknowledgment.** A Layer 2 response by the mobile station or the base station confirming
14 that a signaling message was received correctly.

15 **Action Time.** The time at which the action implied by a message should take effect.

16 **Active Set.** The set of pilots associated with the CDMA Channels containing Forward
17 Traffic Channels assigned to a particular mobile station.

18 **Active User Zone.** A user zone in which the mobile station makes its presence known via
19 an explicit registration in order to activate tiered service features. See also CDMA Tiered
20 Services, User Zone, and Passive User Zone.

21 **Aging.** A mechanism through which the mobile station maintains in its Neighbor Set the
22 pilots that have been recently sent to it from the base station and the pilots whose handoff
23 drop timers have recently expired.

24 **A-key.** A secret, 64-bit pattern stored in the mobile station and HLR/AC. It is used to
25 generate/update the mobile station's Shared Secret Data.

26 **Assured Mode.** Mode of delivery that guarantees that a PDU will be delivered to the peer.
27 A PDU sent in assured mode is retransmitted by the LAC sublayer, up to a maximum
28 number of retransmissions, until the LAC entity at the sender receives an acknowledgement
29 for the PDU. See also Confirmation of Delivery.

30 **Authentication.** A procedure used by a base station to validate a mobile station's identity.

31 **Authentication Center (AC).** An entity that manages the authentication information
32 related to the mobile station.

33 **Authentication Response (AUTHR).** An 18-bit output of the authentication algorithm. It
34 is used, for example, to validate mobile station registrations, originations and terminations.

35 **Autonomous Registration.** A method of registration in which the mobile station registers
36 without an explicit command from the base station.

37 **Auxiliary Pilot Channel.** A non-data-bearing, direct-sequence spread spectrum signal
38 optionally transmitted by a CDMA base station.

Auxiliary Transmit Diversity Pilot Channel. A pilot channel, counterpart to an Auxiliary Pilot Channel, that is transmitted by a CDMA base station from the non-primary antenna when orthogonal transmit diversity is employed.

Bad Frames. Frames classified as insufficient frame quality or as 9600 bps primary traffic only, with bit errors. See also Good Frames.

Band Class. A set of CDMA frequency assignments and a numbering scheme for these channels. See also CDMA Frequency Assignment.

Base Station. A fixed station used for communicating with mobile stations. Depending upon the context, the term base station may refer to a cell, a sector within a cell, an MSC, or other part of the [cellular-wireless](#) system. See also MSC.

Base Station Authentication Response (AUTHBS). An 18-bit pattern generated by the authentication algorithm. AUTHBS is used to confirm the validity of base station orders to update the Shared Secret Data.

Base Station Random Variable (RANDBS). A 32-bit random number generated by the mobile station for authenticating base station orders to update the Shared Secret Data.

Blank-and-Burst. The preemption of an entire Traffic Channel frame's primary traffic by signaling traffic or secondary traffic. Blank-and-burst is performed on a frame-by-frame basis.

BLOB. Block of Bits.

bps. Bits per second.

Broadcast Control Channel. A code channel in a Forward CDMA Channel used for transmission of control information [or broadcast messages](#) from a base station to a mobile station.

Broadcast Control Channel Number (BCN). [A number that identifies the Broadcast Control Channel.](#) BCN number 1 corresponds to the Primary Broadcast Control Channel. BCN numbers 2 through 8 correspond to other Broadcast Control Channels [\(if any\)](#).

Broadcast User Zone. A user zone that is identified to the mobile station by means of broadcast messages. It corresponds to the RF coverage area of a particular set of cells and sectors. See also CDMA Tiered Services and Mobile-Specific User Zone.

Call Disconnect. The process that releases the resources handling a particular call. The disconnect process begins either when the mobile station user indicates the end of the call by generating an on-hook condition or other call-release mechanism, or when the base station initiates a release.

Call History Parameter (COUNT). A modulo-64 event counter maintained by the mobile station and Authentication Center that is used for clone detection.

Candidate Frequency. The frequency, either analog or CDMA, for which the base station specifies a search set, using a *Candidate Frequency Search Request Message*.

Candidate Set. The set of pilots that have been received with sufficient strength by the mobile station to be successfully demodulated, but have not been placed in the Active Set by the base station. See also Active Set, Neighbor Set, and Remaining Set.

CDMA. See Code Division Multiple Access.

CDMA Candidate Frequency. The Candidate Frequency specified for a search of CDMA pilots.

CDMA Channel. The set of channels transmitted between the base station and the mobile stations within a given CDMA Frequency Assignment. See also Forward CDMA Channel and Reverse CDMA Channel.

CDMA Channel Number. An 11-bit number that identifies a CDMA Frequency Assignment.

CDMA Frequency Assignment. A 1.23 or 3.69 MHz segment of spectrum. The center of a CDMA frequency assignment is given by a CDMA Channel Number.

CDMA Preferred Set. The set of CDMA channel numbers in a CDMA system corresponding to Frequency Assignments that a mobile station will normally search to acquire a CDMA Pilot Channel. For CDMA cellular systems, the primary and secondary channels comprise the CDMA Preferred Set.

CDMA Tiered Services. System features and services that are based on location, potentially including private networks. User zones establish the availability of services. See also User Zone, Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and Passive User Zone.

Center SR3 Frequency. The Spreading Rate 3 frequency that has the center frequency assignment.

Chip. See PN Chip.

Code Channel. A subchannel of a Forward CDMA Channel or Reverse CDMA Channel. Each subchannel uses an orthogonal Walsh function or quasi-orthogonal function.

Code Division Multiple Access (CDMA). A technique for spread-spectrum multiple-access digital communications that creates channels through the use of unique code sequences.

Code Symbol. The output of an error-correcting encoder. Information bits are input to the encoder and code symbols are output from the encoder. See Convolutional Code.

Configuration Change Indicator. A one-bit datum, sent on the Quick Paging Channel. Appearance of the Configuration Change Indicator in the Quick Paging Channel serves to alert a slotted mode mobile station, operating in the idle state, that, after performing an idle handoff, it should monitor the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast Control Channel in order to determine if it should update its stored parameters.

Confirmation of Delivery. A notification sent by the LAC sublayer to Layer 3 at the sender, when the LAC entity at the sender receives the acknowledgment for a specific PDU sent in assured mode.

Convolutional Code. A type of error-correcting code. A code symbol can be considered as modulo 2 the convolution of the input data sequence with the impulse response of a generator function.

CRC. See Cyclic Redundancy Code.

Cyclic Redundancy Code (CRC). A class of linear error detecting codes that generate parity check bits by finding the remainder of a polynomial division. See also Frame Quality Indicator.

dBc. The ratio (in dB) of the sideband power of a signal, measured in a given bandwidth at a given frequency offset from the center frequency of the same signal, to the total inband power of the signal.

dBm. A measure of power expressed in terms of its ratio (in dB) to one milliwatt.

dBm/Hz. A measure of power spectral density. The ratio, dBm/Hz, is the power in one Hertz of bandwidth, where power is expressed in units of dBm.

dBW. A measure of power expressed in terms of its ratio (in dB) to one Watt.

Dedicated Control Channel. A portion of a Traffic Channel (Forward or Reverse) that carries a combination of user data, signaling, and power control information.

Deinterleaving. The process of unpermuting the symbols that were permuted by the interleaver. Deinterleaving is performed on received symbols prior to decoding.

Discontinuous Transmission (DTX). A mode of operation in which a base station or a mobile station switches its transmitter on and off on a particular code channel autonomously. For the case of DTX operation on the Forward Dedicated Control Channel, the Forward Power Control Subchannel is still transmitted.

Distance-Based Registration. An autonomous registration method in which the mobile station registers whenever it enters a cell whose distance from the cell in which the mobile station last registered exceeds a given threshold.

DTMF. See Dual-Tone Multifrequency.

Dual-Tone Multifrequency (DTMF). Signaling by the simultaneous transmission of two tones, one from a group of low frequencies and another from a group of high frequencies. Each group of frequencies consists of four frequencies.

E_b. A measure of the energy in a signal, at some point in a communication system, per information bit conveyed by that signal, or an average value of such energies. Its relevance to system performance is most often expressed by its ratio to additive noise and interference, such as in E_b/N₀ or E_b/I₀. Such ratios are dimensionless, and are usually expressed in dB units.

E_c/I_o. A notation used to represent a dimensionless ratio of the average power of some code-distinguished CDMA signal channel, typically a pilot, to the total power comprised of signal plus interference, within the signal bandwidth. It is usually expressed in dB units.

Effective Radiated Power (ERP). The product of the power supplied to the antenna and its gain relative to a half-wave dipole in a given direction.

- EIRP.** See Equivalent Isotropic Radiated Power.
- Electronic Serial Number (ESN).** A 32-bit number assigned by the mobile station manufacturer, uniquely identifying the mobile station equipment.
- Encoder Tail Bits.** A fixed sequence of bits added to the end of a block of data to reset the convolutional encoder to a known state.
- Enhanced Access Channel.** A reverse channel used by mobile station for communicating to the base station. The Enhanced Access Channel operates in the Basic Access Mode, and Reservation Access Mode. It is used for transmission of short messages, such as signaling, MAC messages, response to pages, and call originations. It can also be used to transmit moderate-sized data packets.
- Enhanced Access Channel Preamble.** A non-data bearing portion of the Enhanced Access probe sent by the mobile station to assist the base station in initial acquisition and channel estimation.
- Enhanced Access Channel Slot.** The assigned time interval for an enhanced access probe. An Enhanced Access Channel slot consists of an integer number of Enhanced Access Channel frames. The transmission of an enhanced access probe is performed within the boundaries of an Enhanced Access Channel slot.
- Enhanced Access Data.** The data transmitted while in the Basic Access Mode on the Enhanced Access Channel or while in the Reservation Access Mode on a Reverse Common Control Channel.
- Enhanced Access Header.** A frame containing access origination information transmitted immediately after the Enhanced Access Channel Preamble while in the Reservation Access Mode.
- Enhanced Access Probe.** One Enhanced Access Channel transmission consisting of an Enhanced Access Channel preamble, optionally an Enhanced Access header, and optionally Enhanced Access data. See also Enhanced Access Probe Sequence.
- Enhanced Access Probe Sequence.** A sequence of one or more Enhanced Access probes on the Enhanced Access Channel. See also Enhanced Access Probe.
- Equivalent Isotropically Radiated Power (EIRP).** The product of the power supplied to the antenna and the antenna gain in a direction relative to an isotropic antenna.
- Erasure Indicator Bit.** See [2].
- ERP.** See Effective Radiated Power.
- ESN.** See Electronic Serial Number.
- f-csch.** Forward common signaling logical channel.
- f-dsch.** Forward dedicated signaling logical channel.
- Fade Timer.** A timer kept by the mobile station as a measure of Forward Traffic Channel continuity. If the fade timer expires, the mobile station drops the call.
- Flash.** An indication sent on the Reverse CDMA Channel indicating that the user directed the mobile station to invoke special processing.

1 Foreign NID Roamer. A mobile station operating in the same system (SID) but in a
 2 different network (NID) from the one in which service was subscribed. See also Foreign SID
 3 Roamer and Roamer.

4 Foreign SID Roamer. A mobile station operating in a system (SID) other than the one from
 5 which service was subscribed. See also Foreign NID Roamer and Roamer.

6 Forward CDMA Channel. A CDMA Channel from a base station to mobile stations. The
 7 Forward CDMA Channel contains one or more code channels that are transmitted on a
 8 CDMA Frequency Assignment using a particular pilot PN offset. The code channels are
 9 associated with the Pilot Channel, Sync Channel, Paging Channels, Broadcast Control
 10 Channel, Forward Common Control Channels, and Traffic Channels. The Forward CDMA
 11 Channel always carries a Pilot Channel and may also carry up to one Sync Channel, up to
 12 seven Paging Channels, one-up to eight Broadcast Control Channels, up to seven Forward
 13 Common Control Channels and up to the maximum number of channels allowed for the
 14 assigned Radio Configuration minus one Traffic Channels, as long as the total number of
 15 channels, including the Pilot Channel, is no greater than the maximum number of channels
 16 allowed for the assigned Radio Configuration (see [2] section 3.1.3.1.13).

17 Forward Common Control Channel. A control channel used for the transmission of digital
 18 control information from a base station to one or more mobile stations.

19 Forward Dedicated Control Channel. A Dedicated Control Channel that is transmitted on
 20 the Forward CDMA Channel.

21 Forward Fundamental Channel. A Fundamental Channel that is transmitted on the
 22 Forward CDMA Channel.

23 Forward Pilot Channel. A non-data-bearing direct-sequence spread spectrum signal
 24 transmitted continuously by each CDMA base station. The Forward Pilot Channel allows a
 25 mobile station to acquire the timing of the Forward CDMA Channel, provides a phase
 26 reference for coherent demodulation, and provides a means for signal strength comparisons
 27 between base stations for determining when to handoff. Different base stations are
 28 identified by different pilot PN sequence time phases. See also Pilot PN Sequence, Pilot PN
 29 Sequence Offset.

30 Forward Supplemental Channel. A Supplemental Channel that is transmitted on the
 31 Forward CDMA Channel.

32 Forward Supplemental Code Channel. A Supplemental Code Channel that is transmitted
 33 on the Forward CDMA Channel.

34 Forward Traffic Channel. One or more code channels used to transport user and
 35 signaling traffic from the base station to the mobile station. See Forward Fundamental
 36 Code—Channel, Forward Dedicated Control Channel, Forward Fundamental Channel,
 37 Forward Supplemental, and Forward Supplemental Code Channel.

38 Forward Transmit Diversity Pilot Channel. A pilot channel transmitted by a CDMA base
 39 station from the non-primary antenna when orthogonal transmit diversity is employed.

40 Frame. A basic timing interval in the system. For the Access Channel, Paging Channel,
 41 Broadcast Control Channel, Forward Supplemental Code Channel, and Reverse

1 Supplemental Code Channel, a frame is 20 ms long. For the Forward Supplemental
 2 Channel and Reverse Supplemental channel, a frame is 20, 40, or 80 ms long. For the
 3 Sync Channel, a frame is 26.666... ms long. For the Forward Fundamental Channel,
 4 Forward Dedicated Control Channel, Reverse Fundamental Channel, and Reverse Dedicated
 5 Control Channel, a frame is 5 or 20 ms long. For the Enhance Access Channel, the
 6 Forward Common Control Channel, and the Reverse Common Control Channel, a frame is
 7 5, 10 or 20 ms long.

8 **Frame Category.** A classification of a received Traffic Channel frame based upon
 9 transmission data rate, the frame contents (primary traffic, secondary traffic, or signaling
 10 traffic), and whether there are detected errors in the frame.

11 **Frame Offset.** A time skewing of Traffic Channel frames from System Time in integer
 12 multiples of 1.25 ms. The maximum frame offset is 18.75 ms.

13 **Frame Quality Indicator.** See [2].

14 **Full TMSI.** The combination of TMSI_ZONE and TMSI_CODE. The full TMSI is a globally
 15 unique address for the mobile station.

16 **Fundamental Channel.** A portion of a Traffic Channel that can carry a combination of
 17 primary data, secondary data, signaling, and power control information.

18 **Gating Rate Set.** This specifies the set of supported reverse pilot gating rates. The base
 19 station and the mobile station may support one or more gating rates.

20 **GHz.** Gigahertz (10^9 Hertz).

21 **Global Positioning System (GPS).** A US government satellite system that provides location
 22 and time information to users. See Navstar GPS Space Segment / Navigation User
 23 Interfaces ICD-GPS-200 for specifications.

24 **Good Frames.** Frames not classified as bad frames. See also Bad Frames.

25 **GPS.** See Global Positioning System.

26 **Handoff.** The act of transferring communication with a mobile station from one base
 27 station to another.

28 **Hard Handoff.** A handoff characterized by a temporary disconnection of the Traffic
 29 Channel. Hard handoffs occur when the mobile station is transferred between disjoint
 30 Active Sets, when the CDMA Frequency Assignment changes, when the frame offset
 31 changes, or when the mobile station is directed from a CDMA Traffic Channel to an analog
 32 voice channel. See also Soft Handoff.

33 **Hash Function.** A function used by the mobile station to select one out of N available
 34 resources. The hash function distributes the available resources uniformly among a
 35 random sample of mobile stations.

36 **Highest SR3 Frequency.** The SR3 frequency that has the highest frequency assignment.

37 **HLR.** See Home Location Register.

38 **Home Location Register (HLR).** The location register to which a MIN/IMSI is assigned for
 39 record purposes such as subscriber information.

1 Home System. The [wirelessellular or PCS](#) system in which the mobile station subscribes
2 for service.

3 Hopping Pilot Beacon. A pilot beacon that changes CDMA Frequency periodically to
4 simulate multiple base stations operating on different frequencies. The transmission of the
5 hopping pilot beacon is discontinuous on any CDMA Channel.

6 Idle Handoff. The act of transferring reception of the Paging Channel, Broadcast Control
7 Channel or the Forward Common Control Channel from one base station to another, when
8 the mobile station is in the *Mobile Station Idle State*.

9 Implicit Registration. A registration achieved by a successful transmission of an
10 origination or page response on the r-csch.

11 IMSI. See International Mobile Station Identity.

12 IMSI_M. MIN-based IMSI using the lower 10 digits to store the MIN.

13 IMSI_O. Operational value of IMSI used by the mobile station for operation with the base
14 station.

15 IMSI_T. True IMSI not associated with MIN. This could be 15 digits or fewer.

16 Interleaving. The process of permuting a sequence of symbols.

17 International Mobile Station Identity (IMSI). A method of identifying stations in the land
18 mobile service as specified in [18].

19 kHz. Kilohertz (10^3 Hertz).

20 ksps. Kilo-symbols per second (10^3 symbols per second).

21 LAC. See Link Access Control.

22 Layering. A method of organization for communication protocols in which the transmitted
23 or received information is transferred in pipeline fashion, within each station, in well-
24 defined encapsulated data units between otherwise decoupled processing entities (“layers”).
25 A layer is defined in terms of its communication protocol to a peer layer in another entity
26 and the services it offers to the next higher layer in its own entity.

27 Layer 1. Layer 1 provides for the transmission and reception of radio signals between the
28 base station and the mobile station. Also see Physical Layer.

29 Layer 2. Layer 2 provides for the correct transmission and reception of signaling messages,
30 including partial duplicate detection. Layer 2 makes use of the services provided by Layer
31 1. See also Layering and Layer 3.

32 Layer 3. Layer 3 provides the control messaging for the [wirelessellular or PCS](#) telephone
33 system. Layer 3 originates and terminates signaling messages according to the semantics
34 and timing of the communication protocol between the base station and the mobile station.
35 Layer 3 makes use of the services provided by Layer 2. See also Layering and Layer 2.

36 Link Access Control. See LAC. The LAC Sublayer is the upper sublayer of Layer 2. It
37 implements a data link protocol that provides for the correct transport and delivery of
38 signaling messages generated by Layer 3. The LAC Sublayer makes use of the services

1 provided by the Lower Layers (Layer 1 and the MAC Sublayer).

2 **Local Control.** An optional mobile station feature used to perform manufacturer-specific
3 functions.

4 **Logical Channel.** A communication path between the mobile station and the base station,
5 described in terms of the intended use of, and access to, the transferred data, and direction
6 of transfer. A logical channel can be “mapped” to and from one or more physical channels.

7 **Logical-to-physical Mapping.** The technique for forming associations between logical and
8 physical channels.

9 **Long Code.** A PN sequence with period $2^{42} - 1$ that is used for scrambling on the Forward
10 CDMA Channel and spreading on the Reverse CDMA Channel. The long code uniquely
11 identifies a mobile station on both the Reverse Traffic Channel and the Forward Traffic
12 Channel. The long code provides limited privacy. The long code also separates multiple
13 Access Channels and Enhanced Access Channels on the same CDMA Channel. See also
14 Public Long Code and Private Long Code.

15 **Long Code Mask.** A 42-bit binary number that creates the unique identity of the long code.
16 See also Public Long Code, Private Long Code, Public Long Code Mask, and Private Long
17 Code Mask.

18 **Lowest SR3 Frequency.** The SR3 frequency that has the lowest frequency assignment.

19 **LSB.** Least significant bit.

20 **LTU.** Logical Transmission Unit. One or more Type 3 MuxPDUs with a 16-bit CRC.

21 **MAC.** See Medium Access Control.

22 **Maximal Length Sequence (m-Sequence).** A binary sequence of period $2^n - 1$, n being a
23 positive integer, with no internal periodicities. A maximal length sequence can be
24 generated by a tapped n-bit shift register with linear feedback.

25 **MCC.** See Mobile Country Code.

26 **Mcps.** Megachips per second (10^6 chips per second).

27 **MCSB.** See Message Control and Status Block.

28 **Mean Input Power.** The total received calorimetric power measured in a specified
29 bandwidth at the antenna connector, including all internal and external signal and noise
30 sources.

31 **Mean Output Power.** The total transmitted calorimetric power measured in a specified
32 bandwidth at the antenna connector when the transmitter is active.

33 **Medium Access Control.** See MAC. The MAC Sublayer is the lower sublayer of Layer 2. It
34 implements the medium access protocol and is responsible for transport of LAC protocol
35 data units using the services provided by Layer 1.

36 **Message.** A data structure that conveys control information or application information. A
37 message consists of a length field (MSG_LENGTH), a message body (the part conveying the
38 information), and a CRC.

Message Body. The part of the message contained between the length field (MSG_LENGTH) and the CRC field.

Message Capsule. A sequence of bits comprising a single message and padding. The padding always follows the message and may be of zero length.

Message Control and Status Block. In this document, a parameter block representing the PCI being transferred between Layer 3 and Layer 2.

Message CRC. The CRC check associated with a message. See also Cyclic Redundancy Code.

Message Field. A basic named element in a message. A message field may consist of zero or more bits.

Message Record. An entry in a message consisting of one or more fields that repeats in the message.

MHz. Megahertz (10^6 Hertz).

MIN. See Mobile Identification Number.

MNC. See Mobile Network Code.

Mobile Country Code (MCC). A part of the E.212 IMSI identifying the home country. See [18].

Mobile Directory Number. A dialable directory number that is not necessarily the same as the mobile station's air interface identification, i.e., MIN, IMSI_M or IMSI_T.

Mobile Identification Number (MIN). The 34-bit number that is a digital representation of the 10-digit number assigned to a mobile station.

Mobile Network Code (MNC). A part of the E.212 IMSI identifying the home network within the home country. See [18].

Mobile Protocol Capability Indicator (MPCI). A 2-bit field used to indicate the mobile station's capabilities.

Mobile-Specific User Zone. A user zone that is identified by the mobile station. The mobile station may consider parameters such as the identity of the serving system, cell, and sector, and the geographic location of that station in making the determination. See also CDMA Tiered Services, User Zone, Broadcast User Zone, Active User Zone, and Passive User Zone.

Mobile Station. A station in the Public [WirelessCellular](#) Radio Telecommunications Service intended to be used while in motion or during halts at unspecified points. Mobile stations include portable units (e.g., hand-held personal units) and units installed in vehicles.

Mobile Station Class. A classification of mobile stations based on characteristics such as slotted operation and transmission power. See Table 2.3.3-1 of [12] and Table 2.3.3-1 of this document.

Mobile Station Identification Number (MSIN). A part of the E.212 IMSI identifying the mobile station within its home network. See [18].

- 1 **Mobile Station Originated Call.** A call originating from a mobile station.
- 2 **Mobile Station Terminated Call.** A call received by a mobile station (not to be confused
3 with a disconnect or call release).
- 4 **ms.** Millisecond (10^{-3} second).
- 5 **MSB.** Most significant bit.
- 6 **MSC.** See Mobile Switching Center.
- 7 **MSIN.** See Mobile Station Identification Number.
- 8 **Multiplex Option.** The ability of the multiplex sublayer and lower layers to be tailored to
9 provide special capabilities. A multiplex option defines such characteristics as the frame
10 format, the maximum number of Supplemental Code Channels supported, and the rate
11 decision rules. See also Multiplex Sublayer.
- 12 **Multiplex Sublayer.** One of the conceptual layers of the system that multiplexes and
13 demultiplexes primary traffic, secondary traffic, and signaling traffic.
- 14 **NAM.** See Number Assignment Module.
- 15 **National Mobile Station Identity (NMSI).** A part of the E.212 IMSI identifying the mobile
16 station within its home country. The NMSI consists of the MNC and the MSIN. See [18].
- 17 **NDSS.** See Network Directed System Selection.
- 18 **Neighbor Set.** The set of pilots associated with the CDMA Channels that are probable
19 candidates for handoff. Normally, the Neighbor Set consists of the pilots associated with
20 CDMA Channels that cover geographical areas near the mobile station. See also Active Set,
21 Candidate Set, Remaining Set, and Private Neighbor Set.
- 22 **Network.** A network is a subset of a [wireless cellular or PCS](#) system, such as an area-wide
23 cellular network, a private group of base stations, or a group of base stations set up to
24 handle a special requirement. A network can be as small or as large as needed, as long as
25 it is fully contained within a system. See also System.
- 26 **Network Directed System Selection (NDSS).** A feature that allows the mobile station to
27 automatically register with a preferred system while roaming, or to be automatically
28 directed by a service provider, typically the home service provider, to a suggested system,
29 regardless of the frequency band class, cellular band, or PCS frequency block.
- 30 **Network Identification (NID).** A number that uniquely identifies a network within a
31 [wireless cellular or PCS](#) system. See also System Identification.
- 32 **NID.** See Network Identification.
- 33 **NMSI.** See National Mobile Station Identity.
- 34 **Non-Autonomous Registration.** A registration method in which the base station initiates
35 registration. See also Autonomous Registration.
- 36 **Non-Slotted Mode.** An operation mode of the mobile station in which the mobile station
37 continuously monitors the Paging Channel, or the Forward Common Control Channel/
38 Broadcast Control Channel.

1 ns. Nanosecond (10^{-9} second).

2 NULL. Any value that is not in the specified range of a field.

3 Null Traffic Channel Data. One or more frames of a specified data sequence sent at the
4 lowest agreed-upon rate of the negotiated radio configuration. Null Traffic Channel data
5 may be sent when there is no primary, secondary, or signaling traffic available. Null Traffic
6 Channel data serves to maintain the connectivity between the mobile station and the base
7 station.

8 Number Assignment Module (NAM). A set of MIN/IMSI-related parameters stored in the
9 mobile station.

10 Numeric Information. Numeric information consists of parameters that appear as
11 numeric fields in messages exchanged by the base station and the mobile station and
12 information used to describe the operation of the mobile station.

13 Optional Field. A field defined within a message structure that is optionally transmitted to
14 the message recipient.

15 Order. A type of message that contains control codes for either the mobile station or the
16 base station.

17 Ordered Registration. A registration method in which the base station orders the mobile
18 station to send registration related parameters.

19 Orthogonal Transmit Diversity (OTD). An optional method of transmission of the
20 Forward CDMA Channel that uses two antennas, each transmitting a fraction of the code
21 symbols. It can be used to enhance performance in the presence of multipath fading radio
22 propagation.

23 OTD. See Orthogonal Transmit Diversity

24 Overhead Message. A message sent by the base station on the Paging Channel or the
25 Primary Broadcast Control Channel to communicate base-station-specific and system-wide
26 information to mobile stations.

27 Overload Class (OLC). The means used to control system access by mobile stations,
28 typically in emergency or other overloaded conditions. Mobile stations are assigned one (or
29 more) of sixteen overload classes. Access to the CDMA system can then be controlled on a
30 per class basis by persistence values transmitted by the base station.

31 PACA. Priority Access and Channel Assignment. See PACA Call.

32 PACA Call. A priority mobile station originated call for which no traffic channel or voice
33 channel was immediately available, and which has been queued for a priority access
34 channel assignment.

35 Packet. The unit of information exchanged between the service option applications of the
36 base station and the mobile station.

37 Padding. A sequence of bits used to fill from the end of a message to the end of a message
38 capsule, typically to the end of the frame or half frame. All bits in the padding are '0'.

39 Paging. The act of seeking a mobile station when a call has been placed to that mobile

1 station.

2 **Paging Channel.** A code channel in a Forward CDMA Channel used for transmission of
3 control information and pages from a base station to a mobile station.

4 **Paging Channel Slot.** An 80 ms interval on the Paging Channel. Mobile stations operating
5 in the slotted mode are assigned specific slots in which they monitor messages from the
6 base station.

7 **Paging Indicator.** A one-bit datum, sent on the Quick Paging Channel. Quick paging
8 indicators are associated with mobile stations, in pairs, via a hashing algorithm.
9 Appearance of both of its indicators in its assigned Quick Paging Channel slot serves to
10 alert a slotted mode mobile station, operating in the idle state, that it should monitor the
11 Paging Channel or the Forward Common Control Channel starting in the next slot. See
12 also Quick Paging Channel.

13 **Parameter-Change Registration.** A registration method in which the mobile station
14 registers when certain of its stored parameters change.

15 **Parity Check Bits.** Bits added to a sequence of information bits to provide error detection,
16 correction, or both.

17 **Passive User Zone.** A user zone in which the implicit registration that takes place at call
18 setup is sufficient to trigger a change in tiered service features. See also CDMA Tiered
19 Services, User Zone, and Active User Zone.

20 **PCI.** See Protocol Control Information.

21 **PCS.** See Personal Communications Services.

22 **PCSC.** See Personal Communications Switching Center.

23 **PCS System.** See Personal Communications Services System.

24 **PDU.** See Protocol Data Unit.

25 **Personal Communications Services System.** A configuration of equipment that provides
26 PCS radiotelephone services.

27 **Personal Communications Services (PCS).** A family of mobile and portable radio
28 communications services for individuals and businesses that may be integrated with a
29 variety of competing networks. Broadcasting is prohibited and fixed operations are to be
30 ancillary to mobile operations.

31 **Personal Communications Switching Center (PCSC).** See Mobile Switching Center
32 (MSC).

33 **Physical Channel.** A communication path between stations, described in terms of the RF
34 characteristics such as coding, power control policies, etc.

35 **Physical Layer.** The part of the communication protocol between the mobile station and
36 the base station that is responsible for the transmission and reception of data. The
37 physical layer in the transmitting station is presented a frame by the multiplex sublayer
38 and transforms it into an over-the-air waveform. The physical layer in the receiving station

1 transforms the waveform back into a frame and presents it to the multiplex sublayer above
 2 it.

3 **Pilot Beacon.** A transmit-only base station that broadcasts a Pilot Channel, a Sync
 4 Channel, optionally a Paging Channel or a Primary Broadcast Control Channel, but no
 5 Forward Common Control Channels and Forward Traffic Channels. The mobile station
 6 measures the pilot beacon to assist in CDMA hard handoffs and inter-frequency idle-mode
 7 handoffs.

8 **Pilot Channel.** A non-data-bearing signal transmitted by a CDMA station. See Forward
 9 Pilot Channel, Transmit Diversity Pilot Channel, Auxiliary Pilot Channel, Auxiliary Transmit
 10 Diversity Pilot Channel, and Reverse Pilot Channel.

11 **Pilot PN Chip.** One bit, or bit pair, of a pilot PN sequence, or the time interval
 12 corresponding thereto.

13 **Pilot PN Sequence.** A pair of modified maximal length PN sequences used to spread the
 14 quadrature components of a CDMA Channel.

15 **Pilot PN Sequence Offset.** The time offset of a Forward Pilot Channel from CDMA System
 16 time, as transmitted by the base station, expressed modulo the pilot period.

17 **Pilot PN Sequence Offset Index.** The pilot PN sequence offset in units of 64 PN chips of a
 18 Forward Pilot Channel, relative to the zero offset pilot PN sequence.

19 **Pilot Strength.** The ratio of pilot power to total power in the signal bandwidth of a CDMA
 20 Forward or Reverse Channel. See also E_c/I_0 .

21 **PN.** Pseudonoise.

22 **PN Chip.** One bit in a PN sequence, or the time duration of such a bit. It corresponds to
 23 the smallest modulation interval in a CDMA system.

24 **PN Sequence.** Pseudonoise sequence. A deterministic, periodic binary sequence having
 25 limited statistical similarity to a Bernoulli (coin-tossing).

26 **Power Control Bit.** A bit sent on the Forward Power Control Subchannel or Reverse Power
 27 Control Subchannel to signal the mobile station or base station to increase or decrease its
 28 transmit power.

29 **Power Control Group.** A 1.25 ms interval on the Forward Traffic Channel and the Reverse
 30 Traffic Channel. See also Power Control Bit.

31 **Power-Down Registration.** An autonomous registration method in which the mobile
 32 station registers on power-down.

33 **Power Up Function.** A method by which the mobile station increases its output power to
 34 support location services.

35 **Power-Up Registration.** An autonomous registration method in which the mobile station
 36 registers on power-up.

37 **PPM.** Parts per million.

38 **Preamble.** See Access Channel Preamble and Traffic Channel Preamble.

1 **Primary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by the
 2 mobile station for initial acquisition. See also Secondary CDMA Channel.

3 **Primary Paging Channel (CDMA).** The default code channel (code channel 1) assigned for
 4 paging on a CDMA Channel.

5 **Primary Pilot.** One of the three pilots on the Spreading Rate 3 Forward Channels. The
 6 primary pilot may be on any one of the SR3 frequencies and may have a higher
 7 transmission power comparing to the pilots on the other two SR3 frequencies.

8 **Primary Traffic.** The main traffic stream carried between the mobile station and the base
 9 station on the Traffic Channel. See also Secondary Traffic and Signaling Traffic.

10 **Primitive.** An atomic, well-defined method of transferring data and control information
 11 between two adjacent layers and sublayers. Conventionally represented as a function
 12 invocation with the data and/or control information as parameters.

13 **Private Long Code.** The long code characterized by the private long code mask. See also
 14 Long Code.

15 **Private Long Code Mask.** The long code mask used to form the private long code. See also
 16 Public Long Code Mask and Long Code.

17 **Private Neighbor Set.** The set of pilots associated with the private system base stations
 18 that are probable candidates for idle handoff. See also Active Set, Neighbor Set, Remaining
 19 Set, and CDMA Tiered Services.

20 **Protocol Control Information (PCI).** Data passed between adjacent layers in the protocol
 21 stack, together with the SDU, to assist a layer to properly encapsulate/decapsulate the
 22 SDU. Examples of PCI in this document are the MCSB and the PCSB.

23 **Protocol Data Unit.** Encapsulated data communicated between peer layers on the mobile
 24 station and base station. Unless specified otherwise, in this document PDU refers to the
 25 Layer 3 protocol data unit transferred at the interface between [Layer 3](#) and [Layer 2](#).

26 **Protocol Stack.** Conceptual model of the layered architecture for communication protocols
 27 (see Layering) in which layers within a station are represented in the order of their numeric
 28 designation and requiring that transferred data be processed sequentially by each layer, in
 29 the order of their representation. Graphically, the “stack” is drawn vertically, with the layer
 30 having the lowest numeric designation at the base.

31 **Public Long Code.** The long code characterized by the public long code mask.

32 **Public Long Code Mask.** The long code mask used to form the public long code. The mask
 33 contains a permutation of the bits of the ESN, and also includes the channel number when
 34 used for a Supplemental Code Channel. See also Private Long Code Mask and Long Code.

35 **PUF.** See Power Up Function.

36 **PUF Attempt.** A sequence of PUF probes sent by the mobile station in response to a *Power*
 37 *Up Function Message*.

38 **PUF Probe.** One or more consecutive frames on the Reverse Traffic Channel within which
 39 the mobile station transmits the PUF pulse.

1 PUF Pulse. Portion of PUF probe that may be transmitted at elevated output power.

2 PUF Target Frequency. The CDMA frequency assignment to which the base station directs
3 a mobile station for transmitting the PUF probe.

4 Punctured Code. An error-correcting code generated from another error-correcting code by
5 deleting (i.e., puncturing) code symbols from the coder output.

6 QoS. See Quality of Service.

7 Quality of Service. Set of parameters and procedures associated with a service and/or
8 user, indicating some of the capabilities and constraints related to the delivery of the
9 service to the user.

10 Quick Paging. A feature that permits mobile stations to further conserve battery power
11 beyond the savings achieved by slotted mode operation. See also Paging Indicator and
12 Configuration Change Indicator.

13 Quick Paging Channel. An uncoded, on-off-keyed (OOK) spread spectrum signal sent by
14 base stations to inform slotted mode mobile stations, operating in the idle state, whether to
15 monitor the Paging Channel or the Forward Common Control Channel. See also Quick
16 Paging, Paging Indicator, and Configuration Change Indicator.

17 Quick Paging Channel Slot. An 80 ms interval on the Quick Paging Channel. See also
18 Paging Indicator and Configuration Change Indicator.

19 Quick Repeats. Additional transmissions of identical copies of a message within a short
20 interval to increase the probability that the message is received correctly.

21 r-csch. Reverse common signaling logical channel.

22 r-dsch. Reverse dedicated signaling logical channel.

23 Radio Configuration. A set of Forward Traffic Channel and Reverse Traffic Channel
24 transmission formats that are characterized by physical layer parameters such as
25 transmission rates, modulation characteristics and spreading rate. See Table 3.1.3.1-1 and
26 Table 2.1.3.1-1 of [2].

27 Radio Configuration Class. A group of Radio Configurations. All Radio Configurations, for
28 the Forward Traffic Channel and the Reverse Traffic Channel, are divided into three classes
29 by the types of pre-spreading symbols (BPSK and QPSK) and spreading rates. RC Class 1
30 consists of RC 1 and RC 2 for the Forward Traffic Channel and the Reverse Traffic Channel.
31 RC Class 2 consists of RC 3 and RC 4 of the Reverse Traffic Channel, and RC 3, RC 4 and
32 RC 5 of the Forward Traffic Channel. RC Class 3 consists of RC 5 and RC 6 of the Reverse
33 Traffic Channel, and RC 6, RC 7, RC 8, and RC 9 of the Forward Traffic Channel.

34 RC. See Radio Configuration.

35 Registration. The process by which a mobile station identifies its location and parameters
36 to a base station.

37 Registration Zone. A collection of one or more base stations treated as a unit when
38 determining whether a mobile station should perform zone-based registration. See also
39 User Zone, with which it should not be confused.

1 **Release.** A process that the mobile station and base station use to inform each other of call
 2 disconnect.

3 **Remaining Set.** The set of all allowable pilot offsets as determined by PILOT_INC,
 4 excluding the pilot offsets of the pilots in the Active Set, Candidate Set, and Neighbor Set.
 5 See also Active Set, Candidate Set, and Neighbor Set.

6 **Replay Attack.** An attempt by a third party to record an over-the-air message and send it
 7 later in time so as to mislead the receiver.

8 **Request.** A Layer 3 message generated by either the mobile station or the base station to
 9 retrieve information, ask for service, or command an action.

10 **Response.** A Layer 3 message generated as a result of another message, typically a
 11 request.

12 **Reverse CDMA Channel.** The CDMA Channel from the mobile station to the base station.
 13 From the base station's perspective, the Reverse CDMA Channel is the sum of all mobile
 14 station transmissions on a CDMA Frequency Assignment.

15 **Reverse Dedicated Control Channel.** A Dedicated Control Channel that is transmitted on
 16 the Reverse CDMA Channel.

17 **Reverse Fundamental Channel.** A Fundamental Channel that is transmitted on the
 18 Reverse CDMA Channel.

19 **Reverse Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal
 20 transmitted by each CDMA mobile station whenever the Enhanced Access Channel, Reverse
 21 Common Control Channel, or Reverse Traffic Channel is enabled. The Reverse Pilot
 22 Channel allows a base station to acquire the timing of the Reverse CDMA Channel and
 23 provides a phase reference for coherent demodulation. The Reverse Pilot Channel may be
 24 transmitted either continuously or in gated mode.

25 **Reverse Supplemental Channel.** A Supplemental Channel that is transmitted on the
 26 Reverse CDMA Channel.

27 **Reverse Supplemental Code Channel.** A Supplemental Code Channel that is transmitted
 28 on the Reverse CDMA Channel.

29 **Reverse Traffic Channel.** A Traffic Channel on which data and signaling are transmitted
 30 from a mobile station to a base station. The Reverse Traffic Channel is composed of zero or
 31 one Reverse Fundamental Channel, zero to seven Reverse Supplemental Code Channels,
 32 zero to two Reverse Supplemental Channels, and zero or one Reverse Dedicated Control
 33 Channel.

34 **Roamer.** A mobile station operating in a wireless cellular system (or network) other than
 35 the one from which service was subscribed. See also Foreign NID Roamer and Foreign SID
 36 Roamer.

37 **SAP.** See Service Access Point.

38 **SCI.** See Synchronized Capsule Indicator Bit.

39 **SDU.** See Service Data Unit.

Search Window. The range of PN sequence offsets that a mobile station searches for a pilot.

Search Window Offset. PN sequence offset used by the mobile station to position the search window when searching for a pilot.

Secondary CDMA Channel. A pre-assigned channel in a CDMA Cellular System used by the mobile station for initial acquisition. See also Primary CDMA Channel.

Secondary Traffic. An additional traffic stream that can be carried between the mobile station and the base station on the Traffic Channel. See also Primary Traffic and Signaling Traffic.

Service Access Point. Conceptual point at the interface between two adjacent layers where services are provided to the upper layer and data and protocol information is exchanged between layers.

Service Configuration. The common attributes used by the mobile station and the base station to build and interpret Traffic Channel frames. Service configuration corresponds to the parameters contained in the Service Configuration information record and the Non-negotiable Service Configuration information record. Examples of such parameters include Forward and Reverse Traffic Channel multiplex options, Forward and Reverse Traffic Channel transmission rates, service option connections, and reverse pilot gating rate.

Service Data Unit. Data transferred between adjacent layers in the protocol stack. Unless specified otherwise in this document SDU refers to the Layer 3 service data unit being transferred to/from Layer 2.

Service Negotiation. The procedures used by the mobile station and base station to establish a service configuration. See also Service Option Negotiation.

Service Option. A service capability of the system. Service options may be applications such as voice, data, or facsimile. See [30].

Service Option Connection. A particular instance or session in which the service defined by a service option is used. Associated with a service option connection are a reference, which is used for uniquely identifying the service option connection, a service option, which specifies the particular type of service in use, a Forward Traffic Channel traffic type, which specifies what type of Forward Traffic Channel traffic is used to support the service option connection, and a Reverse Traffic Channel traffic type, which specifies what type of Reverse Traffic Channel traffic is used by the service option connection.

Service Option Connection Reference. A designator used by the base station and mobile station to uniquely identify a particular service option connection.

Service Option Negotiation. The procedures used by the mobile station and base station to establish a service configuration. Service option negotiation is similar to service negotiation, but allows less flexibility for specifying the attributes of the service configuration. See also Service Negotiation.

Service Redirection. The process by which the base station alters the system selection made by a mobile station. It can be used temporarily during maintenance and testing to divert subscribers to an alternate system.

Serving Frequency. The CDMA frequency on which a mobile station is currently communicating with one or more base stations.

Shared Secret Data (SSD). A 128-bit pattern stored in the mobile station (in semi-permanent memory) and known by the base station. SSD is a concatenation of two 64-bit subsets: SSD_A, which is used to support the authentication procedures, and SSD_B, which serves as one of the inputs to the process generating the encryption mask and private long code.

Short Message Services (SMS). A suite of services such as SMS Text Delivery, Digital Paging (i.e., Call Back Number - CBN), and Voice Mail Notification (VMN).

SID. See System Identification.

Signaling Traffic. Control messages that are carried between the mobile station and the base station on the Traffic Channel. See also Primary Traffic and Secondary Traffic.

Silent Re-origination. An autonomous attempt to re-originate a call after the mobile station Layer 3 receives an access attempt failure indication from Layer 2 following a user-initiated origination or a re-origination. Silent re-origination does not apply to any user-programmable capabilities or services, e.g. user-programmable automatic redial.

Slotted Mode. An operation mode of the mobile station in which the mobile station monitors only selected slots on the Paging Channel or the Forward Common Control Channel when in the *Mobile Station Idle State*.

Soft Handoff. A handoff occurring while the mobile station is in the *Mobile Station Control on the Traffic Channel State*. This handoff is characterized by commencing communications with a new base station on the same CDMA Frequency Assignment before terminating communications with an old base station. See also Hard Handoff.

SOM. Start-of-Message bit.

Space Time Spreading (STS). A forward link transmission method which transmits all forward link channel symbols on multiple antennas and spreads the symbols with complementary Walsh or quasi-orthogonal functions.

Spreading Rate. The PN chip rate of the system, defined as a multiple of 1.2288 Mcps.

Spreading Rate 1. A 1.2288 Mcps chip rate-based system using a direct-spread single carrier.

Spreading Rate 3. A 3.6864 Mcps chip rate-based system using three 1.2288 Mcps carriers on the Forward CDMA Channel. The Reverse CDMA Channel uses a 3.6864 Mcps direct-spread carrier.

sps. Symbols per second.

SR. See Spreading Rate.

SR1. See Spreading Rate 1.

SR3. See Spreading Rate 3.

SR3 Frequencies. CDMA frequencies for the three 1.2288 Mcps carriers on the Forward

1 CDMA Channel. SR3 frequencies include the lowest SR3 frequency, the center SR3
 2 frequency, and the highest SR3 frequency.

3 **SR3 Primary Pilot.** See Primary Pilot.

4 **SSD.** See Shared Secret Data.

5 **Station Class Mark (SCM).** An identification of certain characteristics of a mobile station.
 6 Classes are defined in Table 2.3.3-1 of [12] and Table 6.3.3-1 of this document.

7 **Status Information.** The following status information is used to describe mobile station
 8 operation when using the analog system:

- 9 • Serving-System Status. Indicates whether a mobile station is tuned to channels
 10 associated with System A or System B.
- 11 • First Registration ID Status. A status variable used by the mobile station in
 12 association with its processing of received Registration ID messages.
- 13 • First Location Area ID Status. A status variable used by the mobile station in
 14 association with its processing of received Location Area ID messages.
- 15 • Location Registration ID Status. A status variable used by the mobile station in
 16 association with its processing of power-up registrations and location-based
 17 registrations.
- 18 • First Idle ID Status. A status variable used by the mobile station in association with
 19 its processing of the Idle Task.
- 20 • Local Control Status. Indicates whether a mobile station must respond to local
 21 control messages.
- 22 • Roam Status. Indicates whether a mobile station is in its home system.
- 23 • Termination Status. Indicates whether a mobile station must terminate the call
 24 when it is on an analog voice channel.
- 25 • Update Protocol Capability Status. Indicates whether the mobile station should
 26 report its protocol capability to the serving system.

27 **Supplemental Channel.** An optional portion of a Traffic Channel (Forward or Reverse
 28 Radio Configurations 3 and above) that operates in conjunction with a Fundamental
 29 Channel in that Traffic Channel, and (optionally) with other Supplemental Channels to
 30 provide higher data rate services.

31 **Supplemental Code Channel.** An optional portion of a Traffic Channel (Forward or
 32 Reverse Radio Configurations 1 and 2) that operates in conjunction with a Fundamental
 33 **Code**-Channel in that Traffic Channel, and (optionally) with other Supplemental Code
 34 Channels to provide higher data rate services. On this channel a combination of primary
 35 data, secondary data, or both (but never signaling information) are transmitted.

36 **Symbol.** See Code Symbol and Modulation Symbol.

37 **Sync Channel.** Code channel 32 in the Forward CDMA Channel which transports the
 38 synchronization message to the mobile station.

1 **Sync Channel Superframe.** An 80 ms interval consisting of three Sync Channel frames
 2 (each 26.666... ms in length).

3 **System.** A system is a ~~cellular telephone service or personal wireless~~ communications
 4 service that covers a geographic area such as a city, metropolitan region, county, or group
 5 of counties. See also Network.

6 **System Identification (SID).** A number uniquely identifying a ~~cellular or PCS wireless~~
 7 system.

8 **System Time.** The time reference used by the system. System Time is synchronous to
 9 UTC time (except for leap seconds) and uses the same time origin as GPS time. All base
 10 stations use the same System Time (within a small error). Mobile stations use the same
 11 System Time, offset by the propagation delay from the base station to the mobile station.
 12 See also Universal Coordinated Time.

13 **Target Frequency.** The CDMA frequency assignment to which the base station directs a
 14 mobile station in a handoff using an *Extended Handoff Direction Message*, a *General*
 15 *Handoff Direction Message*, or a *Universal Handoff Direction Message*.

16 **TD.** See Transmit Diversity.

17 **Temporary Mobile Station Identity (TMSI).** A temporary mobile station identification
 18 assigned by the base station.

19 **Timer-Based Registration.** A registration method in which the mobile station registers
 20 whenever a counter reaches a predetermined value. The counter is incremented an average
 21 of once per 80 ms period.

22 **Time Reference.** A reference established by the mobile station that is synchronous with
 23 the earliest arriving multipath component used for demodulation.

24 **TMSI.** See Temporary Mobile Station Identity.

25 **TMSI Zone.** The administrative zone that allows the TMSI to be reused. The TMSI_CODE
 26 has to be unique within a TMSI zone but may be reused in a different TMSI zone. The TMSI
 27 zone is identified by the field TMSI_ZONE.

28 **Traffic Channel.** A communication path between a mobile station and a base station used
 29 for user and signaling traffic. The term Traffic Channel implies a Forward Traffic Channel
 30 and Reverse Traffic Channel pair. See also Forward Traffic Channel and Reverse Traffic
 31 Channel.

32 **Traffic Channel Preamble.** For RC1 and RC2, a sequence of all-zero frames that is sent by
 33 the mobile station on the Reverse Traffic Channel as an aid to Traffic Channel acquisition.
 34 For RC3 to RC6 inclusive, the traffic preamble is the ungated transmission of the Reverse
 35 Pilot.

36 **Transmit Diversity.** See Orthogonal Transmit Diversity and Space Time Spreading.

37 **Unassured Mode.** Mode of delivery that does not guarantee that a PDU will be delivered to
 38 the peer. The LAC entity at the receiver does not acknowledge a PDU sent in unassured
 39 mode.

1 Unique Challenge-Response Procedure. An exchange of information between a mobile
 2 station and a base station for the purpose of confirming the mobile station's identity. The
 3 procedure is initiated by the base station and is characterized by the use of a challenge-
 4 specific random number (i.e., RANDU) instead of the random variable broadcast globally
 5 (RAND).

6 Unique Random Variable (RANDU). A 24-bit random number generated by the base
 7 station in support of the Unique Challenge-Response procedure.

8 Universal Coordinated Time (UTC). An internationally agreed-upon time scale maintained
 9 by the Bureau International de l'Heure (BIH) used as the time reference by nearly all
 10 commonly available time and frequency distribution systems i.e., WWV, WWVH, LORAN-C,
 11 Transit, Omega, and GPS.

12 User Zone. An area within which CDMA Tiered Services may be provided. It may
 13 correspond to an RF coverage area, or it may be established independent of RF topology.
 14 User Zones are classified as broadcast versus mobile-specific, and as active versus passive.
 15 See Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and Passive User
 16 Zone. See also Registration Zone, with which it should not be confused.

17 User Zone Registration. An autonomous registration method in which the mobile station
 18 registers when it selects an active user zone while in the Idle State. See also Zone-Based
 19 Registration, with which it should not be confused.

20 Upper Layers. General reference to Layer 3 and the layers above it.

21 User Zone Exit parameter. A parameter used by the mobile station to determine if it
 22 should exit a User Zone.

23 UTC. Universal Temps Coordiné. See Universal Coordinated Time.

24 Voice Privacy. The process by which user voice transmitted over a CDMA Traffic Channel
 25 is afforded a modest degree of protection against eavesdropping over the air.

26 Walsh Chip. See [2].

27 Walsh Function. One of 2^N time orthogonal binary functions (note that the functions are
 28 orthogonal after mapping '0' to 1 and '1' to -1).

29 Wireless Local Loop. Wireless alternative access mechanism to provide standard
 30 telecommunication services using standard wireline terminal via a radio link between the
 31 network and customer premises equipment.

32 WLL. See Wireless Local Loop.

33 Zone-Based Registration. An autonomous registration method in which the mobile station
 34 registers whenever it enters a zone that is not in the mobile station's zone list. See also
 35 User Zone Registration, with which it should not be confused.

36 Zone Timer. A timer used by the mobile station to remove outdated entries from its list of
 37 zones in which it has previously registered.

38 μs. Microsecond (10^{-6} second).

1 1.1.2 Numeric Information

2 Numeric information is used to describe the operation of the mobile station. The following
 3 subscripts are used to clarify the use of the numeric information:

- 4 • “s” indicates a value stored in a mobile station’s temporary memory.
- 5 • “sv” indicates a stored value that varies as a mobile station processes various tasks.
- 6 • “sl” indicates the stored limits on values that vary.
- 7 • “r” indicates a value received by a mobile station over a forward analog control
 8 channel or a CDMA Forward Channel.
- 9 • “p” indicates a value set in a mobile station’s permanent security and identification
 10 memory.
- 11 • “s-p” indicates a value stored in a mobile station’s semi-permanent security and
 12 identification memory.

13 1.1.2.1 Reserved

14 1.1.2.2 CDMA Numeric Information

15 The following are internal values that are stored by the mobile station in temporary memory
 16 that are not sent over the air. See Annex F for values stored by the mobile station in
 17 permanent and semi-permanent memory.

18 **1XRL_FREQ_OFFSET_s** – Frequency offset of the 1X reverse link.

19 **A41_SYS_PAR_MSG_SEQ_s** – ANSI-41 *System Parameters Message* sequence number.

20 **ACC_CHAN_s** – Number of Access Channels supported by the current Paging Channel.

21 **ACC_ENT_HO_ORDER_s** – Access entry handoff permitted from the *Mobile Station Order and*
 22 *Message Processing Operation* of the *Mobile Station Idle State*.

23 **ACCESS_ENTRY_HO_s** – Idle handoff permitted when entering the *System Access State*.

24 **ACCESS_HO_s** – Handoff permitted after performing an access attempt while the mobile
 25 station is in the *System Access State*.

26 **ACCESS_HO_ALLOWED_s** – Handoff permitted to the corresponding neighbor base station
 27 while in the *System Access State*.

28 **ACCESS_HO_LIST** – List of pilots to which access handoff or access probe handoff is
 29 permitted.

30 **ACC_HO_LIST_UPD_s** – Access handoff list update permitted indicator.

31 **ACCESS_HO_MSG_RSP_s** – Access handoff permitted in the *System Access State* between
 32 the time that the mobile station receives a message and responds to that message.

33 **ACCESS_PROBE_HO_s** – Access probe handoff permitted during an access attempt in the
 34 *Mobile Station Origination Attempt Substate* or the *Page Response Substate*.

- 1 **ACC_MSG_SEQ_s** – Last received Access Parameters Message or Enhanced Access
2 Parameters Message sequence number.
- 3 **ACC_PROBE_HO_OTHER_MSG_s** – Access probe handoff permitted for Access Channel
4 messages other than the *Origination Message* and the *Page Response Message*.
- 5 **ACCT_INCL_EMG_s** – Access Control based on Call Type (ACCT) applies to emergency calls
6 indicator.
- 7 **ACCT_SO_GRP_LIST** – List of service option groups that have Access Control based on Call
8 Type (ACCT) enabled.
- 9 **ACCT_SO_LIST** – List of individual service options that have Access Control based on Call
10 Type (ACCT) enabled.
- 11 **ACH_ACC_TMO_s** – Access Channel acknowledgment timeout, in units of 80 ms.
- 12 **ACK_WAITING_{s[i]}** – Acknowledgment status indicator for message sequence number i. Set
13 to YES if an acknowledgment is pending for the message; otherwise, set to NO.
- 14 **ADD_INTERCEPT_s** – The intercept in the inequality criterion for adding a pilot to the Active
15 Set.
- 16 **AGE_s** – Neighbor list age. For each pilot in the Neighbor Set, the mobile station increments
17 this counter each time a *Neighbor List Update Message* or an *Extended Neighbor List Update*
18 Message is received. When AGE_s exceeds NGBHR_MAX_AGE, the pilot is deleted from the
19 Neighbor Set.
- 20 **ALIGN_TIMING_USED_s** – Indicates whether the mobile station aligns the times of visits
21 away from the Serving Frequency, as requested by the base station, in the periodic search
22 procedures.
- 23 **ANALOG_CHAN_s** – Analog channel number for CDMA-to-analog handoff.
- 24 **ANALOG_NGHBR_LIST** – List containing information about neighboring analog systems.
- 25 **AN_CHAN_TYPE_s** – Analog voice channel type.
- 26 **ASSIGNED_QPAGECH_s** – Assigned Quick Paging Channel number.
- 27 **AUTH_s** – Current authentication mode.
- 28 **AUTO_MSG_INTERVAL** – Autonomous message interval.
- 29 **AUTO_MSG_SUPPORTED** – Autonomous message supported indicator.
- 30 **BAD_FRAMES_s** – Forward Fundamental Channel bad frames count. The number of
31 received bad forward Fundamental Channel frames.
- 32 **BASE_CLASS_s** – Base station class of the current base station.
- 33 **BASE_ID_s** – Base station identification of the current base station.
- 34 **BASE_LAT_s** – Latitude of the current base station, in units of 0.25 seconds.
- 35 **BASE_LONG_s** – Longitude of the current base station, in units of 0.25 seconds.

1 **BEGIN_PREAMBLE_s** – A stored variable in the mobile station that contains the size of the
 2 preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
 3 beginning of a Reverse Supplemental Code Channel transmission.

4 **BKOFF_s** – Access Channel probe sequence backoff range.

5 **BRAT_s** – Data rate of the Broadcast Control Channel.

6 **BYPASS_ALERT_ANSWER_s** – Mobile station termination bypass indicator. This is set to ‘1’
 7 if the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for Mobile*
 8 *Station Answer Substate*, and proceed directly to the *Conversation Substate* when Layer 3
 9 receives a *forward dedicated channel-acquired* indication from Layer 2.

10 **CDMABAND_s**. CDMA band class. The CDMA band class currently used by the mobile
 11 station.

12 **CDMACH_s** – CDMA Channel number. The CDMA Channel number currently used by the
 13 mobile station.

14 **CF_CDMABAND_s** – Candidate Frequency CDMA band class. The CDMA band class
 15 specified in the *Candidate Frequency Search Request Message*.

16 **CF_CDMACH_s** – Candidate Frequency CDMA Channel number. The CDMA Channel
 17 number specified in the *Candidate Frequency Search Request Message*.

18 **CF_PILOT_INC_s** – PILOT_INC to be used by the mobile station after an inter-frequency hard
 19 handoff to the CDMA Candidate Frequency is successfully completed.

20 **CF_SEARCH_PRIORITY_INCL_s** – Candidate Frequency neighbor pilots’ search priority
 21 included indicator.

22 **CF_SRCH_OFFSET_INCL_s** – Candidate Frequency neighbor pilot search window offset
 23 included indicator.

24 **CF_SRCH_WIN_NGHBR_INCL_s** – Candidate Frequency neighbor pilots’ search window
 25 included indicator.

26 **CF_SRCH_WIN_N_s** – Search window size for the Candidate Frequency Search Set.

27 **CF_SRCH_WIN_R_s** – Search window size to be used for the Remaining Set after an inter-
 28 frequency hard handoff to the CDMA Candidate Frequency is successfully completed.

29 **CF_T_ADD_s** – Pilot detection threshold to be used on the CDMA Candidate Frequency. The
 30 stored value is a positive value in units of 0.5 dB.

31 **CH_IND_s** – A two-bit physical channel indicator, based on the currently established
 32 physical channels. The least significant bit denotes the Fundamental Channel, and the
 33 most significant bit denotes the Dedicated Control Channel.

34 **CHAN_LST_MSG_SEQ_s** – *CDMA Channel List Message* sequence number.

35 **CODE_CHAN_LIST** – Code Channel List. A descriptive structure used to manage the
 36 Forward Fundamental Channel, and Forward Supplemental Code Channels, if any,
 37 associated with the mobile station’s Active Set.

38 **COMPLETE_PUF_FRAME_s** – Number of power control groups required to make the PUF

1 probe an integer number of frames.

2 **COMPLETE_SEARCH_s** – Flag to indicate if the mobile station is to complete the search of
 3 the Candidate Frequency Search Set after it has determined that the inter-frequency
 4 handoff attempt to the CDMA Candidate Frequency is unsuccessful.

5 **CONFIG_MSG_SEQ_s** – Current message sequence number for the *System Parameters*
 6 *Message*, *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List*
 7 *Message*, *CDMA Channel List Message*, *Extended System Parameters Message*, *Global Service*
 8 *Redirection Message*, *Private Neighbor List Message*, *User Zone Identification Message*,
 9 *Extended CDMA Channel List Message*, *Extended Global Service Redirection Message*, [MC-RR](#)
 10 [Parameters Message](#), [ANSI-41 System Parameters Message](#).

11 **COUNTER_ENABLED_s** – Timer-based registration indicator. Set to YES if timer-based
 12 registration is enabled; otherwise, set to NO.

13 [C SIG ENCRYPT MODE_s](#) – Common Channel signaling message encryption mode.

14 **CS_SUPPORTED_s** – Base station Concurrent Services supported indicator. This 1-bit field
 15 is set to ‘1’ if the base station supports [concurrent connection of at least two services that](#)
 16 [use either Primary or Secondary traffic type eoncurrent services](#).

17 **CURR_ACC_MSG_SEQ** – Current Access [Parameters](#) Message or Enhanced Access
 18 *Parameters Message* sequence number.

19 **CURRENT_ACTIVE_PILOT_s** – Identifies the current pilot in the Active Set during an access
 20 attempt.

21 **CURRENT_PUF_PROBE_s** – Number of the next PUF probe to be transmitted within the PUF
 22 attempt.

23 **DAYLT_s** – Daylight Savings Time indicator.

24 **DCCH_BAD_FRAMES_s** – Forward Dedicated Control Channel bad frames count. The
 25 number of received bad forward Dedicated Control Channel frames.

26 **DCCH_TOT_FRAMES_s** – Total forward Dedicated Control Channel frames received. The
 27 total number of received forward Dedicated Control Channel frames, counted for Forward
 28 Traffic Channel power control.

29 **DECORR** – Hashing function input used to decorrelate hashing function applications for
 30 the same mobile station.

31 **DEFAULT_CONFIG_s** – Mobile station current default configuration.

32 **DELETE_FOR_TMSI_s** – A storage variable in the mobile station that indicates whether the
 33 mobile station should delete its current TMSI if the TMSI was assigned in a different TMSI
 34 zone.

35 **DIFF_RX_PWR_THRESH_s** – Threshold for the difference between the received power on the
 36 Serving Frequency and the received power on the CDMA Candidate Frequency for the
 37 mobile station to search for pilots on the CDMA Candidate Frequency.

38 **DISTANCE** – Distance from registered base station to current base station, used for
 39 distance-based registration.

- 1 **DROP_INTERCEPT_s** – The intercept in the inequality criterion for dropping a pilot from the
2 Active Set.
- 3 **DSCC_s** – Digital supervisory color code.
- 4 **D SIG ENCRYPT MODE_s** – Dedicated Channel signaling message encryption mode.
- 5 **DTX_s** – Discontinuous transmission mode for analog channel assignment and CDMA-to-
6 analog handoff.
- 7 **EACH_ACC_TMO_s** – Enhanced Access Channel acknowledgment timeout, in units of 20
8 ms.
- 9 **EACH_SLOT_s** – See [2].
- 10 **EACH_SLOT_OFFSET1_s** – See [2].
- 11 **EACH_SLOT_OFFSET2_s** – See [2].
- 12 **EC_IO_THRESH_s** – Pilot E_C/I_O threshold used for system reselection.
- 13 **EC_THRESH_s** – Pilot power threshold used for system reselection.
- 14 **ENC KEY SIZE_s** – The key size used for signaling and user information encryption on
15 common channel and dedicated channel.
- 16 **ENC KEY_s** – The encryption key for signaling and user information encryption on common
17 channel and dedicated channel.
- 18 **ENC SEQ** – An 8-bit temporary variable for encryption/decryption.
- 19 **ENCRYPT_MODE_s** – Current message encryption mode.
- 20 **EXCL_P_REV_MS** – Exclude from redirection by MOB_P_REV indicator.
- 21 **EXT_NGHBR_LST_MSG_SEQ_s** – Extended Neighbor List Message sequence number.
- 22 **EXT_CHAN_LIST_s** – Extended CDMA Channel List Message sent indicator.
- 23 **EXT_CHAN_LST_MSG_SEQ_s** – Extended CDMA Channel List Message sequence number.
- 24 **EXT_DECRYPT_SEQ[i]** – The 32-bit crypto-sync counter used to decrypt signaling
25 messages, where $i = 0$ is for unassured messages and $i = 1$ is for assured messages.
- 26 **EXT_ENCRYPT_SEQ[i]** – The 32-bit crypto-sync counter used to encrypt signaling
27 messages, where $i = 0$ is for unassured messages and $i = 1$ is for assured messages.
- 28 **EXT_ENC_SEQ** – A 32-bit temporary variable for encryption/decryption.
- 29 **EXT_GLOBAL_REDIRECT_s** – Extended Global Service Redirection Message sent indicator.
- 30 **EXT_GLOB_SERV_REDIR_MSG_SEQ_s** – Extended Global Service Redirection Message
31 sequence number.
- 32 **EXT_SYS_PARAMETER_s** – Extended System Parameters Message sent indicator.
- 33 **EXT_SYS_PAR_MSG_SEQ_s** – Extended System Parameters Message sequence number.
- 34 **FCCCH_s** – Current Forward Common Control Channel number.

1 **FIRST_ACTIVE_PILOT_s** – While the mobile station is in the *System Access State*, identifies
 2 the pilot to which the first access probe was transmitted, upon entering the *System Access*
 3 *State*.

4 **FOR_DURATION_s** – A stored variable in the mobile station that contains the duration (in
 5 units of 80 ms) of a forward Supplemental Code Channel transmission that begins at time
 6 FOR_START_TIME_s.

7 **FOR_FCH_RC_s** – Forward Fundamental Channel Radio Configuration.

8 **FOR_FRAME_40_MAX_RATE_s** – The maximum data rate for the mobile station's
 9 transmission at 40 ms frame length on the Forward Supplemental Channel.

10 **FOR_FRAME_80_MAX_RATE_s** – The maximum data rate for the mobile station's
 11 transmission at 80 ms frame length on the Forward Supplemental Channel.

12 **FOR_LINKED_HDM_SEQ_s** – Storage variable containing the most recent forward sequence
 13 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
 14 *Assignment Message* forward assignment was linked.

15 **FOR_NID_REG_s** – Foreign NID roamer autonomous registration enable.

16 **FOR_RC_s** – Forward Channel Radio Configuration.

17 **FOR_SCH_CC_INDEX_s** – Supplemental code channel index used on the Supplemental
 18 Channel.

19 **FOR_SCH_DURATION_s** – A stored variable in the mobile station which contains the
 20 duration of a forward Supplemental Channel transmission which begins at time
 21 FOR_SCH_START_TIME_s.

22 **FOR_SCH_FRAME_LENGTH_s** – The Forward Supplemental Channel frame length.

23 **FOR_SCH_RATE_s** – The rate of the Forward Supplemental Channel.

24 **FOR_SCH_START_TIME_s** – A stored variable in the mobile station which contains the
 25 System Time, in units of time specified by START_TIME_UNIT_s, (modulo 32) at which the
 26 mobile station shall start (or resume) processing Forward Supplemental Channels.

27 **FOR_SID_REG_s** – Foreign SID roamer autonomous registration enable.

28 **FOR_START_TIME_s** – A stored variable in the mobile station that contains the System
 29 Time, in units of 80 ms, (modulo 64) at which the mobile station shall start (or resume)
 30 processing Forward Supplemental Code Channels.

31 **FPC_DCCH_CURR_SETPT_s** – Current power control subchannel outer loop setpoint for the
 32 Forward Dedicated Control Channel.

33 **FPC_DCCH_FER_s** – Target frame error rate for the Forward Dedicated Control Channel.

34 **FPC_DCCH_MAX_SETPT_s** – Maximum value of the power control subchannel outer loop
 35 setpoint for the Forward Dedicated Control Channel.

36 **FPC_DCCH_MIN_SETPT_s** – Minimum value of the power control subchannel outer loop
 37 setpoint for the Forward Dedicated Control Channel.

- 1 **FPC_DELTA_SCH_SETPT_s** – The difference between the Fundamental Channel current
 2 power control subchannel outer loop setpoint and the Supplemental Channel current power
 3 control subchannel outer loop setpoint.
- 4 **FPC_DELTA_SETPT_s** – The difference between the Fundamental Channel current power
 5 control subchannel outer loop setpoint and the Dedicated Control Channel current power
 6 control subchannel outer loop setpoint.
- 7 **FPC_FCH_CURR_SETPT_s** – Current power control subchannel outer loop setpoint for the
 8 Forward Fundamental Channel.
- 9 **FPC_FCH_FER_s** – Target frame error rate for the Forward Fundamental Channel.
- 10 **FPC_FCH_MAX_SETPT_s** – Maximum value of the power control subchannel outer loop
 setpoint for the Forward Fundamental Channel.
- 12 **FPC_FCH_MIN_SETPT_s** – Minimum value of the power control subchannel outer loop
 setpoint for the Forward Fundamental Channel.
- 14 **FPC_MODE_s** – Forward power control operating mode.
- 15 **FPC_MODE_NO_SCH_s** – Forward power control operating mode except during the forward
 Supplemental Channel assignment interval.
- 17 **FPC_MODE_SCH_s** – Forward power control operating mode during the forward
 Supplemental Channel assignment interval.
- 19 **FPC_PRI_CHAN_s** – Primary power control subchannel measured channel.
- 20 **FPC_SEC_CHAN_s** – Index of Forward Supplemental Channel to be measured by the
 secondary power control subchannel.
- 22 **FPC_SCH_CURR_SETPT_{s[i]}** – Current power control subchannel outer loop setpoint for
 Forward Supplemental Channel i.
- 24 **FPC_SCH_FER_{s[i]}** – Target frame error rate for Forward Supplemental Channel i.
- 25 **FPC_SCH_MAX_SETPT_{s[i]}** – Maximum value of the power control subchannel outer loop
 setpoint for Forward Supplemental Channel i.
- 27 **FPC_SCH_MIN_SETPT_{s[i]}** – Minimum value of the power control subchannel outer loop
 setpoint for Forward Supplemental Channel i.
- 29 **FPC_SETPT_THRESH_s** – Power control subchannel outer loop setpoint report threshold for
 the Dedicated Control Channel.
- 31 **FPC_SETPT_THRESH_SCH_s** – Power control subchannel outer loop setpoint report
 threshold for the Supplemental Channel.
- 33 **FRAME_OFFSET_s** – Current Traffic Channel frame offset, in units of 1.25 ms.
- 34 **GEN_NGHBR_LST_MSG_SEQ_s** – *General Neighbor List Message sequence number*.
- 35 **GLOBAL_REDIRECT_s** – *Global Service Redirection Message sent indicator*.
- 36 **GLOB_SERV_REDIR_MSG_SEQ_s** – *Global Service Redirection Message sequence number*.
- 37 **GRANTED_MODE_s** – Mobile station current granted mode.

1 **HASH_KEY** – Hashing function input that determines the return value. Derived from
 2 IMSI_O.

3 **HDM_SEQs** – Last received *Extended Handoff Direction Message*, *General Handoff Direction*
 4 *Message*, or *Universal Handoff Direction Message* sequence number.

5 **HOME_REGs** – Home (non-roaming) autonomous registration enable.

6 **IGNORE_ESCAMs** – Identifies whether a mobile station will process the reverse
 7 supplemental channel assignment portion of the subsequent *Supplemental Channel*
 8 *Assignment Message* or *Reverse Supplemental Channel Assignment Mini Message*.

9 **IGNORE_SCAMs** – Identifies whether a mobile station will process the reverse supplemental
 10 code channel assignment portion of the subsequent *Supplemental Channel Assignment*
 11 *Message*.

12 **IMSI_11_12s** – The 11th and 12th digits of the IMSI used for address matching.

13 **IMSI_O_ADDR_NUMs** – The number of digits in the NMSI of the Operational IMSI (IMSI_O)
 14 minus four.

15 **IMSI_O_Ss** – The last 10-digits of Operational IMSI (IMSI_O).

16 **IMSI_O_11_12s** – The 11th and 12th digits of the Operational IMSI (IMSI_O).

17 **INIT_PWRs** – Initial power offset for Access Channel probes.

18 **LC_STATEs** – Long code state obtained from the *Sync Channel Message*.

19 **LOGICAL_TO_PHYSICAL_MAPPING_TABLE[]s** – This table contains the logical to physical
 20 mapping for signaling and user traffic.

21 **LP_SECs** – Leap seconds count (offset of CDMA system time from UTC).

22 **LTM_OFFs** – Local time offset from UTC, in units of 15 minutes.

23 **MAX_CAP_SZs** – Maximum number of Access Channel or *Enhanced Access Channel* frames
 24 in an Access Channel message capsule, less 3.

25 **MAX_NUM_ALT_SOs** – The maximum number of alternative service option numbers that
 26 the mobile station is allowed to include in the *Origination Message* or in the *Page Response*
 27 *Message*.

28 **MAX_NUM_PROBE_HOs** – The maximum number of times that a mobile station is
 29 permitted to perform an access probe handoff.

30 **MAX_PWR_PUFs** – Maximum number of PUF probes to be transmitted at maximum mobile
 31 station output power during a PUF attempt.

32 **MAX_REQ_SEQs** – Maximum number of access probe sequences for an Access Channel or
 33 Enhanced Access Channel request.

34 **MAX_RSP_SEQs** – Maximum number of access probe sequences for an Access Channel or
 35 Enhanced Access Channel response.

36 **MAX_SLOT_CYCLE_INDEXs** – Maximum value of the slot cycle index allowed by the
 37 current base station.

- 1 **MCC_s** – The Mobile Country Code used for address matching.
- 2 **MCC_O_s** – The Mobile Country Code of IMSI_O.
- 3 **MC_RR_PAR_MSG_SEQ_s** – *MC-RR System Parameters Message* sequence number.
- 4 **MEM_s** – Analog message encryption mode for CDMA-to-analog handoff.
- 5 **MIN_PILOT_EC_IO_THRESH_s** – Threshold for total E_c/I_o of pilots in the Serving Frequency
- 6 Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 7 **MIN_PILOT_PWR_THRESH_s** – Threshold for total E_c of pilots in the Serving Frequency
- 8 Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 9 **MIN_P_REV_s** – Minimum mobile station protocol revision level required for access to the
- 10 CDMA system.
- 11 **MIN_TOTAL_PILOT_EC_IO_s** – Total pilot strength threshold for the mobile station to
- 12 attempt to demodulate the Forward Traffic Channel on the CDMA Candidate Frequency.
- 13 **MOB_QOS_s** – Indicator of whether the mobile station is allowed to request QoS settings in
- 14 the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination*
- 15 *Message*.
- 16 **MOB_TERM_s** – Mobile station termination indicator. Set to ‘1’ if the mobile station will
- 17 accept mobile station terminated calls in its current roaming status.
- 18 **MSG_PSIST_s** – Persistence modifier for Access Channel message and Enhanced Access data
- 19 transmissions.
- 20 **MS_LAT_s** – The latitude of the mobile station as estimated by the base station.
- 21 **MS_LOC_TSTAMP_s** – The time corresponding to the estimate of mobile station’s latitude
- 22 and longitude.
- 23 **MS_LONG_s** – The longitude of the mobile station as estimated by the base station.
- 24 **MS_INIT_POS_LOC_SUP_IND_s** – *Mobile station initiated position location determination*
- 25 *supported indicator*.
- 26 **MULT_NIDS_s** – Multiple NID storage indicator. Set to ‘1’ if the mobile station may store
- 27 more than one entry in SID_NID_LIST_s for each SID.
- 28 **MULT_SIDS_s** – Multiple SID storage indicator. Set to ‘1’ if the mobile station may store
- 29 entries in SID_NID_LIST_s having different SIDs.
- 30 **NAR_AN_CAP_s** – Narrow analog voice channel capability.
- 31 **NDSS_ORIG_s** – NDSS Origination Indicator. Indicator used when the mobile station is
- 32 NDSS-redirected while originating a call.
- 33 **NGHBR_BAND_s** – Neighbor band class.
- 34 **NGHBR_CONFIG_s** – Neighbor base station channel allocation configuration.
- 35 **NGHBR_FREQ_s** – Neighbor CDMA channel number.
- 36 **NGHBR_LST_MSG_SEQ_s** – *Neighbor List Message* sequence number.

- 1 **NGHBR_MAX_AGE_s** – Neighbor set maximum age for retention in the set.
- 2 **NGHBR_PN_s** – Neighbor base station Pilot Channel PN sequence offset in units of 64 PN
3 chips.
- 4 **NGHBR_REC** – Record containing information about a neighbor base station (see also
5 NGHBR_REC_LIST).
- 6 **NGHBR_REC_LIST** – Neighbor base station record list. A descriptive structure used to
7 manage the base station's information records about neighbor base stations (see also
8 NGHBR_REC).
- 9 **NGHBR_SET_ACCESS_INFO_s** – Neighbor Set access handoff or access probe handoff
10 information included indicator.
- 11 **NGHBR_SET_ENTRY_INFO_s** – Neighbor Set access entry handoff information included
12 indicator.
- 13 **NGHBR_SET_SIZE_s** – Size of the Neighbor Set.
- 14 **NGHBR_TIMING_INCL_s** – Indicates that hopping pilot beacon timing information is
15 included.
- 16 **NGHBR_TX_DURATION_s** – Hopping pilot beacon transmit time duration.
- 17 **NGHBR_TX_OFFSET_s** – Hopping pilot beacon transmit time offset.
- 18 **NGHBR_TX_PERIOD_s** – Hopping pilot beacon transmit time period.
- 19 **NID_s** – Network identification. A network is a subset of the base stations within a
20 [wireless cellular or PCS](#) system.
- 21 **NOM_PWR_s** – Nominal transmit power offset. A correction factor to be used by mobile
22 stations in the open loop power estimate.
- 23 **NUM_ANALOG_NGHBR_s** – Number of neighboring analog systems.
- 24 **NUM_FCCCH_s** – Number of Forward Common Control Channels supported on the current
25 CDMA channel.
- 26 **NUM_PREAMBLE_s** – Number of Traffic Channel preamble.
- 27 **NUM_QPCH_s** – Number of Quick Paging Channels supported on the current CDMA channel.
- 28 **NUM_REV_CODES_s** – A storage variable in the mobile station that contains the number of
29 Reverse Supplemental Code Channels that will be utilized in the next Reverse Supplemental
30 Code Channel transmission beginning at time REV_START_TIME_s. A value of 0 indicates
31 no Reverse Supplemental Code Channel transmission will be permitted (i.e., there is no
32 pending Reverse Supplemental Code Channel transmission).
- 33 **NUM_STEP_s** – Number of access probes or enhanced access probes in a single access probe
34 sequence or enhanced access probe sequence.
- 35 **OTHER_REPORTED_LIST** – List of other pilots that have pilot strengths exceeding T_ADD
36 and that are not included in ACCESS_HO_LIST.

1 **PACAs** – PACA call indicator. Set to enabled to indicate that the mobile station is waiting
 2 for a priority access channel assignment; otherwise, set to disabled. In Sections 2 and 3,
 3 PACAs = 0 is equivalent to setting PACAs to disabled and PACAs = 1 is equivalent to setting
 4 PACAs to enabled.

5 **PACA_CANCEL** – PACA call cancel indicator. Set to ‘1’ when the mobile station is directed
 6 by the user to cancel the PACA call; otherwise, set to ‘0’.

7 **PACA_SIDs** – PACA system identifier. Equal to the SID of the system on which the mobile
 8 station originated a PACA call.

9 **PACA_TIMEOUTs** – PACA state timer duration. Specifies how long the mobile station
 10 should wait for a *PACA Message* from the base station.

11 **PACKET_ZONE_IDs** – Packet data services zone identifier of the base station.

12 **PAGECHs** – Current CDMA Paging Channel number.

13 **PAGED** – Indicator for a page match detected while the mobile station is in the *System*
 14 *Access State*.

15 **PAGE_CHANs** – Number of Paging Channels supported on the current CDMA channel.

16 **PAM_SZs** – Number of frames in the Access Channel or Enhanced Access Channel
 17 preamble, less 1.

18 **PARAMETER_REGs** – Parameter-change registration enable.

19 **PERIODIC_SEARCHs** – Flag to indicate if the mobile station is to perform a periodic search
 20 on the Candidate Frequency.

21 **PGSLOT** – Value obtained from the hashing function, used to determine the mobile
 22 station’s assigned Paging Channel slots.

23 **PILOT_ARRIVAL** – Time of occurrence, as measured at the mobile station antenna
 24 connector, of the earliest arriving usable multipath component of the pilot. The arrival time
 25 is measured relative to the mobile station’s time reference.

26 **PILOT_INFO_REQ_SUPPORTEDs** – Pilot information request supported indicator.

27 **PILOT_GATING_RATEs** – Reverse pilot gating rate on the Reverse Pilot Channel.

28 **PILOT_GATING_USE_RATE** – Reverse pilot gating rate enable indicator. It indicates
 29 whether or not the Reverse Pilot Channel is gated.

30 **PILOT_INCs** – Pilot PN sequence offset index increment. The interval between pilots, in
 31 units of 64 PN chips, for base stations in a system.

32 **PILOT_PNs** – Pilot Channel PN sequence offset, in units of 64 PN chips, for a base station.

33 **PILOT_PN_PHASE** – Calculated Pilot Channel PN phase, in chips, including the PN
 34 sequence offset and the arrival time relative to the mobile station’s time reference.

35 **PILOT_REPORTs** – Pilot reporting indicator.

36 **POTENTIAL_CDMACHs** – The CDMA Channel number that could potentially be used by the
 37 mobile station.

- 1 **POWER_DOWN_REG_s** – Power down registration enable indicator.
- 2 **POWER_UP_REG_s** – Power up registration enable indicator.
- 3 **PPSMM_PERIOD_s** – The period used in the Periodic Serving Frequency Pilot Report
4 Procedure.
- 5 **PRAT_s** – Data rate of the Paging Channels.
- 6 **P_REV_s** – Protocol revision level supported by a base station.
- 7 **P_REV_IN_USE_s** – Protocol revision level currently in use by a mobile station.
- 8 **PREF_MSID_TYPE_s** – Preferred mobile station identifier field type.
- 9 **PREVIOUS_ACTIVE_PILOT_s** – Identifies the pilot, if any, which was in the Active Set
10 immediately prior to the current pilot in the Active Set, during the current access attempt.
- 11 **PRI_NGHBR_LIST_s** – *Private Neighbor List Message* sent indicator.
- 12 **PRI_NGHBR_PN** – Private Neighbor base station Pilot Channel PN sequence offset in units
13 of 64 PN chips.
- 14 **PRI_NGHBR_REC** – Record containing information about a private neighbor base station
15 (see also PRI_NGHBR_REC_LIST).
- 16 **PRI_NGHBR_REC_LIST** – Private neighbor base station record list. A descriptive structure
17 used to manage the base station's information records about private neighbor base stations
18 (see also PRI_NGHBR_REC).
- 19 **PRI_NGHBR_LST_MSG_SEQ_s** – *Private Neighbor List Message* sequence number.
- 20 **PROBE_BKOFF_s** – Access Channel probe backoff range, in slots.
- 21 **PROBE_PN_RAN_s** – Range for hashing function selection of the delay prior to transmission
22 of Access Channel probes. Value is $\log_2(\text{range} + 1)$.
- 23 **PSIST_s** – Persistence value for the mobile station's overload class.
- 24 **PUF_FREQ_INCL_s** – Flag to indicate whether the mobile station is to transmit a PUF probe
25 on the serving frequency or on a target frequency.
- 26 **PUF_INIT_PWR_s** – Power increase (in dB) of the first PUF pulse in a PUF attempt.
- 27 **PUF_INTERVAL_s** – Number of frames between the start of each PUF probe.
- 28 **PUF_PULSE_SIZE_s** – Duration of a PUF pulse in power control groups.
- 29 **PUF_PWR_STEP_s** – Amount (in dB) by which the mobile station is to increment the power
30 of a PUF pulse above nominal power from one PUF pulse to the next.
- 31 **PUF_SETUP_SIZE_s** – Number of power control groups within a PUF probe before the
32 transmission of the PUF pulse.
- 33 **PUF_SF_CDMABAND_s** – Serving Frequency CDMA band class.
- 34 **PUF_SF_CDMACH_s** – Serving Frequency CDMA Channel number.
- 35 **PUF_TF_CDMABAND_s** – Target Frequency CDMA band class.

- 1 **PUF_TF_CDMACH_s** – Target Frequency CDMA Channel number.
- 2 **PUF_TX_PWR_s** – Mobile station's output power for the PUF pulse.
- 3 **PWR_CNTL_STEP_s** – Power control step size assigned by the base station that the mobile
4 station is to use for closed loop power control.
- 5 **PWR_PERIOD_ENABLE_s** – Forward power control periodic reporting enabled indicator.
- 6 **PWR REP_DELAY_s** – Power report delay. The period that the mobile station waits following
7 an autonomous *Power Measurement Report* before restarting frame counting for power
8 control purposes.
- 9 **PWR REP FRAMES_s** – Power control reporting frame count. The number of frames over
10 which the mobile station is to count frame errors. Value is $2 \times \log_2(\text{frames} / 5)$.
- 11 **PWR REP THRESH_s** – Power control reporting threshold. The number of bad frames to be
12 received in a measurement period before the mobile station is to generate a *Power*
13 *Measurement Report Message*.
- 14 **PWR STEP_s** – Power increment for successive access probes, in units of 1.0 dB.
- 15 **PWR THRESH_ENABLE_s** – Forward power control threshold reporting enabled indicator.
- 16 **QOF ID_s** – Quasi-orthogonal function index on the Supplemental Channel.
- 17 **QPAGECH_s** – Current Quick Paging Channel number.
- 18 **QPCH_CCI_SUPPORTED_s** – Flag to indicate if configuration change indicators are
19 supported on the Quick Paging Channel.
- 20 **QPCH_POWER_LEVEL_PAGE_s** – Relative power level of the transmitted Quick Paging
21 Channel Paging Indicator modulation symbols, relative to the Forward Pilot Channel.
- 22 **QPCH_POWER_LEVEL_CONFIG_s** – Relative power level of the transmitted Quick Paging
23 Channel Configuration Change Indicator modulation symbols, relative to the Forward Pilot
24 Channel.
- 25 **QPCH_RATE_s** – Indicator rate of the current Quick Paging Channel(s).
- 26 **QPCH_SUPPORTED_s** – Flag to indicate if the Quick Paging Channel is supported by the
27 base station.
- 28 **RA** – Random access channel number. The Access Channel number generated (pseudo-
29 randomly) by the mobile station.
- 30 **RAND_s** – Authentication random challenge value.
- 31 **RANDC** – The eight most-significant bits of the random challenge value used by the mobile
32 station.
- 33 **RANDOM_TIME** – Random time. A portion of SYS_TIME used to seed the random number
34 generator.
- 35 **RC_CAP_REQUESTED_s** – Radio Configuration Capability indicator. When set to “1” the
36 mobile station shall include the Radio Configuration capabilities that it supports in the
37 *Origination Message and Page Response Message*.

- 1 **RCCCH_SLOT_s** – See [2].
- 2 **RCCCH_SLOT_OFFSET1_s** – See [2].
- 3 **RCCCH_SLOT_OFFSET2_s** – See [2].
- 4 **REDIRECTION_s** – Service redirection indicator. Set to enabled to indicate that service
5 redirection is currently in effect; otherwise, set to disabled.
- 6 **REDIRECT_REC_s** – Holds the service redirection criteria specified in the redirection record
7 of the most recently received *Global Service Redirection Message* or *Service Redirection
8 Message*.
- 9 **REG_COUNT_s** – The timer-based registration counter.
- 10 **REG_COUNT_MAX_s** – Timer-based registration count limit. The timer-based registration
11 counter expiration value computed from REG_PRD_r.
- 12 **REG_DIST_s** – Registration distance. Distance from last registration that causes a distance-
13 based registration to occur.
- 14 **REG_ENABLED_s** – Autonomous registrations enabled indicator.
- 15 **REG_ENCRYPT RESYNC** – Encryption re-sync required registration indicator.
- 16 **REGISTERED_s** – Mobile station registered indicator.
- 17 **REG_PRD_s** – Registration period. The time interval between timer-based registrations.
18 Value is $4 \times \log_2(\text{time} / 0.08 \text{ s})$.
- 19 **REG_PSIST_s** – Persistence modifier for registration accesses (except ordered registrations).
- 20 **REG_ZONE_s** – Registration zone number of the base station.
- 21 **REJECT_UZID_s** – User Zone identifier of the User Zone rejected by the base station.
- 22 **RESELECT_INCLUDED_s** – System reselection information included indicator. When this is
23 set to ‘1’, the system reselection procedure is enabled.
- 24 **RESUME_PREAMBLE_s** – A storage variable in the mobile station that contains the size of
25 the preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
26 beginning of transmission on a Reverse Supplemental Code Channel when resuming
27 transmission following an interruption when discontinuous transmission is occurring.
- 28 **RETRY_DELAY_{s[i]}** – A storage variable in the mobile station that contains the system time
29 before which the mobile station may not transmit a specific message. The type of message
30 that cannot be transmitted is specified by RETRY_TYPE, represented here by i. A
31 RETRY_DELAY_{s[i]} value of 0 indicates no retry delay is in effect, and a value of ‘11111111’
32 indicates an infinite retry delay.
- 33 **RETRY_DELAY_UNIT_s** – The units for the value of RETRY_DELAY_s. Possible values are
34 1000ms and 60000ms.
- 35 **RETRY_DELAY_VALUE_s** – The unitless value of the retry delay.
- 36 **RETRY_TYPE_s** – The retry delay type. It specifies the type of message to which the retry
37 delay value applies. If set to a value of 0, it indicates that all retry delay values should be

- 1 cleared.
- 2 **RETURN_CAUSE_s** – Reason for the mobile station registering or accessing the system.
- 3 **RETURN_IF_FAIL_s** – Return if fail indicator. Set to ‘1’ to indicate that mobile station is to
4 return to the system from which it was redirected if it fails to acquire service on a system
5 using specified redirection criteria. Otherwise, set to ‘0’.
- 6 **RETURN_IF_HANDOFF_FAIL_s** – Return if handoff fail indicator. Indicates if the mobile
7 station is to resume using the Active Set on the Serving Frequency following an
8 unsuccessful hard handoff attempt.
- 9 **REV_DTX_DURATION_s** – Maximum duration of time in units of 20 ms that the mobile
10 station is allowed to stop transmitting on a Reverse Supplemental Code Channel ~~or Reverse~~
11 ~~Supplemental Channel~~ within the reverse assignment duration.
- 12 **REV_DURATION_s** – A stored variable in the mobile station that contains the duration (in
13 units of 80 ms) of the Reverse Supplemental Code Channel transmission that will begin at
14 time REV_START_TIME_s.
- 15 **REV_FCH_GATING_MODE_s** – The reverse Fundamental Traffic Channel gating mode in
16 Radio Configurations 3, 4, 5, and 6 where 50% of the PCGs in the 1500 bps and 1800 bps
17 frames are gated off (see 2.1.3.7.8 of C.P0002-A). Set to ‘1’ if the mobile station is operating
18 in the reverse fundamental channel gating mode.
- 19 **REV_FCH_RC_s** – Reverse Fundamental Channel Radio Configuration.
- 20 **REV_FRAME_40_MAX_RATE_s** – The maximum data rate for the mobile station's
21 transmission at 40 ms frame length on the Reverse Supplemental Channel.
- 22 **REV_FRAME_80_MAX_RATE_s** – The maximum data rate for the mobile station's
23 transmission at 80 ms frame length on the Reverse Supplemental Channel.
- 24 **REV_LINKED_HDM_SEQ_s** – Storage variable containing the most recent reverse sequence
25 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
26 *Assignment Message* reverse assignment was linked.
- 27 **REV_PWR_CNTL_DELAY_s** – The reverse link power control delay for the reverse
28 fundamental channel gating mode in Radio Configurations 3, 4, 5, and 6 and the gated
29 preamble transmission on the Enhanced Access Channel or the Reverse Common Control
30 Channel. The delay is the time between the end of the reverse link PCG and the beginning
31 of the forward link PCG minus one, when the round trip delay is zero.
- 32 **REV_RC_s** – Reverse Channel Radio Configuration.
- 33 **REV_SCH_DTX_DURATION_s** – Maximum duration of time in units of 20 ms that the mobile
34 station is allowed to stop transmitting on a Reverse Supplemental Channel within the
35 reverse assignment duration.
- 36 **REV_SCH_DURATION_s** – A stored variable in the mobile station which contains the
37 duration of the Reverse Supplemental Channel transmission which will begin at time
38 REV_SCH_START_TIME_s.
- 39 **REV_SCH_FRAME_LENGTH_s** – The Reverse Supplemental Channel frame length.

1 **REV SCH RATE_s** – The rate of the Reverse Supplemental Channel.

2 **REV_SCH_START_TIME_s** – A stored variable in the mobile station which contains the
3 System Time, in units of time specified by START_TIME_UNIT_s, (modulo 32) at which the
4 mobile station shall start (or resume) processing Reverse Supplemental Channels.

5 **REV_START_TIME_s** – A stored variable in the mobile station that contains the next 80 ms
6 frame boundary (modulo 64) on which the mobile station is assigned to start Reverse
7 Supplemental Code Channel transmission.

8 **REV WALSH ID_s** – Reverse Supplemental Channel Walsh cover Identifier.

9 **RN_HASH_KEY_s** – Name of an internal variable having the same value as the mobile
10 station's ESN. This variable is used by procedures defined in [3].

11 **ROAM_INDI_s** – Enhanced roaming indicator used for mobile station roaming condition
12 display.

13 **RS** – Inter-probe sequence backoff. The delay in slots generated (pseudorandomly) by the
14 mobile station following an unsuccessful access probe sequence or prior to the first access
15 probe in a response attempt.

16 **RT** – Inter-probe backoff. The delay in slots generated (pseudorandomly) by the mobile
17 station following an unacknowledged access probe.

18 **SCC_s** – SAT color code for analog channel assignment and CDMA-to-analog handoff.

19 **SCAM_FOR_DURATION_MODE_s** – Indicator for a specific or an indefinite Forward
20 Supplemental Code Channel assignment duration.

21 **SCAM_FOR_ORDER_s** – The stop or start command set by a *Supplemental Channel
Assignment Message* that is linked to a *General Handoff Direction Message*.

23 **SCAM_REV_DURATION_MODE_s** – Indicator for a specific or an indefinite Reverse
24 Supplemental Code Channel assignment duration.

25 **SCH_BAD_FRAMES_s** – Forward Supplemental Channel bad frames count. The number of
26 received bad forward Supplemental Channel frames.

27 **SCH_TOT_FRAMES_s** – Total forward Supplemental Channel frames received. The total
28 number of received forward Supplemental Channel frames, counted for Forward Traffic
29 Channel power control.

30 **SYNC_ID_s** – Service Configuration Synchronization Identifier. This is a ~~16-bit CRC variable
length computed over the entire identifier corresponding to the~~ Service Configuration
31 information record and Non-negotiable Service Configuration information record ~~that may
32 be stored by the mobile station and The SYNC ID value is used for by the base station to
33 determine whether these two information records should may be included omitted in from
34 the Service Connect Message sent by the base station to the mobile station. The mobile
35 station generates this parameter based on the Service Configuration information record and
36 Non-negotiable Service Configuration information record stored at the mobile station (if
37 stored), and sends it to the base station in the Origination Message or the Page Response
38 Message. The base station computes this parameter based on these two information records
39 targeted to be sent to the mobile station. If the computed value matches the one sent by~~

1 | the mobile station, then Based on the value of SYNC ID sent by the mobile station, base
 2 | station doesmay not send these two information records over the air and expects the mobile
 3 | station to start using the stored ones.

4 | **SCRM_SEQ_NUM_s** – Storage variable containing the most recently transmitted
 5 | *Supplemental Channel Request Message* sequence number.

6 | **SEARCH_MODE_s** – Search mode to be used in a periodic search on the Candidate
 7 | Frequency.

8 | **SEARCH_OFFSET_s** – Time offset of the start of the first search from the action time of the
 9 | *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control*
 10 | *Message* that starts a search.

11 | **SEARCH_PERIOD_s** – Period for search on the Candidate Frequency.

12 | **SEARCH_PRIORITY_s** – Neighbor Pilot Channel search priority.

13 | **SEARCH_PRIORITY_INCL_s** – Search priorities included indicator.

14 | **SEARCH_TIME_RESOLUTION_s** – Unit of delay used in the *Candidate Frequency Search Report Message* to report the total and maximum times away from the Serving Frequency.

16 | **SENDING_RAND_s** – ANSI-41 RAND Message sent indicator.

17 | **SERV_NEG_s** – Service negotiation indicator. Indicates whether the mobile station is to use
 18 | service negotiation or service option negotiation.

19 | **SERV_REQ_NUM_s** – Service request sequence number. Sequence number to use when
 20 | requesting a new service configuration.

21 | **SERVSYS_s** – Selected serving system indicator for Band Class 0. Set to SYS_A if the mobile
 22 | station operates in system A; otherwise, set to SYS_B.

23 | **SETTING_SEARCH_WIN** – SRCH_WIN_NGHBR Setting flag. Set to ‘1’ if the mobile station
 24 | shall set the SRCH_WIN_NGHBR field of each NGHBR_REC to SEARCH_WIN_N_s for all
 25 | NGHBR_SET_SIZE_s entries upon receiving the *System Parameters Message*.

26 | **SF_ADD_INTERCEPT_s** – Intercept of the handoff add criterion for the Serving Frequency,
 27 | stored during hard handoff.

28 | **SF_CDMABAND_s** – Serving Frequency CDMA band class, stored during hard handoff.

29 | **SF_CDMACH_s** – Serving Frequency CDMA Channel number, stored during hard handoff.

30 | **SF_CODE_CHAN_LIST_s** – Serving Frequency Code Channel List, stored during hard
 31 | handoff.

32 | **SF_DROP_INTERCEPT_s** – Intercept of the handoff drop criterion for the Serving Frequency,
 33 | stored during hard handoff.

34 | **SF_ENCRYPT_MODE_s** – Message encryption indicator for the Serving Frequency, stored
 35 | during hard handoff.

36 | **SF_FRAME_OFFSET_s** – Traffic Channel frame offset used on the Serving Frequency, stored
 37 | during hard handoff.

- 1 **SF_NOM_PWR_s** – Nominal transmit power offset used on the Serving Frequency, stored
2 during hard handoff.
- 3 **SF_NOM_PWR_EXT_s** – Extended nominal transmit power offset indicator for the Serving
4 Frequency, stored during hard handoff.
- 5 **SF_P_REV_s** – Protocol revision level supported by the base station on the Serving
6 Frequency.
- 7 **SF_P_REV_IN_USE_s** – Protocol revision level currently used by the mobile station on the
8 Serving Frequency.
- 9 **SF_PRIVATE_LCM_s** – Private long code mask indicator for the Serving Frequency, stored
10 during hard handoff.
- 11 **SF_SERV_NEG_s** – Service negotiation indicator for the Serving Frequency, stored during
12 hard handoff.
- 13 **SF_SERVICE_CONFIG_s** – Service configuration (service configuration record and non-
14 negotiable service configuration record) for the Serving Frequency.
- 15 **SF_SOFT_SLOPE_s** – Slope of the handoff add/drop criterion for the Serving Frequency,
16 stored during hard handoff.
- 17 **SF_SRCH_WIN_A_s** – Search window size for the Active Set and Candidate Set used on the
18 Serving Frequency, stored during hard handoff.
- 19 **SF_SRCH_WIN_N_s** – Search window size for the Neighbor Set used on the Serving
20 Frequency, stored during hard handoff.
- 21 **SF_SRCH_WIN_R_s** – Search window size for the Remaining Set used on the Serving
22 Frequency, stored during hard handoff.
- 23 **SF_T_ADD_s** – Pilot detection threshold used on the Serving Frequency, stored during hard
24 handoff.
- 25 **SF_T_COMP_s** – Active Set versus Candidate Set comparison threshold used on the Serving
26 Frequency, stored during hard handoff.
- 27 **SF_T_DROP_s** – Pilot drop threshold used on the Serving Frequency, stored during hard
28 handoff.
- 29 **SF_T_TDROP_s** – Pilot drop timer value used on the Serving Frequency, stored during hard
30 handoff.
- 31 **SF_TOTAL_EC_THRESH_s** – Threshold for total E_c of pilots in the Serving Frequency Active
32 Set used in the Candidate Frequency periodic search procedures.
- 33 **SF_TOTAL_EC_IO_THRESH_s** – Threshold for total E_c/I_o of pilots in the Serving Frequency
34 Active Set used in the Candidate Frequency periodic search procedures.
- 35 **SID_s** – System identifier.
- 36 **SID_NID_LIST_s** – Registration SID, NID list. The SID, NID pairs in which the mobile station
37 has registered.

- 1 **SLOT_CYCLE_INDEX_s** – Slot cycle index. Equal to the smaller of SLOT_CYCLE_INDEX_p
 2 and the received maximum slot cycle index.
- 3 **SLOT_NUM** – Paging Channel or Forward Common Control Channel slot number.
- 4 **SOFT_SLOPE_s** – The slope in the inequality criterion for adding a pilot to the Active Set, or
 5 dropping a pilot from the Active Set.
- 6 **SO_REQ_s** – Service option request number. The number of the service option requested by
 7 the mobile station during service option negotiation.
- 8 **SR1_BRAT_NON_TD_s** – Spreading Rate 1 Broadcast data rate with no transmit diversity.
- 9 **SR1_BRAT_TD_s** – Spreading Rate 1 Broadcast data rate with transmit diversity.
- 10 **SR1_CRAT_NON_TD_s** – Spreading Rate 1 coding rate with no transmit diversity.
- 11 **SR1_CRAT_TD_s** – Spreading Rate 1 coding rate with transmit diversity.
- 12 **SR1_TD_MODE_s** – Spreading Rate 1 transmit diversity mode in support of OTD or STS.
- 13 **SR1_TD_LEVEL_s** – Spreading Rate 1 transmit diversity power level.
- 14 **SR3_BRAT_s** – Data rate of the Broadcast Control Channel on SR3 frequencies.
- 15 **SR3_PRIMARY_PILOT_s** – Frequency offset of the primary SR3 pilot.
- 16 **SR3_PILOT_POWER1_s** – The power level of the primary pilot with respect to the pilot on the
 17 lower frequency of the two remaining SR3 frequencies.
- 18 **SR3_PILOT_POWER2_s** – The power level of the primary pilot with respect to the pilot on the
 19 higher frequency of the two remaining SR3 frequencies.
- 20 **SRCH_OFFSET_INCL_s** – Neighbor pilot search window offset included indicator.
- 21 **SRCH_OFFSET_NGHBR_s** – Neighbor pilot search window offset.
- 22 **SRCH_WIN_A_s** – Search window size for the Active Set and Candidate Set.
- 23 **SRCH_WIN_NGHBR_s** – Neighbor Pilot Channel search window size.
- 24 **SRCH_WIN_NGHBR_INCL_s** – Neighbor Pilot Channel search window size included indicator.
- 25 **SRCH_WIN_N_s** – Search window size for the Neighbor Set.
- 26 **SRCH_WIN_R_s** – Search window size for the Remaining Set.
- 27 **START_TIME_UNIT_s** – A stored variable in the mobile station which contains the time unit
 28 used for determining FOR_SCH_START_TIME and REV_SCH_START_TIME on Supplemental
 29 Channels.
- 30 **SYS_PAR_MSG_SEQ_s** – *System Parameters Message* sequence number.
- 31 **SYS_TIME_s** – Current value of CDMA system time as received in the *Sync Channel
 32 Message*.
- 33 **TA** – Acknowledgment response timeout.
- 34 **T_ADD_s** – Pilot detection threshold. The stored value is a positive value in units of 0.5 dB.

- 1 **T_COMP_s** – Active Set versus Candidate Set comparison threshold. The stored value is a
2 positive value in units of 0.5 dB.
- 3 **T_DROP_s** – Pilot drop threshold. The stored value is a positive value in units of 0.5 dB.
- 4 **TAG_s** – Transaction identifier. This is a 4-bit parameter maintained by the mobile station
5 which is used to uniquely identify a new call origination (via an *Enhanced Origination*
6 *Message*) by the mobile station. When the mobile station is to send an *Enhanced Origination*
7 *Message*, the mobile station increments the stored value of TAG and includes it in the
8 message.
- 9 **TAG_OUTSTANDING_LIST** – List of outstanding TAG values. This corresponds to those
10 values of TAG sent in the *Enhanced Origination Message* which have neither been accepted
11 by the base station (by assigning the requested call) nor rejected by the base station.
- 12 **TEMP_SUB_s** – User Zone temporary subscription flag.
- 13 **TF_CDMABAND_s** – Target Frequency CDMA band class. The CDMA band class specified in
14 the *Extended Handoff Direction Message* or the *General Handoff Direction Message*.
- 15 **TF_CDMACH_s** – Target Frequency CDMA Channel number. The CDMA Channel number
16 specified in the *Extended Handoff Direction Message* or the *General Handoff Direction*
17 *Message*.
- 18 **TF_RESET_FPC_s** – Flag to initialize the Forward Traffic Channel power control counters on
19 the Target Frequency.
- 20 **TF_RESET_L2_s** – Flag to reset acknowledgment procedures on the Target Frequency.
- 21 **TF_T_ADD_s** – Pilot detection threshold to be used on the Target Frequency. The stored
22 value is a positive value in units of 0.5 dB.
- 23 **TF_WAIT_TIME_s** – Maximum time that the mobile station may wait to receive a period of
24 ($N_{11m} \times 20$) ms with sufficient signal quality (e.g. good frames) on the CDMA Target
25 Frequency.
- 26 **TMSI_ZONE_s** – TMSI zone number of the base station.
- 27 **TMSI_ZONE_LEN_s** – The number of octets in TMSI zone.
- 28 **T_MULCHAN_s** – ~~A storage variable in the mobile station that contains the threshold offset~~
29 ~~that the mobile station is to use when reporting neighbor pilot strength measurements in a~~
30 ~~Supplemental Channel Request Message~~
31 ~~Reverse Supplemental Code Channel neighbor pilot strength measurement offset~~. The stored value is a positive value in units of 0.5 dB.
- 32 **TOTAL_PUF_PROBES_s** – Maximum number of PUF probes transmitted in a PUF attempt.
- 33 **TOTAL_ZONES_s** – Number of registration zones to be retained in ZONE_LIST_s.
- 34 **TOT_FRAMES_s** – Total forward Fundamental Channel frames received. The total number
35 of received forward Fundamental Channel frames, counted for Forward Traffic Channel
36 power control.
- 37 **T_TDROPS_s** – Pilot drop timer value.

- 1 **USE_FOR_HDM_SEQs** – Storage variable containing a flag indicating a pending
2 *Supplemental Channel Assignment Message* forward assignment that is linked to a *General*
3 *Handoff Direction Message*.
- 4 **USE_REV_HDM_SEQs** – Storage variable containing a flag indicating a pending
5 *Supplemental Channel Assignment Message* reverse assignment that is linked to a *General*
6 *Handoff Direction Message*.
- 7 **USE_T_ADD_ABORTs** – A storage variable in the mobile station that contains the Reverse
8 Supplement Code Channel assignment T_ADD abort indicator.
- 9 **USE_TMSIs** – Base station's preference of the use of TMSI.
- 10 **USER_ZONE_IDs** – *User Zone Identification Message* sent indicator.
- 11 **USER_ZONE_ID_MSG_SEQs** – *User Zone Identification Message* sequence number.
- 12 **UZ_EXIT_IN_USEs** – The User Zone Exit parameter that the mobile station received from
13 the *User Zone Identification Message* broadcast by the last base station of the old user zone.
- 14 **UZ_EXIT_RCVDs** – The User Zone Exit parameter that the mobile station just received from
15 the *User Zone Identification Message* broadcast by the currently serving base station.
- 16 **UZIDs** – User Zone identifier.
- 17 **UZ_REC** – Record containing information about a User Zone broadcast by the base station
18 (see also UZ_REC_LIST).
- 19 **UZ_REC_LIST** – Broadcast User Zone record list. A descriptive structure used to manage
20 the base station's information records about broadcast User Zones (see also UZ_REC).
- 21 **UZ_REVs** – User Zone update revision number.
- 22 **VMACs** – Analog voice mobile station attenuation code for analog channel assignment or
23 CDMA-to-analog handoff.
- 24 **ZONE_LISTs** – Registration zone list. List of zones in which the mobile station has
25 registered.
- 26 **ZONE_TIMERs** – Zone timer length.

1.2 Signaling Architecture

Layer 3 signaling for cdma2000 is modeled as follows:

- **Protocol Layer.** Layer 3 generates Layer 3 PDUs and passes these PDUs to Lower Layers, where proper encapsulation into Lower Layer PDUs is performed. On the receiving end, Lower Layer PDUs are decapsulated and the resulting SDUs are sent from Lower Layers to Layer 3 for processing.
- **Service Access Points.** SAPs and corresponding communication primitives are defined between the Layer 3 and Lower Layers over the data plane. No SAPs are defined for communications through the control plane.

1.3 Signaling and Functionality

1.3.1 General Architecture

The general architecture is presented in Figure 1.3.1-1.

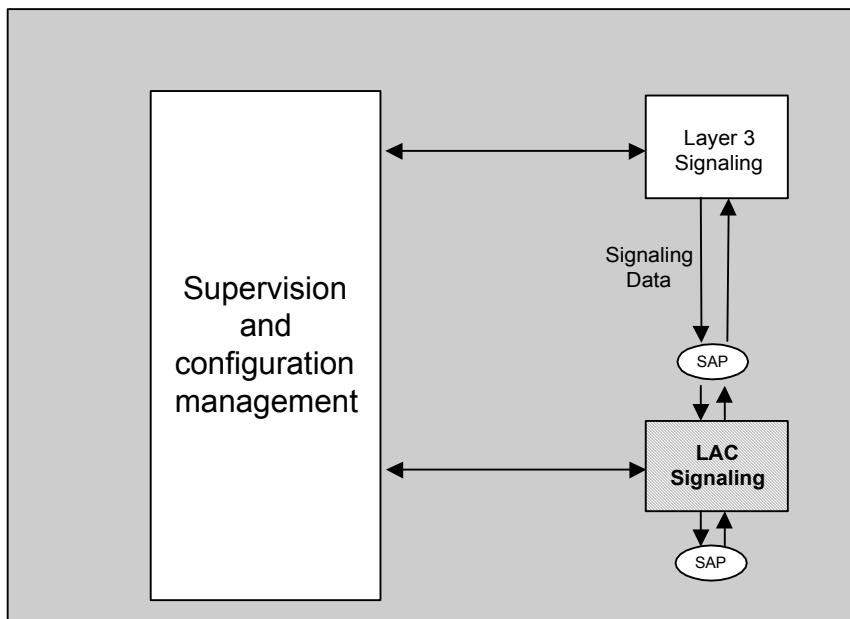

Figure 1.3.1-1. cdma2000 Signaling – General Architecture

1.3.2 Interface to Layer 2

The interface between Layer 3 and Layer 2 is a Service Access Point (SAP). At the SAP, Layer 3 and Layer 2 exchange Service Data Units (SDU) and interface control information in the form of Message Control and Status Blocks (MCSB) using a set of primitives.

1.3.2.1 Message Control and Status Block (MCSB)

The MCSB is a parameter block for the defined primitives, containing relevant information about an individual Layer 3 message (PDU), as well as instructions on how the message

1 may be handled or how it is to be (for transmission), or was (for reception), processed by
 2 Layer 2. The MCSB is a conceptual construct and is not subject to detailed specification in
 3 this document; however, it is envisioned the MCSB will contain information such as:

- 4 • The MSG_TAG. If the message is generated in response to a previously received
 5 message, the MSG_TYPE of the previously received message is also stored.
- 6 • The length of the PDU.
- 7 • Page record length parameters, i.e., values of the SDU_INCLUDED field for a *Mobile*
 8 *Station-addressed* record in a *General Page Message*, the
 9 EXT_MS_SDU_LENGTH_INCL and EXT_MS_SDU_LENGTH fields for a *Mobile*
 10 *Station-addressed* record in a *Universal Page Message*, and the
 11 EXT_BCAST_SDU_LENGTH_IND and EXT_BCAST_SDU_LENGTH fields for an
 12 *Enhanced Broadcast* record sent in a *General Page Message* or a *Universal Page*
 13 *Message*.
- 14 • A unique instance identifier associated with the message, which enables
 15 identification of a message for notifications of delivery/non-delivery or recovery
 16 procedures.
- 17 • Whether the message should be acknowledged at Layer 2 (i.e., delivered in assured
 18 mode or unassured mode).
- 19 • Whether notification of delivery is required.
- 20 • The identity of the addressee for the message.
- 21 • Whether the PDU delivered to Layer 3 is a duplicate (in cases where Layer 2 does
 22 not discard duplicates).
- 23 • Data needed by the authentication procedures (e.g., the CHARi fields of the
 24 *Origination Message*).
- 25 • Relevant PDU classification (e.g., registrations, originations), where processing at
 26 Layer 2 is sensitive to the kind of PDU being transferred.
- 27 • The encryption status of the logical channel.
- 28 • CDMA System Time corresponding to the frame in which the first or last bit of a
 29 message was received.
- 30 • Transmission instructions for Layer 2, such as an instruction to send a message
 31 with a certain priority (before, after, or by interrupting the transmission of other
 32 messages), an instruction regarding supervision, and so on.
- 33 • Abnormal conditions indications from Layer 2.

34 1.3.2.2 Interface Primitives

35 The following primitives are defined for communication between the Layer 3 and Layer 2:

36 | Name: L2-Data.Request

1 Type: Request
 2 Direction: Layer 3 to Layer 2
 3 Parameters: PDU, MCSB
 4 Action: The PDU is handed to Layer 2 for delivery across the radio interface.
 5
 6 Name: **L2-Data.Confirm**
 7 Type: Confirm
 8 Direction: Layer 2 to Layer 3
 9 Parameters: MCSB
 10 Action: Reception of the specified (in the MCSB) transmitted PDU was acknowledged
 11 at Layer 2 by the addressee.
 12
 13 Name: **L2-Data.Indication**
 14 Type: Indication
 15 Direction: Layer 2 to Layer 3
 16 Parameters: PDU, MCSB
 17 Action: The received PDU is handed to Layer 3.
 18
 19 Name: **L2-Condition.Notification**
 20 Type: Indication
 21 Direction: Layer 2 to Layer 3
 22 Parameters: MCSB
 23 Action: Layer 3 is notified of a relevant event (e.g. abnormal condition) detected at
 24 Layer 2. Details are indicated via the MCSB.
 25
 26 Name: **L2-Supervision.Request**
 27 Type: Request
 28 Direction: Layer 3 to Layer 2
 29 Parameters: MCSB
 30 Action: Layer 2 executes a control command as directed by Layer 3. This could be,
 31 for example, an order to abandon retransmission of a message or an order
 32 for local reset for the message sequence number, acknowledgment sequence
 33 number and duplicate detection.

1 1.3.3 Reserved

2

3 1.3.4 Functional Description

4 In the Data Plane, Layer 3 originates and terminates signaling data units according to the
5 semantic and timing of the communication protocol between the base station and the
6 mobile station. From a semantic point of view the signaling data units are referred to as
7 “messages” (or “orders”). From a protocol point of view, the signaling data units are PDUs.
8 In general, the language of this specification does not explicitly distinguish between the
9 terms “PDU” and “Message”. It is considered that the context provides enough information
10 to allow the reader to make the appropriate distinctions.

11 1.3.5 PDU Transmission and Reception

12 Layer 3 employs the services offered at the interface with Layer 2 to transfer PDUs to and
13 from the 4Layer 3 entity.

14 When requesting the transmission of a PDU, Layer 3 will typically specify whether the
15 transfer will be performed in *assured mode* or in *unassured mode* (for example, by setting
16 the proper parameters in the MCSB argument of the L2-Data.Request primitive). For
17 transmission in assured mode, 4Layer 3 may specify if *confirmation of delivery* of the PDU is
18 required.

19 Layer 2 guarantees that an assured mode PDU received from the transmitting Layer 3
20 entity is delivered to the receiving Layer 3 entity. Each assured mode PDU is delivered to
21 the receiving Layer 3 entity only once and without errors. Additionally, if the transmitting
22 Layer 3 entity requests confirmation of delivery of an assured mode PDU, Layer 2 will send
23 an indication to the transmitting Layer 3 entity (for example by using the L2-Data.Confirm
24 primitive) when Layer 2 receives an acknowledgment for that PDU. If Layer 2 is not able to
25 deliver an assured mode PDU, it sends an indication of the failure to Layer 3 which can
26 then take corrective action.

27 Layer 2 does not guarantee that an unassured mode PDU received from the transmitting
28 Layer 3 entity is delivered to the receiving Layer 3 entity. Thus, Layer 2 acknowledgments
29 may not be required for unassured mode PDUs. To increase the probability of delivery of
30 unassured mode PDUs, Layer 3 may request Layer 2 to send those PDUs multiple times in
31 quick repeat sequence and rely on the duplicate detection capabilities of the receiver to
32 achieve uniqueness of delivery.

33 Layer 3 can also request Layer 2 to perform a reset of the Layer 2 ARQ procedures (for
34 example, by using the L2-Supervision.Request primitive).

2. REQUIREMENTS FOR MOBILE STATION CDMA OPERATION

This section defines requirements that are specific to CDMA mobile station equipment and operation. A CDMA mobile station may support operation in one or more band classes.

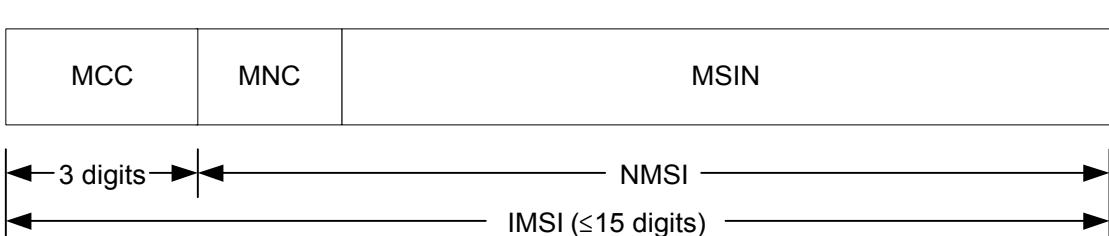

2.1 Reserved

2.2 Reserved

2.3 Security and Identification

2.3.1 Mobile Station Identification Number

Mobile stations operating in the CDMA mode are identified by the International Mobile Station Identity (IMSI).¹ Mobile Stations shall have two different identifiers, IMSI_T and IMSI_M. The IMSI consists of up to 15 numerical characters (0-9). The first three digits of the IMSI are the Mobile Country Code (MCC), and the remaining digits are the National Mobile Station Identity (NMSI). The NMSI consists of the Mobile Network Code (MNC) and the Mobile Station Identification Number (MSIN). The IMSI structure is shown in Figure 2.3.1-1.

MCC	Mobile Country Code
MNC	Mobile Network Code
MSIN	Mobile Station Identifier Number
NMSI	National Mobile Station Identity
IMSI	International Mobil Station Identity

Figure 2.3.1-1. IMSI Structure

An IMSI that is 15 digits in length is called a class 0 IMSI (the NMSI is 12 digits in length); an IMSI that is less than 15 digits in length is called a class 1 IMSI (the NMSI is less than 12 digits in length).

¹ See [18] CCITT Blue Book, Volume II Faseicle II.2, Recommendation E.212, November 1988.

1 IMSI_M is an IMSI that contains a MIN in the lower ten digits of the NMSI. An IMSI_M can
 2 be a class 0 or a class 1 IMSI. If the IMSI_M is not programmed, the mobile station shall
 3 set the four least-significant digits of the IMSI_M to the value of the ESN_p, converted
 4 directly from binary to decimal, modulo 10000, and the mobile station shall set the other
 5 digits to 0.

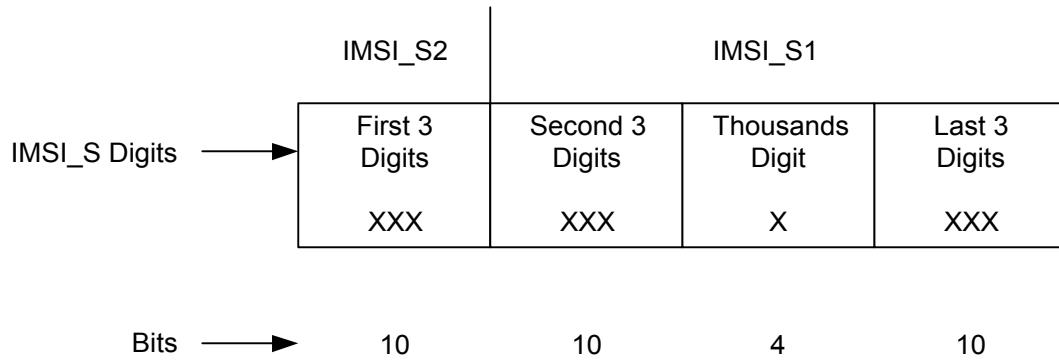

6 IMSI_T is an IMSI that is not associated with the MIN assigned to the mobile station. An
 7 IMSI_T can be a class 0 or class 1 IMSI. If the IMSI_T is not programmed, the mobile
 8 station shall set the four least-significant digits of the IMSI_T to the value of the ESN_p,
 9 converted directly from binary to decimal, modulo 10000, and the mobile station shall set
 10 the other digits to 0.

11 When operating in the CDMA mode the mobile station shall set its operational IMSI value,
 12 IMSI_O, to either the IMSI_M or the IMSI_T depending on the capabilities of the base
 13 station (See 2.6.2.2.5).

14 An IMSI_S is a 10-digit (34-bit) number derived from the IMSI. When an IMSI has ten or
 15 more digits, IMSI_S is equal to the last ten digits. When an IMSI has fewer than ten digits,
 16 the least significant digits of IMSI_S are equal to the IMSI and zeros are added to the most
 17 significant side to obtain a total of ten digits. A 10-digit IMSI_S consists of 3- and 7-digit
 18 parts, called IMSI_S2 and IMSI_S1, respectively, as illustrated in Figure 2.3.1-2. IMSI_S is
 19 mapped into a 34-bit number (see 2.3.1.1). The IMSI_S derived from IMSI_M is designated
 20 IMSI_M_S. The IMSI_S derived from IMSI_T is designated IMSI_T_S. The IMSI_S derived
 21 from IMSI_O is designated IMSI_O_S.

22 The mobile station shall have memory to store the 34-bit IMSI_M_S_p and the 34-bit
 23 IMSI_T_S_p. IMSI_M_S_p is represented by the 10-bit IMSI_M_S2_p and the 24 bit
 24 IMSI_M_S1_p. IMSI_T_S_p is represented by the 10-bit IMSI_T_S2_p and the 24 bit
 25 IMSI_T_S1_p.

26

27
28

29 **Figure 2.3.1-2. IMSI_S Binary Mapping**

31 When an IMSI has 12 or more digits, IMSI_11_12 is equal to the 11th and 12th digits of the
 32 IMSI. When an IMSI has fewer than 12 digits, digits with a value equal to zero are added to

1 the most significant side to obtain a total of 12 digits and the IMSI_11_12 is equal to the
 2 11th and 12th digits of the resulting number.

3 IMSI_11_12 is encoded as described in 2.3.1.2. The mobile station shall have memory to
 4 store the 7-bit IMSI_M_11_12_p and the 7-bit IMSI_T_11_12_p.

5 The 3-digit MCC is encoded as described in 2.3.1.3. The mobile station shall have memory
 6 to store the 10-bit MCC_M_p and the 10-bit MCC_T_p.

7 If the mobile station has a class 1 IMSI_T, or IMSI_M, it shall have memory to store
 8 IMSI_T_ADDR_NUM_p and IMSI_M_ADDR_NUM_p. IMSI_T_ADDR_NUM_p is equal to the
 9 number of digits in the NMSI² minus four. IMSI_M_ADDR_NUM_p is equal to the number of
 10 digits in the NMSI of the IMSI_M minus four.

11 2.3.1.1 Encoding of IMSI_M_S and IMSI_T_S

12 The IMSI_M_S and IMSI_T_S binary mapping is defined as follows:

- 13 1. The first three digits of the IMSI_M_S and the first three digits of the IMSI_T_S are
 14 mapped into ten bits (corresponding to IMSI_M_S2_p and IMSI_T_S2_p, respectively)
 15 by the following coding algorithm:
 - 16 a. Represent these three digits as D₁ D₂ D₃ with the digit equal to zero being given
 17 the value of ten.
 - 18 b. Compute $100 \times D_1 + 10 \times D_2 + D_3 - 111$.
 - 19 c. Convert the result in step b to binary by the standard decimal-to-binary
 20 conversion as shown in Table 2.3.1.1-1.

21

² It is assumed that the number of digits in NMSI is greater than three.

1

Table 2.3.1.1-1. Decimal to Binary Conversion Table

Decimal Number	Binary Number
0	0000000000
1	0000000001
2	0000000010
3	0000000011
4	0000000100
•	•
•	•
•	•
998	1111100110
999	1111100111

2

- 3 2. The second three digits of IMSI_M_S and the second three digits of IMSI_T_S are
 4 mapped into the ten most significant bits of IMSI_M_S1_p and IMSI_T_S1_p,
 5 respectively, by the coding algorithm indicated in 1.
- 6 3. The last four digits of IMSI_M_S and the last four digits of IMSI_T_S are mapped into
 7 the 14 least significant bits of IMSI_M_S1_p and IMSI_T_S1_p, respectively, as follows:
 8 a. The thousands digit is mapped into four bits by a Binary-Coded-Decimal (BCD)
 9 conversion, as shown in Table 2.3.1.1-2.
 10 b. The last three digits are mapped into ten bits by the coding algorithm indicated
 11 in 1.

12

Table 2.3.1.1-2. BCD Mapping

Decimal Digit	Binary Number
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
0	1010

The following example illustrates the $\text{IMSI}_{\text{T}} \text{S2}_p$ and $\text{IMSI}_{\text{T}} \text{S1}_p$ calculation procedure. Let the IMSI_{T} be the 9-digit number 123456789. Since the IMSI_{T} has fewer than ten digits, the nine least significant digits of the $\text{IMSI}_{\text{T}} \text{S}$ are equal to the IMSI_{T} digits and the most significant $\text{IMSI}_{\text{T}} \text{S}$ digit is set to zero. So the 10-digit $\text{IMSI}_{\text{T}} \text{S}$ is 012 345 6 789. $\text{IMSI}_{\text{T}} \text{S2}_p$ and $\text{IMSI}_{\text{T}} \text{S1}_p$ are calculated as follows:

- $\text{IMSI}_{\text{T}} \text{S2}_p$. The ten-bit $\text{IMSI}_{\text{T}} \text{S2}_p$ is derived from the first three digits of the $\text{IMSI}_{\text{T}} \text{S}$ (i.e., 012):

$$\text{a. } D_1 = 10; D_2 = 1; D_3 = 2.$$

$$\text{b. } 100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 10 + 10 \times 1 + 2 - 111 = 901.$$

c. 901 in binary is '11 1000 0101'.

Therefore, $\text{IMSI}_{\text{T}} \text{S2}_p$ is '11 1000 0101'.

- $\text{IMSI}_{\text{T}} \text{S1}_p$. The ten most significant bits of $\text{IMSI}_{\text{T}} \text{S1}_p$ are derived from the second three digits of the $\text{IMSI}_{\text{T}} \text{S}$ (i.e., 345):

$$\text{a. } D_1 = 3; D_2 = 4; D_3 = 5.$$

$$\text{b. } 100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 3 + 10 \times 4 + 5 - 111 = 234.$$

c. 234 in binary is '0011 1010 10'.

The next four most significant bits of $\text{IMSI}_{\text{T}} \text{S1}_p$ are derived from the thousands digit of the $\text{IMSI}_{\text{T}} \text{S}$ (i.e., 6) by BCD conversion: 6 in BCD is '0110'.

The ten least significant bits of $\text{IMSI}_{\text{T}} \text{S1}_p$ are derived from the last three digits of the $\text{IMSI}_{\text{T}} \text{S}$ (i.e., 789):

$$\text{a. } D_1 = 7; D_2 = 8; D_3 = 9.$$

$$\text{b. } 100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 7 + 10 \times 8 + 9 - 111 = 678.$$

1 c. 678 in binary is '10 1010 0110'.

2 Therefore, IMSI_T_S1_p is '0011 1010 1001 1010 1010 0110'.

3 2.3.1.2 Encoding of IMSI_M_11_12 and IMSI_T_11_12

4 The IMSI_M_11_12 and IMSI_T_11_12 binary mapping is defined as follows:

5 1. Represent the 11th digit as D₁₁ and the 12th digit as D₁₂ with the digit equal to
6 zero being given the value of ten.

7 2. Compute $10 \times D_{12} + D_{11} - 11$.

8 3. Convert the result in step 2 to binary by a standard decimal-to-binary conversion as
9 described in Table 2.3.1.1-1 and limit the resulting number to the 7 least significant
10 bits.

11 2.3.1.3 Encoding of the MCC_M and MCC_T

12 The MCC_M and MCC_T binary mapping is defined as follows:

13 1. Represent the 3-digit Mobile Country Code as D₁ D₂ D₃ with the digit equal to zero
14 being given the value of ten.

15 2. Compute $100 \times D_1 + 10 \times D_2 + D_3 - 111$.

16 3. Convert the result in step (2) to binary by a standard decimal-to-binary conversion
17 as described in Table 2.3.1.1-1.

18 2.3.1.4 Mobile Directory Number

19 A Mobile Directory Number (MDN) is a dialable number associated with the mobile station
20 through a service subscription. A Mobile Directory Number is not necessarily the same as
21 the mobile station identification on the air interface, i.e., MIN, IMSI_M or IMSI_T. An MDN
22 consists of up to 15 digits. The mobile station should have memory to store at least one
23 Mobile Directory Number (see Table F.3-1).

24 2.3.2 Electronic Serial Number

25 The ESN is a 32-bit binary number that uniquely identifies the mobile station to any
26 wireless system. The ESN value is available to procedures in the mobile station as the
27 value of the variable ESN_p. The value of the variable RN_HASH_KEY_s is the same as the
28 value of the variable ESN_p, and need not be stored separately.

29 2.3.3 Station Class Mark

30 Class-of-station information referred to as the station class mark (SCM_p) must be stored in
31 a mobile station. The digital representation of this class mark is specified in Table 2.3.3-1.

1

Table 2.3.3-1. Station Class Mark

Function	Bit(s)	Setting	
Extended SCM Indicator	7	Band Classes 1,4 1XXXXXXXX Other bands 0XXXXXXXX	
Dual Mode	6	CDMA Only X0XXXXXX Dual Mode X1XXXXXX	
Slotted Class	5	Non-Slotted XX0XXXXX Slotted XX1XXXXX	
IS-54 Power Class	4	Always 0 XXX0XXXX	
25 MHz Bandwidth	3	Always 1 XXXX1XXX	
Transmission	2	Continuous XXXX0XX Discontinuous XXXX1XX	
Power Class for Band Class 0 Analog Operation	1 - 0	Class I XXXXX00 Class II XXXXX01 Class III XXXXX10 Reserved XXXXX11	

2

3 If the mobile station supports analog mode operation in Band Class 0, the mobile station
 4 shall set the Power Class function bits to reflect its analog power class at Band Class 0,
 5 regardless of the band class in which it is operating; otherwise, the mobile station shall set
 6 these bits to '00'.

7 2.3.4 Registration Memory

8 The mobile station shall have memory to store one element in the zone-based registration
 9 list ZONE_LIST_{s-p} (see 2.6.5.1.5 and 2.6.5.5). This stored element shall include both
 10 REG_ZONE and the corresponding (SID, NID) pair. The data retention time under power-off
 11 conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot be
 12 guaranteed, then the entry in ZONE_LIST_{s-p} shall be deleted upon power-on.

13 The mobile station shall have memory to store one element in the system/network
 14 registration list SID_NID_LIST_{s-p} (see 2.6.5.1.5 and 2.6.5.5). The data retention time under
 15 power-off conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot
 16 be guaranteed, then the entry in SID_NID_LIST_{s-p} shall be deleted upon power-on.

17 The mobile station shall have memory to store the distance-based registration variables
 18 BASE_LAT_REG_{s-p}, BASE_LONG_REG_{s-p}, and REG_DIST_REG_{s-p} (see 2.6.5.1.4 and
 19 2.6.5.5). The data retention time under power-off conditions shall be at least 48 hours. If,
 20 after 48 hours, the data integrity cannot be guaranteed, then REG_DIST_REG_{s-p} shall be
 21 set to zero upon power-on.

1 2.3.5 Access Overload Class

2 The 4-bit access overload class indicator (ACCOLC_p) is used to identify which overload class
 3 controls access attempts by the mobile station and is used to identify redirected overload
 4 classes in global service redirection.

5 The mobile station shall store 4-bit access overload class (ACCOLC_p). Mobile stations that
 6 are not for test or emergency use should be assigned to overload classes ACCOLC 0 through
 7 ACCOLC 9. For mobile stations that are classified as overload classes ACCOLC 0 through
 8 ACCOLC 9, the mobile station's 4-bit access overload class indicator (ACCOLC_p) shall be
 9 automatically derived from the last digit of the associated decimal representation of the
 10 IMSI_M by a decimal to binary conversion as specified in Table 2.3.5-1. When a mobile
 11 station's IMSI_M is updated, the mobile station shall re-calculate the ACCOLC_p as indicated
 12 above. Mobile stations designated for test use should be assigned to ACCOLC 10; mobile
 13 stations designated for emergency use should be assigned to ACCOLC 11. ACCOLC 12
 14 through ACCOLC 15 are reserved.³ Programming the 4-bit ACCOLC_p for overload classes
 15 ACCOLC 10 through ACCOLC 15 as specified in Table 2.3.5-2 shall require a special facility
 16 only available to equipment manufacturers and system operators.

17 The content of ACCOLC_p shall not be visible through the mobile station's display.

18

19 **Table 2.3.5-1. ACCOLC_p Mapping for ACCOLC 0 through ACCOLC 9**

Last Digit of the Decimal Representation of the IMSI (binary)	ACCOLC _p

11	1011
12	1100
13	1101
14	1110
15	1111

2.3.6 Public Long Code Mask

The Public Long Code Mask consists of 42 bits (see [2]). The 37 least significant bits (PLCM_37) are set as follows:

Bits M₃₆ through M₃₂ shall be set to '11000'; bits M₃₁ through M₀ shall be set to a permutation of the mobile station's ESN as follows:

ESN = (E₃₁, E₃₀, E₂₉, E₂₈, E₂₇, E₂₆, E₂₅, ..., E₂, E₁, E₀)

Permuted ESN = (E₀, E₃₁, E₂₂, E₁₃, E₄, E₂₆, E₁₇, E₈, E₃₀, E₂₁, E₁₂, E₃, E₂₅, E₁₆, E₇, E₂₉, E₂₀, E₁₁, E₂, E₂₄, E₁₅, E₆, E₂₈, E₁₉, E₁₀, E₁, E₂₃, E₁₄, E₅, E₂₇, E₁₈, E₉).

2.3.7 Reserved

2.3.8 Home System and Network Identification

In addition to the HOME_SID_p parameter that the mobile station stores for 800 MHz analog operation, the mobile station shall provide memory to store at least one home (SID_p, NID_p) pair. The mobile station shall also provide memory to store the 1-bit parameters MOB_TERM_HOME_p, MOB_TERM_FOR_SID_p, and MOB_TERM_FOR_NID_p (see 2.6.5.3).

2.3.9 Local Control Option

If the mobile station supports the local control option, a means shall be provided within the mobile station to enable or disable the local control option.

2.3.10 Preferred Operation Selection

2.3.10.1 Preferred System

If the mobile station supports operation in Band Class 0 or Band Class 3 (see [2]), a means shall be provided within the mobile station to identify the preferred system. In addition, the mobile station may provide a means for allowing operation only with System A or only with System B.

1 2.3.10.2 Preferred CDMA or Analog
 2 If the mobile station supports operation in Band Class 0 (see [2]), a means may be provided
 3 within the mobile station to identify the preferred operation type as either CDMA mode or
 4 analog mode. In addition, the mobile station may provide a means for allowing operation
 5 only in the preferred mode.

6 2.3.11 Discontinuous Reception
 7 The mobile station shall provide memory to store the preferred slot cycle index,
 8 SLOT_CYCLE_INDEX_p (see 2.6.2.1.1.3.2).

9 2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice Privacy

10 2.3.12.1 Authentication

11 Authentication is the process by which information is exchanged between a mobile station
 12 and base station for the purpose of confirming the identity of the mobile station. A
 13 successful outcome of the authentication process occurs only when it can be demonstrated
 14 that the mobile station and base station possess identical sets of shared secret data.

15 The authentication algorithms are described in [15]. The interface (input and output
 16 parameters) for the algorithms is described in [23], Table 2.3.12.1-1 summarizes the
 17 setting of the input parameters of the Auth_Signature procedure for each of its uses in this
 18 standard.

19 For authentication purposes, the mobile station shall use IMSI_M if it is programmed;
 20 otherwise, the mobile station shall use IMSI_T. The base station uses the IMSI selected
 21 according to the same criteria.

22

23 **Table 2.3.12.1-1. Auth_Signature Input Parameters**

Procedure	RAND_CHALLENGE	ESN	AUTH_DATA	SSD_AUTH	SAVE_REGISTERS
Unique Challenge (2.3.12.1.4)	RANDU and 8 LSBs of IMSI_S2	ESN _p	IMSI_S1	SSD_A	FALSE
Base Station Challenge (2.3.12.1.5)	RANDBS	ESN _p	IMSI_S1	SSD_A _ NEW	FALSE

24

25 2.3.12.1.1 Shared Secret Data (SSD)

26 SSD is a 128-bit quantity that is stored in semi-permanent memory in the mobile station
 27 and is readily available to the base station. As depicted in Figure 2.3.12.1.1-1, SSD is
 28 partitioned into two distinct subsets. Each subset is used to support a different process.

29

Contents	SSD_A	SSD_B
Length (bits)	64	64

Figure 2.3.12.1.1-1. Partitioning of SSD

SSD_A is used to support the authentication procedures and SSD_B is used to support voice privacy (see 2.3.12.3) and message encryption (see 2.3.12.2). SSD is generated according to the procedure specified in 2.3.12.1.5. The SSD shall not be accessible to the user.

2.3.12.1.2 Random Challenge Memory (RAND)

RAND is a 32-bit value held in the mobile station. When operating in CDMA mode, it is equal to the RAND value received in the last *Access Parameters Message* (see 3.7.2.3.2.2) or the *ANSI-41 RAND Message* (see 3.7.2.3.2.31) of the CDMA f-csch.

RAND_s is used in conjunction with SSD_A and other parameters, as appropriate, to authenticate mobile station originations, terminations and registrations.

2.3.12.1.3 Call History Parameter (COUNT_{s-p})

COUNT_{s-p} is a modulo-64 count held in the mobile station. COUNT_{s-p} is updated by the mobile station when a *Parameter Update Order* is received on the f-dsch (see 3.7.4).

2.3.12.1.4 Unique Challenge-Response Procedure

The Unique Challenge-Response Procedure is initiated by the base station and can be carried out either on the f-csch and r-csch, or on the f-dsch and r-dsch. The procedure is as follows:

The base station generates the 24-bit quantity RANDU and sends it to the mobile station in the *Authentication Challenge Message* on either the f-csch or f-dsch. Upon receipt of the *Authentication Challenge Message*, the mobile station shall set the input parameters of the Auth_Signature procedure (see [23] section 2.3) as illustrated in Figure 2.3.12.1.5-3. The 24 most significant bits of the RAND_CHALLENGE input parameter shall be filled with RANDU, and the 8 least significant bits of RAND_CHALLENGE shall be filled with the 8 least significant bits of IMSI_S2.

The mobile station shall set the SAVE_REGISTERS input parameter to FALSE.

The mobile station shall then execute the Auth_Signature procedure. The 18-bit output AUTH_SIGNATURE shall be used to fill the AUTHU field of the *Authentication Challenge Response Message*, which shall be sent to the base station.

The base station computes the value of AUTHU in the same manner as the mobile station, but using its internally stored value of SSD_A. The base station compares its computed value of AUTHU to the value received from the mobile station. If the comparison fails, the base station may deny further access attempts by the mobile station, drop the call in progress, or initiate the process of updating SSD (see 2.3.12.1.5).

- 1 2.3.12.1.5 Updating the Shared Secret Data (SSD)
- 2 SSD is updated using the SSD_Generation procedure (see [23], section 2.2.1), initialized
 3 with mobile station specific information, random data, and the mobile station's A-key. The
 4 A-key is 64 bits long. It is assigned to the mobile station and is stored in the mobile
 5 station's permanent security and identification memory. The A-key is known only to the
 6 mobile station and to its associated Home Location Register/Authentication Center
 7 (HLR/AC) (see [13]). Non-manual methods, such as described in [26], are preferred for
 8 entry of the A-key into the mobile station. A manual method of entry that may be used
 9 when automated methods are not available is described in [29].
- 10 The SSD update procedure is performed as follows (see Figure 2.3.12.1.5-1):
- 11 The base station sends an *SSD Update Message* on either the f-csch or the f-dsch. The
 12 RANDSSD field of the *SSD Update Message* contains the same value used for the HLR/AC
 13 computation of SSD.
- 14 Upon receipt of the *SSD Update Message* the mobile station shall set the input parameters
 15 of the SSD_Generation procedure (see [23], section 2.2.1) as illustrated in Figure 2.3.12.1.5-
 16 2. The mobile station shall then execute the SSD_Generation procedure. The mobile
 17 station shall set SSD_A_NEW and SSD_B_NEW to the outputs of the SSD_Generation
 18 procedure.
- 19 The mobile station shall then select a 32-bit random number, RANDBS, and shall send it to
 20 the base station in a *Base Station Challenge Order* on the r-csch or r-dsch.
- 21 Both the mobile station and the base station shall then set the input parameters of the
 22 Auth_Signature procedure (see [23], section 2.3) as illustrated in Figure 2.3.12.1.5-3 and
 23 shall execute the Auth_Signature procedure.
- 24 The mobile station and base station shall set the SAVE_REGISTERS input parameter to
 25 FALSE.
- 26 The mobile station and base station shall execute the Auth_Signature procedure. AUTHBS
 27 is set to the 18-bit result AUTH_SIGNATURE. The base station sends its computed value of
 28 AUTHBS to the mobile station in a *Base Station Challenge Confirmation Order* on the f-csch
 29 or the f-dsch.
- 30 Upon receipt of the *Base Station Challenge Confirmation Order* the mobile station shall
 31 compare the received value of AUTHBS to its internally computed value. (If the mobile
 32 station receives a *Base Station Challenge Confirmation Order* when an SSD update is not in
 33 progress, the mobile station shall respond with an *SSD Update Rejection Order*.)
- 34 If the comparison is successful, the mobile station shall execute the SSD_Update procedure
 35 (see [23], section 2.2.2) to set SSD_A and SSD_B to SSD_A_NEW and SSD_B_NEW,
 36 respectively. The mobile station shall then send an *SSD Update Confirmation Order* to the
 37 base station, indicating successful completion of the SSD update.
- 38 If the comparison is not successful, the mobile station shall discard SSD_A_NEW and
 39 SSD_B_NEW. The mobile station shall then send an *SSD Update Rejection Order* to the base
 40 station, indicating unsuccessful completion of the SSD update.

- 1 Upon receipt of the *SSD Update Confirmation Order*, the base station sets SSD_A and SSD_B
2 to the values received from the HLR/AC (see [13]).
3 If the mobile station fails to receive the *Base Station Challenge Confirmation Order* within
4 T_{64m} seconds of when the acknowledgment to the *Base Station Challenge Order* was
5 received, the mobile station shall discard SSD_A_NEW and SSD_B_NEW. The mobile
6 station shall then terminate the SSD update process.

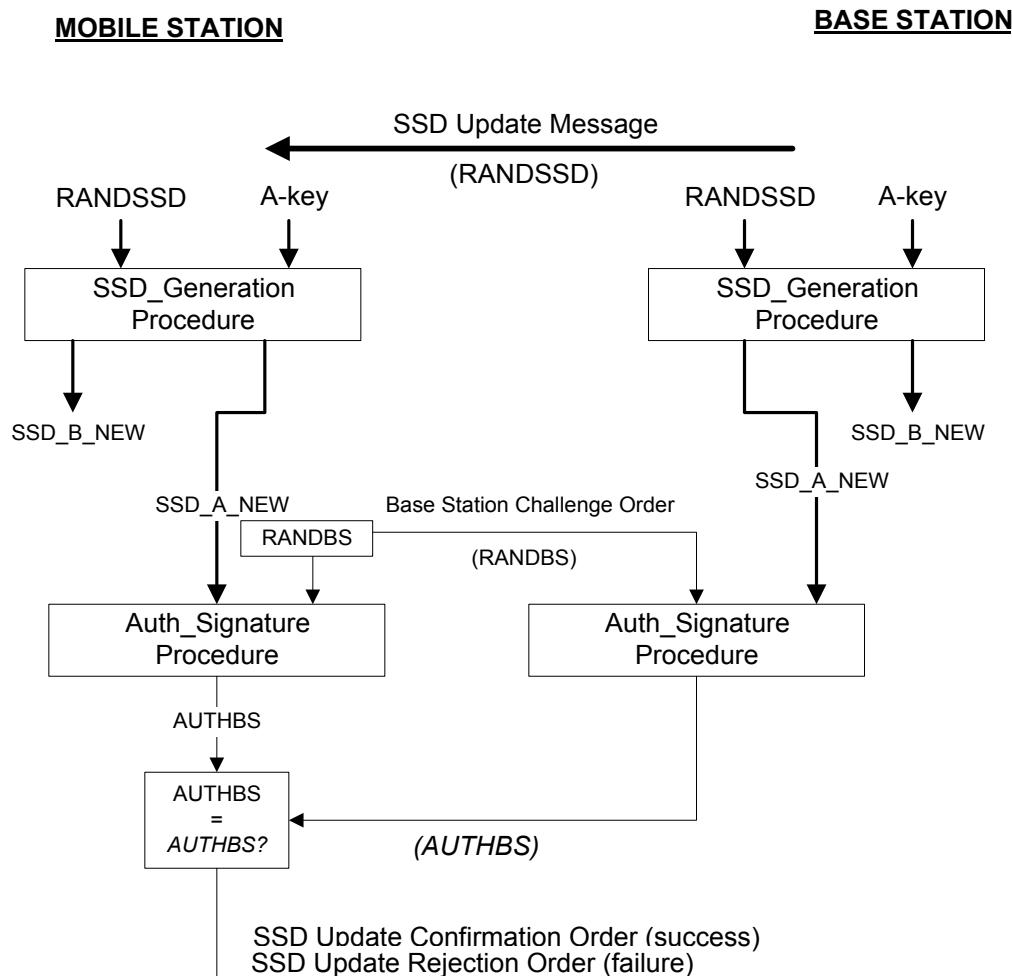

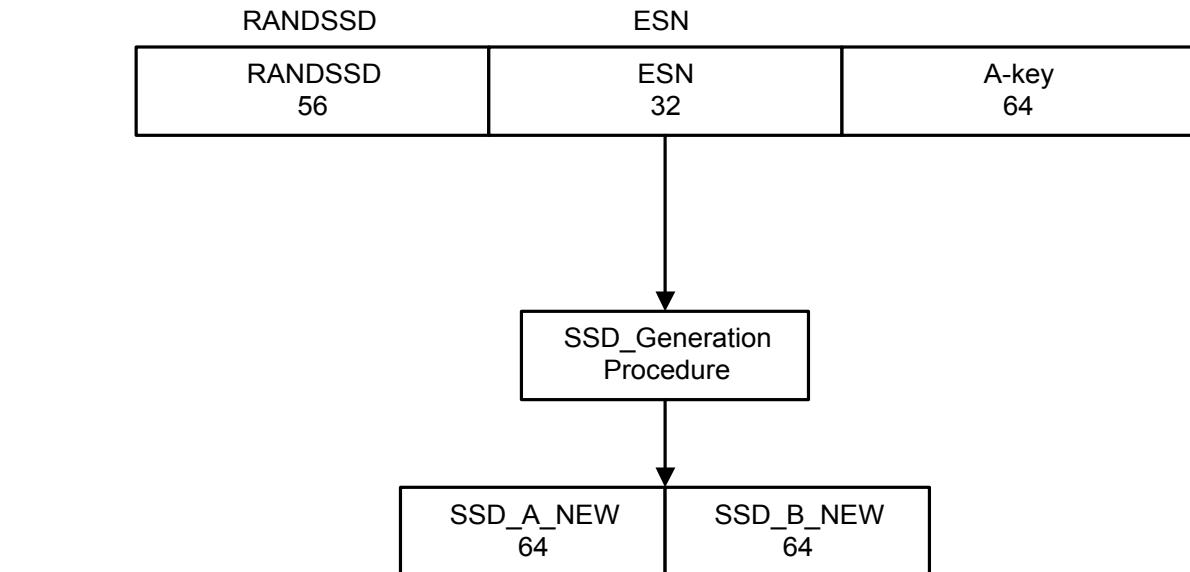

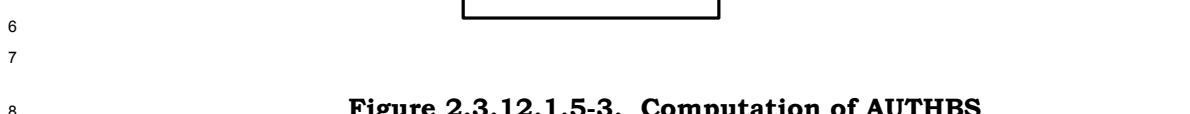

Figure 2.3.12.1.5-1. SSD Update Message Flow

**Figure 2.3.12.1.5-2. Computation of Shared Secret Data (SSD)****Figure 2.3.12.1.5-3. Computation of AUTHBS**

1 2.3.12.2 Signaling Message Encryption

2 In an effort to enhance the authentication process and to protect sensitive subscriber
 3 information (such as PINs), a method is provided to encrypt certain fields of selected f-dsch
 4 or r-dsch signaling messages.

5 The following is a description of the messages on f-dsch ([See-see](#) 2.3.12.2.1) and r-dsch (see
 6 2.3.12.2.2) that are enciphered using the Cellular Message Encryption Algorithm (see
 7 section 2.5.1, [15]) or the Enhanced Cellular Message Encryption Algorithm (see section
 8 2.5.2, [15]), and when ENCRYPT_MODE_S is set to '01' or '10'. The availability of encryption
 9 algorithm information is under government control.

10 For each message, the enciphered fields are identified. The messages are grouped by
 11 channel designation.

12 Messages shall not be encrypted if authentication is not performed (AUTH_S is set to '00').
 13 See [23] for details of the initialization and use of the encryption procedure.

14 Signaling message encryption is controlled for each call individually. If PREV_IN_USE is
 15 less than or equal to six, the mobile station identifies its encryption capability in the
 16 ENCRYPTION_SUPPORTED field in the *Origination Message* and the *Page Response Message*
 17 as shown in Table 2.7.1.3.2.4-5. If PREV_IN_USE is greater than or equal to seven, the
 18 mobile station identifies its encryption capability in the SIG_ENCRYPT_SUP field in
 19 *Registration Message*, *Origination Message*, *Page Response Message*, *Security Mode Request*
 20 *Message*, and the encryption capability information record in *Status Response Message* and
 21 *Extended Status Response Message*, as shown in Table 2.7.1.3.2.1-5. The initial encryption
 22 mode for the call is established by setting the ENCRYPT_MODE field to '00', '01', or '10' in
 23 the *Channel Assignment Message* or in the *Extended Channel Assignment Message*. If
 24 ENCRYPT_MODE is set to '00', message encryption is off. To turn encryption on after
 25 channel assignment, the base station sends one of the following f-dsch messages to the
 26 mobile station:

- 27 • *Extended Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or
 28 '10'
- 29 • *General Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- 30 • *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or
 31 '10'
- 32 • *Analog Handoff Direction Message* with the MEM field set to '1'
- 33 • *Message Encryption Mode Order* with the ENCRYPT_MODE field set to '01' or '10'

34 To turn signaling message encryption off, the base station sends one of the following f-dsch
 35 messages to the mobile station:

- 36 • *Extended Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- 37 • *General Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- 38 • *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '00'

- *Analog Handoff Direction Message* with the MEM field set to '0'
- *Message Encryption Mode Order* with the ENCRYPT_MODE field set to '00'

Encryption shall apply only to the part of the Layer 3 message specified below.

When encryption is off, all fields of all Layer 3 messages sent by the mobile station and base station are unencrypted.

When additional octets are inserted, the overall Lower Layers message length is updated to reflect the addition. Specific Layer 3 record length fields (e.g., RECORD_LEN, NUM_FIELDS, or NUM_DIGITS) shall not be affected by the insertion of additional bits.

If the Enhanced Cellular Message Encryption Algorithm is used, the following requirements apply:

- The mobile station and base station shall each maintain an 8-bit encryption sequence counter. The encryption sequence counter shall be incremented modulo 256 for each new encryption. The counter value, hereafter called ES_COUNT, shall be used to form the SYNC parameter of the Enhanced Cellular Message Encryption Algorithm as described below.
- As part of each encryption, an additional octet of value ES_COUNT shall be inserted immediately following the encrypted part of the message. This additional octet shall not be encrypted. The additional octet shall be removed from the message after decryption.

2.3.12.2.1 Encrypted Messages on the f-dsch

When encryption is on (ENCRYPT_MODE_S equal to binary '01' or '10'), the encryptable fields of the following messages sent on f-dsch, as listed below, shall be encrypted. All other messages sent on f-dsch shall be unencrypted.

1. Alert With Information Message (see 3.7.3.3.2.3) and Extended Alert With Information Message (see 3.7.3.3.2.42) are encrypted.

The type-specific fields of all information records (see 3.7.5) shall be encrypted. For each information record, the type-specific fields shall be treated by the encryption procedure as a new single message. If the type-specific fields of an information record consist of a single octet (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall be inserted following the information record and shall be encrypted as if part of the record. (If the RECORD_LEN field is 0, the information record contains no type-specific fields, and the record contains no encrypted data.)

No other fields in the *Alert With Information Message* and *Extended Alert With Information Message* are encrypted.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal to binary '10'), the following requirements apply for each information record:

- The DATA_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:

- 1 – SYNC[0] = ES_COUNT
 2 – SYNC[1] = RECORD_TYPE

3 2. Flash With Information Message (see 3.7.3.3.2.14) and Extended Flash With
 4 Information Message (see 3.7.3.3.2.43) are encrypted.

5 The type-specific fields of all information records (see 3.7.5) shall be encrypted. For each
 6 information record, the type-specific fields shall be treated by the encryption procedure
 7 as a new single message. If the type-specific fields of an information record consist of a
 8 single octet (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall
 9 be inserted following the information record and shall be encrypted as if part of the
 10 record. (If the RECORD_LEN field is 0, the information record contains no type-specific
 11 fields, and the record contains no encrypted data.)

12 No other fields in the *Flash With Information Message* and *Extended Flash With*
 13 *Information Message* are encrypted.

14 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODEs
 15 equal to binary '10'), the following requirements apply for each information record:

- 16 • The DATA_TYPE parameter shall be set to '0'.
- 17 • The SYNC parameter shall be set as follows:
 - 18 – SYNC[0] = ES_COUNT
 - 19 – SYNC[1] = RECORD_TYPE

20 3. *Send Burst DTMF Message* (see 3.7.3.3.2.9) is encrypted.

21 The DIGITi fields of the *Send Burst DTMF Message* shall be encrypted. These fields are
 22 treated by the encryption procedure as a new single message, with the 4-bit digit codes
 23 packed into consecutive octets. If the NUM_DIGITS field contains an odd number, four
 24 bits of value '0000' shall follow the last digit and shall be included in the encrypted
 25 message. If NUM_DIGITS is less than 3, an additional eight bits of value '00000000'
 26 shall follow the DIGITi fields and shall be included in the encrypted part of the message.

27 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODEs
 28 equal to binary '10'), the following requirements apply:

- 29 • The DATA_TYPE parameter shall be set to '0'.
- 30 • The SYNC parameter shall be set as follows:
 - 31 – SYNC[0] = ES_COUNT
 - 32 – SYNC[1] = MSG_TYPE = '00001001'

33 4. *Continuous DTMF Tone Order* (see 3.7.3.3.2.1) is encrypted.

34 The 16 bits comprised of ADD_RECORD_LEN, the order-specific fields and the first five
 35 (5) bits of the RESERVED field shall be encrypted. These fields shall be treated by the
 36 encryption procedure as a new single message.

37 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODEs

1 equal to binary ‘10’), the following requirements apply:

- 2 • The DATA_TYPE parameter shall be set to ‘0’.
- 3 • The SYNC parameter shall be set as follows:
 - 4 – SYNC[0] = ES_COUNT
 - 5 – SYNC[1] = MSG_TYPE = ‘00000001’

6 5. *Data Burst Message* (see 3.7.3.3.2.4) is encrypted.

7 If BURST_TYPE is equal to ‘111110’ or ‘111111’, all CHARi fields after the first two shall
8 be encrypted; otherwise, all CHARi fields shall be encrypted.

9 If the CHARi field consists of a single octet (NUM_FIELDS field equal to 1), an
10 additional octet of value ‘00000000’ shall be inserted following the information record
11 and shall be encrypted as if part of the record. (If the NUM_FIELDS field is 0, the
12 information record contains no type-specific fields, and the record contains no
13 encrypted data).

14 If the Cellular Message Encryption Algorithm is used (ENCRYPT_MODEs equal to binary
15 ‘01’), the following requirements apply:

- 16 • If BURST_TYPE is equal to ‘000011’ (SMS) or ‘000100’ (OTASP), the message
17 shall be encrypted.
- 18 • For all other values of BURST_TYPE, the message shall be encrypted only if
19 encryption is required by the service option standard governing use of the *Data
20 Burst Message*; otherwise, the message shall not be encrypted.

21 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODEs
22 equal to binary ‘10’), the following requirements apply:

- 23 • If BURST_TYPE is equal to ‘000100’ (OTASP), the DATA_TYPE parameter shall be
24 set to ‘0’. Otherwise, the DATA_TYPE parameter shall be set to ‘1’.
- 25 • The SYNC parameter shall be set as follows:
 - 26 – SYNC[0] = ES_COUNT
 - 27 – SYNC[1] = MSG_TYPE = ‘00000100’

28 6. Power Up Function Completion Message (see 3.7.3.3.2.30) is encrypted.

29 If the LOC_IND field is set to ‘1’, the fields RESERVED (3 bits), MS_LAT (22 bits),
30 MS_LONG (23 bits), and MS_LOC_TSTAMP (24 bits) are encrypted. These fields shall be
31 treated by the encryption procedure as a new single message.

32 Otherwise, if the LOC_IND field is set to ‘0’, no fields in this message are encrypted.

33 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODEs
34 equal to binary ‘10’), the following requirements apply:

- 35 • The DATA_TYPE parameter shall be set to ‘1’.
- 36 • The SYNC parameter shall be set as follows:

- 1 – SYNC[0] = ES_COUNT
 2 – SYNC[1] = MSG_TYPE = ‘00011110’

3 2.3.12.2.2 Encrypted Messages on the r-dsch

4 When encryption is on (ENCRYPT_MODE_S equal to binary ‘01’ or ‘10’) the encryptable fields
 5 of the following r-dsch ~~H~~Layer 3 messages, as listed below, shall be encrypted. All other r-
 6 dsch messages shall be unencrypted.

7 1. Origination Continuation Message (see 2.7.2.3.2.9) and Enhanced Origination Message
 8 are encrypted.

9 The CHARI fields of the *Origination Continuation Message* and *Enhanced Origination*
 10 Message shall be encrypted. These fields shall be treated by the encryption procedure
 11 as a new single message, with the character codes packed into consecutive octets. If
 12 DIGIT_MODE is ‘0’ and the NUM_FIELDS field contains an odd number, four bits of
 13 value ‘0000’ shall follow the last digit and shall be included in the encrypted part of the
 14 message. In addition, if ENCRYPT_MODE_S is equal to ‘01’, the following requirement
 15 applies

- 16 • If DIGIT_MODE is ‘0’ and NUM_FIELDS is less than 3, or if DIGIT_MODE is ‘1’
 17 and NUM_FIELDS is less than 2, an additional eight bits of value ‘00000000’
 18 shall follow the CHARI fields and shall be included in the encrypted part of the
 19 message.

20 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S
 21 equal to binary ‘10’), the following requirements apply:

- 22 • The DATA_TYPE parameter shall be set to ‘0’.
- 23 • The SYNC parameter shall be set as follows:
 - 24 – SYNC[0] = ES_COUNT
 - 25 – SYNC[1] = MSG_TYPE = ‘00001001’ for *Origination Continuation Message*
 - 26 – SYNC[1] = MSG_TYPE = ‘00011010’ for *Enhanced Origination Message*

27 The type-specific fields of all information records (see 2.7.4) in the *Origination*
 28 *Continuation Message* and *Enhanced Origination Message* shall be encrypted. For each
 29 information record, the type-specific fields shall be treated by the encryption procedure
 30 as a new single message. If the type-specific fields of an information record consist of a
 31 single octet (RECORD_LEN field equal to 1), an additional octet of value ‘00000000’ shall
 32 be inserted following the information record and shall be encrypted as if part of the
 33 record. (If the RECORD_LEN field is 0, the information record contains no type-specific
 34 fields, and the record contains no encrypted data.)

35 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S
 36 equal to binary ‘10’), the following requirements apply for each information record:

- 37 • The DATA_TYPE parameter shall be set to ‘0’.
- 38 • The SYNC parameter shall be set as follows:

- 1 – SYNC[0] = ES_COUNT
- 2 – SYNC[1] = RECORD_TYPE

3 2. Flash With Information Message (see 2.7.2.3.2.3) and Extended Flash With Information
4 Message (see 2.7.2.3.2.32) are encrypted.

5 The type-specific fields of all information records (see 2.7.4) shall be encrypted. For each
6 information record, the type-specific fields shall be treated by the encryption procedure
7 as a new single message. If the type-specific fields of an information record consist of a
8 single octet (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall
9 be inserted following the information record and shall be encrypted as if part of the
10 record. (If the RECORD_LEN field is 0, the information record contains no type-specific
11 fields, and the record contains no encrypted data.)

12 No other fields in the *Flash With Information Message* and *Extended Flash With*
13 *Information Message* are encrypted.

14 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
15 equal to binary '10'), the following requirements apply for each information record:

- 16 • The DATA_TYPE parameter shall be set to '0'.
- 17 • The SYNC parameter shall be set as follows:
 - 18 – SYNC[0] = ES_COUNT
 - 19 – SYNC[1] = RECORD_TYPE

20 3. *Send Burst DTMF Message* (see 2.7.2.3.2.7) is encrypted.

21 The DIGIT_i fields of the *Send Burst DTMF Message* shall be encrypted. These fields shall
22 be treated by the encryption procedure as a new single message, with the 4-bit digit
23 codes packed into consecutive octets. If the NUM_DIGITS field contains an odd
24 number, four bits of value '0000' shall follow the last digit and shall be included in the
25 encrypted message. If NUM_DIGITS is less than 3, an additional eight bits of value
26 '00000000' shall follow the DIGIT_i fields and shall be included in the encrypted part of
27 the message.

28 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
29 equal to binary '10'), the following requirements apply:

- 30 • The DATA_TYPE parameter shall be set to '0'.
- 31 • The SYNC parameter shall be set as follows:
 - 32 – SYNC[0] = ES_COUNT
 - 33 – SYNC[1] = MSG_TYPE = '00000111'

34 4. *Continuous DTMF Tone Order* (see 2.7.2.3.2.1) is encrypted.

35 The 16 bits comprised of ADD_RECORD_LEN, the order-specific fields and the first five
36 (5) bits of the RESERVED field shall be encrypted. These fields shall be treated by the
37 encryption procedure as a new single message.

38 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s

1 equal to binary '10'), the following requirements apply:

- 2 • The DATA_TYPE parameter shall be set to '0'.
- 3 • The SYNC parameter shall be set as follows:
 - 4 – SYNC[0] = ES_COUNT
 - 5 – SYNC[1] = MSG_TYPE = '00000001'

6 5. *Data Burst Message* (see 2.7.2.3.2.4) is encrypted.

7 If BURST_TYPE is equal to '111110' or '111111', all CHARi fields after the first two shall
8 be encrypted; otherwise, all CHARi fields shall be encrypted.

9 If the CHARi field consists of a single octet (NUM_FIELDS field equal to 1), an
10 additional octet of value '00000000' shall be inserted following the information record
11 and shall be encrypted as if part of the record. (If the NUM_FIELDS field is 0, the
12 information record contains no type-specific fields, and the record contains no
13 encrypted data).

14 If the Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal to binary
15 '01'), the following requirements apply:

- 16 • If BURST_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message
17 shall be encrypted.
- 18 • For all other values of BURST_TYPE, the message shall be encrypted only if
19 encryption is required by the service option standard governing use of the *Data
Burst Message*; otherwise, the message shall not be encrypted.

21 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S
22 equal to binary '10'), the following requirements apply:

- 23 • If BURST_TYPE is equal to '000100' (OTASP), the DATA_TYPE parameter shall be
24 set to '0'. Otherwise, the DATA_TYPE parameter shall be set to '1'.
- 25 • The SYNC parameter shall be set as follows:
 - 26 – SYNC[0] = ES_COUNT
 - 27 – SYNC[1] = MSG_TYPE = '00000100'

28 2.3.12.3 Voice Privacy

29 Also see [2].

30 Voice privacy is provided in the CDMA system by means of the private long code mask used
31 for PN spreading.

32 Voice privacy is provided on the Traffic Channels only. All calls are initiated using the
33 public long code mask for PN spreading. The mobile station user may request voice privacy
34 during call setup using the *Origination Message* or *Page Response Message*, and during
35 Traffic Channel operation using the *Long Code Transition Request Order*.

36 The transition to private long code mask shall not be performed if authentication is not
37 performed (AUTH_S is set to '00' or mobile station unable to perform authentication).

- 1 To initiate a transition to the private or public long code mask, either the base station or
 2 the mobile station sends a *Long Code Transition Request Order* on the f-dsch or r-dsch. The
 3 mobile station actions in response to receipt of this order are specified in 2.6.4, and the
 4 base station actions in response to receipt of this order are specified in 3.6.4.
 5 The base station can also cause a transition to the private or public long code mask by
 6 sending the *Extended Handoff Direction Message*, the *General Handoff Direction Message*, or
 7 the *Universal Handoff Direction Message* with the PRIVATE_LCM bit set appropriately.

8 2.3.12.4 Extended Encryption for Signaling Message and User Information

9 ~~In an effort to enhance the authentication process and to protect sensitive subscriber~~
 10 ~~information (such as PINs), a method is provided to encrypt selected f-dsch, r-dsch, f-esch,~~
 11 ~~or r-esch Layer 3 signaling PDUs.~~

12 ~~The availability of encryption algorithm information is under government control.~~

13 Extended encryption is an encryption framework used for encrypting/decrypting both
 14 signaling messages and user information on f/r-dsch or f/r-csch. Signaling message and
 15 user information encryption algorithms can be negotiated independently. Signaling message
 16 and user information encryption can be turned on or off independently.

17 Signaling messages or user information shall not be encrypted if authentication is not
 18 performed (i.e., when AUTH_S is set to '00'. See 2.3.12.1). ~~See [23] for details of the~~
 19 ~~initialization and use of the encryption procedure.~~

20 2.3.12.4.1 Extended Encryption for Signaling Messages

21 Signaling messages with zero length shall be sent un-encrypted, in which case Layer 3
 22 shall indicate to LAC layer that the messages are sent un-encrypted, ~~and the following~~
 23 ~~encryption/decryption procedures shall not be performed on the messages.~~

24 All mini messages shall be sent un-encrypted, ~~in which case the following~~
 25 ~~encryption/decryption procedures shall not be performed on the messages.~~

26 When sending a Registration Accepted Order, Security Mode Command Message, or Base
 27 Station Reject Order, the base station should use assured mode.

28 ~~The initial encryption mode for the call is established by setting one of the following in the~~
 29 ~~Channel Assignment Message, Extended Channel Assignment Message, Registration Accepted~~
 30 ~~Order, or Security Mode Command Message.~~

- 31 • ~~ENCRYPT_MODE field is set to '00'; or~~
- 32 • ~~ENCRYPT_MODE field is set to '11' and the SIG_ENCRYPT_MODE field is set to '000'~~
 33 ~~or '001'.~~

34 ~~If the ENCRYPT_MODE field is set to '00', or if the ENCRYPT_MODE field is set to '11' and~~
 35 ~~the SIG_ENCRYPT_MODE field is set to '000', message encryption is off. To turn encryption~~
 36 ~~on after channel assignment, the base station sends one of the following f-dsch messages to~~
 37 ~~the mobile station:~~

- 1 • *General Handoff Direction Message* with the ENCRYPT_MODE field set to '11' and
2 the SIG_ENCRYPT_MODE field set to '001'.
- 3 • *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '11' and
4 the SIG_ENCRYPT_MODE field set to '001'.
- 5 • *Security Mode Command Message* with the ENCRYPT_MODE field set to '11' and the
6 SIG_ENCRYPT_MODE field set to '001'.

7 To turn signaling message encryption off, the base station sends one of the following f/dsch
8 messages to the mobile station:

- 9 • *General Handoff Direction Message* with the ENCRYPT_MODE field set to '00', or the
10 ENCRYPT_MODE field set to '11' and the SIG_ENCRYPT_MODE field set to '000'.
- 11 • *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '00', or
12 the ENCRYPT_MODE field set to '11' and the SIG_ENCRYPT_MODE field set to '000'.
- 13 • *Security Mode Command Message* with the ENCRYPT_MODE field set to '00', or the
14 ENCRYPT_MODE field set to '11' and the SIG_ENCRYPT_MODE field set to '000'.

15 2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch

16 To turn f/r-csch signaling encryption on or off, the base station sends a *Registration
17 Accepted Order* or *Security Mode Command Message* on f-csch, with the
18 C SIG ENCRYPT MODE field set to one of the values specified in Table 3.7.4.5-1. The value
19 of C SIG ENCRYPT MODE_r is then stored in C SIG ENCRYPT MODE_s.

20 If C SIG ENCRYPT MODE_s is not equal to '000' and ENC KEY_s is not equal to NULL, all
21 f/r-csch signaling messages shall be encrypted based on the value of
22 C SIG ENCRYPT MODE_s using the procedures specified in 2.3.12.4.1.3; except for the
23 exceptions listed below in the rest of this section.

24 If the mobile station sends an encrypted *Registration Message*, *Origination Message*, or *Page
25 Response Message*, and receives a layer 2 acknowledgement from the base station, but does
26 not receive any Layer 3 message from the base station that the mobile station could decrypt
27 successfully thereafter, then the mobile station should resend the same message un-
28 encrypted.

29 On the f-csch, *General Page Message*, *Universal Page Message*, *Registration Request Order*,
30 *Authentication Challenge Message*, and *Registration Accepted Order* shall be sent un-
31 encrypted. *Channel Assignment Message*, *Extended Channel Assignment Message*, and
32 *Security Mode Command Message* may be sent un-encrypted. All overhead messages and all
33 signaling messages with a broadcast address type shall be sent un-encrypted.

34 On the r-csch, *Registration Message*, *Page Response Message*, *Authentication Challenge
35 Response Message*, and *Security Mode Request Message* shall be sent un-encrypted. When
36 sending an *Origination Message*, if all of the following conditions are true, the mobile station
37 shall not include the dialed digits in the *Origination Message*, and the mobile station shall
38 include the dialed digits in the *Origination Continuation Message*:

- 39 • The base station supports extended encryption;

- C SIG ENCRYPT MODE_S is equal to ‘000’ or ENC KEY_S is equal to NULL;
- C SIG ENCRYPT REQ is set to ‘1’ or D SIG ENCRYPT REQ is set to ‘1’ in the Origination Message;
- The mobile station does not recognize that this is an emergency call.

2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch

The initial mode of extended encryption for f/r-dsch signaling messages is established by sending a Channel Assignment Message or Extended Channel Assignment Message with the ENCRYPT MODE field set to ‘11⁴ and the D SIG ENCRYPT MODE field set to one of the values specified in Table 3.7.4.5-1. The value of D SIG ENCRYPT MODE_r is then stored in D SIG ENCRYPT MODE_S.

To turn f/r-dsch signaling encryption on or off after channel assignment, the base station sends a General Handoff Direction Message or Universal Handoff Direction Message with the ENCRYPT MODE field and the D SIG ENCRYPT MODE field set accordingly. Alternatively, the base station may send a Security Mode Command Message on f-dsch with the D SIG ENCRYPT MODE field set accordingly.

If D SIG ENCRYPT MODE_S is not equal to ‘000’ and ENC KEY_S is not equal to NULL, all f/r-dsch signaling messages shall be encrypted based on the value of D SIG ENCRYPT MODE_S using the procedures specified in 2.3.12.4.1.3, except for the exceptions listed below in the rest of this section.

On the f-dsch, the Security Mode Command Message may be sent un-encrypted. The Base Station Reject Order shall be sent un-encrypted.

On the r-dsch, the Security Mode Request Message shall be sent un-encrypted.

2.3.12.4.1.3 Signaling Encryption/Decryption Procedures

In order to perform signaling encryption/decryption on f/r-csch or f/r-dsch, both the mobile station and the base station shall each maintain the following 32-bit counters:

- EXT ENCRYPT SEQ[i] (the 32-bit crypto-sync for encryption. $i = 0$ and 1)
- EXT DECRYPT SEQ[i] (the 32-bit crypto-sync for decryption. $i = 0$ and 1)

The above counters in the base station and the mobile station shall only be initialized by a Registration Accepted Order, Channel Assignment Message, Extended Channel Assignment Message, or Security Mode Command Message in response to a Registration Message, Origination Message, Page Response Message, or Security Mode Request Message that carries an ENC SEQ H field with a valid ENC SEQ H SIG field.⁵ The response to a

⁴ If ENCRYPT MODE is set to a value other than ‘11’, see section 2.3.12.2.1.

⁵ The mobile station should select a different value of ENC SEQ H every time ENC SEQ H is included in a message. This is to prevent the re-use of the same 24 most significant bits of the 32-bit crypto-sync.

1 *Registration Message* is a *Registration Accepted Order*. The response to an *Origination*
 2 *Message or Page Response Message* is a *Channel Assignment Message* or *Extended Channel*
 3 *Assignment Message*. The response to a *Security Mode Request Message* is a *Security Mode*
 4 *Command Message*.

5 Upon initialization of the crypto-sync counters, the following initialization shall be
 6 performed at the mobile station:

- 7 • The 24 most significant bits of EXT ENCRYPT SEQ[i] and EXT DECRYPT SEQ[i]
 8 shall be set to the value of the ENC SEQ H field included in the message for $i = 0$
 9 and 1.
- 10 • The 8 least significant bits of EXT ENCRYPT SEQ[i] and EXT DECRYPT SEQ[i] shall
 11 be set to 0 for $i = 0$ and 1.

12 The sender shall perform the following procedures for each Layer 3 PDU (including all Layer
 13 3 PDU retransmitted by Layer 3) that is to be encrypted:

14 If ENCRYPT MODE_s is equal to '11' and SIG_ENCRYPT MODE_s is equal to '001', the mobile
 15 station or the base station shall perform the following procedures for transmission of
 16 messages that are to be encrypted, in the order listed:

- 17 1. The sender of the message shall append between 0 and 7 inclusive padding bits
 18 (set to any random combination of '0's and '1's) to the Layer 3 PDU such that the
 19 length of the padded Layer 3 PDU in bits is an integer multiple of eight (the padding
 20 bits become part of the L3 PDU).
- 21 2. The sender of the message shall compute an 8-bit Layer 3 PDU CRC as specified in
 22 2.3.12.4.1.4 over the un-encrypted Layer 3 PDU (including the padding bits, if any).
- 23 3. The sender of the message shall append the 8-bit CRC to the end of the Layer 3
 24 PDU.
- 25 4. The sender of the message shall set EXT_ENC_SEQ_s to $(\text{EXT_ENC_SEQ}_s + 1) \bmod 2^{32}$, and set ENC_SEQ_s to the 8 least significant bits of the crypto sync,
 26 EXT_ENC_SEQ_s. If the PDU is to be transmitted on f/r-csch, let SDU ENCRYPT MODE equal C SIG ENCRYPT MODE_s. If the PDU is to be
 27 transmitted on f/r-dsch, let SDU ENCRYPT MODE equal D SIG ENCRYPT MODE_s.
 28 If the Layer 3 PDU uses unassured mode, let $i = 0$; otherwise, let $i = 1$.
- 29 5. The sender of the message shall encrypt the concatenated Layer 3 PDU and the 8-bit
 30 Layer 3 CRC using the encryption procedures specified in 2.3.12.4.1.2. Let
 31 EXT ENC SEQ equal EXT ENCRYPT SEQ[i]. Encrypt the concatenated Layer 3 PDU
 32 and the 8-bit Layer 3 CRC by using EXT ENC SEQ and the encryption algorithm specified
 33 by SDU ENCRYPT MODE, in accordance with 2.3.12.4.3.
- 34 6. Let ENC SEQ be the 8 least significant bits of EXT ENCRYPT SEQ[i]. The sender of
 35 the message shall pass the encrypted concatenated Layer 3 PDU and the 8-bit Layer 3 CRC, along with ENC_SEQ_s and the signaling encryption
 36 mode indicated by SIGSDU_ENCRYPT_MODE_s, to the LAC layer.
- 37 7. Set EXT ENCRYPT SEQ[i] to $(\text{EXT_ENCRYPT_SEQ}_i + 1) \bmod 2^{32}$.

1 If ENCRYPT_MODE_s is not equal to '11', or ENCRYPT_MODE_s is equal to '11' and
 2 SIG_ENCRYPT_MODE_s is equal to '000', the mobile station and base station shall not
 3 perform the above encryption procedures for Layer 3 PDU as specified in this section.

4 The mobile station or the base station shall perform the following procedures upon
 5 reception of encrypted messages (i.e., if SDU_ENCRYPT_MODE indicated by LAC Layer is
 6 equal to '001'), in the order listed.
The receiver shall perform the following procedures upon
reception of an encrypted signaling message with an ENC SEQ field passed by the LAC
Layer (e.g., if SDU ENCRYPT MODE indicated by LAC Layer is not equal to '000'):

9 1. The receiver of the message shall update EXT_ENC_SEQ_s as specified in
 10 2.3.12.4.1.1 by using the 8-bit ENC_SEQ passed from the LAC Layer. If the Layer 3
 11 PDU uses unassured mode, let i = 0 and N = 8; otherwise, let i = 1 and N = 4. Let V
 12 be the 8 least significant bits of EXT ENC SEQ D[i]. Perform the duplicate detection
 13 procedures in accordance with 2.3.12.4.1.5 using N and V, before proceeding
 14 further.

15 2. The receiver of the message shall set ENC_SEQ_s to ENC_SEQ, which is received
 16 from the LAC Layer. Construct EXT ENC SEQ as follows:

17 If (ENC SEQ - V) mod 256 < 128:

18 EXT ENC SEQ[i] = (EXT DECRYPT SEQ[i] + (ENC SEQ - V) mod 256) mod 2³²

19 Else:

20 EXT ENC SEQ[i] = (EXT DECRYPT SEQ[i] - (V - ENC SEQ) mod 256) mod 2³²

21 3. The receiver of the message shall remove the LAC Layer padding, at the end of the
 22 Layer 3 PDU, if any, such that the Layer 3 PDU is octet aligned.

23 4. The receiver of the message shall decrypt the concatenated Layer 3 PDU and the 8-
 24 bit Layer 3 CRC using EXT ENC SEQ and the encryption algorithm specified by
 25 SDU ENCRYPT MODE, in accordance with 2.3.12.4.3, the decryption procedures
 26 specified in 2.3.12.4.1.2.

27 5. The receiver of the message shall compute an 8-bit CRC as specified in
 28 2.3.12.4.1.4 over the un-encrypted Layer 3 PDU (excluding the received 8-bit CRC).

29 6. The receiver of the message shall compare the value of the computed CRC with the
 30 decrypted 8-bit CRC. If the two CRCs are equal, the receiver shall declare that the
 31 decryption has been performed is defined to be successfully; otherwise the
 32 decryption is defined to be not unsuccessful.

33 7. If the decryption was unsuccessful, the message shall be discarded; otherwise, if
 34 ((ENC SEQ - V) mod 256) < 128, the receiver shall set EXT DECRYPT SEQ[i] to
 35 EXT ENC SEQ.

36 8. If the base station can not decrypt an Origination Message, the base station should
 37 send a Base Station Reject Order (ORDQ = '00000000'). If the base station can not
 38 decrypt any other message, the base station should send a Base Station Reject Order
 39 (ORDQ = '00000001').

2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field

The generator polynomials for the 8-bit Layer 3 PDU CRC field shall be as follows:

$$g(x) = x^8 + x^7 + x^4 + x^3 + x + 1$$

The Layer 3 PDU CRC field shall be computed according to the following procedure using the logic shown in Figures 2.3.12.4.5-1:

- Initially, all shift register elements shall be set to logical one and the switches shall be set in the up position.
- The register shall be clocked a number of times equal to the number bits in the Layer 3 PDU with those bits as input.
- The switches shall be set in the down position so that the output is a modulo-2 addition with a '0' and the successive shift register inputs are '0'.
- The register shall be clocked an additional 8 number of times.
- These additional bits shall be the Layer 3 PDU CRC field indicator bits.
- The bits shall be transmitted in the order calculated.

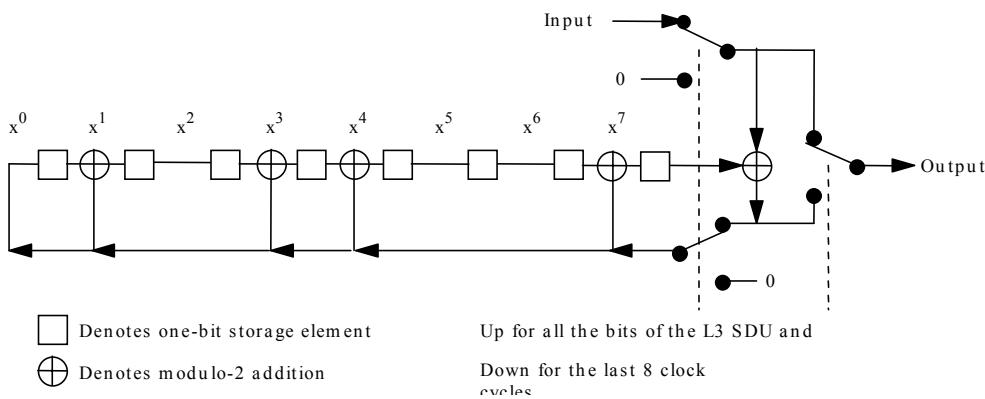

Figure 2.3.12.4.1.4-1. 8-Bit Layer 3 SDU CRC Field Calculation

2.3.12.4.1 Extended Encryption of Signaling Messages

All broadcast messages (messages that are not addressed to a particular mobile station) shall not be encrypted.

When ENCRYPT_MODE_s is equal to '11' and SIG_ENCRYPT_MODE_s is equal to '001' and when there is a valid encryption key, all Layer 3 PDU of the signaling messages with the following exceptions shall be encrypted as specified in 2.3.12.4.

— General Page Message

— Universal Page Message

If the mobile station sends an encrypted Registration Message, Origination Message, or a

1 ~~Page Response Message, and receives a layer 2 acknowledgement from the base station, but~~
 2 ~~does not receive any Layer 3 message from the base station that the mobile station could~~
 3 ~~decrypt successfully thereafter, then the mobile station should resend the same message~~
 4 ~~unencrypted.~~

5 **2.3.12.4.1.1 Extension of ENC_SEQ to EXT_ENC_SEQ for decryption**

6 ~~EXT_ENC_SEQ_s is the Extended Encryption Sequence Number that is used as one of the~~
 7 ~~inputs to the encryption algorithm as shown in Figure 2.3.12.4.2-1. The following formula~~
 8 ~~shall be used to update the 32 bit EXT_ENC_SEQ_s in the receiver from the 8-bit ENC_SEQ~~
 9 ~~passed by the LAC Layer:~~

10 ~~If (ENC_SEQ - ENC_SEQ_s) mod 256 < 128:~~

11 ~~EXT_ENC_SEQ_s = (EXT_ENC_SEQ_s + (ENC_SEQ - ENC_SEQ_s) mod 256) mod 2³²~~

12 ~~Else:~~

13 ~~EXT_ENC_SEQ_s = (EXT_ENC_SEQ_s - (ENC_SEQ_s - ENC_SEQ) mod 256) mod 2³²~~

14 **2.3.12.4.1.5 Duplicate Detection of Encrypted Messages**

15 ~~This section describes the duplicate detection of encrypted signaling messages (see the~~
 16 ~~decryption procedures at the receiver described in 2.3.12.4.1.3).~~

17 ~~Given the value of the latest sequence number received, V, and the window size, N (see the~~
 18 ~~decryption procedures at the receiver described in 2.3.12.4.1.3), the 8-bit encryption~~
 19 ~~sequence number space at the receiver can be divided into the following three segments as~~
 20 ~~shown in Figure 2.3.12.4.1.5-1:~~

- 21 • Segment #1 - sequence numbers from ((V - N + 1) mod 256) to V inclusive (the anti-
 22 replay window)
- 23 • Segment #2 - sequence numbers from ((V + 1) mod 256) to ((V + 127) mod 256)
 24 inclusive (future sequence numbers)
- 25 • Segment #3 - sequence numbers from ((V + 128) mod 256) to ((V - N) mod 256)
 26 inclusive (past sequence numbers)

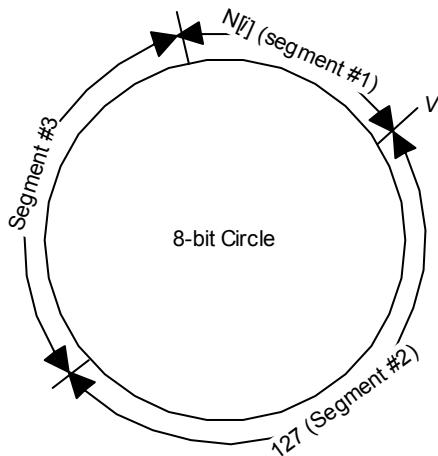

Figure 2.3.12.4.1.5-1 An 8-bit encryption sequence number space divided into 3 segments

If the received sequence number, ENC SEQ, belongs to segment #1, the receiver shall check whether ENC SEQ has already been received.⁶ If ENC SEQ has been received already, the receiver shall discard the message and shall not perform the remaining steps of the decryption procedures described in 2.3.12.4.1.3; otherwise, the receiver shall continue the decryption procedures described in 2.3.12.4.1.3.

If the received sequence number, ENC SEQ, belongs to segment #2, the receiver shall continue the decryption procedures described in 2.3.12.4.1.3.

If the received sequence number, ENC SEQ, belongs to segment #3, the receiver shall discard the message and shall not perform the remaining steps of the decryption procedures described in 2.3.12.4.1.3.

2.3.12.4.2 Extended Encryption for User Information

Extended encryption can be turned on or off independently for each individual service on f/r-dtch.

⁶ The actual means of checking is left to implementation. One simple implementation is for the receiver to maintain an N -bit bitmap, w , to represent the sequence numbers in segment #1. The order of w is most significant bit first (i.e., $w[N-1], w[N-2], \dots, w[1], w[0]$). Let $w[0]$ represents V , $w[1]$ represents $((V - 1) \bmod 256)$, etc. $w[i] = '1'$ means sequence number i has already been received. When a message with sequence number i has been decrypted successfully, $w[i]$ is set to '1'. Whenever V moves from V_1 to V_2 , left-shift w $((V_2 - V_1) \bmod 256)$ times. Each time w is left-shifted, stuff a '0' at the eight end of w . After all the shifting, set $w(0)$ to '1'.

1 The initial encryption mode of user information of a service is established by sending a
 2 *Security Mode Command Message* on f-csch or by setting the UI ENCRYPT MODE field in
 3 the Service Configuration information record, with the UI ENCRYPT MODE field set to one
 4 of the values specified in 3.7.5.7-3. The value of the UI ENCRYPT MODE field is then
 5 stored in SO CON REC_{S[j]}.UI ENCRYPT MODE, where SO CON REC_{S[j]} is the service
 6 option connection record (see 2.6.4.1.12) corresponding to the service.

7 To turn user information encryption for a service on or off after channel assignment, the
 8 base station sends a *Security Mode Command Message* on f-dsch with the
 9 UI ENCRYPT MODE field set accordingly. Explicit action time should be used when
 10 sending the *Security Mode Command Message*.

11 User information shall be encrypted based on the value of
 12 SO CON REC_{S[j]}.UI ENCRYPT MODE, where SO CON REC_{S[j]} is the service option
 13 connection record (see 2.6.4.1.12) corresponding to the service.

14 2.3.12.4.2.1 User Information Encryption/Decryption Procedures

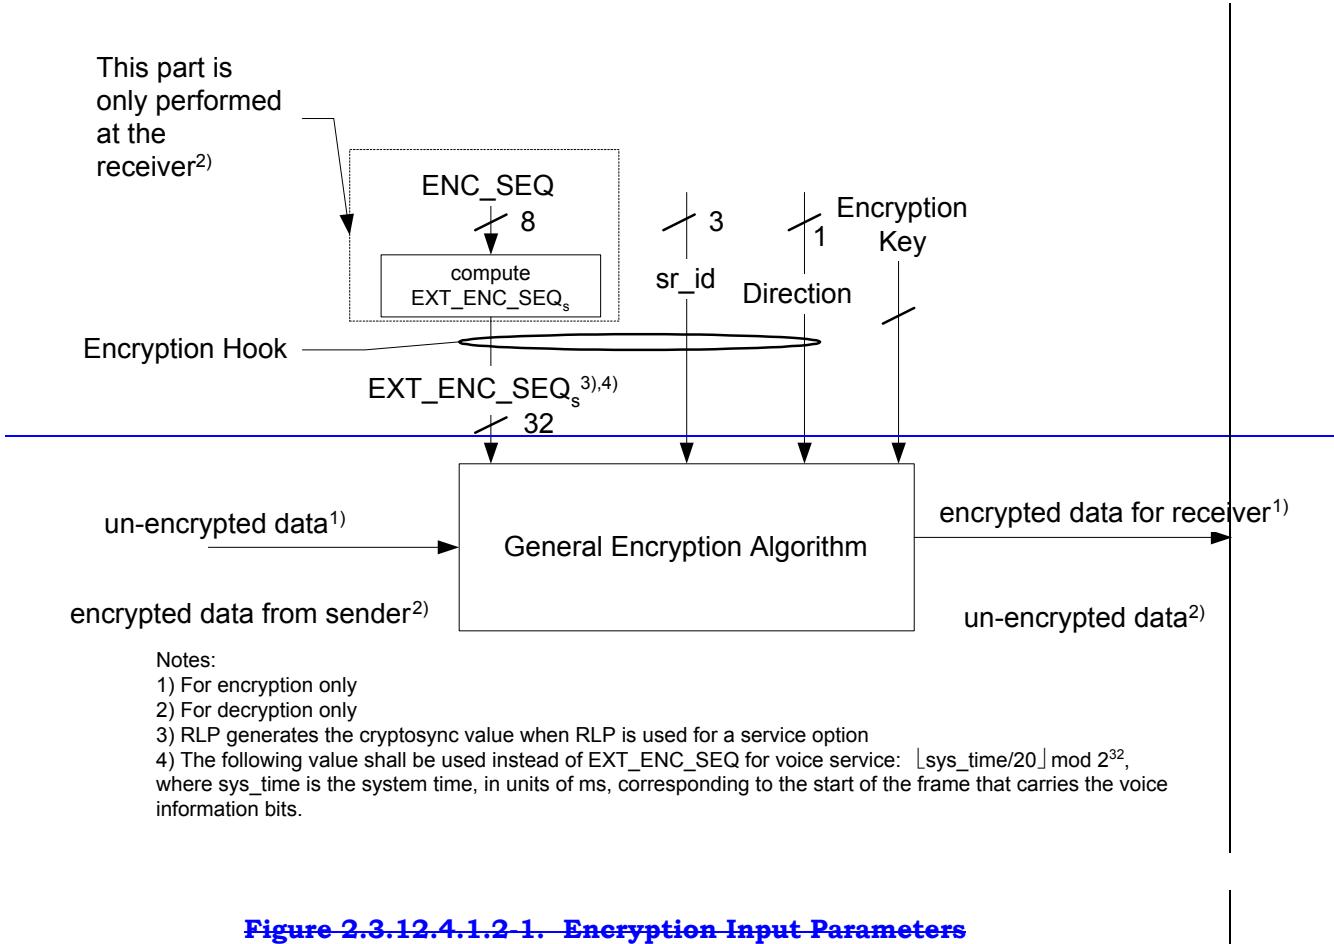

15 [Reserved]

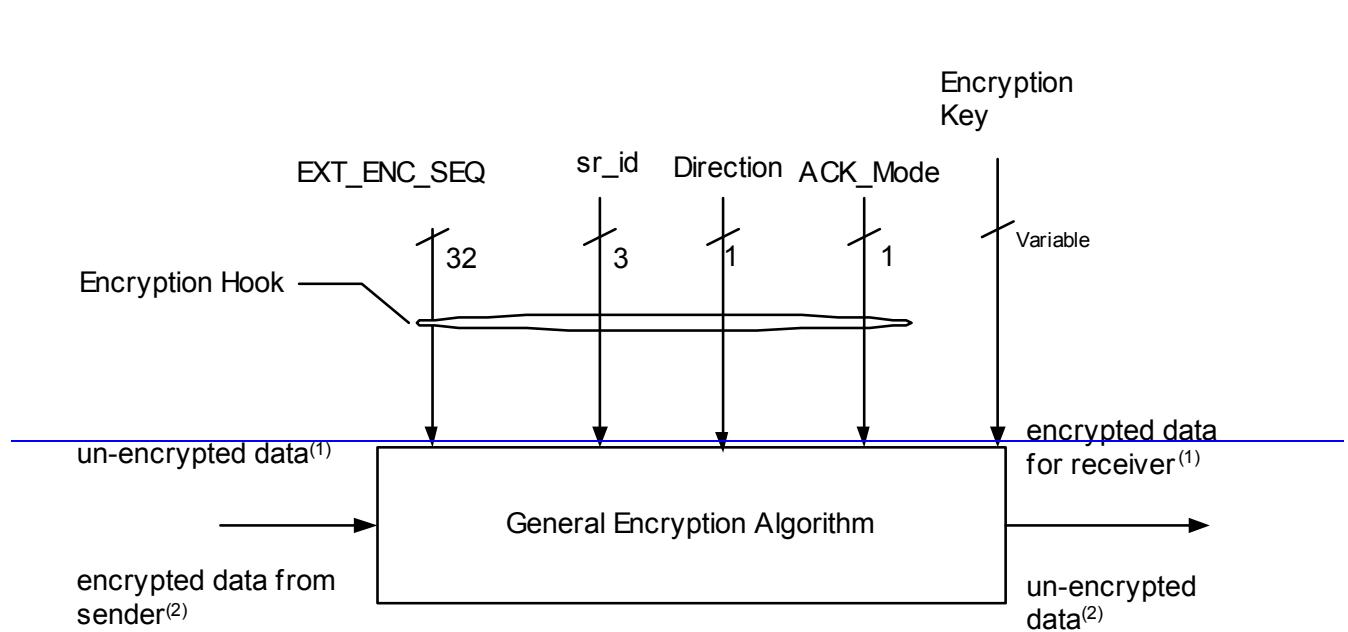

16 If extended encryption for user information is turned on for a service, the sender shall
 17 encrypt each data block (see [3]) from that service, in accordance with 2.3.12.4.3, before
 18 passing the data blocks to MAC Layer. On the receiver side, the receiver shall decrypt each
 19 data block for that service from MAC Layer, in accordance with 2.3.12.4.3, before passing
 20 them to that service.

21 2.3.12.4.31.2 Encryption/Decryption Procedures Interface to the Encryption Algorithms

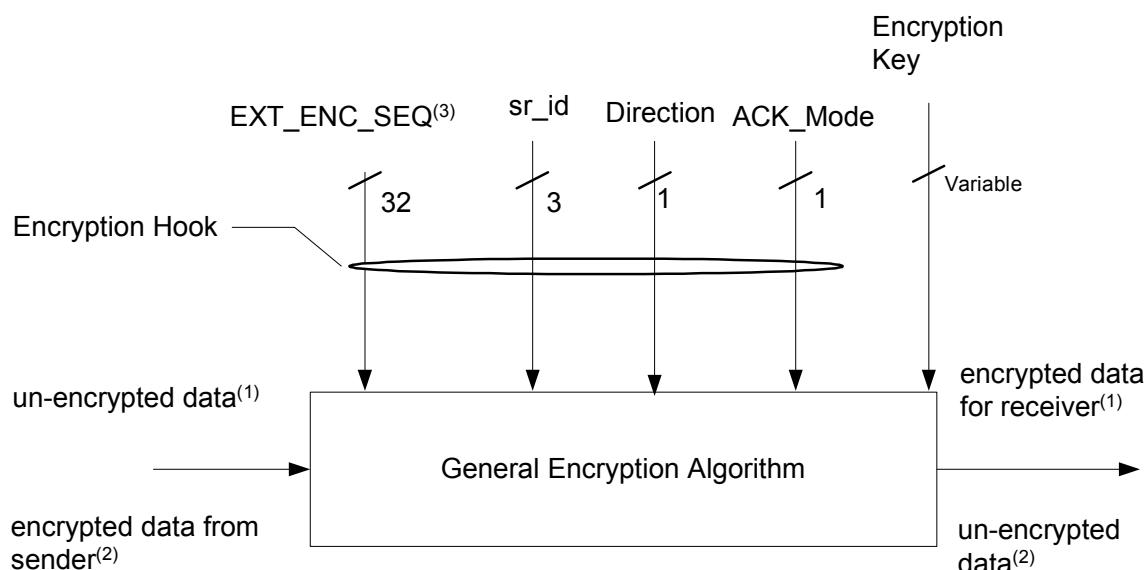

22 Figure 2.3.12.4.3-1 shows the structure for encrypting/decrypting both signaling messages
 23 and user information. Various encryption algorithms can be used with this structure. The
 24 encryption algorithm takes all or part of the following parameters as inputs, as illustrated
 25 in Figure 2.3.12.4.3-1. The actual inputs to the algorithm are specified in the rest of this
 26 section.

27 The encryption algorithm used takes all or part of the following parameters as input (as
 28 illustrated in Figure 2.3.12.4.1.2-1). The actual inputs to the algorithm are specified in this
 29 section.

1

2

3

Figure 2.3.12.4.3-1. Encryption Input Parameters

The inputs to the encryption algorithm are described as follows:

- EXT_ENC_SEQ_s - A 32-bit Extended Encryption Sequence Number ~~stored in the sender or receiver (in the receiver, it is updated and derived from the 8 bit ENC_SEQ as described in 2.3.12.4.1.1) for encryption/decryption.~~
 - sr_id - Service Reference Identifier (see [3]), which identifies the associated service option instance. ~~The value of '000' is reserved for signaling.~~
 - Direction - The direction of the ~~message data~~ being ~~transmitted encrypted/decrypted~~. This shall be set to '0' if the ~~message data~~ is transmitted on or received on a forward link. Otherwise, it shall be set to '1'.
 - Encryption Key – Session Key for Encryption. This shall be a result of successful Session Key Agreement between the base station and the mobile station. The Encryption Key shall be stored by the mobile station in a semi-permanent memory. ~~{ENC_KEY_i} where i ranges from '0000' to '1111'~~.
 - Channel id – Channel identifier, which identifies the physical channel that carries the data to be encrypted or decrypted. This is applicable only to user information encryption on f/r-dtch. Channel id shall be set to, '000' for Fundamental Channel, '001' for Dedicated Control Channel, '010' for Supplemental Code Channel, '011' for Supplemental Channel 0, and '101' for Supplemental Channel 1.
 - ACK Mode – The delivery mode (unassured or assured) of the signaling message. This shall be set to '0' if the message is delivered using unassured mode; otherwise, this shall be set to '1'.

If the Enhanced Cellular Message Encryption Algorithm is used ([ENCRYPT_MODE_s](#) is equal to '11' and [SIG_ENCRYPT_MODE_s](#) is equal to '001'), the following requirements apply for encrypting/decrypting signaling messages, the input parameters of the Enhanced Cellular Message Encryption Algorithm (see [23]) shall be set as follows:

- The DATA_TYPE parameter shall be set to ‘0’.
 - The SYNC parameter shall be set as follows:
 - SYNC[0] = ~~ENC_SEQ_s when encrypting~~ EXT ENC SEQ [7:0]⁷.
 - SYNC[0] = ~~ENC_SEQ passed by the LAC Layer associated with the Layer 3 PDU when decrypting~~
 - SYNC[1] = (ACK_Mode | Direction | EXT_ENC_SEQ_s [1413:8]), where “|” denotes concatenation and EXT_ENC_SEQ_s [1413:8] is bits 8 through 1413 of EXT_ENC_SEQ_s (with the LSB being bit 0).

If the Rijndael Encryption Algorithm is used for encrypting/decrypting signaling messages,

⁷ $Z[y:x]$ denotes bit x to bit y of the binary value Z with bit 0 the least significant bit of Z .

1 the input parameters of ESP AES (see [33]) shall be set as follows:

- 2 • The key parameter shall be set to ENC KEYS.
- 3 • The FRESH parameter shall be set to (ACK Mode | sr id [2:0] | Direction |
EXT ENC SEQ [31:0] | '000').
- 4 • The FRESHSIZE parameter shall be set to 5.
- 5 • The BUF parameter shall be set to the pointer of the most significant bit of the
buffer⁸ that contains the data to be encrypted or decrypted.
- 6 • The BIT_OFFSET parameter shall be set to the offset between the bit position of the
most significant bit of the data to be encrypted/decrypted and the bit position of the
most significant bit of the buffer (e.g., if the bit position of the most significant bit of
the data to be encrypted/decrypted and the bit position of the most significant bit of
the buffer are equal, BIT_OFFSET = 0).
- 7 • The BIT_COUNT parameter shall be set to the number of bits of the data to be
encrypted/decrypted.

8 If the Rijndael Encryption Algorithm is used for encrypting/decrypting user information,
the input parameters of ESP AES (see [33]) shall be set as follows:

- 9 • The key parameter shall be set to ENC KEYS.
- 10 • The FRESH parameter shall be set to (sr id [2:0] | Direction | (sys time/20 mod
 2^{32}) [31:0] | Channel id [2:0] | '0'), where sys time is the system time, in units of ms,
corresponding to the start of the physical layer frame that carries the data block(s).
- 11 • The FRESHSIZE parameter shall be set to 5.
- 12 • The BUF parameter shall be set to the pointer of the most significant bit of the
buffer⁹ that contains the data to be encrypted or decrypted.
- 13 • The BIT_OFFSET parameter shall be set to the offset between the bit position of the
most significant bit of the data to be encrypted/decrypted and the bit position of the
most significant bit of the buffer (e.g., if the bit position of the most significant bit of
the data to be encrypted/decrypted and the bit position of the most significant bit of
the buffer are equal, BIT_OFFSET = 0).
- 14 • The BIT_COUNT parameter shall be set to the number of bits of the data to be
encrypted/decrypted.

8 “Buffer” refers to the physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

9 “Buffer” refers to the implementation-dependent physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

1 **2.3.12.4.2 Extended Encryption for Voice**

2 ~~Extended Encryption for voice service option is performed by means of the encryption~~
 3 ~~procedures as specified in 2.3.12.4.1.2. If UI_ENCRYPT_MODE_{s[i]} is equal to '000', where i~~
 4 ~~is the connection reference associated with the voice service option, the voice data shall not~~
 5 ~~be encrypted. Instead of EXT_ENC_SEQ_s, the following value shall be used as an input to~~
 6 ~~the encryption procedure specified in 2.3.12.4.1.2.~~

7 $\lfloor \text{sys_time}/20 \rfloor \bmod 2^{22}$,

8 ~~where sys_time is the system time, in units of ms, corresponding to the start of the frame~~
 9 ~~that carries the information bits.~~

10 **2.3.12.4.34 Encryption Negotiation**

11 The mobile station shall indicate to the base station the encryption algorithms supported by
 12 using SIG_ENCRYPT_SUP and UI_ENCRYPT_SUP in one of the following messages:

- 13 • *Registration Message*
- 14 • *Origination Message*
- 15 • *Page Response Message*
- 16 • *Security Mode Request Message*
- 17 • **Status Response Message (in Encryption Capability information record)**
- 18 • **Extended Status Response Message (in Encryption Capability information record)**

19 ~~The mobile station can also indicate to the base station the encryption algorithms~~
 20 ~~supported by using SIG_ENCRYPT_SUP and UI_ENCRYPT_SUP in Encryption Capability~~
 21 ~~information record in the Status Response Message or Extended Status Response Message.~~

22 The base station may turn on or turn off the encryption of the voice, data services, or
 23 signaling encryption with a *Security Mode Command Message* sent on f-dsch or f-csch.
 24 Similarly, the mobile station may propose to turn on or turn off the user information
 25 encryption or signaling encryption with a *Security Mode Request Message* sent on r-dsch or
 26 r-csch.

27 **2.3.12.4.4 Computation of the 8 bit Layer 3 PDU CRC Field**

28 ~~The generator polynomials for the 8 bit Layer 3 PDU CRC field shall be as follows:~~

$$g(x) = x^8 + x^7 + x^4 + x^3 + x + 1$$

30 ~~The Layer 3 PDU CRC field shall be computed according to the following procedure using~~
 31 ~~the logic shown in Figures 2.3.12.4.4-1:~~

- 32 • ~~Initially, all shift register elements shall be set to logical one and the switches shall~~
 33 ~~be set in the up position.~~
- 34 • ~~The register shall be clocked a number of times equal to the number bits in the~~
 35 ~~Layer 3 PDU with those bits as input.~~

- 1 • The switches shall be set in the down position so that the output is a modulo-2
2 addition with a '0' and the successive shift register inputs are '0'.
- 3 • The register shall be clocked an additional 8 number of times.
- 4 • These additional bits shall be the Layer 3 PDU CRC field indicator bits.
- 5 • The bits shall be transmitted in the order calculated.

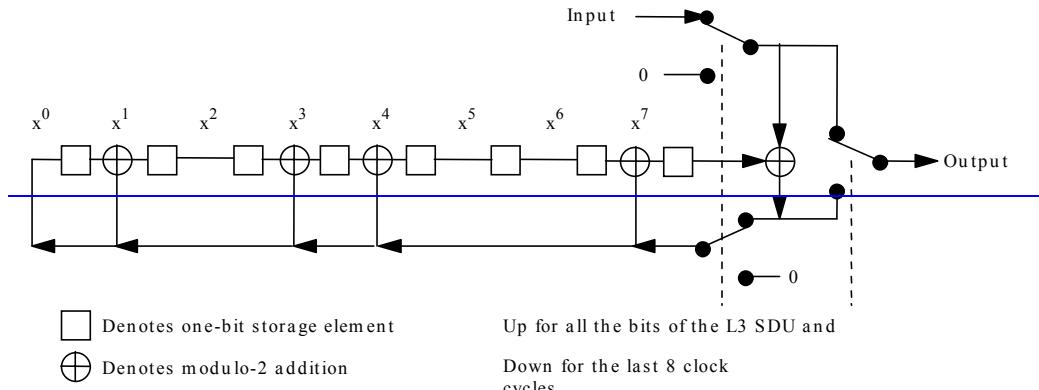

Figure 2.3.12.4.4-1. 8-Bit Layer 3 SDU CRC Field Calculation

2.3.12.4.5 Computation of ENC_SEQ_H_SIG

The ENC_SEQ_H_SIG field (included in the *Registration Message*, *Origination Message*, *Page Response Message*, and *Security Mode Request Message*) is a signature of the 24 most significant 24-bits of the cryptosync (ENC_SEQ_H). The mobile station shall compute this 8-bit field as follows:

1. The mobile station shall construct the *message bits* as shown in Figure 2.3.12.4.5-1.

For messages that are sent on the r-csch, X is set to RAND_s. For messages that are sent on the r-dsch, X is set to (sys time/20000) mod 2³², where sys time is the system time in ms at which the message is assembled.

MSB	LSB
SSD_A (64 bits)	<u>X</u> RAND _s (32 bits)

Figure 2.3.12.4.5-1. Message Bits

2. The mobile station shall pad the *message bits* constructed in the previous step, as specified in FIPS PUB 180-1 (Federal Information Processing Standards Publication 180-1), and compute the 160-bit *message digest* as specified in FIPS PUB 180-1.
3. The mobile station shall store the 8 rightmost (least significant) bits of the *message digest* in ENC_SEQ_H_SIG.

2.3.13 Lock and Maintenance Required Orders

The mobile station shall have memory to store the lock reason code (LCKRSN_Ps-p) received in the *Lock Until Power-Cycled Order*. The data retention time under power-off conditions shall be at least 48 hours.

1 The mobile station shall have memory to store the maintenance reason code (MAINTRSN_{s-p})
2 received in the *Maintenance Required Order*. The data retention time under power-off
3 conditions shall be at least 48 hours.

4 There are no requirements on the use of the lock and maintenance reason codes, and
5 interpretation and use are implementation dependent.

6 2.3.14 Mobile Station Revision Identification

7 The mobile station shall provide memory to store the following parameters sent in the
8 *Status Message*, the *Status Response Message*, or the *Extended Status Response Message*
9 (*Terminal Information* information record):

- 10 • Mobile manufacturer code (MOB_MFG_CODE_p)
- 11 • Manufacturer's model number (MOB_MODEL_p)
- 12 • Firmware revision number (MOB_FIRM_REV_p)

13 In addition, the mobile station shall provide memory to store the following parameter for
14 each supported band class:

- 15 • Protocol revision number (MOB_P_REV_p)

16 2.3.15 Temporary Mobile Station Identity

17 2.3.15.1 Overview

18 The Temporary Mobile Station Identity (TMSI) is a temporary locally assigned number used
19 for addressing the mobile station. The mobile station obtains a TMSI when assigned by the
20 base station. The TMSI as a number does not have any association with the mobile
21 station's IMSI, ESN, or directory number all of which are permanent identifications.

22 A TMSI zone is an arbitrary set of base stations for the administrative assignment of TMSIs.
23 A TMSI_CODE is uniquely assigned to a mobile station inside a TMSI zone. A TMSI zone is
24 identified by the TMSI_ZONE field. The same TMSI_CODE may be reused to identify a
25 different mobile station in a different TMSI zone. The pair (TMSI_ZONE, TMSI_CODE) is a
26 globally unique identity for the mobile station. This pair is called the full TMSI. The
27 TMSI_CODE can be two, three, or four octets in length. The TMSI_ZONE can range from 1
28 to 8 octets in length. Figure 2.3.15-1 shows an example of a TMSI_ZONE where the
29 TMSI_ZONE is a subset of the NID (see 2.6.5.2).

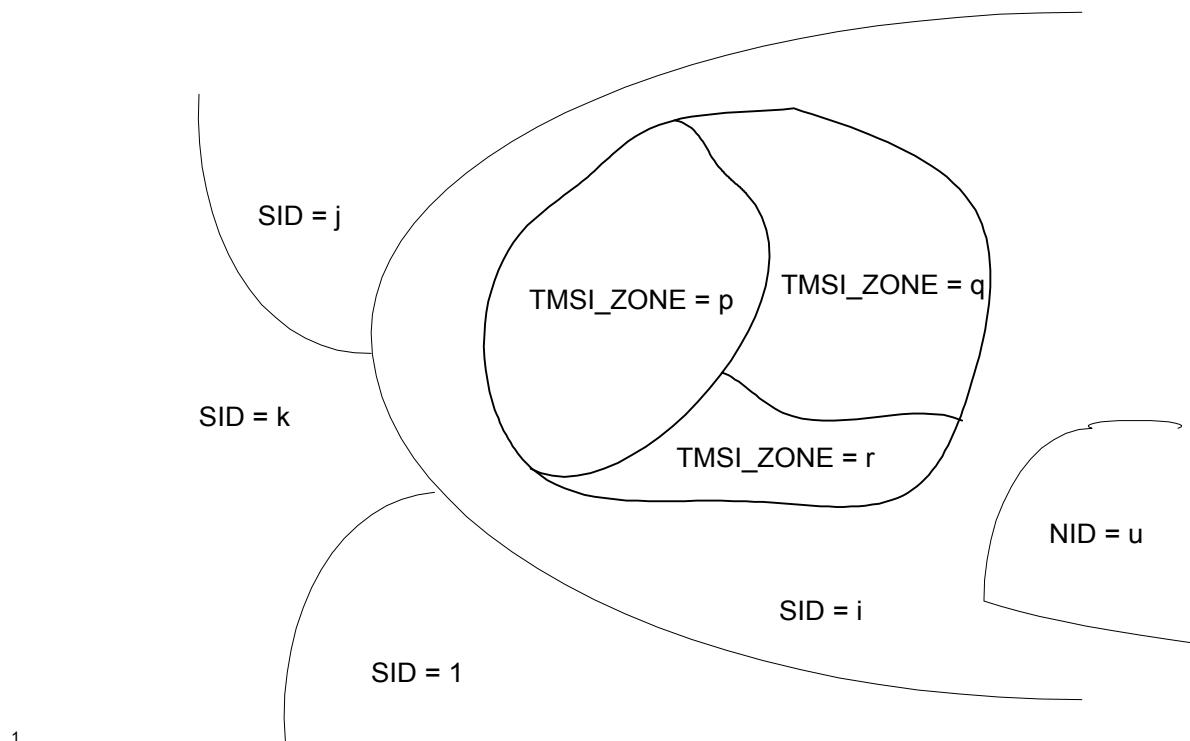

Figure 2.3.15-1. TMSI Zone Example

The base station sends a *TMSI Assignment Message* to assign a TMSI. In response, the mobile station sends a *TMSI Assignment Completion Message*. The base station instructs the mobile station to delete the TMSI by sending a *TMSI Assignment Message* with all the bits in the TMSI_CODE field set equal to '1'.

The TMSI expiration time is used to automatically delete the assigned TMSI. The mobile station obtains the expiration time when the TMSI is assigned in the *TMSI Assignment Message*. The mobile station compares the expiration time to the current System Time when it powers up and periodically during operation.

Whenever the mobile station sends its full TMSI, the mobile station sets a timer, called the full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by setting all bits in the TMSI_CODE field to '1'.

2.3.15.2 TMSI Assignment Memory

The mobile station shall provide memory to store the following parameters:

- 4-bit assigning TMSI zone length (ASSIGNING_TMSI_ZONE_LEN_{s-p})
- 8-octet assigning TMSI zone (ASSIGNING_TMSI_ZONE_{s-p})
- 4-octet TMSI code (TMSI_CODE_{s-p})
- 3-octet TMSI expiration time (TMSI_EXP_TIME_{s-p})

1 **2.4 Accumulated Statistics**

2 2.4.1 Monitored Quantities and Statistics

3 The mobile station shall store the value described in Table 2.4.1-1.

4 **Table 2.4.1-1. Monitored Quantities and Statistics**

Quantity Identifier	Length (bits)	Description
OTHER_SYS_TIME	36	The SYS_TIME field from the most recently received <i>Sync Channel Message</i>

5 2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel Statistics

6 The mobile station shall maintain the counters shown in Table 2.4.2-1. The counters shall
7 have the length as specified in Table 2.4.2-1. The mobile station shall initialize each
8 counter described herein to zero upon power-on; the mobile station shall not re-initialize
9 any counter described herein at any other time except upon command from the base
10 station. Each counter shall be maintained modulo 2^{Length} , where Length is specified in
11 Table 2.4.2-1.

12 The mobile station shall increment the counter PAG_6 each time that it declares a loss of
13 the Paging Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter
14 PAG_7 for each idle handoff it performs. The mobile station shall increment the counter
15 FCCCH_4 each time that it declares a loss of the Forward Common Control Channel (see
16 2.6.2.1.1.4). The mobile station shall increment the counter BCCH_5 each time that it
17 declares a loss of the Broadcast Control Channel (see 2.6.2.1.1.4).

18 **Table 2.4.2-1. Accumulated PCH/BCCH/F-CCCH Channel Statistics**

Counter Identifier	Length (bits)	Description
PAG_6	16	Number of times that the mobile station declared a loss of the Paging Channel
PAG_7	16	Number of mobile station idle handoffs
FCCCH_4	16	Number of times that the mobile station declared a loss of the Forward Common Control Channel
BCCH_5	16	Number of times that the mobile station declared a loss of the Broadcast Control Channel

19 **2.5 Reserved**

21

22

23

1 **2.6 Layer 3 Processing**

2 This section describes mobile station Layer 3 processing. It contains frequent references to
3 the messages that flow between the mobile station and base station. While reading this
4 section, it may be helpful to refer to the PDU formats (see 2.7 and 3.7), and to the message
5 flow examples (see Annex B).

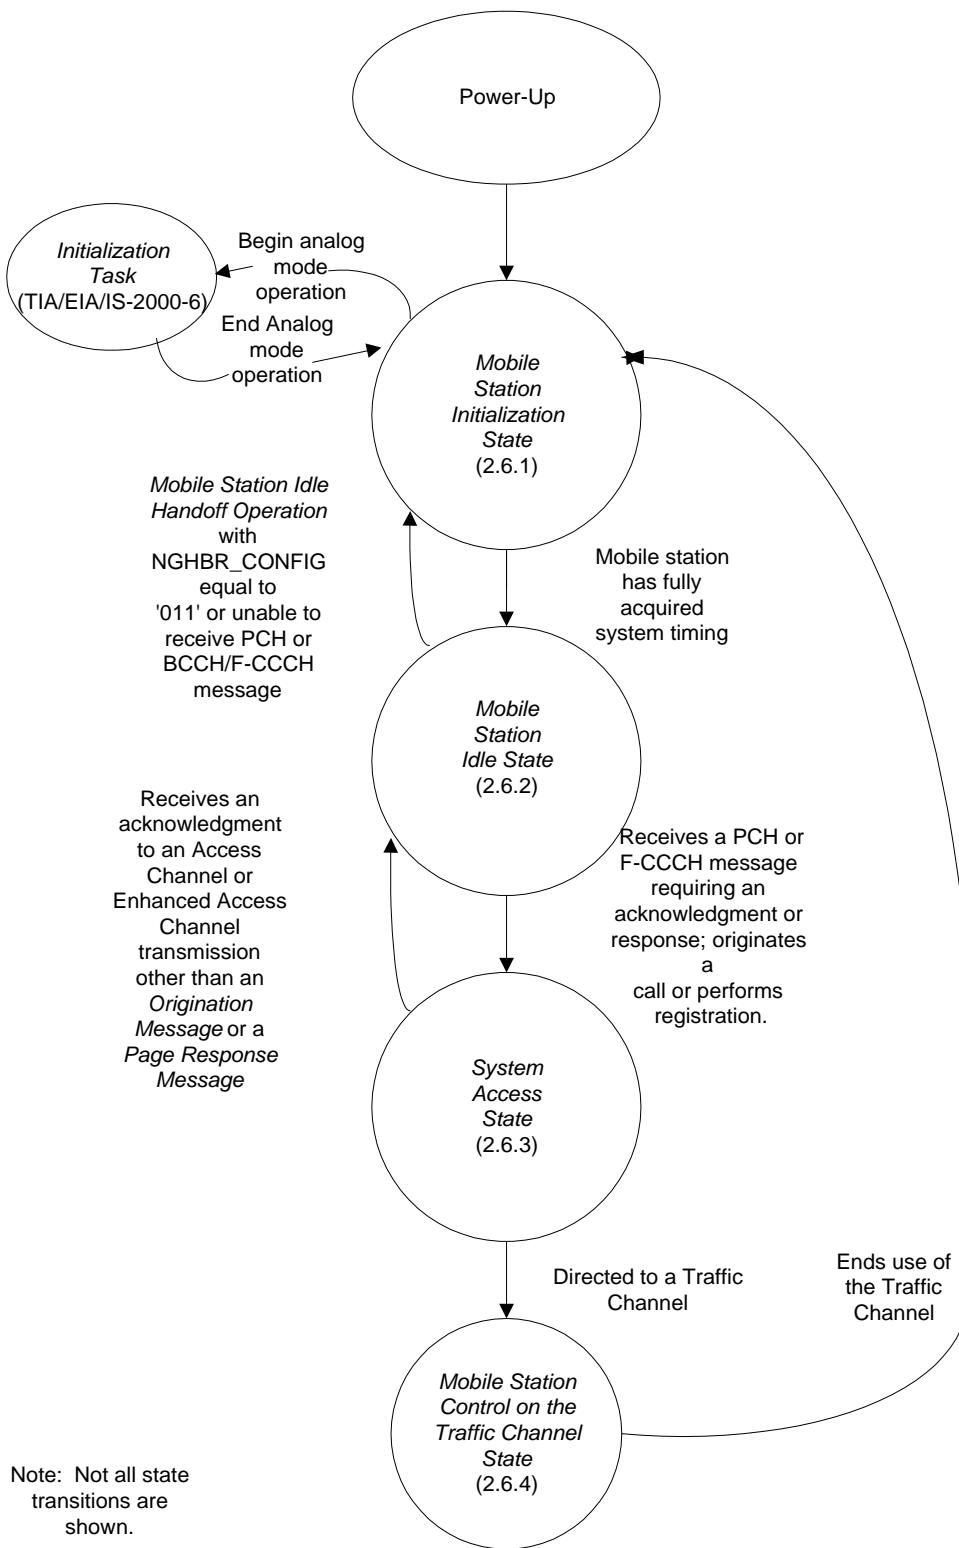

6 The mobile station shall ignore fields at the end of messages that do not exist in the
7 protocol revision supported by the mobile station.

8 The values for the time and numerical constants used in this section (e.g., T_{20m}, N_{4m}) are
9 specified in Annex D.

10 As illustrated in Figure 2.6-1, mobile station Layer 3 processing consists of the following
11 states:

- 12 • *Mobile Station Initialization State* - In this state, the mobile station selects and
13 acquires a system.
- 14 • *Mobile Station Idle State* - In this state, the mobile station monitors messages on the
15 f-csch.
- 16 • *System Access State* - In this state, the mobile station sends messages to the base
17 station on the r-csch and receives messages from the base station on the f-csch.
- 18 • *Mobile Station Control on the Traffic Channel State* - In this state, the mobile station
19 communicates with the base station using the f/r-dsch and f/r-dtch.

20 After power is applied to the mobile station, it shall enter the *System Determination Substate*
21 of the *Mobile Station Initialization State* with a power-up indication (see 2.6.1.1).

**Figure 2.6-1. Mobile Station Layer 3 Processing States**

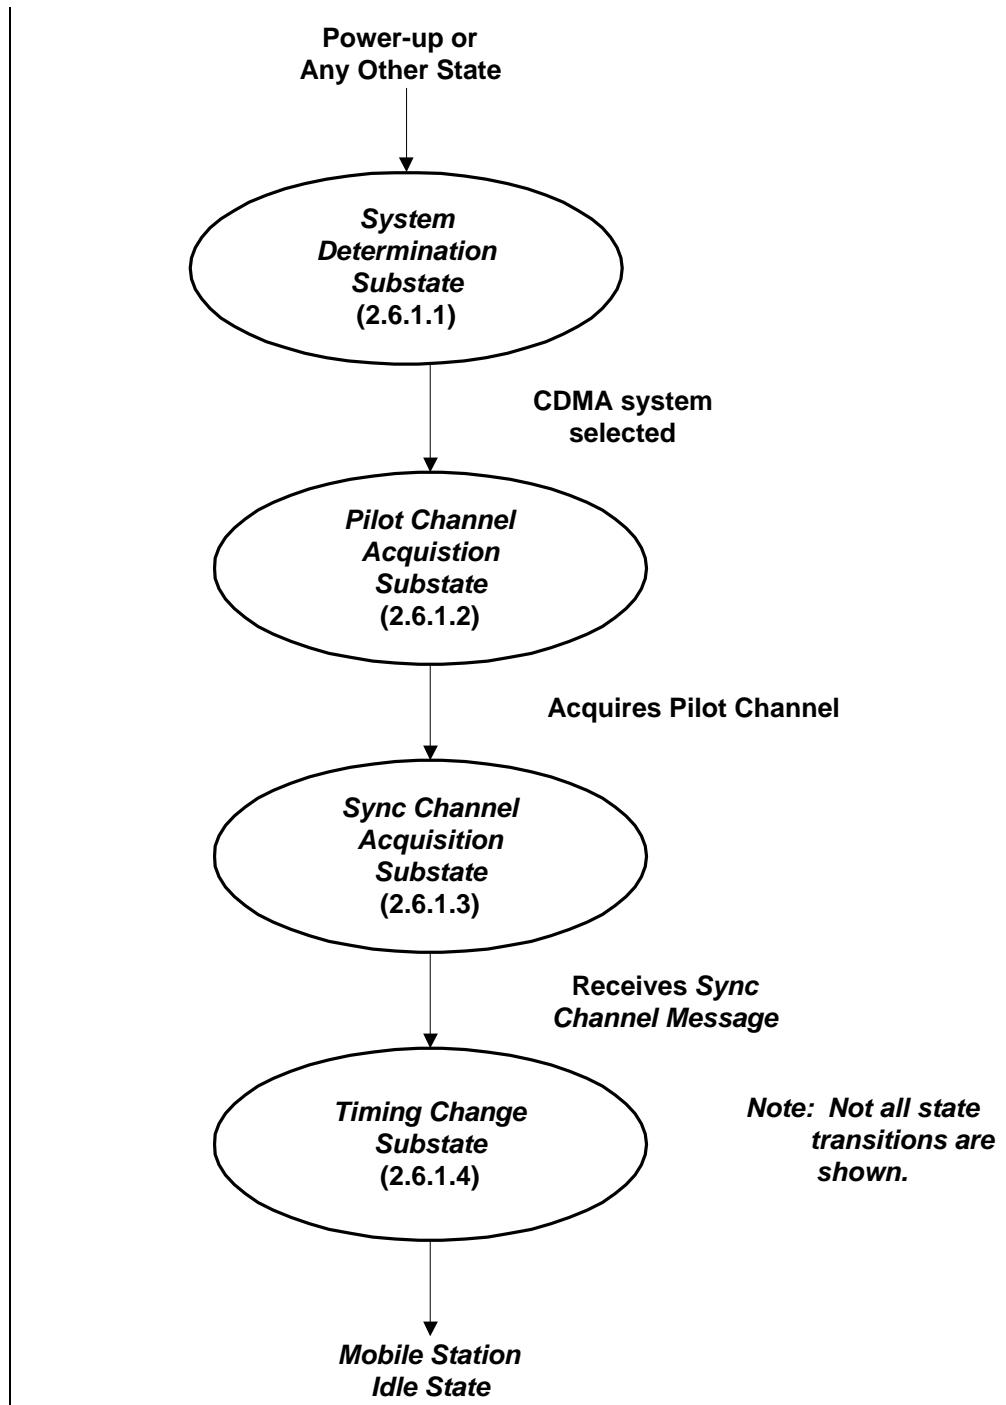

1 2.6.1 Mobile Station Initialization State

2 In this state, the mobile station first selects a system to use. If the selected system is a
3 CDMA system, the mobile station proceeds to acquire and then synchronize to the CDMA
4 system. If the selected system is an analog system, the mobile station begins analog mode
5 operation (see 2.6.1 of [6]).

6 As illustrated in Figure 2.6.1-1, the *Mobile Station Initialization State* consists of the
7 following substates:

- 8 • *System Determination Substate* - In this substate, the mobile station selects which
9 system to use.
- 10 • *Pilot Channel Acquisition Substate* - In this substate, the mobile station acquires the
11 Pilot Channel of a CDMA system.
- 12 • *Sync Channel Acquisition Substate* - In this substate, the mobile station obtains
13 system configuration and timing information for a CDMA system.
- 14 • *Timing Change Substate* - In this substate, the mobile station synchronizes its
15 timing to that of a CDMA system.

16 While in the *Mobile Station Initialization State*, the mobile station shall update all active
17 registration timers as specified in 2.6.5.5.1.2.

1

2

Figure 2.6.1-1. Mobile Station Initialization State

1 2.6.1.1 System Determination Substate

2 In this substate, the mobile station selects the system to use.

3 Upon entering the *System Determination Substate*, the mobile station shall initialize
4 registration parameters as specified in 2.6.5.5.1.1.

5 If the mobile station enters the *System Determination Substate* with a power-up indication,
6 the mobile station shall set RAND_S to 0 (see 2.3.12.1.2), PACA_S to disabled, PACA_CANCEL
7 to '0', the PACA state timer to disabled, NDSS_ORIG_S to disabled, MAX_REDIRECT_DELAY_S
8 to 31, REDIRECTION_S to disabled, all entries of SDB_SO OMIT_S to '0', and T_SLOTTED_S to
9 T74m, ~~KEY_S to NULL, and C_SIC_ENCRYPT_MODE_S to '000'~~. If the mobile station supports
10 analog mode operation in Band Class 0, the mobile station shall set the First-Idle ID status
11 to enabled (see [6]). The mobile station shall select a system in accordance with the custom
12 system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system
13 (see 2.6.1.1.4).

14 If the mobile station enters the *System Determination Substate* with any indication other
15 than a power-up indication, and if PACA_S is equal to enabled, the mobile station shall also
16 set PACA_S to disabled, PACA_CANCEL to '0', the PACA state timer to disabled, and should
17 indicate to the user that the PACA call has been canceled.

18 If the mobile station enters the *System Determination Substate* with an acquisition failure
19 indication, the mobile station shall perform the following:

- 20 • If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select
21 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If
22 the mobile station is able to select another system, the mobile station shall attempt
23 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has
24 exhausted all possible selections using the current redirection criteria, the mobile
25 station shall perform the following:
 - 26 – The mobile station shall set REDIRECTION_S to disabled.
 - 27 – The mobile station shall set RETURN_CAUSE_S to '0001'.
 - 28 – If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
29 system from which it was redirected and shall attempt to acquire the selected
30 system (see 2.6.1.1.4). The precise process for determining how to select the
31 system from which the mobile station was redirected is left to the mobile station
32 manufacturer.
 - 33 – If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
34 than the system from which it was redirected in accordance with the custom
35 system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
36 system (see 2.6.1.1.4). The precise process that the mobile station uses to avoid
37 selecting the system from which it was redirected is left to the mobile station
38 manufacturer.

- 1 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
2 accordance with the custom system selection process (see 2.6.1.1.1) and shall
3 attempt to acquire the selected system (see 2.6.1.1.4).

4 If the mobile station enters the *System Determination Substate* with a new system
5 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
6 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the
7 user that the call origination has been canceled. The mobile station shall select a system in
8 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to
9 acquire the selected system (see 2.6.1.1.4).

10 If the mobile station enters the *System Determination Substate* with a CDMA available
11 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
12 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the
13 user that the call origination is canceled. The mobile station should set CDMACH_S to the
14 CDMA Channel (CDMA_FREQ) specified in the *CDMA Capability Global Action Message* and
15 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).
16 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA
17 Channel, the mobile station shall select a system in accordance with the custom system
18 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
19 2.6.1.1.4).

20 If the mobile station enters the *System Determination Substate* with an additional CDMA
21 available indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
22 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should
23 indicate to the user that the call origination is canceled. The mobile station should set
24 CDMACH_S to the CDMA Channel (CDMA_FREQ) specified in the *CDMA Info Order* and
25 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).
26 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA
27 Channel, the mobile station shall select a system in accordance with the custom system
28 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
29 2.6.1.1.4).

30 If the mobile station enters the *System Determination Substate* with a reselection indication,
31 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
32 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
33 call origination is canceled. The mobile station shall select a system in accordance with the
34 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
35 system (see 2.6.1.1.4).

36 If the mobile station enters the *System Determination Substate* with an encryption failure
37 indication, the mobile station shall set REDIRECTION_S to disabled, ENC KEY_S to NULL,
38 D SIG ENCRYPT MODE_S to '000' and C SIG ENCRYPT MODE_S to '000'. If NDSS ORIG_S is
39 enabled, the mobile station shall set NDSS ORIG_S to disabled and should indicate to the
40 user that the call origination is canceled. The mobile station shall select a system in
41 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to
42 acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a system reselection indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station should attempt to select a system available for system reselection as specified in 2.6.1.1.3, and should attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select such a system is left to the mobile station manufacturer. If the mobile station does not attempt to select such a system, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a rescan indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a protocol mismatch indication, the mobile station shall perform the following:

- If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select another system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile station is able to select another system, the mobile station shall attempt to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all possible selections using the current redirection criteria, the mobile station shall perform the following:
 - The mobile station shall set REDIRECTION_S to disabled.
 - The mobile station shall set RETURN_CAUSE_S to '0010'.
 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the system from which it was redirected and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the system from which the mobile station was redirected is left to the mobile station manufacturer.
 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other than the system from which it was redirected in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to avoid the system from which the mobile station was redirected is left to the mobile station manufacturer.
- If REDIRECTION_S is equal to disabled, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a system lost indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the

mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station should attempt to select the same system that was lost, and should attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the same system is left to the mobile station manufacturer. If the mobile station does not attempt to select the same system, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a lock indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an unlock indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an access denied indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an ACCT blocked indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an NDSS off indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a release indication and REDIRECTION_S is equal to enabled, the mobile station shall attempt to select the same system on which the release occurred and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the same system is left to the mobile station manufacturer. If REDIRECTION_S is equal to disabled, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1)

1 and shall attempt to acquire the selected system (see 2.6.1.1.4). If NDSS_ORIG_S is enabled,
 2 the mobile station shall set NDSS_ORIG_S to disabled.

3 If the mobile station enters the *System Determination Substate* with an error indication, the
 4 mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile
 5 station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call
 6 origination is canceled. The mobile station shall select a system in accordance with the
 7 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
 8 system (see 2.6.1.1.4).

9 If the mobile station enters the *System Determination Substate* with a redirection indication,
 10 the mobile station shall set REDIRECTION_S to enabled. The mobile station shall delete all
 11 entries from the ZONE_LIST_S and SID_NID_LIST_S. The mobile station shall select a system
 12 in accordance with the current redirection criteria (see 2.6.1.1.2) and shall attempt to
 13 acquire the selected system (see 2.6.1.1.4).

14 If the mobile station enters the *System Determination Substate* with a registration rejected
 15 indication, the mobile station shall perform the following:

- 16 • The mobile station shall delete the newly generated encryption key (if any).
- 17 • If REDIRECTION_S is equal to enabled, the mobile station shall perform the following:
 - 18 – The mobile station shall set REDIRECTION_S to disabled.
 - 19 – The mobile station shall set RETURN_CAUSE_S to '0011'.
 - 20 – If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
 21 system from which it was redirected and shall attempt to acquire the selected
 22 system (see 2.6.1.1.4). The precise process for determining how to select the
 23 system from which the mobile station was redirected is left to the mobile station
 24 manufacturer.
 - 25 – If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
 26 than the system from which it was redirected in accordance with the custom
 27 system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
 28 system (see 2.6.1.1.4). The precise process for determining how to avoid the
 29 system from which the mobile station was redirected is left to the mobile station
 30 manufacturer.
- 31 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
 32 accordance with the custom system selection process (see 2.6.1.1.1) and shall
 33 attempt to acquire the selected system (see 2.6.1.1.4).

34 If the mobile station enters the *System Determination Substate* with a wrong system
 35 indication, the mobile station shall perform the following:

- 36 • If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select
 37 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If
 38 the mobile station is able to select another system, the mobile station shall attempt
 39 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has
 40 exhausted all possible selections using the current redirection criteria, the mobile
 41 station shall perform the following:

- The mobile station shall set REDIRECTION_S to disabled.
 - The mobile station shall set RETURN_CAUSE_S to '0100'.
 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the system from which it was redirected and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the system from which the mobile station was redirected is left to the mobile station manufacturer.
 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other than the system from which it was redirected in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to avoid the system from which the mobile station was redirected is left to the mobile station manufacturer.
- If REDIRECTION_S is equal to disabled, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a wrong network indication, the mobile station shall perform the following:

- If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select another system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile station is able to select another system, the mobile station shall attempt to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all possible selections using the current redirection criteria, the mobile station shall perform the following:
 - The mobile station shall set REDIRECTION_S to disabled.
 - The mobile station shall set RETURN_CAUSE_S to '0101'.
 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the system from which it was redirected and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the system from which the mobile station was redirected is left to the mobile station manufacturer.
 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other than the system from which it was redirected in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to avoid the system from which the mobile station was redirected is left to the mobile station manufacturer.
- If REDIRECTION_S is equal to disabled, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

1 2.6.1.1.1 Custom System Selection Process

2 The precise process for custom system selection is left to the mobile station manufacturer.

3 The mobile station shall perform the custom system selection process as follows:

- 4 • The mobile station shall determine which system to use.
- 5 • If the mobile station is to use a CDMA system, it shall set CDMABAND_S to the band class (see [30]) for the selected system.
- 6 • If the mobile station is to use a CDMA system with CDMABAND_S = '00000' or CDMABAND_S = '00011', it shall perform the following:
 - 7 – If the mobile station is to use System A, it shall set SERVSYS_S to SYS_A. If the mobile station is to use System B, it shall set SERVSYS_S to SYS_B.
 - 8 – The mobile station shall set CDMACH_S either to the Primary or Secondary CDMA Channel number (see 2.1.1.1.1 of [2]) for the selected serving system (SERVSYS_S). If the mobile station fails to acquire a CDMA system on the first CDMA Channel it tries, the mobile station should attempt to acquire on the alternate CDMA Channel (Primary or Secondary) before attempting other alternatives.
- 9 • If the mobile station is to use a CDMA system with CDMABAND_S other than '00000'- 10 or '00011', '00001', CDMABAND_S = '00010', CDMABAND_S = '00100', CDMABAND_S = '00101', CDMABAND_S = '00110', CDMABAND_S = '00111', CDMABAND_S = '01000', or CDMABAND_S = '01001' it shall set CDMACH_S to the CDMA Channel number (see 2.1.1.1.1 of [2]) for the selected system.

22 If the mobile station is to use System A of the 800 MHz analog system, it shall set SERVSYS_S to SYS_A. If the mobile station is to use System B of the 800 MHz analog system, it shall set SERVSYS_S to SYS_B.

25 2.6.1.1.2 System Selection Using Current Redirection Criteria

26 To perform system selection using current redirection criteria, the mobile station shall use information received either in a *Service Redirection Message*, a *Global Service Redirection Message*, or an *Extended Global Service Redirection Message* and stored in the variable REDIRECT_REC_S.

30 If the RECORD_TYPE field of REDIRECT_REC_S is equal to '00000001' and the mobile station supports Band Class 0, the mobile station shall perform system selection as follows:

- 32 • If the SYS_ORDERING field is equal to '000', the mobile station shall make sequential system selections as follows:
 - 33 – The mobile station shall set SERVSYS_S either to SYS_A or SYS_B. The precise process for determining how many system selections to make and for determining whether to use SYS_A or SYS_B is left to the mobile station manufacturer.
- 38 • If the SYS_ORDERING field is equal to '001', the mobile station shall select no more than one system selection as follows:

- The mobile station shall set SERVSYS_S to SYS_A.
- If the SYS_ORDERING field is equal to '010', the mobile station shall select no more than one system selection as follows:
 - The mobile station shall set SERVSYS_S to SYS_B.
- If the SYS_ORDERING field is equal to '011', the mobile station shall make at most two sequential system selections as follows:
 - For the first system selection, the mobile station shall set SERVSYS_S to SYS_A.
 - For the second system selection, the mobile station shall set SERVSYS_S to SYS_B.
- If the SYS_ORDERING field is equal to '100', the mobile station shall make at most 2 sequential system selections as follows:
 - For the first system selection, the mobile station shall set SERVSYS_S to SYS_B.
 - For the second system selection, the mobile station shall set SERVSYS_S to SYS_A.
- If the SYS_ORDERING field is equal to '101', the mobile station shall make at most 2 sequential system selections as follows:
 - For the first system selection, the mobile station shall set SERVSYS_S either to SYS_A or SYS_B. The precise process for determining whether to use SYS_A or SYS_B first is left to the mobile station manufacturer.
 - For the second system selection, the mobile station shall set SERVSYS_S to SYS_B if SYS_A was used for the first selection, or to SYS_A if SYS_B was used for the first selection.

If the RECORD_TYPE field of REDIRECT_REC_S is equal to '00000010', the mobile station shall perform system selection as follows:

- If the mobile station supports CDMA mode operation in the band class identified by the BAND_CLASS field, the mobile station shall make at most n sequential system selections, where n is equal to the value of the NUM_CHANS field, as follows:
 - For the i^{th} system selection, where i ranges from 1 to n , if the mobile station supports operation on the CDMA channel associated with the value of the i^{th} occurrence of the CDMA_CHAN field, the mobile station shall set CDMACH_S to the value of the i^{th} occurrence of the CDMA_CHAN field and shall set CDMABAND_S to the value specified in the BAND_CLASS field. If the mobile station does not support operation on the CDMA Channel associated with the value of the i^{th} occurrence of the CDMA_CHAN field, the mobile station shall not make the i^{th} system selection.

2.6.1.1.3 System Selection Using System Reselection Criteria

The precise process for selecting a system using system reselection criteria is left to the mobile station manufacturer. The mobile station should use information received in the

1 *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List Message*, or
 2 the *Universal Neighbor List Message* to perform the system reselection process as follows:

- 3 • If there are pilots in the Neighbor List on a different Frequency Assignment than
 4 that of the mobile station, the mobile station may select the CDMA system
 5 consisting of these neighbor pilots. If the mobile station is to use a CDMA system, it
 6 shall set CDMABAND_S to the band class (see [30]) for the selected system and shall
 7 set CDMACH_S to the CDMA Channel number (see 2.1.1.1 of [2]) for the selected
 8 system.
- 9 • If NUM_ANALOG_NGHBR_S is not equal to '000', the mobile station may select an
 10 analog system as specified by ANALOG_NGHBR_LIST. If the mobile station is to use
 11 System A of the 800 MHz analog system, it shall set SERVSYS_S to SYS_A. If the
 12 mobile station is to use System B of the 800 MHz analog system, it shall set
 13 SERVSYS_S to SYS_B.

14 2.6.1.1.4 Acquiring the Selected System

15 The mobile station shall attempt to acquire the selected system as follows:

- 16 • If the selected system is an analog system, the mobile station shall enter the
 17 Initialization Task (see 2.6.1 of [6]).
- 18 • If the selected system is a CDMA system, the mobile station shall enter the *Pilot*
 19 *Channel Acquisition Substate*.

20 2.6.1.2 Pilot Channel Acquisition Substate

21 In this substate, the mobile station acquires the Pilot Channel of the selected CDMA
 22 system.

23 Upon entering the *Pilot Channel Acquisition Substate*, the mobile station shall tune to the
 24 CDMA Channel number equal to CDMACH_S, shall set its code channel for the Pilot Channel
 25 (see 3.1.3.1.10 of [2]) and shall search for the Pilot Channel for no longer than T_{20m}
 26 seconds (see Annex D). If the mobile station acquires the Pilot Channel, the mobile station
 27 shall enter the *Sync Channel Acquisition Substate*.

28 If the mobile station determines that it is unlikely to acquire the Pilot Channel within T_{20m}
 29 seconds, the mobile station may enter the *System Determination Substate* with an
 30 acquisition failure indication (see 2.6.1.1). The time, to either acquire the Pilot Channel or
 31 determine that Pilot Channel acquisition is unlikely, shall not exceed T_{20m} seconds (see
 32 Annex D), after which the mobile station shall enter the *System Determination Substate* with
 33 an acquisition failure indication (see 2.6.1.1).

34 2.6.1.3 Sync Channel Acquisition Substate

35 In this substate, the mobile station receives and processes the *Sync Channel Message* to
 36 obtain system configuration and timing information.

37 Upon entering the *Sync Channel Acquisition Substate*, the mobile station shall set its code
 38 channel for the Sync Channel (see [2]).

- 1 If the mobile station does not receive a valid *Sync Channel Message* within T_{21m} seconds,
 2 the mobile station shall enter the *System Determination Substate* with an acquisition failure
 3 indication.
- 4 If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds, but the
 5 protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band
 6 class) is less than the minimum protocol revision level supported by the base station
 7 ($MIN_P_REV_r$), the mobile station shall enter the *System Determination Substate* with a
 8 protocol mismatch indication (see 2.6.1.1).
- 9 If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds, but the
 10 values of the $PRAT_r$, the $SR1_BRAT_NON_TD_r$, the $SR1_BRAT_TD_r$, or the $SR3_BRAT_r$ fields
 11 are designated as reserved by the protocol revision level supported by the mobile station
 12 ($MOB_P_REV_p$ of the current band class), the mobile station shall enter the *System*
 13 *Determination Substate* with a protocol mismatch indication (see 2.6.1.1).
- 14 If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds and the
 15 protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band
 16 class) is greater than or equal to the minimum protocol revision level supported by the base
 17 station ($MIN_P_REV_r$), the mobile station shall store the following information from the
 18 message:
- 19 • Protocol revision level ($P_REV_S = P_REV_r$)
 - 20 • Minimum protocol revision level ($MIN_P_REV_S = MIN_P_REV_r$)
 - 21 • System identification ($SID_S = SID_r$)
 - 22 • Network identification ($NID_S = NID_r$)
 - 23 • Pilot PN sequence offset index ($PILOT_PN_S = PILOT_PN_r$)
 - 24 • Long code state ($LC_STATE_S = LC_STATE_r$)
 - 25 • System Time ($SYS_TIME_S = SYS_TIME_r$)
 - 26 • Paging Channel data rate ($PRAT_S = PRAT_r$)
 - 27 • Protocol revision level currently in use ($P_REV_IN_USE_S =$ the lesser value of P_REVs
 28 and $MOB_P_REV_p$ of the current band class)
 - 29 • SR1 Non-TD BCCH support indicator ($SR1_BCCH_SUPPORTED_S_NON_TD_INCL_S =$
 30 $SR1_BCCH_SUPPORTED_r_NON_TD_INCL_r$)
 - 31 • SR1 TD BCCH support indicator ($SR1_TD_INCL_S = SR1_TD_INCL_r$)
 - 32 • If $SR1_BCCH_NON_TD_INCL_SUPPORTED_r$ is equal to '1':
 - 33 – $SR1_BRAT_NON_TD_S = SR1_BRAT_NON_TD_r;$
 - 34 – $SR1_CRAT_NON_TD_S = SR1_CRAT_NON_TD_r;$
 - 35 – $BCCH_CODE_CHAN_NON_TD_S = SR1_BCCH_CODE_CHAN_NON_TD_r.$

- 1 • If [SR1_TD_INCL_r is included and is equal to '1'](#) the mobile station supports the
2 Transmit Diversity [indicated by SR1_TD_MODE_r, SR1_TD_INCL_r is included and is](#)
3 [equal to '1'](#):
 - 4 – [SR1_BRAT_TD_S = SR1_BRAT_TD_r](#);
 - 5 – [SR1_CRAT_TD_S = SR1_CRAT_TD_r](#);
 - 6 – [BCCH_CODE_CHAN_TD_S = SR1_BCCH_CODE_CHAN_TD_r](#).
- 7 • [If the mobile station supports the Transmit Diversity, SR1_BCCH_NON_TD_INCL_r is](#)
8 [equal to '1', and SR1_TD_INCL_r is equal to '0'](#):
 - 9 – [SR1_BRAT_TD_S = SR1_BRAT_NON_TD_r](#);
 - 10 – [SR1_CRAT_TD_S = SR1_CRAT_NON_TD_r](#);
 - 11 – [BCCH_CODE_CHAN_TD_S = SR1_BCCH_CODE_CHAN_NON_TD_r](#).
- 12 • SR3 support indicator ($SR3_{INCL_S} = SR3_{INCL_r}$)

13 The mobile station shall ignore any fields at the end of the *Sync Channel Message* that are
14 not defined according to the protocol revision level (MOB_P_REV_p of the current band class)
15 being used by the mobile station.

16 The mobile station may store the following information from the message:

- 17 • Number of leap seconds that have occurred since the start of System Time
18 ($LP_{SEC_S} = LP_{SEC_r}$)
- 19 • Offset of local time from System Time ($LTM_{OFF_S} = LTM_{OFF_r}$)
- 20 • Daylight savings time indicator ($DAYLT_S = DAYLT_r$)

21 If REDIRECTION_S and NDSS_ORIG_S are equal to disabled, the mobile station may enter the
22 *System Determination Substate* with a reselection indication (see 2.6.1.1).

23 If REDIRECTION_S is equal to enabled, the EXPECTED_SID field of REDIRECT_REC_S is not
24 equal to 0, and SID_r is not equal to EXPECTED_SID, the mobile station shall enter the
25 *System Determination Substate* with a wrong system indication (see 2.6.1.1). If
26 REDIRECTION_S is equal to enabled, the EXPECTED_NID field of REDIRECT_REC_S is not
27 equal to 65535, and NID_r is not equal to EXPECTED_NID, the mobile station shall enter the
28 *System Determination Substate* with a wrong network indication.

29 If P_REV_IN_USE_S is less than 6, the mobile station shall set POTENTIAL_CDMACH_S to
30 CDMA_FREQ_r.

31 If P_REV_IN_USE_S is equal to six, [and](#) the mobile station shall perform the following:

- 32 • If the mobile station supports the Quick Paging Channel or any radio configuration
33 in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile station shall set
34 POTENTIAL_CDMACH_S equal to EXT_CDMA_FREQ_r; otherwise, the mobile station
35 shall set POTENTIAL_CDMACH_S equal to CDMA_FREQ_r.

36 If P_REV_IN_USE_S is greater than six, the mobile station shall perform the following:

- 37 • If the mobile station supports Spreading Rate 3 on the common channels and

- 1 SR3_INCL_S is equal to '1', the mobile station shall set:
- 2 – BRAT_S = SR3_BRAT_r;
- 3 – BCCH_CODE_RATE_S = 1/3;
- 4 – BCCH_S = SR3_BCCH_CODE_CHAN_r;
- 5 – SR3_PRIMARY_PILOT_S = SR3_PRIMARY_PILOT_r;
- 6 – SR3_PILOT_POWER1_S = SR3_PILOT_POWER1_r;
- 7 – SR3_PILOT_POWER2_S = SR3_PILOT_POWER2_r;
- 8 – If SR3_CENTER_FREQ_INCL_r is equal to '1', POTENTIAL_CDMACH_S =
9 SR3_CENTER_FREQ_r; otherwise, POTENTIAL_CDMACH_S = EXT_CDMA_FREQ_r.
- 10 • If the mobile station does not support Spreading Rate 3 on the common channel or
11 if SR3_INCL_S is equal to '0', the mobile station shall perform the following:
- 12 ~~If SR1_BCCH_SUPPORTED_S is equal to '1', the mobile station shall perform the following:~~
- 13 ~~– If SR1_TD_INCL_r is equal to '1' and the mobile station supports the Transmit Diversity mode specified by SR1_TD_MODE_r, the mobile station shall set:~~
- 14 ~~+ If SR1_TD_INCL_r is equal to '1' and the mobile station supports the Transmit Diversity mode specified by SR1_TD_MODE_r, the mobile station shall set:~~
- 15 + SR1_TD_MODE_S = SR1_TD_MODE_r
- 16 + SR1_TD_POWER_LEVEL_S = SR1_TD_POWER_LEVEL_r
- 17 + BRAT_S = SR1_BRAT_TD_r
- 18 + BCCH_CODE_RATE_S = SR1_CRAT_TD_r,
- 19 + BCCH_S = SR1_BCCH_CODE_CHAN_TD_r,
- 20 + POTENTIAL_CDMACH_S = SR1_CDMA_FREQ_TD_r
- 21 ~~– Otherwise, if SR1_BCCH_NON_TD_INCL_r is equal to '1', the mobile station shall set:~~
- 22 ~~+ If SR1_TD_INCL_r is equal to '0', or if SR1_TD_INCL_r is equal to '1' and the mobile station does not support the Transmit Diversity mode specified by SR1_TD_MODE_r, the mobile station shall set:~~
- 23 + BRAT_S = SR1_BRAT_NON_TD_r
- 24 + BCCH_CODE_RATE_S = SR1_CRAT_NON_TD_r,
- 25 + BCCH_S = SR1_BCCH_CODE_CHAN_NON_TD_r,
- 26 + If SR1_NON_TD_FREQ_INCL_r is equal to '1', POTENTIAL_CDMACH_S =
27 SR1_CDMA_FREQ_NON_TD_r; otherwise, POTENTIAL_CDMACH_S =
28 EXT_CDMA_FREQ_r
- 29 ~~– If SR1_BCCH_SUPPORTED_S is equal to '0', the mobile station shall~~

1 perform the following:

- 2 + If the mobile station supports the Quick Paging Channel or any radio
 3 configuration in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile
 4 station shall set POTENTIAL_CDMACH_S = EXT_CDMA_FREQ_r; otherwise, the
 5 mobile station shall set POTENTIAL_CDMACH_S = CDMA_FREQ_r.

6 If POTENTIAL_CDMACH_S is different from CDMACH_S, the mobile station shall set
 7 CDMACH_S = POTENTIAL_CDMACH_S and then tune to the CDMA Channel (CDMACH_S).

8 The mobile station shall enter the *Timing Change Substate*.

9 2.6.1.4 Timing Change Substate

10 Figure 2.6.1.4-1 illustrates the mobile station timing changes that occur in this substate.
 11 The mobile station synchronizes its long code timing and system timing to those of the
 12 CDMA system, using the PILOT_PN_S, LC_STATE_S, and SYS_TIME_S values obtained from the
 13 received *Sync Channel Message*. SYS_TIME_S is equal to the System Time (see 1.3 of [2])
 14 corresponding to 320 ms past the end of the last 80 ms superframe (see Figure 3.1.3.2.1-1
 15 of [2]) of the received *Sync Channel Message* minus the pilot PN sequence offset.
 16 LC_STATE_S is equal to the system long code state (see 2.1.3.1.12 of [2]) corresponding to
 17 SYS_TIME_S.

18 In the *Timing Change Substate*, the mobile station shall synchronize its long code timing to
 19 the CDMA system long code timing derived from LC_STATE_S, and synchronize its system
 20 timing to the CDMA system timing derived from SYS_TIME_S.

21 The mobile station shall perform the following:

- 22 • If SR1_BCCH_NON_TD_INCL_S, SR1_BCCH_SUPPORTED_S is equal to '1', or if
 SR1_TD_INCL_S is equal to '1' and the mobile supports the transmit diversity mode
 specified by SR1_TD_MODE_S, or if the mobile station supports Spreading Rate 3 on
 the common channel and SR3_INCL_S is equal to '1', the mobile station shall:
 - 26 – Set the stored message sequence numbers CONFIG_MSG_SEQ_S,
 A41_SYS_PAR_MSG_SEQ_S, ACC_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S,
 UNI_NGHBR_LST_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
 EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S and
 PRI_NGHBR_LST_MSG_SEQ_S variables to NULL (see 2.6.2.2);
 - 31 – Set the index number of the Primary Broadcast Control Channel (BCN) to 1;
 - 32 – Set IMSI_11_12_S and MCC_S to NULL;
 - 33 – Perform registration initialization as specified in 2.6.5.5.1.3; and
 - 34 – If the bits of TMSI_CODE_{S-p} are not all equal to '1' and if SYS_TIME_S exceeds
 TMSI_EXP_TIME_{S-p} × 2¹², the mobile station shall set all the bits of
 TMSI_CODE_{S-p} to '1'.
- 37 • Otherwise, the mobile station shall:
 - 38 – Set PAGECH_S to the Primary Paging Channel (see 3.1.3.4 of [2]);

- 1 - Set PAGE_CHAN_S to '1';
 2 - Set the stored message sequence numbers CONFIG_MSG_SEQ_S,
 3 SYS_PAR_MSG_SEQ_S, ACC_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
 4 GEN_NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 5 CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 6 GLOB_SERV_REDIR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
 7 EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S and
 8 PRI_NGHBR_LST_MSG_SEQ_S variables to NULL (see 2.6.2.2);
 9 - Set IMSI_11_12_S and MCC_S to NULL;
 10 - Perform registration initialization as specified in 2.6.5.5.1.3; and
 11 - If the bits of TMSI_CODE_{S-p} are not all equal to '1' and if SYS_TIME_S exceeds
 12 TMSI_EXP_TIME_{S-p} × 2¹², the mobile station shall set all the bits of
 13 TMSI_CODE_{S-p} to '1'.
 14 The mobile station shall enter the *Mobile Station Idle State*.

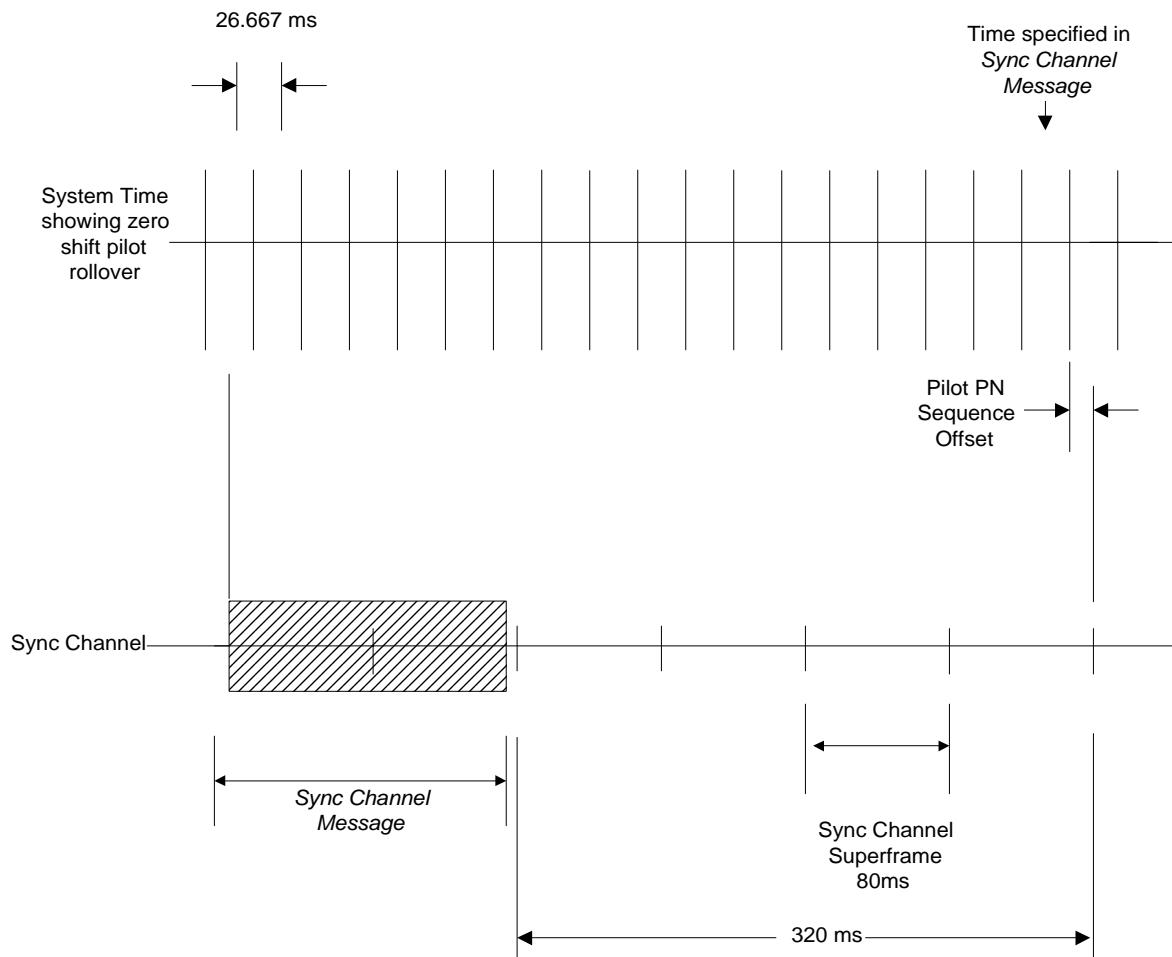

Figure 2.6.1.4-1. Mobile Station Internal Timing

1 2.6.2 Mobile Station Idle State

2 In this state, the mobile station monitors the Paging Channel or the Quick Paging Channel
 3 or Forward Common Control Channel/Primary Broadcast Control Channel. The mobile
 4 station can receive messages, receive an incoming call (mobile station terminated call),
 5 initiate a call (mobile station originated call), cancel a PACA call, initiate a registration, or
 6 initiate a message transmission.

7 The mobile station may monitor the Quick Paging Channel to determine if it should receive
 8 messages from the Paging Channel or Forward Common Control Channel.

9 Upon entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the
 10 mobile station shall perform the following:

- 11 • If $\text{SR1_BCCH_NON_TD_INCL}_S$ $\text{SR1_BCCH_SUPPORTED}_S$ is equal to '1', or if
 12 SR1_TD_INCL_S is equal to '1' and the mobile station supports the transmit diversity
 13 mode specified by SR1_TD_MODE_S , or if the mobile station supports Spreading Rate
 14 3 on the common channel and SR3_INCL_S is equal to '1', the mobile station shall
 15 perform the following:
 - 16 - Set its Primary Broadcast Control Channel code channel to BCCH_S ,
 - 17 - Set the Primary Broadcast Control Channel data rate as determined by BRAT_S ,
 - 18 - Set the Primary Broadcast Control Channel code rate as determined by
 19 BCCH_CODE_RATE_S .
 - 20 - Set SLOTTED_S to YES if T_SLOTTED_S is equal to '00000000' or if the mobile
 21 station does not support the slotted timer; otherwise enable the TMS_Slotted
 22 timer with the duration specified by T_SLOTTED_S and set SLOTTED_S to NO, and
 - 23 - Perform common channel supervision as specified in 2.6.2.1.1.4.
- 24 • Otherwise, the mobile station shall perform the following:
 - 25 - Set its code channel to PAGECH_S ,
 - 26 - Set the Paging Channel data rate as determined by PRAT_S ,
 - 27 - Set SLOTTED_S to YES if T_SLOTTED_S is equal to '00000000' or if the mobile
 28 station does not support the slotted timer; otherwise enable the TMS_Slotted
 29 timer with the duration specified by T_SLOTTED_S and set SLOTTED_S to NO, and
 - 30 - Perform Paging Channel supervision as specified in 2.6.2.1.1.4.

31 If REDIRECTION_S , PACA_S , and NDSS_ORIG_S are equal to disabled, the mobile station may
 32 exit the *Mobile Station Idle State* at any time and enter the *System Determination Substate* of
 33 the *Mobile Station Initialization State* with a reselection indication (see 2.6.1.1).

34 While in the *Mobile Station Idle State*, the mobile station shall perform the following
 35 procedures:

- 36 • The mobile station shall perform Paging Channel or Forward Common Control
 37 Channel monitoring procedures as specified in 2.6.2.1.1.

- 1 • The mobile station shall perform message acknowledgment procedures as specified
2 in 2.1.1.2 and 2.1.2.1 of [4].
- 3 • The mobile station shall perform registration procedures as specified in 2.6.2.1.3.
- 4 • The mobile station shall perform idle handoff procedures as specified in 2.6.2.1.4.
- 5 • The mobile station shall perform system reselection procedures as specified in
6 2.6.2.1.6.
- 7 • The mobile station shall perform the *Response to Overhead Information Operation* as
8 specified in 2.6.2.2 whenever the mobile station receives a system overhead message
9 (*ANSI-41 System Parameters Message*, *Enhanced Access Parameters Message*,
10 *Extended CDMA Channel List Message*, *MC-RR Parameters Message*, *Universal*
11 *Neighbor List Message*, *ANSI-41 RAND Message*, *System Parameters Message*, *CDMA*
12 *Channel List Message*, *Extended System Parameters Message*, *Neighbor List Message*,
13 *Extended Neighbor List Message*, *General Neighbor List Message*, *Global Service*
14 *Redirection Message*, *Extended Global Service Redirection Message*, *User Zone*
15 *Identification Message*, *Private Neighbor List Message*, or *Access Parameters*
16 *Message*).
- 17 • The mobile station shall perform the *Mobile Station Page Match Operation* as
18 specified in 2.6.2.3 whenever it receives a mobile station-directed page.
- 19 • The mobile station shall perform the *Mobile Station Order and Message Processing*
20 *Operation* as specified in 2.6.2.4 whenever a message or order directed to the mobile
21 station is received other than a mobile station-directed page.
- 22 • The mobile station shall set NDSS_ORIG_S to disabled if directed by the user to
23 cancel the call origination.
- 24 • The mobile station shall perform the *Mobile Station Origination Operation* as specified
25 in 2.6.2.5 if directed by the user to initiate a call, or if NDSS_ORIG_S is equal to
26 enabled.
- 27 • The mobile station shall not send any subsequent *Origination Message* containing
28 the same packet data service option until the system time stored in
29 RETRY_DELAY_S[001]. At the system time stored in RETRY_DELAY_S[001], the mobile
30 station shall reset RETRY_DELAY_S[001] to 0.
- 31 • The mobile station shall perform the *Mobile Station PACA Cancel Operation* as
32 specified in 2.6.2.8, if PACA_S is equal to enabled and any one of the following
33 conditions is met:
 - 34 – PACA_CANCEL is equal to '1'; or
 - 35 – The mobile station is directed by the user to cancel the PACA call.
- 36 • If the PACA state timer expires, the mobile station shall perform the following:
 - 37 – The mobile station should enter the *Update Overhead Information Substate* of the
38 *System Access State* (see 2.6.3) with an origination indication within T_{33m}
39 seconds to re-originate the PACA call.

- Otherwise, the mobile station shall perform the *Mobile Station PACA Cancel Operation* as specified in 2.6.2.8.
- If the mobile station supports *Data Burst Message* transmission, it shall perform the *Mobile Station Message Transmission Operation* as specified in 2.6.2.6 if directed by the user to transmit a message.
- If the mobile station supports the *Device Information Message* on the r-csch, AUTO_MSG_SUPPORTED_S is equal to '1', and the mobile station has detected a change in hook status [since the last time when the mobile station sent hook status information](#), the mobile station shall perform the following:
 - If the autonomous message timer has expired [or is disabled](#), the mobile station shall perform the *Mobile Station Message Transmission Operation* as specified in 2.6.2.6.
 - If the autonomous message timer has not expired, the mobile station shall set the autonomous message timer equal to AUTO_MSG_INTERVAL_S and shall restart the timer.
- The mobile station shall perform the *Mobile Station Power-Down Operation* as specified in 2.6.2.7 if directed by the user to power down.
- If the bits of TMSI_CODE_{S-p} are not all equal to '1' and if System Time (in 80 ms units) exceeds TMSI_EXP_TIME_{S-p} × 2¹², the mobile station shall set all the bits of TMSI_CODE_{S-p} to '1' within T66m seconds.
- If the full-TMSI timer expires or has expired, the mobile station shall set all the bits of TMSI_CODE_{S-p} to '1'. The mobile station shall update the registration variables as described in 2.6.5.5.2.5.

2.6.2.1 Idle Procedures

2.6.2.1.1 Forward Channel Monitoring Procedures

2.6.2.1.1 General Overview

The Paging Channel is divided into 80 ms slots called Paging Channel slots. Paging and control messages for a mobile station operating in the non-slotted mode can be received in any of the Paging Channel slots; therefore, the non-slotted mode of operation requires the mobile station to monitor all slots.

The Forward Common Control Channel is divided into 80 ms slots called Forward Common Control Channel slots. Paging and mobile directed messages for a mobile station operating in the non-slotted mode can be received in any of the Forward Common Control Channel slots. The overhead messages can be received on the Primary Broadcast Control Channel. Therefore, the non-slotted mode of operation requires the mobile station to continuously monitor the Forward Common Control Channel/Primary Broadcast Control Channel.

¹ 2.6.2.1.1.1 General Overview for Individually Addressed Messages

² The Paging Channel or the Forward Common Control Channel protocol provides for
³ scheduling the transmission of messages for a specific mobile station in certain assigned
⁴ slots. Support of this feature is optional and may be enabled by each mobile station. A
⁵ mobile station that monitors the Paging Channel or the Forward Common Control Channel
⁶ only during certain assigned slots is referred to as operating in the slotted mode. During
⁷ the slots in which the Paging Channel or the Forward Common Control Channel is not
⁸ being monitored, the mobile station can stop or reduce its processing for power
⁹ conservation. A mobile station may not operate in the slotted mode in any state except the
¹⁰ *Mobile Station Idle State*.

¹¹ A mobile station operating in the slotted mode generally monitors the Paging Channel or the
¹² Forward Common Control Channel for one or two slots per slot cycle. The mobile station
¹³ can specify its preferred slot cycle using the SLOT_CYCLE_INDEX field in the *Registration*
¹⁴ *Message*, *Origination Message*, or *Page Response Message*. The mobile station can also
¹⁵ specify its preferred slot cycle using the SLOT_CYCLE_INDEX field of the *Terminal*
¹⁶ *Information* record of the *Status Response Message* or the *Extended Status Response*
¹⁷ *Message*. In addition, the mobile station can also specify its preferred slot cycle using the
¹⁸ SLOT_CYCLE_INDEX field of the *Terminal Information* record of the *Status Response*
¹⁹ *Message* or the *Status Message* when in the *Mobile Station Control on the Traffic Channel*
²⁰ *State*. The length of the slot cycle, T, in units of 1.28 seconds,¹ is given by

$$T = 2^i,$$

²² where i is the selected slot cycle index (see 2.6.2.1.1.3).

²³ A mobile station operating in the slotted mode may optionally monitor additional slots to
²⁴ receive broadcast messages and/or broadcast pages (see 2.6.2.1.1.3.3 and 2.6.2.1.1.3.4).

²⁵ There are $16 \times T$ slots in a slot cycle.

²⁶ SLOT_NUM is the Paging Channel or the Forward Common Control Channel slot number,
²⁷ modulo the maximum length slot cycle (2048 slots). That is, the value of SLOT_NUM is

$$\text{SLOT_NUM} = \lfloor t/4 \rfloor \bmod 2048,$$

²⁹ where t is the System Time in frames. For each mobile station, the starting times of its slot
³⁰ cycles are offset from the slot in which SLOT_NUM equals zero by a fixed, randomly selected
³¹ number of slots as specified in 2.6.2.1.1.3.

³² Figure 2.6.2.1.1.1-1 shows an example for a slot cycle length of 1.28 seconds, in which the
³³ computed value of PGSLOT (see 2.6.2.1.1.3) is equal to 6, so that one of the mobile station's
³⁴ slot cycles begins when SLOT_NUM equals 6. The mobile station begins monitoring the
³⁵ Paging Channel or the Forward Common Control Channel at the start of the slot in which
³⁶ SLOT_NUM equals 6. The next slot in which the mobile station must begin monitoring the

¹ The minimum length slot cycle consists of 16 slots of 80 ms each, hence 1.28 seconds.

- 1 Paging Channel or the Forward Common Control Channel is 16 slots later, i.e., the slot in
 2 which SLOT_NUM is 22.

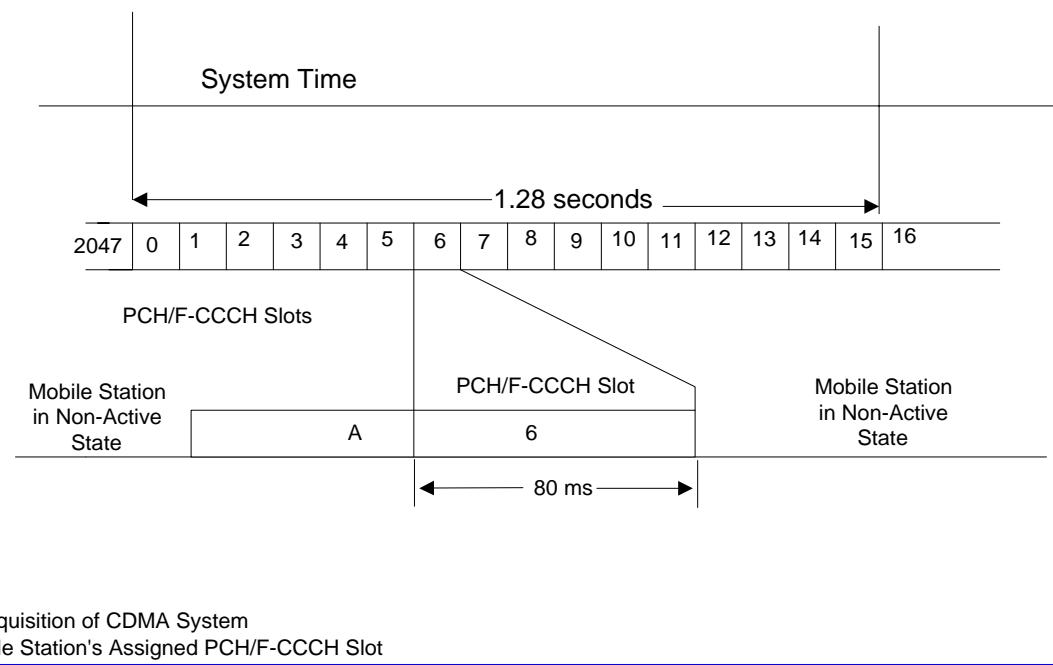

Figure 2.6.2.1.1.1-1. Mobile Station Idle Slotted Mode Structure Example

2.6.2.1.1.1 Overview of Stopping Monitoring via the General Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel based upon indications received from Layer 2 (see 2.1.2.2.4.1 of [4]). When the *General Page Message* is used, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *General Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

A *General Page Message* contains four fields: CLASS_0_DONE, CLASS_1_DONE, TMSI_DONE, and ORDERED_TMSIS, which indicate when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel.

When CLASS_0_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 0 IMSI will be directed to the mobile station during the current slot. When CLASS_1_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 1 IMSI will be directed to the mobile station during the current slot. Similarly, when TMSI_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the

1 slotted mode, no further messages or records addressed by a TMSI will be directed to the
 2 mobile station during the current slot.

3 The field ORDERED_TMSIS, when set to '1' during a mobile station's assigned slot,
 4 indicates that the base station has ordered TMSI page records directed to mobile stations
 5 operating in the slotted mode so that the resulting TMSI_CODE values are in ascending
 6 order in the *General Page Messages* in the slot.

7 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and
 8 does not have a TMSI assigned (all the bits of TMSI_CODE_{s-p} are equal to '1'), may stop
 9 monitoring the Paging Channel or the Forward Common Control Channel after processing a
 10 *General Page Message* containing CLASS_0_DONE equal to '1'. Similarly, a mobile station
 11 which is operating in the slotted mode, has a class 1 IMSI assigned, and does not have a
 12 TMSI assigned (all the bits of TMSI_CODE_{s-p} are equal to '1'), may stop monitoring the
 13 Paging Channel or the Forward Common Control Channel after processing a *General Page*
 14 *Message* containing CLASS_1_DONE equal to '1'.

15 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and
 16 has a TMSI assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop
 17 monitoring the Paging Channel or the Forward Common Control Channel after processing a
 18 *General Page Message* containing both CLASS_0_DONE equal to '1' and TMSI_DONE equal
 19 to '1'. Similarly, a mobile station which is operating in the slotted mode, has a class 1 IMSI
 20 assigned, and has a TMSI assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may
 21 stop monitoring the Paging Channel or the Forward Common Control Channel after
 22 processing a *General Page Message* containing both CLASS_1_DONE equal to '1' and
 23 TMSI_DONE equal to '1'.

24 If ORDERED_TMSIS is equal to '1' and CLASS_0_DONE is equal to '1', a mobile station
 25 which has a class 0 IMSI assigned, is operating in the slotted mode, and has a TMSI
 26 assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop monitoring the Paging
 27 Channel or the Forward Common Control Channel after processing a page record with a
 28 TMSI_CODE value of higher numerical value than TMSI_CODE_{s-p}.

29 If ORDERED_TMSIS is equal to '1' and CLASS_1_DONE is equal to '1', a mobile station
 30 which has a class 1 IMSI assigned, is operating in the slotted mode, and has a TMSI
 31 assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop monitoring the Paging
 32 Channel or the Forward Common Control Channel after processing a page record with a
 33 TMSI_CODE value of higher numerical value than TMSI_CODE_{s-p}.

34 The mobile station continues to monitor the Paging Channel or the Forward Common
 35 Control Channel for one additional slot unless, within its assigned slot, the mobile station
 36 receives a *General Page Message* containing the appropriate indicator permitting it to stop
 37 monitoring the Paging Channel or the Forward Common Control Channel (CLASS_0_DONE,
 38 CLASS_1_DONE, TMSI_DONE, or ORDERED_TMSIS equal to '1', whichever is appropriate).
 39 This allows the base station to carry over a message begun in the assigned slot into the
 40 following slot, if necessary.

1 2.6.2.1.1.1.2 Overview of Stopping Monitoring via the Universal Page Message

2 Layer 3 determines when a mobile station operating in the slotted mode may stop
 3 monitoring the Forward Common Control Channel based upon indications from Layer 2
 4 (see 2.1.2.2.4.2 of [4]). When the *Universal Page Message* is used on the Forward
 5 Common Control Channel, Layer 2 determines whether there is an address mismatch or a
 6 broadcast address mismatch, based upon the address information received in the *Universal*
 7 *Page Message*. Based upon the address mismatch and broadcast address mismatch
 8 indications received from Layer 2, Layer 3 can determine when no further messages or
 9 records addressed to an individual mobile station will be present in the slot.

10 The *Universal Page Message* contains the READ_NEXT_SLOT field, which, when equal to '1'
 11 and received in an assigned slot, indicates to a mobile station that it is to monitor the
 12 Forward Common Control Channel in time to receive the first bit of the slot following the
 13 assigned slot. This allows the base station to use both an assigned slot and the following
 14 slot for pages if all of the pages for an assigned slot cannot be fit into the assigned slot. The
 15 *Universal Page Message* also contains the READ_NEXT_SLOT_BCAST field, which, when
 16 equal to '1' and received in an assigned slot or broadcast slot, indicates to a mobile station
 17 configured to receive broadcast messages that it is to monitor the Forward Common Control
 18 Channel in time to receive the first bit of the subsequent slot. This allows the base station
 19 to use the subsequent slot for enhanced broadcast pages if all of the enhanced broadcast
 20 pages for an assigned slot or broadcast slot cannot be fit into the slot.

21 2.6.2.1.1.2 Overview of Broadcast Messages on Paging Channel

22 The Paging Channel protocol provides two methods for the transmission of broadcast
 23 messages. Each method enables mobile stations operating in the slotted mode or in the
 24 non-slotted mode to receive broadcast messages. A broadcast message on the Paging
 25 Channel is a *Data Burst Message* that has a broadcast address type. A mobile station
 26 operating in the slotted mode has assigned slots that it monitors to receive Paging Channel
 27 messages (see 2.6.2.1.1.1). A broadcast page is a record within a *General Page Message*
 28 that has a broadcast address type. A base station may transmit a broadcast page in an
 29 assigned slot to inform mobile stations monitoring that slot that a broadcast message will
 30 be transmitted in a predetermined subsequent slot. A slot that a mobile station monitors in
 31 order to receive either a broadcast page or a broadcast message is referred to as a broadcast
 32 slot.

33 2.6.2.1.1.2.1 Method 1: Multi-Slot Broadcast Message Transmission

34 According to this method, a broadcast message is sent in a sufficient number of assigned
 35 slots such that it may be received by all mobile stations that are operating in the slotted
 36 mode.

37 Figure 2.6.2.1.1.2.1-1 shows an example for the case when the maximum slot cycle index
 38 is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst*
 39 *Message* is transmitted in 16 consecutive slots.

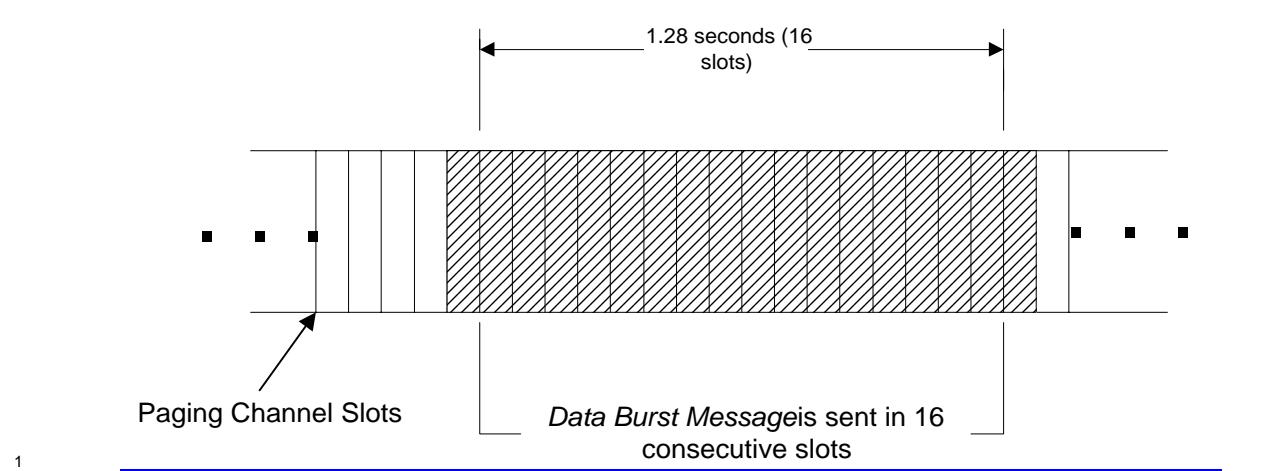

Figure 2.6.2.1.1.2.1-1. Multi-Slot Broadcast Message Transmission Example

2.6.2.1.1.2.2 Method 2: Periodic Broadcast Paging

According to this method, mobile stations configured to receive broadcast messages monitor a specific broadcast slot (the first slot of a broadcast paging cycle; see 2.6.2.1.3.3). There are two methods of sending broadcast messages used with Periodic Broadcast Paging.

If all of the broadcast messages to be transmitted fit within the first slot of a broadcast paging cycle, they may all be transmitted in this broadcast slot. If there is a single broadcast message to be transmitted, it may be transmitted beginning in this broadcast slot.

Alternately, one or more broadcast pages may be transmitted in the first slot of a broadcast paging cycle. Each broadcast page is associated with a subsequent broadcast slot. For each broadcast page, an associated broadcast message may be transmitted in the associated subsequent broadcast slot. The broadcast slot for the associated broadcast message is determined according to the position of the broadcast page within the *General Page Message* transmitted in the first slot of the broadcast paging cycle.

Figure 2.6.2.1.1.2.2-1 shows an example of Periodic Broadcast Paging when the broadcast index is set to 1. A *General Page Message* containing three broadcast pages is transmitted in the first slot of the broadcast paging cycle. For each of the three broadcast pages, a *Data Burst Message* is transmitted in a subsequent slot.

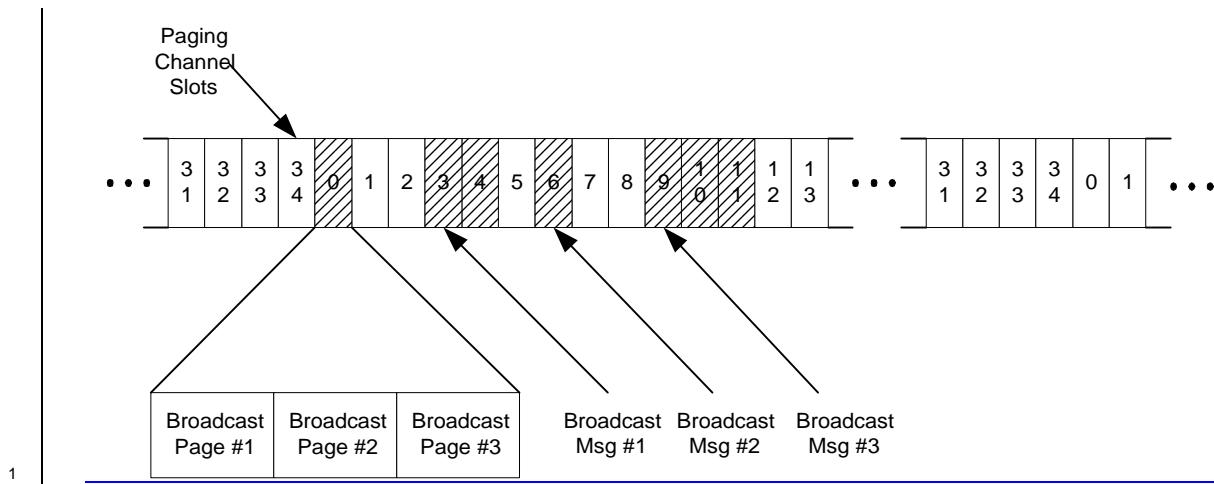

Figure 2.6.2.1.1.2.2-1. Periodic Broadcast Paging Example

2.6.2.1.1.1.3 Overview of Broadcast Messages on Broadcast Control Channel

The Broadcast Control Channel/Forward Common Control Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages on the Broadcast Control Channel. A broadcast message on the Broadcast Control Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned Forward Common Control Channel slots that it monitors to receive Forward Common Control Channel messages (see 2.6.2.1.1.1). A mobile station operating in the slotted mode and configured to receive broadcast messages may also have special assigned Forward Common Control Channel slots, called broadcast slots, that it monitors to receive enhanced broadcast pages. An enhanced broadcast page is a record within a *General Page Message* or a *Universal Page Message* that has a broadcast address type and that includes broadcast message scheduling information. A base station may transmit an enhanced broadcast page in an assigned Forward Common Control Channel slot, or in a broadcast slot, to inform mobile stations that a broadcast message will be transmitted in a specified Broadcast Control Channel slot. The enhanced broadcast page identifies the Broadcast Control Channel and the slot the mobile station is to monitor to receive the broadcast message.

2.6.2.1.1.3.1 Method 1: Multi-Slot Enhanced Broadcast Paging

According to this method, an enhanced broadcast page is sent in a sufficient number of assigned slots on the Forward Common Control Channel such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.3.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. The enhanced broadcast page is transmitted in 16 consecutive slots.

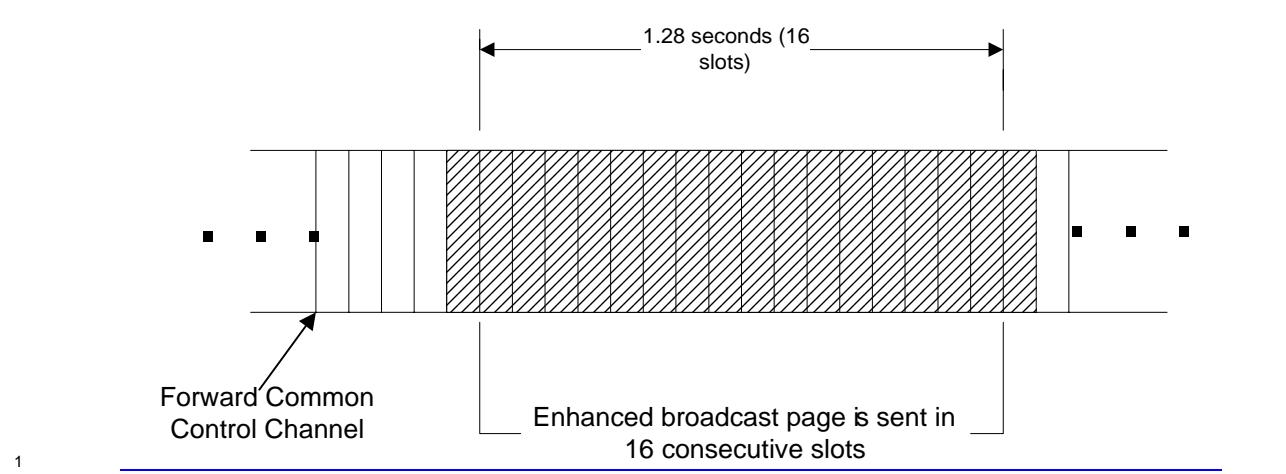

Figure 2.6.2.1.1.3.1-1. Multi-Slot Enhanced Broadcast Paging Example

3

2.6.2.1.1.3.2 Method 2: Periodic Enhanced Broadcast Paging

5 According to this method, mobile stations configured to receive broadcast messages monitor
6 a specific broadcast slot (the first slot of a broadcast paging cycle).

7 One or more enhanced broadcast pages may be transmitted in the first slot of a broadcast
8 paging cycle and/or in the subsequent slot. Each enhanced broadcast page is associated
9 with a subsequent broadcast slot. The broadcast slot for the associated broadcast message
10 is determined according to a time offset specified in the enhanced broadcast page. In
11 addition, a broadcast slot for a repeat of the broadcast message can be specified via a time
12 offset from the slot of the first broadcast message.

13 2.6.2.1.1.2 Non-Slotted Mode Requirements

14 A mobile station operating in the non-slotted mode shall monitor the Paging Channel or the
15 Forward Common Control Channel/Primary Broadcast Control Channel at all times. If the
16 mobile station declares a loss of the Paging Channel or the Forward Common Control
17 Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall
18 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
19 system lost indication (see 2.6.1.1).

20 When a mobile station monitors the Paging Channel or the Forward Common Control
21 Channel in any state other than the *Mobile Station Idle State*, it shall operate in the non-
22 slotted mode.

23 A mobile station monitoring the Paging Channel shall operate in the non-slotted mode when
24 $PACAS_S$ is equal to enabled.

25 A mobile station monitoring the Paging Channel shall operate in the non-slotted mode when
26 $SLOTTED_S$ is equal to NO.

27 2.6.2.1.1.3 Slotted Mode Requirements

28 A mobile station monitoring the Paging Channel shall not operate in the slotted mode if any

1 of the of the following conditions are true:

- 2 • SLOTTED_S is equal to NO,
- 3 • Bit 5 of the station class mark is set to '0' (see 2.3.3),
- 4 • PACA_S is equal to enabled, or
- 5 • The mobile station's configuration parameters are not current (see 2.6.2.2).

6 A mobile station monitoring the Forward Common Control Channel shall not operate in the
7 slotted mode if either of the following conditions is true:

- 8 • Bit 5 of the station class mark is set to '0' (see 2.3.3), or
- 9 • The mobile station's configuration parameters are not current (see 2.6.2.2).

10 A mobile station monitoring the Forward Common Control Channel with bit 5 of the station
11 class mark set to '1' shall monitor all Forward Common Control Channel slots (see
12 2.6.2.1.1.3.1) if either of the following conditions is true:

- 13 • SLOTTED_S is equal to NO, or
- 14 • PACA_S is equal to enabled.

15 During operation in the slotted mode, the mobile station shall ensure that its stored
16 configuration parameter values are current (see 2.6.2.2).

17 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
18 Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall
19 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
20 system lost indication (see 2.6.1.1).

21 2.6.2.1.1.3.1 Monitoring Assigned Slots

22 If the mobile station does not support Quick Paging Channel operation or if
23 QPCH_SUPPORTED_S = '0', the mobile station shall monitor the Paging Channel or the
24 Forward Common Control Channel in each of its assigned slots.

25 If the mobile station supports Quick Paging Channel operation and if QPCH_SUPPORTED_S
26 = '1', for each of its assigned slots, the mobile station shall perform the following:

- 27 • The mobile station should check its assigned paging indicators in the complete
28 Quick Paging Channel slot immediately preceding its assigned Paging Channel or
29 Forward Common Control Channel slot, as specified in 2.6.2.1.2.1; the mobile
30 station shall monitor the assigned Paging Channel or Forward Common Control
31 Channel slot if the paging indicators meet the conditions specified in 2.6.2.1.2.2.
- 32 • If the mobile station does not check its assigned paging indicators, the mobile
33 station shall monitor its assigned Paging Channel or Forward Common Control
34 Channel slot.

35 If the mobile station supports Quick Paging Channel operation, the mobile station is
36 configured to receive broadcast messages, BCAST_INDEX_S is not equal to '000', and
37 QPCH_BI_SUPPORTED_S equals '1', then for each of its assigned broadcast slots on the
38 Forward Common Control Channel, the mobile station shall perform the following:

- 1 • The mobile station should check the broadcast indicators in the complete Quick
2 Paging Channel broadcast slot immediately preceding its assigned broadcast slot, as
3 specified in 2.6.2.1.1.3.3.
- 4 • The mobile station should receive its assigned broadcast slot on the Forward
5 Common Control Channel if the broadcast indicators meet the conditions specified
6 in 2.6.2.1.2.1.

7 The mobile station shall monitor each slot following an assigned slot in which the mobile
8 station received a *Universal Page Message* with READ_NEXT_SLOT equal to '1', and shall
9 begin monitoring the Forward Common Control Channel in time to receive the first bit of
10 the slot. If the mobile station is configured to receive broadcast messages, it shall monitor
11 each slot following an assigned slot in which the mobile station received a *Universal Page*
12 *Message* with READ_NEXT_SLOT_BCAST equal to '1', and shall begin monitoring the
13 Forward Common Control Channel in time to receive the first bit of the slot.

14 If SLOTTED_S is equal to NO or PACA_S is equal to enabled, the mobile station may stop
15 monitoring a Forward Common Control Channel slot when Layer 3 receives an address
16 mismatch indication from Layer 2. When the mobile station stops monitoring a Forward
17 Common Control Channel slot when SLOTTED_S is equal to NO or PACA_S is equal to
18 enabled, the mobile station shall begin monitoring the subsequent Forward Common
19 Control Channel slot in time to receive the first bit of the slot.

20 If the mobile station monitors a Paging Channel or Forward Common Control Channel slot,
21 it shall begin monitoring the Paging Channel or the Forward Common Control Channel in
22 time to receive the first bit of the slot. If the mobile station is not configured to receive
23 broadcast addresses, the mobile station shall continue to monitor the Paging Channel or
24 the Forward Common Control Channel until one of the following conditions is satisfied:

- 25 • Layer 3 receives an address mismatch indication from Layer 2 (see 2.1.2.2.2.4 of
26 [4]); or
- 27 • The mobile station monitors the assigned slot and the slot following the assigned
28 slot, and the mobile station receives at least one valid message (see 2.1.2.4.2 of [4]).

29 If the mobile station is configured to receive broadcast addresses and the mobile station is
30 monitoring a Paging Channel, the mobile station shall continue to monitor the Paging
31 Channel until one of the preceding conditions is satisfied and should monitor the Paging
32 Channel until Layer 3 receives a broadcast address mismatch indication from Layer 2 (see
33 2.1.2.2.2.4 of [4]).

34 If the mobile station is configured to receive broadcast addresses and the mobile station is
35 monitoring a Forward Common Control Channel Channel, the mobile station shall continue
36 to monitor the the Forward Common Control Channel until one of the preceding conditions
37 is satisfied and should monitor the Forward Common Control Channel until Layer 3
38 receives a broadcast address mismatch indication from Layer 2 (see 2.1.2.2.2.4 of [4]).

39 The mobile station shall monitor each slot following a broadcast slot in which the mobile
40 station received a *Universal Page Message* with READ_NEXT_SLOT_BCAST equal to '1', and
41 shall begin monitoring the Forward Common Control Channel in time to receive the first bit
42 of the slot.

1 For each broadcast slot monitored to receive broadcast pages or broadcast messages that is
 2 not one of its assigned slots, the mobile station should begin monitoring the Paging
 3 Channel or the Forward Common Control Channel in the first bit of the broadcast slot. The
 4 mobile station should continue to monitor the Paging Channel or the Forward Common
 5 Control Channel until one of the following conditions is satisfied:

- 6 • Layer 3 receives a broadcast address mismatch indication from Layer 2; or
- 7 • The mobile station monitors the Paging Channel or the Forward Common Control
 8 Channel to receive all messages beginning in the broadcast slot and in the slot
 9 following the broadcast slot, and the mobile station receives at least one valid
 10 message (see 2.2.2.3.2 of [4]).

11 To determine its assigned slots, the mobile station shall use the hash function specified in
 12 2.6.7.1 to select a number, PG SLOT, in the range 0 to 2047 (spanning the maximum slot
 13 cycle length, which is 163.84 seconds). The mobile station's assigned slots shall be those
 14 slots in which

$$15 \lfloor t/4 \rfloor - PG SLOT \bmod (16 \times T) = 0,$$

16 where t is the System Time in frames and T is the slot cycle length in units of 1.28 seconds
 17 given by

$$18 T = 2^i,$$

19 where i is the slot cycle index.

20 For each slot on the Broadcast Control Channel monitored to receive broadcast messages,
 21 the mobile station should begin monitoring the Broadcast Control Channel in the first bit of
 22 the slot. The mobile station should continue to monitor the Broadcast Control Channel
 23 until one of the following conditions is satisfied:

- 24 • The mobile station has monitored all frames of a Broadcast Control Channel slot
 25 and the frame quality for all of the frames of the slot was insufficient; or
- 26 • The mobile station monitors the Broadcast Control Channel slot specified by the
 27 enhanced broadcast page and the slot did not contain an SCI bit set to '1' (see [4]).
- 28 • The mobile station has received a broadcast *Data Burst Message* having the same
 29 BURST_TYPE and broadcast address as the enhanced broadcast page which
 30 announced the *Data Burst Message*.

31 2.6.2.1.1.3.2 Determination of the Slot Cycle Index

32 If the SID and NID of the current base station (SID_S and NID_S , as stored from the *System
 33 Parameters Message* or *ANSI-41 System Parameters Message*) do not match any entry of
 34 $SID_NID_LIST_S$, the mobile station shall use a slot cycle index no greater than the smaller
 35 of $MAX_SLOT_CYCLE_INDEX_S$ and 1; otherwise, the mobile station shall use a slot cycle
 36 index no greater than $SLOT_CYCLE_INDEX_S$ (see 2.6.2.2.1.6).

37 If the mobile station is directed by the user to modify the preferred slot cycle index
 38 ($SLOT_CYCLE_INDEX_p$), the mobile station shall perform parameter-change registration
 39 (see 2.6.5.1.6).

1 2.6.2.1.1.3.3 Slot Cycles for Broadcast Message Transmission

2 2.6.2.1.1.3.3.1 Slot Cycles for Broadcast Message Transmission on the Paging Channel

3 Distribution of broadcast messages relies on specially defined Paging Channel slot cycles.

4 The definitions are as follows:

5 *Maximum paging cycle:* On the Paging Channel, a maximum paging cycle is a Paging
6 Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M slots such that:

$$7 \quad M = 2^i \times 16, \quad 0 \leq i \leq 7$$

8 where $i = \text{MAX_SLOT_CYCLE_INDEX}_S$ as received in the *System Parameters Message*.

9 The first slot of each maximum paging cycle is any Paging Channel slot in which

$$10 \quad \lfloor t/4 \rfloor \bmod M = 0,$$

11 where t represents system time in frames.

12 *Broadcast paging cycle:* On the Paging Channel, a broadcast paging cycle is a Paging
13 Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of B + 3 slots where:

$$14 \quad B = 2^i \times 16, \quad 1 \leq i \leq 7$$

15 where $i = \text{BCAST_INDEX}_S$ as received in the *Extended System Parameters Message*, or set
16 by default when the *Extended System Parameters Message* is not sent.

17 The first slot of each broadcast paging cycle is any Paging Channel slot in which

$$18 \quad \lfloor t/4 \rfloor \bmod (B + 3) = 0,$$

19 where t represents system time in frames.

20 2.6.2.1.1.3.3.2 Slot Cycles for Broadcast Message Transmission on the Forward Common
21 Control Channel

22 Distribution of broadcast messages relies on specially defined Forward Common Control
23 Channel slot cycles. The definitions are as follows:

24 *Maximum paging cycle:* On the Forward Common Control Channel, a maximum paging
25 cycle is a Forward Common Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M
26 slots such that:

$$27 \quad M = 2^i \times 16, \quad 0 \leq i \leq 7$$

28 where $i = \text{MAX_SLOT_CYCLE_INDEX}_S$ as received in the *MC-RR Parameters Message*.

29 The first slot of each maximum paging cycle is any Forward Common Control Channel slot
30 in which

$$31 \quad \lfloor t/4 \rfloor \bmod M = 0,$$

1 where t represents system time in frames.

2 *Broadcast paging cycle*: On the Forward Common Control Channel, a broadcast paging
3 cycle is a Forward Common Control Channel slot cycle (see 2.6.2.1.1.3.1) having a duration
4 of B + 7 slots where:

5
$$B = 2^{1+i} \times 16, 1 \leq i \leq 7$$

6 where $i = \text{BCAST_INDEX}_S$ as received in the *MC-RR Parameters Message*.

7 The first slot of each broadcast paging cycle is any Forward Common Control Channel slot
8 in which

9
$$\lfloor t/4 \rfloor \bmod (B + 7) = 0,$$

10 where t represents system time in frames.

11 2.6.2.1.1.3.4 Monitoring Paging Channel Broadcasts

12 The following requirements apply to mobile stations monitoring the Paging Channel and
13 supporting the reception of broadcast messages.

14 If BCAST_INDEX_S is equal to '000', the mobile station shall monitor only its assigned Paging
15 Channel slots (see 2.6.2.1.1.3.1).

16 If BCAST_INDEX_S is not equal to '000', and the mobile station is configured to receive
17 messages addressed to broadcast addresses, the mobile station should also monitor the
18 Paging Channel beginning with the first slot of each broadcast paging cycle (see
19 2.6.2.1.1.3.3).

20 If the mobile station receives a broadcast page containing a burst type and broadcast
21 address that the mobile station has been configured to receive (see 2.6.2.3), the mobile
22 station should monitor the slot in which the corresponding broadcast Paging Channel
23 message will be sent, determined as follows:

- 24 • The mobile station shall consider a broadcast page to have been received in the
25 paging slot in which the *General Page Message* containing the broadcast page
26 began.
- 27 • If BCAST_INDEX_S is not equal to '000', the paging slot containing the broadcast
28 page is defined as the reference slot.
- 29 • Let n represent the ordinal number of the broadcast page relative to other broadcast
30 pages that are contained in the same *General Page Message* (n = 1, 2, 3,...). The
31 mobile station should monitor the Paging Channel slot that occurs $n \times 3$ paging
32 slots after the reference slot.

33 After receiving a broadcast message or a broadcast page and a corresponding broadcast
34 Paging Channel message when BCAST_INDEX_S is not equal to '000', the mobile station
35 should discard all further broadcast pages and all further broadcast Paging Channel
36 messages containing the same BURST_TYPE and BC_ADDR fields that are received within
37 $4 \times (B + 3)$ paging slots of the first paging slot in the broadcast paging cycle in which the

1 broadcast page or broadcast message was first received. ($B + 3$ is the duration of the
2 broadcast paging cycle as defined in 2.6.2.1.1.3.3).

3 **2.6.2.1.1.3.5 Support of Broadcast Delivery Options on the Paging Channel**

4 A mobile station configured to receive broadcast messages shall support reception of
5 broadcast messages transmitted using Multi-Slot Broadcast Message Transmission (see
6 3.6.2.4.1.2.1.1).

7 A mobile station configured to receive broadcast messages shall support reception of
8 broadcast messages transmitted using Periodic Broadcast Paging (see 3.6.2.4.1.2.1.2).

9 **2.6.2.1.1.3.6 Monitoring the Forward Common Control Channel for the Enhanced
10 Broadcast Page**

11 The following requirements apply to mobile stations monitoring the Forward Common
12 Control Channel and supporting the reception of broadcast messages.

13 If $BCAST_INDEX_S$ is equal to '000', the mobile station shall monitor only its assigned Quick
14 Paging Channel slots or its assigned Forward Common Control Channel slots (see 2.6.2.1.2)
15 for enhanced broadcast pages.

16 If $BCAST_INDEX_S$ is not equal to '000', and the mobile station is configured to receive
17 messages addressed to broadcast addresses, the mobile station should also monitor the
18 Quick Paging Channel broadcast slots or the Forward Common Control Channel broadcast
19 slots (see 2.6.2.1.2) beginning with the first slot of each broadcast paging cycle.

20 If the mobile station receives an enhanced broadcast page containing a burst type and
21 broadcast address that the mobile station has been configured to receive, the mobile station
22 should monitor at least one Broadcast Control Channel slot in which the corresponding
23 broadcast message will be sent, determined as follows:

- 24 • The mobile station shall monitor the Broadcast Control Channel slot which begins
25 $40\text{ ms} \times (1 + \text{TIME_OFFSET})$ later than the beginning of the slot in which the
26 message containing the enhanced broadcast page began or the Broadcast Control
27 Channel slot which begins $40\text{ ms} \times (1 + \text{REPEAT_TIME_OFFSET})$ later than the
28 Broadcast Control Channel slot in which the first transmission began.

29 After receiving an enhanced broadcast page and a corresponding broadcast message when
30 $BCAST_INDEX_S$ is not equal to '000', the mobile station should discard all further enhanced
31 broadcast pages containing the same BURST_TYPE and having the same broadcast address
32 that are received within $4 \times (B + 7)$ slots of the first slot in the broadcast paging cycle in
33 which the enhanced broadcast page was received. ($B + 7$ is the duration of the broadcast
34 paging cycle as defined in 2.6.2.1.1.3.3.1). The mobile station should ignore broadcast
35 messages for which a corresponding enhanced broadcast page was not received.

36 If the mobile station received an enhanced broadcast page and a corresponding broadcast
37 message, and the broadcast message announced by a pending enhanced broadcast page
38 containing the same BURST_TYPE and having the same broadcast address has not yet been
39 received, the mobile station shall ignore the pending enhanced broadcast page.

1 2.6.2.1.3.7 Support of Broadcast Delivery Options on the Forward Common Control
2 Channel/Broadcast Control Channel

3 A mobile station configured to receive broadcast messages shall support reception of
4 broadcast messages transmitted using Multi-Slot Enhanced Broadcast Paging (see
5 2.6.2.1.1.3.1).

6 A mobile station configured to receive broadcast messages shall support reception of
7 broadcast messages transmitted using Periodic Enhanced Broadcast Paging (see
8 2.6.2.1.1.3.2).

9 **2.6.2.1.4 Common Channel Supervision**

10 The mobile station shall monitor the Paging Channel, the Forward Common Control
11 Channel, or the Primary Broadcast Control Channel as specified in 2.6.2.1.1. The mobile
12 station shall set a timer for T_{30m} seconds whenever it begins to monitor the Paging
13 Channel, the Forward Common Control Channel, or the Primary Broadcast Control
14 Channel. The mobile station shall reset the timer for T_{30m} seconds whenever it gets an
15 indication that a valid message was received on the Paging Channel, the Forward Common
16 Control Channel, or the Primary Broadcast Control Channel, whether addressed to the
17 mobile station or not (see 2.1.2.3.2 of [4]). The mobile station shall disable the timer when
18 it is not monitoring the Paging Channel, the Forward Common Control Channel, or the
19 Primary Broadcast Control Channel. If the timer expires, the mobile station shall declare a
20 loss of the Paging Channel, the Forward Common Control Channel, or the Primary
21 Broadcast Control Channel.

22 **2.6.2.1.2 Quick Paging Channel Monitoring Procedures**

23 **2.6.2.1.2.1 Overview**

24 The Quick Paging Channel is divided into 80 ms slots called Quick Paging Channel slots.

25 The Quick Paging Channel protocol provides for scheduling the transmission of paging
26 indicators for a mobile station in Quick Paging Channel slots assigned to the mobile station.
27 Support of this feature is optional.

28 The Quick Paging Channel protocol provides for scheduling the transmission of configuration
29 change indicators for mobile stations in Quick Paging Channel slots. Support of this
30 feature is optional.

31 The Quick Paging Channel protocol provides for scheduling the transmission of broadcast
32 indicators for mobile stations in Quick Paging Channel broadcast slots. Support of this
33 feature is optional.

34 If the mobile station is operating in the slotted mode and it supports the Quick Paging
35 Channel, and QPCH_SUPPORTED_s is equal to '1', the mobile station monitors paging
36 indicators on the Quick Paging Channel as follows:

37 The mobile station's assigned Quick Paging Channel slots are offset from its assigned
38 Paging Channel slots or its assigned Forward Common Control Channel slots by 100 ms, as
39 shown in Figure 2.6.2.1.2.1-1. Two paging indicators are assigned to a mobile station in its

1 assigned Quick Paging Channel slot. In the following, t^* is the start time of the mobile
 2 station's assigned Paging Channel or Forward Common Control Channel slot. According to
 3 the hash function specified in 2.6.7.1, paging indicators are assigned as follows:

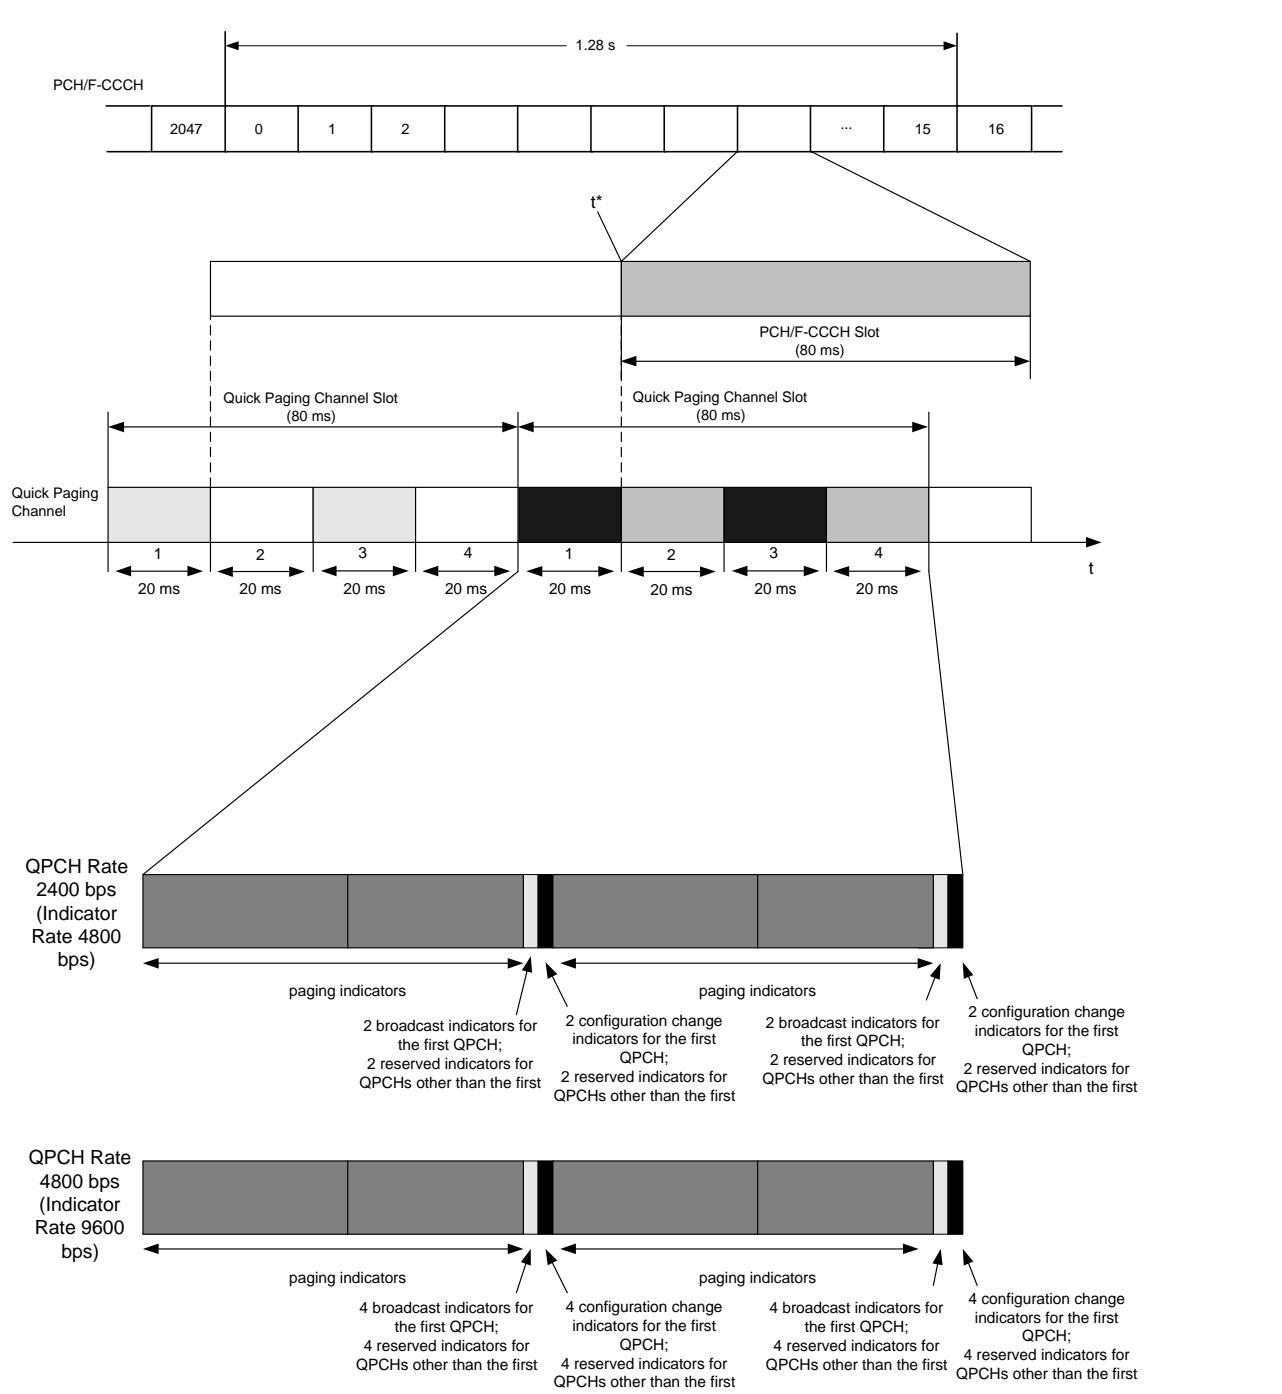

- 4 • The first paging indicator for the mobile station is assigned between (t^*-100) ms and
 5 (t^*-80) ms (marked as 1 in Figure 2.6.2.1.2.1-1) and the second paging indicator is
 6 assigned between (t^*-60) ms and (t^*-40) ms (marked as 3 in the figure); or
- 7 • The first paging indicator for the mobile station is assigned between (t^*-80) ms and
 8 (t^*-60) ms (marked as 2 in the figure) and the second paging indicator is assigned
 9 between (t^*-40) ms and (t^*-20) ms (marked as 4 in the figure).

10 If the mobile station is operating in the slotted mode and it supports the Quick Paging
 11 Channel, the mobile station can, when performing an idle handoff to a base station whose
 12 Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel
 13 has recently been monitored, monitor one or more configuration change indicators.
 14 Configuration change indicators are scheduled every 40 ms on the first Quick Paging
 15 Channel.

16 If the mobile station is operating in the slotted mode, is configured to receive the broadcast
 17 messages, supports the Quick Paging Channel, $BCAST_INDEX_S$ is not equal to '000',
 18 $QPCH_SUPPORTED_S$ is equal to '1', and $QPCH_BI_SUPPORTED_S$ is equal to '1', the mobile
 19 station monitors broadcast indicators on the Quick Paging Channel as follows:

- 20 • The mobile station's assigned Quick Paging Channel broadcast slots are offset from
 21 its assigned Forward Common Control Channel broadcast slots by 100 ms, as
 22 shown in Figure 2.6.2.1.2.1-1.
- 23 • The mobile station monitors one or more broadcast indicators in an assigned Quick
 24 Paging Channel broadcast slot.

25

**Figure 2.6.2.1.2.1-1. Quick Paging Channel Timeline**

1 2.6.2.1.2.2 Requirements

2 A mobile station operating in the slotted mode should monitor the paging indicators in the
3 mobile station's assigned Quick Paging Channel slot if all of the following conditions hold:

- 4 • The mobile station supports the Quick Paging Channel;
- 5 • QPCH_SUPPORTED_S = '1'; and
- 6 • The mobile station is not monitoring the Paging Channel or the Forward Common
7 Control Channel.

8 The mobile station's assigned Quick Paging Channel slots shall be those slots in which

$$9 \quad \lfloor (t+5)/4 \rfloor - \text{PGSLOT} \bmod (16 \times T) = 0.$$

10 where t is the System Time in frames, PGSLOT is selected in the range 0 to 2047 by using
11 the hash function specified in 2.6.7.1, and T is the slot cycle length in units of 1.28 seconds
12 such that

$$13 \quad T = 2^i,$$

14 and i is the slot cycle index.

15 To determine the position of the mobile station's two assigned paging indicators respective
16 to the beginning of the mobile station's assigned Quick Paging Channel slot, the mobile
17 station shall use the hash function specified in 2.6.7.1. The R1 and R2 outputs of the
18 hashing algorithm correspond to an indicator bit position relative to the beginning of the
19 Quick Paging Channel slot. The hashing algorithm is so devised that two paging indicators
20 (R1 and R2) for a mobile station will be in the first and third quarter slot or the second and
21 fourth quarter slot.

22 If the mobile station checks assigned paging indicators, the mobile station shall perform the
23 following:

- 24 • If the mobile station detects that one of the paging indicators is set to "OFF", the
25 mobile station need not detect another paging indicator.
- 26 • If the mobile station does not detect that at least one of the paging indicators is set
27 to "OFF", the mobile station shall monitor its assigned Paging Channel or Forward
28 Common Control Channel slot immediately following its assigned Quick Paging
29 Channel slot.²

30 When performing an idle handoff to a base station whose Paging Channel or Forward
31 Common Control Channel was previously monitored, a mobile station operating in the
32 slotted mode should monitor one or more configuration change indicators on the first Quick

² A case for which the mobile station may not be able to detect that at least one of the paging indicators is set to "OFF" is for a mobile station that misses a part of or its entire Quick Paging Channel slot during overhead information update. In this case, the mobile station monitors its assigned Paging Channel slot.

- 1 Paging Channel for the new base station if all of the following conditions hold:
- 2 • The mobile station supports the Quick Paging Channel;
- 3 • The mobile station has knowledge that the new base station supports the Quick
- 4 Paging Channel;
- 5 • The mobile station has knowledge that the new base station supports configuration
- 6 change indicators,
- 7 • The mobile station is not monitoring the Paging Channel or the Forward Common
- 8 Control Channel; and
- 9 • No more than T_{31m} seconds have elapsed since the mobile station last received a
- 10 valid message on the new Paging Channel or the new Forward Common Control
- 11 Channel.

12 Before monitoring a configuration change indicator, the mobile station shall perform the

13 following:

- 14 • The mobile station shall set $\text{ASSIGNED_QPAGECH}_S$ equal to QPAGECH_S , and
- 15 • The mobile station shall set QPAGECH_S equal to 1.

16 Before monitoring a paging indicator subsequent to monitoring a configuration change

17 indicator, the mobile station shall set QPAGECH_S equal to $\text{ASSIGNED_QPAGECH}_S$.

18 If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit

19 positions of the mobile station's first pair of configuration change indicators shall be the

20 last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the

21 mobile station's second pair of configuration change indicators shall be the last two bits in

22 a Quick Paging Channel slot.

23 If the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the bit

24 positions of the mobile station's first four configuration change indicators shall be the last

25 four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the

26 mobile station's second four configuration change indicators shall be the last four bits in a

27 Quick Paging Channel slot.

28 If the mobile station monitors a configuration change indicator and determines that it is set

29 to "OFF", the mobile station can enter or remain in the slotted mode after an idle handoff

30 (see 2.6.2.1.4.2).

31 If a mobile station is operating in the slotted mode and is configured to receive broadcast

32 messages, it should monitor the broadcast indicators in the mobile station's assigned Quick

33 Paging Channel broadcast slot if all of the following conditions hold:

- 34 • The mobile station supports the Quick Paging Channel;
- 35 • BCAST_INDEX_S is not equal to '000'
- 36 • $\text{QPCH_BI_SUPPORTED}_S = '1'$; and
- 37 • The mobile station is not monitoring the Forward Common Control Channel or the
- 38 Primary Broadcast Control Channel.

1 The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in
 2 which

$$3 \lfloor (t+5)/4 \rfloor \bmod (B + 7) = 0.$$

4 where t is the System Time in frames, and B is the broadcast paging cycle such that B =
 5 $2^{1+i} \times 16$, $1 \leq i \leq 7$ and i = BCAST_INDEX_S as received in the *MC-RR Parameters Message*.

6 The mobile station should monitor one or more broadcast indicators on the Quick Paging
 7 Channel. If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps),
 8 the bit positions of the mobile station's first pair of broadcast indicators shall be the two
 9 bits prior to the last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit
 10 positions of the mobile station's second pair of broadcast indicators shall be the two bits
 11 prior to the last two bits in a Quick Paging Channel slot.

12 If the Quick Paging Channel data rate 4800 bps (indicator rate is 9600 bps), the bit
 13 positions of the mobile station's first four broadcast indicators shall be the four bits prior to
 14 the last four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of
 15 the mobile station's second four broadcast indicators shall be the four bits prior to the last
 16 four bits in a Quick Paging Channel slot.

17 If the mobile station monitors broadcast indicators and determines that they are not set to
 18 "OFF", the mobile station should perform the following:

- 19 • The mobile station should receive its assigned broadcast slot on the Forward
 20 Common Control Channel immediately following its assigned Quick Paging Channel
 21 broadcast slot.

22 2.6.2.1.3 Registration

23 While in the *Mobile Station Idle State*, the mobile station shall perform the registration
 24 procedures specified in 2.6.5.5.2.1.

25 2.6.2.1.4 Idle Handoff

26 2.6.2.1.4.1 Pilot Search

27 An idle handoff occurs when a mobile station has moved from the coverage area of one base
 28 station into the coverage area of another base station during the *Mobile Station Idle State*. If
 29 the mobile station detects a Pilot Channel signal from another base station that is
 30 sufficiently stronger than that of the current base station, the mobile station determines
 31 that an idle handoff should occur. When multiple idle handoff candidates are available, the
 32 mobile station should select, if any, a candidate which supports Primary Broadcast Control
 33 Channel.

34 Pilot Channels are identified by their offsets relative to the zero offset pilot PN sequence (see
 35 3.1.3.2.1). Pilot offsets are grouped into sets describing their status with regard to pilot
 36 searching.

37 The following sets of pilot offsets are defined for a mobile station in the *Mobile Station Idle*
 38 *State*. Each pilot offset is a member of only one set.

- Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or Forward Common Control Channel is being monitored.
- Neighbor Set: The offsets of the Pilot Channels that are likely candidates for idle handoff. The members of the Neighbor Set are specified in the *Neighbor List Message*, *Extended Neighbor List Message*, and the *General Neighbor List Message* on the Paging Channel, and the *Universal Neighbor List Message* on the Primary Broadcast Control Channel.
- Remaining Set: The set of all possible pilot offsets in the current system (integer multiples of PILOT_INC_S) on the current CDMA Frequency Assignment, excluding the pilots in the Neighbor Set and the Active Set.
- Private Neighbor Set: The offsets of the Pilot Channels for the private systems that are likely candidates for idle handoff. The members of the Private Neighbor Set are specified in the *Private Neighbor List Message*.

The mobile station shall support a Neighbor Set size of at least N_{8m} pilots (see Annex D).

In the *Mobile Station Idle State*, the mobile station shall continuously search for the strongest Pilot Channel signal on the corresponding CDMA Frequency Assignment whenever it monitors the Paging Channel or the Forward Common Control Channel.

The mobile station may search other frequencies and band classes. For example, if a pilot in the Neighbor Set or in the Private Neighbor Set is on a different Frequency Assignment than that of the mobile station, this frequency should be included in the search criteria. Search performance criteria are defined in [11].

This search should be governed by the following:

- Active Set: The search window size for the pilot in the Active Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH_WIN_A_S. The mobile station should center the search window for the pilot of the Active Set around the earliest arriving usable multipath component of the pilot. If the mobile station receives a value greater than or equal to 13 for SRCH_WIN_A_r, it may store and use the value 13 in SRCH_WIN_A_S.
- Neighbor Set: The search window size for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH_WIN_NGHBR_S field of the NGHBR_REC for the pilot. The mobile station should center the search window for each pilot in the Neighbor Set around the pilot's PN sequence offset plus the corresponding SRCH_OFFSET_NGHBR_S (see Table 2.6.6.2.1-2) using timing defined by the mobile station's time reference (see 2.1.5 of [2]). The mobile station should use the SEARCH_PRIORITY field of the NGHBR_REC for the corresponding pilot to schedule its neighbor search. If ADD_PILOT_REC_INCL field of the NGHBR_REC for the corresponding pilot is equal to '1', the mobile station shall use the information included in the NGHBR_PILOT_REC field for searching the neighbor.

If the mobile station supports hopping pilot beacons and the TIMING_INCL field of the NGHBR_REC for the corresponding pilot is equal to '1', then the mobile station shall use the information included in the NGHBR_TX_OFFSET, NGHBR_TX_DURATION, and NGHBR_TX_PERIOD fields of the NGHBR_REC for the corresponding pilot to schedule the time for searching the neighbor.

- Remaining Set: The search window size for each pilot in the Remaining Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH_WIN_RS. The mobile station should center the search window for each pilot in the Remaining Set around the pilot's PN sequence offset using timing defined by the mobile station's time reference (see 2.1.5 of [2]). The mobile station should only search for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer multiples of PILOT_INC_S.
- Private Neighbor Set: The search window size for each pilot in the Private Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH_WIN_PRI_NGHBRs field of the PRI_NGHBR_REC for the pilot. The mobile station should center the search window for each pilot in the Private Neighbor Set around the pilot's PN sequence offset using timing defined by the mobile station's time reference (see 2.1.5 of [2]).

If the mobile station determines that one of the Neighbor Set, Private Neighbor Set or Remaining Set Pilot Channel signals is sufficiently stronger (see [11]) than the Pilot Channel of the Active Set, the mobile station should perform an idle handoff as specified in 2.6.2.1.4.2.

A mobile station operating in slotted mode, which is successfully demodulating the Paging Channel or the Forward Common Control Channel, should not perform an idle handoff while it is required to monitor its assigned slot (see 2.6.2.1.1.3.1).

2.6.2.1.4.2 Idle Handoff Procedures

While performing an idle handoff, the mobile station should not begin operating in non-slotted mode after the idle handoff if all of the following conditions hold:

- The mobile station supports the Quick Paging Channel;
- The mobile station has knowledge that the new base station supports configuration change indicators;
- The mobile station determines that the Quick Paging Channel configuration change indicator for the new Quick Paging Channel is set to "OFF" (see 2.6.2.1.2.1); and
- No more than T31m seconds have elapsed since the mobile station last received a valid message on the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel.

Otherwise, the mobile station shall operate in non-slotted mode until the mobile station has received at least one valid configuration message or mobile station-addressed page on the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel. Following the reception of this message the mobile station may resume slotted mode operation in accordance with 2.6.2.1.1.3. After performing an idle handoff, the

1 mobile station shall discard all unprocessed messages received on the old Paging Channel
 2 or Forward Common Control Channel/Primary Broadcast Control Channel.

3 If the new base station is listed in NGHBR_REC_LIST for the old base station (see 2.6.2.2.3,
 4 2.6.2.2.7, and 2.6.2.1.4.1), the mobile station shall use the corresponding 3-bit
 5 NGHBR_CONFIG field to determine the actions required to transition to the new base
 6 station. If the new base station is not listed in NGHBR_REC_LIST for the old base station,
 7 the mobile station shall perform the handoff operation using the same procedure as for a
 8 pilot in NGHBR_REC_LIST with the NGHBR_CONFIG field set to '011'.

9 If the mobile station is currently monitoring the Paging Channel and selected a neighbor
 10 base station for idle handoff which supports Primary Broadcast Control Channel, the
 11 mobile station shall perform the following:

- 12 – The mobile station shall enter the *System Determination Substate* of the *Mobile Station*
 13 *Initialization State* with a new system indication, upon performing idle handoff to this
 14 neighbor base station.
- 15 – The mobile station shall not perform any of the remaining procedures in this section.

16 If the NGHBR_CONFIG field is '000', the mobile station shall perform the following:

- 17 • The mobile station shall set ACC_MSG_SEQ_S and CURR_ACC_MSG_SEQ to NULL
 18 (see 2.6.2.2) and shall set PILOT_PN_S to the pilot offset index of the base station
 19 transmitting the new Paging Channel or Forward Common Control
 20 Channel/Primary Broadcast Control Channel.
- 21 • If the mobile station has not stored configuration parameters for the new Paging
 22 Channel or Forward Common Control Channel and Primary Broadcast Control
 23 Channel, or if the stored information is not current, the mobile station shall perform
 24 the following:
 - 25 – If the mobile station has monitored the Paging Channel before the idle handoff,
 26 the mobile station shall set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S,
 27 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 28 GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
 29 EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S,
 30 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 31 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
 - 32 – If the mobile station has monitored the Forward Common Control
 33 Channel/Primary Broadcast Control Channel before the idle handoff, the mobile
 34 station shall set CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S,
 35 UNI_NGHBR_LST_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S,
 36 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 37 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.

- 1 • If the stored information for the new Paging Channel or the Forward Common
2 Control Channel and Primary Broadcast Control Channel is current, the mobile
3 station shall set CONFIG_MSG_SEQ_S to the stored information for the new Paging
4 Channel or Forward Common Control Channel and Primary Broadcast Control
5 Channel, and the mobile station shall set NGHBR_REC_LIST to the stored
6 information for the new Paging Channel or the new Forward Common Control
7 Channel and Primary Broadcast Control Channel.
- 8 • If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new base station in
9 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_S and
10 CDMACH_S respectively, the mobile station shall set CDMABAND_S to NGHBR_BAND_S,
11 CDMACH_S to NGHBR_FREQ_S, and tune to the new CDMA Channel. The mobile
12 station shall begin monitoring the Paging Channel or the Forward Common Control
13 Channel/Primary Broadcast Control Channel of the new base station, using the
14 same rate, code rate, and code channel, as applicable.
- 15 • If PACA_S is equal to enabled, the mobile station shall enter the *Update Overhead*
16 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
17 indication within T33m seconds to re-originate the PACA call using the new base
18 station.

19 If the NGHBR_CONFIG field is '001', the mobile station shall perform the following:

- 20 • The mobile station shall set ACC_MSG_SEQ_S and CURR_ACC_MSG_SEQ to NULL
21 and shall set PILOT_PN_S to the pilot offset index of the base station transmitting the
22 new Paging Channel.
- 23 • If the stored information for [Primary Paging Channel or](#) any of the Paging Channels
24 on the associated NGHBR_FREQ_S of the new base station in NGHBR_REC_LIST of
25 the old base station is current, the mobile station shall perform the following:
26 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
27 new Paging Channel number in the range 1 to PAGE_CHAN_S, where
28 PAGE_CHAN_S is the value stored for the Paging Channel whose stored
29 information is current. The mobile station shall store the new Paging Channel
30 number as PAGECH_S. The mobile station shall perform the following:
31 + If the mobile station has not stored configuration parameters for the new
32 Paging Channel, or if the stored parameters are not current (see 2.6.2.2), the
33 mobile station shall set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S,
34 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
35 GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
36 EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
37 PRI_NGHBR_LST_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
38 EXT_CHAN_LST_MSG_SEQ_S, and GLOB_SERV_REDIR_MSG_SEQ_S to NULL.

- 1 + If the stored information for the new Paging Channel is current, the mobile
 2 station shall set CONFIG_MSG_SEQ_S to the stored information for the new
 3 Paging Channel and set NGHBR_REC_LIST to the stored information for the
 4 new Paging Channel.
- 5 - If the mobile station has monitored the Forward Common Control
 6 Channel/Primary Broadcast Control Channel before the idle handoff, the mobile
 7 station shall set Paging Channel data rate, PRAT_S = '00'.
- 8 - If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new base station in
 9 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_S and
 10 CDMACH_S respectively, the mobile station shall set CDMABAND_S to
 11 NGHBR_BAND_S, CDMACH_S to NGHBR_FREQ_S, and tune to the new CDMA
 12 Channel. The mobile station shall begin monitoring the new Paging Channel of
 13 the new base station.
- 14 • If none of the Paging Channel stored information on the associated NGHBR_FREQ_S
 15 of the new base station in NGHBR_REC_LIST of the old base station are current, the
 16 mobile station shall perform the following:
- 17 - The mobile station shall set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S,
 18 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 19 GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
 20 EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S,
 21 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 22 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
- 23 - If the mobile station has monitored the Forward Common Control
 24 Channel/Primary Broadcast Control Channel before the idle handoff, the mobile
 25 station shall set Paging Channel data rate, PRAT_S = '00'.
- 26 - The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary
 27 Paging Channel. If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new
 28 base station in NGHBR_REC_LIST of the old base station is not equal to
 29 CDMABAND_S and CDMACH_S respectively, the mobile station shall set
 30 CDMABAND_S to NGHBR_BAND_S, CDMACH_S to NGHBR_FREQ_S, and tune to the
 31 new CDMA Channel. The mobile station shall begin monitoring the Primary
 32 Paging Channel of the new base station.
- 33 • If PACA_S is equal to enabled, the mobile station shall enter the *Update Overhead*
 34 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
 35 indication within T33m seconds to re-originate the PACA call using the new base
 36 station.
- 37 If the NGHBR_CONFIG field is '010', the mobile station shall perform the following:

- 1 • The mobile station shall set ACC_MSG_SEQ_S and CURR_ACC_MSG_SEQ to NULL
2 and shall set PILOT_PNs to the pilot offset index of the base station transmitting the
3 new Paging Channel or Forward Common Control Channel/Primary Broadcast
4 Control Channel.
- 5 • If the mobile station has monitored the Paging Channel before the idle handoff, the
6 mobile station shall perform the following:
 - 7 - If the stored information for Primary Paging Channel or any of the Paging
8 Channels on the target frequency or any of the frequencies of the new base
9 station is current, the mobile station shall perform the following:
 - 10 + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
11 stored value of the number of CDMA channels to determine the new CDMA
12 Channel and shall set FREQ_NEW to this new CDMA Channel. The mobile
13 station shall perform the following:
 - 14 o If the stored information for any of the Paging Channels on the CDMA
15 channel specified by FREQ_NEW is current, the mobile station shall
16 perform the following:
 - 17 ◊ The mobile station shall use the hash algorithm specified in 2.6.7.1 to
18 select a new Paging Channel number in the range 1 to PAGE_CHAN_S,
19 where PAGE_CHAN_S is the value stored for the Paging Channel whose
20 stored information is current. The mobile station shall store the new
21 Paging Channel number as PAGECH_S. The mobile station shall
22 perform the following:
 - 23 - If the mobile station has not stored configuration parameters for
24 the new Paging Channel, or if the stored parameters are not
25 current (see 2.6.2.2), the mobile station shall set CONFIG-
26 _MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
27 EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S,
28 CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
29 USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, and
30 EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
31 EXT_CHAN_LST_MSG_SEQ_S, and
32 GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
 - 33 - If the stored information for the new Paging Channel is current,
34 the mobile station shall set CONFIG_MSG_SEQ_S to the stored
35 information for the new Paging Channel and set
36 NGHBR_REC_LIST to the stored information for the new Paging
37 Channel.

- 1 ◊ If the band class corresponding to FREQ_NEW is not equal to
 2 CDMABAND_S of the old base station or FREQ_NEW is not equal to
 3 CDMACH_S of the old base station, the mobile station shall set
 4 CDMABAND_S to band class corresponding to FREQ_NEW and shall
 5 set CDMACH_S to FREQ_NEW, and tune to the new CDMA Channel.
 6 The mobile station shall begin monitoring the new Paging Channel of
 7 the new base station.
- 8 o If none of the Paging Channel stored information on the CDMA channel
 9 specified by FREQ_NEW are current, the mobile station shall perform the
 10 following:
- 11 ◊ The mobile station shall set CONFIG_MSG_SEQ_S, SYS_PAR-
 12 _MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
 13 EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S,
 14 CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 15 GLOB_SERV_REDIR_MSG_SEQ_S,
 16 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 17 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to
 18 NULL.
- 19 ◊ The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the
 20 Primary Paging Channel. If the band class corresponding to
 21 FREQ_NEW is not equal to CDMABAND_S of the old base station or
 22 FREQ_NEW is not equal to CDMACH_S of the old base station, the
 23 mobile station shall set CDMABAND_S to band class corresponding to
 24 FREQ_NEW and shall set CDMACH_S to FREQ_NEW, and tune to the
 25 new CDMA Channel. The mobile station shall begin monitoring the
 26 Primary Paging Channel of the new base station.
- 27 - If none of the Paging Channel stored information on any of the frequencies of the
 28 new base station are current, the mobile station shall perform the following:
- 29 + The mobile station shall set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S,
 30 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 31 GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
 32 EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S,
 33 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 34 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
- 35 + The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary
 36 Paging Channel. If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the
 37 new base station in NGHBR_REC_LIST of the old base station is not equal to
 38 CDMABAND_S and CDMACH_S of the old base station respectively, the mobile
 39 station shall set CDMABAND_S to NGHBR_BAND_S, and CDMACH_S to
 40 NGHBR_FREQ_S; otherwise, the mobile station shall set CDMACH_S as follows:

- 1 o If the *Extended CDMA Channel List Message* is being sent on the old base
2 station, set $CDMACH_S$ to the first CDMA Channel given in the *Extended*
3 *CDMA Channel List Message* for the old base station.
- 4 o Otherwise, set $CDMACH_S$ to the first CDMA Channel given in the *CDMA*
5 *Channel List Message* for the old base station.

6 Then the mobile station shall tune to the new CDMA channel and begin
7 monitoring the Primary Paging Channel of the new base station.

- 8 • If the mobile station has monitored the Forward Common Control Channel/Primary
9 Broadcast Control Channel before the idle handoff, the mobile station shall perform
10 the following:
 - 11 – If the stored information for any of the Forward Common Control Channels and
12 Primary Broadcast Control Channel on any of the frequencies of the new base
13 station is current, the mobile station shall perform the following:
 - 14 + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
15 stored value of the number of CDMA channels to determine the new CDMA
16 Channel and shall set $FREQ_NEW$ to this new CDMA Channel. The mobile
17 station shall perform the following
 - 18 o If the stored information for any of the Forward Common Control
19 Channels and Primary Broadcast Control Channel on the CDMA channel
20 specified by $FREQ_NEW$ is current, the mobile station shall perform the
21 following: If the *Extended CDMA Channel List Message* is being sent on
22 the old base station, set $CDMACH_S$ to the first CDMA Channel given in
23 the *Extended CDMA Channel List Message* for the old base station.
 - 24 ◊ The mobile station shall use the hash algorithm specified in 2.6.7.1 to
25 select a new Forward Common Control Channel number in the range
26 1 to NUM_FCCCH_S , where NUM_FCCCH_S is the stored value. The
27 mobile station shall store the new Forward Common Control Channel
28 number as $FCCCH_ID_S$.
 - 29 ◊ If the stored information for this new Forward Common Control
30 Channel and Primary Broadcast Control Channel is current, the
31 mobile station shall perform the following:
 - 32 – The mobile station shall set $CONFIG_MSG_SEQ_S$ to the stored
33 information for this new Forward Common Control Channel and
34 Primary Broadcast Control Channel and the mobile station shall
35 set $NGHBR_REC_LIST$ to the stored information for this new
36 Forward Common Control Channel and Primary Broadcast
37 Control Channel.

- If the band class corresponding to FREQ_NEW is not equal to CDMABAND_S of the old base station or FREQ_NEW is not equal to CDMACH_S of the old base station, the mobile station shall set CDMABAND_S to band class corresponding to FREQ_NEW and shall set CDMACH_S to FREQ_NEW, and tune to the new CDMA Channel. The mobile station shall begin monitoring the new Forward Common Control Channel/Primary Broadcast Control Channel of the new base station.
- ◊ If the stored information for this new Forward Common Control Channel and Primary Broadcast Control Channel is not current, the mobile station shall perform the following:
 - The mobile station shall set CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S, UNI_NGHBR_LST_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
 - If the band class corresponding to FREQ_NEW is not equal to CDMABAND_S of the old base station or FREQ_NEW is not equal to CDMACH_S of the old base station, the mobile station shall set CDMABAND_S to band class corresponding to FREQ_NEW and shall set CDMACH_S to FREQ_NEW, and tune to the new CDMA Channel. The mobile station shall begin monitoring the Primary Broadcast Control Channel of the new base station.
- o If none of the Forward Common Control Channel and Primary Broadcast Control Channel stored information on the CDMA channel specified by FREQ_NEW are current, the mobile station shall perform the following:
 - ◊ The mobile station shall set CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S, UNI_NGHBR_LST_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
 - ◊ If the associated NGBHR_BAND_S of the new base station in NGBHR_REC_LIST of the old base station is not equal to CDMABAND_S or the associated NGBHR_FREQ_S of the new base station in NGBHR_REC_LIST of the old base station is not equal to CDMACH_S of the old base station, the mobile station shall set CDMABAND_S to NGBHR_BAND_S, CDMACH_S to NGBHR_FREQ_S, and tune to the new CDMA Channel. Otherwise, the mobile station shall set CDMACH_S to the first CDMA Channel given in the *Extended CDMA Channel List Message* for the old base station and tune to the new CDMA channel.

- 1 ◊ Then the mobile station shall begin monitoring the Primary Broadcast
 2 Control Channel of the new base station, using the same rate, code
 3 rate, and code channel.
- 4 – If none of the Forward Common Control Channel and Primary Broadcast Control
 5 Channel stored information on any of the frequencies of the new base station are
 6 current, the mobile station shall perform the following:
- 7 + The mobile station shall set CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S,
 8 UNI_NGHBR_LST_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S,
 9 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 10 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
- 11
- 12 + If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new base station
 13 in NGHBR_REC_LIST of the old base station is not equal to CDMABAND_S
 14 and CDMACH_S of the old base station respectively, the mobile station shall
 15 set CDMABAND_S to NGHBR_BAND_S, CDMACH_S to NGHBR_FREQ_S, and tune
 16 to the new CDMA Channel. Otherwise, the mobile station shall set
 17 CDMACH_S to the first CDMA Channel given in the *Extended CDMA Channel*
 18 *List Message* for the old base station and tune to the new CDMA channel.
- 19 + Then the mobile station shall begin monitoring the Primary Broadcast
 20 Control Channel of the new base station, using the same rate, code rate, and
 21 code channel.
- 22 • If PACA_S is equal to enabled, the mobile station shall enter the *Update Overhead*
 23 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
 24 indication within T33m seconds to re-originate the PACA call using the new base
 25 station.
- 26 If the NGHBR_CONFIG field is ‘011’, the mobile station shall perform the following:
- 27 • Enter the *System Determination Substate* of the *Mobile Station Initialization State* with
 28 a new system indication (see 2.6.1.1).
- 29 If the NGHBR_CONFIG field is ‘100’, the mobile station shall perform the following:
- 30 • The mobile station shall set ACC_MSG_SEQ_S and CURR_ACC_MSG_SEQ to NULL
 31 (see 2.6.2.2) and shall set PILOT_PN_S to the pilot offset index of the base station
 32 transmitting the new Forward Common Control Channel/Primary Broadcast Control
 33 Channel.
- 34 • If the stored information for any of the Forward Common Control Channels and
 35 Primary Broadcast Control Channel on the associated NGHBR_FREQ_S of the new
 36 base station in NGHBR_REC_LIST of the old base station is current, the mobile
 37 station shall perform the following:

- The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Forward Common Control Channel number in the range 1 to NUM_FCCCH_S, where NUM_FCCCH_S is the stored value. The mobile station shall store the new Forward Common Control Channel number as FCCCH_ID_S.
- If the mobile station has not stored configuration parameters for this new Forward Common Control Channel and Primary Broadcast Control Channel, or if the stored information is not current, the mobile station shall perform the following:
 - + The mobile station shall set CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S, UNI_NGHBR_LST_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
 - + If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new base station in NGHBR_REC_LIST of the old base station is not equal to CDMABAND_S and CDMACH_S respectively, the mobile station shall set CDMABAND_S to NGHBR_BAND_S, CDMACH_S to NGHBR_FREQ_S, and tune to the new CDMA Channel.
 - + Then the mobile station shall begin monitoring the Primary Broadcast Control Channel of the new base station, using the same rate, code rate, and code channel.
- If the stored information for this new Forward Common Control Channel and Primary Broadcast Control Channel is current, the mobile station shall perform the following:
 - + The mobile station shall set CONFIG_MSG_SEQ_S to the stored information for this new Forward Common Control Channel and Primary Broadcast Control Channel and the mobile station shall set NGHBR_REC_LIST to the stored information for this new Forward Common Control Channel and Primary Broadcast Control Channel.
 - + If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new base station in NGHBR_REC_LIST of the old base station is not equal to CDMABAND_S and CDMACH_S respectively, the mobile station shall set CDMABAND_S to NGHBR_BAND_S, CDMACH_S to NGHBR_FREQ_S, and tune to the new CDMA Channel. The mobile station shall begin monitoring the new Forward Common Control Channel/Primary Broadcast Control Channel of the new base station.
- If none of the Forward Common Control Channel and Primary Broadcast Control Channel stored information on the associated NGHBR_FREQ_S of the new base station in NGHBR_REC_LIST of the old base station are current, the mobile station shall perform the following:

- 1 – The mobile station shall set CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S,
2 UNI_NGHBR_LST_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S,
3 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
4 USER_ZONE_ID_MSG_SEQ_S, and PRI_NGHBR_LST_MSG_SEQ_S to NULL.
- 5 – If the associated NGHBR_BAND_S or NGHBR_FREQ_S of the new base station in
6 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_S and
7 CDMACH_S respectively, the mobile station shall set CDMABAND_S to
8 NGHBR_BAND_S, CDMACH_S to NGHBR_FREQ_S, and tune to the new CDMA
9 Channel.
- 10 – The mobile station shall begin monitoring the Primary Broadcast Control
11 Channel of the new base station, using the same rate, code rate, and code
12 channel.
- 13 • If PACA_S is equal to enabled, the mobile station shall enter the *Update Overhead*
14 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
15 indication within T33m seconds to re-originate the PACA call using the new base
16 station.

17 2.6.2.1.5 Primary Broadcast Control Channel Monitoring

18 2.6.2.1.5.1 General Overview

19 The Broadcast Control Channel is divided into 40, 80, or 160 ms slots called the Broadcast
20 Control Channel slots (see 3.1.3.5 in [2]). The Primary Broadcast Control Channel will be
21 used for control messages. Support for the Primary Broadcast Control Channel is
22 mandatory for mobile stations. The Primary Broadcast Control Channel will operate with
23 the Forward Common Control Channels and the Quick Paging Channels, or only with the
24 Forward Common Control Channels.

25 After a mobile station acquires and synchronizes with a new base station that supports a
26 Primary Broadcast Control Channel, the mobile station monitors the Primary Broadcast
27 Control Channel to receive overhead information. Once the mobile station has received the
28 updated overhead information from the Primary Broadcast Control Channel, the mobile
29 station may begin to monitor a Forward Common Control Channel or a Quick Paging
30 Channel, if it is supported.

31 2.6.2.1.5.2 Requirements

32 If the base station supports the Primary Broadcast Control Channel, the mobile station
33 shall monitor the Primary Broadcast Control Channel for overhead messages. If the mobile
34 station determines that the CONFIG_MSG_SEQ has changed, the mobile station shall
35 monitor the Primary Broadcast Control Channel to receive updated overhead messages.

36 2.6.2.1.6 System Reselection Procedures

37 If the mobile station supports more than one operating mode or the Remaining

Set/Neighbor Set contains pilots on frequencies different from the current frequency, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system reselection indication (see 2.6.1.1) if all of the following are true:

- RESELECT_INCLUDED_S is equal to '1';

- The following inequality is satisfied:

$$\underline{-}20 \times \log_{10} (E_c/I_o) > EC_IO_THRESH_S$$

where E_c/I_o is the measured E_c/I_o of the active pilot; and

- The following inequality is satisfied:

$$pilot_power < EC_THRESH_S - 115$$

where $pilot_power$ (dBm/1.23 MHz) = $10 \times \log_{10}$ (PS) (dB) + mean input power

(dBm/1.23 MHz) and PS is the strength of the active pilot, as specified in 2.6.6.2.2.

2.6.2.1.7 Slotted Timer Expiration

Upon expiration of the slotted T_{MS} Slotted timer, the mobile station shall disable the timer and set SLOTTED_S to YES.

2.6.2.2 Response to Overhead Information Operation

The overhead messages on the Primary Broadcast Control Channel are:

- *ANSI-41 System Parameters Message*
- *MC-RR Parameters Message*
- *Enhanced Access Parameters Message*
- *Universal Neighbor List Message*
- *User Zone Identification Message*
- *Private Neighbor List Message*
- *Extended Global Service Redirection Message*
- *Extended CDMA Channel List Message*
- *ANSI-41 RAND Message*

The overhead messages on the Paging Channel are:

- *System Parameters Message*
- *Access Parameters Message*
- *Neighbor List Message*
- *CDMA Channel List Message*
- *Extended System Parameters Message*
- *Global Service Redirection Message*

- 1 • *Extended Neighbor List Message*
- 2 • *General Neighbor List Message*
- 3 • *User Zone Identification Message*
- 4 • *Private Neighbor List Message*
- 5 • *Extended Global Service Redirection Message*
- 6 • *Extended CDMA Channel List Message*

7 The *Response to Overhead Information Operation* is performed whenever the mobile station
 8 receives an overhead message. The mobile station updates internally stored information
 9 from the received message's data fields.

10 Configuration parameters and access parameters are received in the configuration
 11 messages and the *Access Parameters Message* or the *Enhanced Access Parameters Message*.

12 The configuration messages on the Primary Broadcast Control Channel are:

- 13 • *ANSI-41 System Parameters Message*
- 14 • *MC-RR Parameters Message*
- 15 • *Universal Neighbor List Message*
- 16 • *User Zone Identification Message*
- 17 • *Private Neighbor List Message*
- 18 • *Extended Global Service Redirection Message*
- 19 • *Extended CDMA Channel List Message*

20 The configuration messages on the Paging Channel are:

- 21 • *System Parameters Message*
- 22 • *Neighbor List Message*
- 23 • *CDMA Channel List Message*
- 24 • *Extended System Parameters Message*
- 25 • *Global Service Redirection Message*
- 26 • *Extended Neighbor List Message*
- 27 • *General Neighbor List Message*
- 28 • *User Zone Identification Message*
- 29 • *Private Neighbor List Message*
- 30 • *Extended Global Service Redirection Message*
- 31 • *Extended CDMA Channel List Message*

32 Associated with the set of configuration messages sent on each Paging Channel or Primary
 33 Broadcast Control Channel is a configuration message sequence number
 34 (CONFIG_MSG_SEQ). When the contents of one or more of the configuration messages

1 change, the configuration message sequence number is incremented. For each of the
 2 configuration messages received, the mobile station stores the configuration message
 3 sequence number contained in the configuration message (A41_SYS_PAR_MSG_SEQ_S,
 4 MC_RR_PAR_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LIST_MSG_SEQ_S,
 5 EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S,
 6 UNI_NGHBR_LST_MSG_SEQ_S, CHAN_LIST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 7 GLOB_SERV_REDIR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
 8 EXT_CHAN_LST_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S, or
 9 PRI_NGHBR_LST_MSG_SEQ_S). The mobile station also stores the most recently received
 10 configuration message sequence number (CONFIG_MSG_SEQ_S) contained in any message
 11 (see 2.6.2.2.1, 2.6.2.2.3, 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9,
 12 2.6.2.2.10, 2.6.2.2.11, 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, and 2.6.2.3). The
 13 mobile station examines the stored values of the configuration message sequence numbers
 14 to determine whether the configuration parameters stored by the mobile station are
 15 current.

16 The field EXT_SYS_PARAMETER in the *System Parameters Message*, when set equal to '0',
 17 indicates that the base station is not sending the *Extended System Parameters Message*.
 18 When the mobile station receives the *System Parameters Message* with the
 19 EXT_SYS_PARAMETER field set equal to '0', the mobile station shall set
 20 EXT_SYS_PAR_MSG_SEQ_S to CONFIG_MSG_SEQ_S to indicate that the *Extended System*
 21 *Parameters Message* is current.

22 The field EXT CHAN LST in the *System Parameters Message*, when set equal to '0',
 23 indicates that the base station is not sending the *Extended CDMA Channel List Message*.
 24 When the mobile station receives the *System Parameters Message* with the EXT CHAN LST
25 field set equal to '0', the mobile station shall set EXT CHAN LST MSG SEQ_S to
26 CONFIG MSG SEQ_S to indicate that the *Extended CDMA Channel List Message* is current.

27 The field GEN_NGHBR_LST in the *System Parameters Message*, when set equal to '0',
 28 indicates that the base station is not sending the *General Neighbor List Message*. When the
 29 mobile station receives the *System Parameters Message* with the GEN_NGHBR_LST field set
 30 equal to '0', the mobile station shall set the GEN_NGHBR_LST_MSG_SEQ_S to
 31 CONFIG_MSG_SEQ_S to indicate that the *General Neighbor List Message* is current.

32 The field EXT_NGHBR_LST in the *System Parameters Message*, when set equal to '0',
 33 indicates that the base station is not sending the *Extended Neighbor List Message*. When
 34 the mobile station receives the *System Parameters Message* with the EXT_NGHBR_LST field
 35 set equal to '0', the mobile station shall set EXT_NGHBR_LIST_MSG_SEQ_S to
 36 CONFIG_MSG_SEQ_S to indicate that the *Extended Neighbor List Message* is current.

37 The field GLOBAL_REDIRECT in the *System Parameters Message*, when set equal to '0',
 38 indicates that the base station is not sending the *Global Service Redirection Message*. When
 39 the mobile station receives the *System Parameters Message* with the GLOBAL_REDIRECT
 40 field set equal to '0', the mobile station shall set GLOB_SERV_REDIR_MSG_SEQ_S to
 41 CONFIG_MSG_SEQ_S to indicate that the *Global Service Redirection Message* is current.

42 The field EXT_GLOBAL_REDIRECT in the *System Parameters Message* or *MC-RR Parameters*
 43 *Message*, when set equal to '0', indicates that the base station is not sending the *Extended*

1 *Global Service Redirection Message.* When the mobile station receives the *System*
 2 *Parameters Message* or *MC-RR Parameters Message* with the EXT_GLOBAL_REDIRECT field
 3 set equal to '0', the mobile station shall set EXT_GLOB_SERV_REDIR_MSG_SEQ_S to
 4 CONFIG_MSG_SEQ_S to indicate that the *Extended Global Service Redirection Message* is
 5 current.

6 The field USER_ZONE_ID in the *System Parameters Message* or *MC-RR Parameters*
 7 *Message*, when set equal to '0', indicates that the base station is not sending the *User Zone*
 8 *Identification Message*. When the mobile station receives the *System Parameters Message* or
 9 *MC-RR Parameters Message* with the USER_ZONE_ID field set equal to '0', the mobile
 10 station shall set USER_ZONE_ID_MSG_SEQ_S to CONFIG_MSG_SEQ_S to indicate that the
 11 *User Zone Identification Message* is current.

12 The field PRI_NGHBR_LIST in the *System Parameters Message* or *MC-RR Parameters*
 13 *Message*, when set equal to '0', indicates that the base station is not sending the *Private*
 14 *Neighbor List Message*. When the mobile station receives the *System Parameters Message* or
 15 *MC-RR Parameters Message* with the PRI_NGHBR_LIST field set equal to '0', the mobile
 16 station shall set PRI_NGHBR_LIST_MSG_SEQ_S to CONFIG_MSG_SEQ_S to indicate that the
 17 *Private Neighbor List Message* is current.

18 The configuration message sequence number is also included in the *General Page Message*
 19 and the *Universal Page Message*. This allows the mobile station to determine whether the
 20 stored configuration parameters are current without waiting for a configuration message.

21 *Access Parameters Messages* or *Enhanced Access Parameters Messages* are independently
 22 sequence-numbered by the ACC_MSG_SEQ field. The mobile station stores the most
 23 recently received *Access Parameters Message* or *Enhanced Access Parameters Messages*
 24 sequence number (ACC_MSG_SEQ_S).

25 Paging Channels, Broadcast Control Channels, and Forward Common Control Channels
 26 shall be considered different if they are transmitted by different base stations, if they are
 27 transmitted on different code channels, or if they are transmitted on different CDMA
 28 Channels. Configuration and access parameters from one Paging Channel or Primary
 29 Broadcast Control Channel shall not be used while monitoring a different Paging Channel
 30 or Primary Broadcast Control Channel/Forward Common Control Channel except for
 31 registration and authentication parameters while the mobile station is performing an access
 32 probe handoff or access handoff. The mobile station shall ignore any overhead message
 33 whose PILOT_PN_r field is not equal to the pilot offset index (PILOT_PNs) of the base station
 34 whose Paging Channel or Primary Broadcast Control Channel is being monitored.

35 The mobile station may store the configuration parameters from Paging Channels or
 36 Primary Broadcast Control Channel it has recently monitored. When a mobile station
 37 starts monitoring a Paging Channel or a Primary Broadcast Control Channel/Forward
 38 Common Control Channel that it has recently monitored, the mobile station can determine
 39 whether the stored parameters are current by examining the CONFIG_MSG_SEQ_S in a
 40 configuration message or a page message.

41 The mobile station shall use a special value, NULL, to be stored in place of sequence
 42 numbers for messages that have not been received or are marked as not current. The
 43 special value NULL shall be unequal to any valid message sequence number.

1 The mobile station shall consider the stored configuration parameters to be current only if
 2 all of the following conditions are true:

- 3 • If the mobile station is monitoring the Paging Channel, all stored configuration
 4 message sequence numbers (SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
 5 EXT_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 6 GEN_NGHBR_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
 7 PRI_NGHBR_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 8 EXT_GLOB_SERV_REDIR_MSG_SEQ_S and GLOB_SERV_REDIR_MSG_SEQ_S) are
 9 equal to CONFIG_MSG_SEQ_S; and
- 10 • If the mobile station is monitoring the Forward Common Control Channel/ Primary
 11 Broadcast Control Channel, all stored configuration message sequence numbers
 12 (A41_SYS_PAR_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S,
 13 UNI_NGHBR_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
 14 PRI_NGHBR_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, and
 15 EXT_GLOB_SERV_REDIR_MSG_SEQ_S) are equal to CONFIG_MSG_SEQ_S; and
- 16 • CONFIG_MSG_SEQ_S is not equal to NULL; and
- 17 • No more than T_{31m} seconds (see Annex D) have elapsed since the mobile station last
 18 received a valid message on the Paging Channel or the Primary Broadcast Control
 19 Channel/Forward Common Control Channel for which the parameters were stored.

20 If the configuration parameters are not current, the mobile station shall process the stored
 21 parameters upon receipt of the configuration messages as described in 2.6.2.2.1, 2.6.2.2.3,
 22 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9, 2.6.2.2.10, 2.6.2.2.11,
 23 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, and 2.6.2.2.17.

24 2.6.2.2.1 System Parameters Message

25 Whenever a *System Parameters Message* is received on the Paging Channel, the
 26 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
 27 stored in SYS_PAR_MSG_SEQ_S. If the comparison results in a match, the mobile station
 28 may ignore the message. If the comparison results in a mismatch, then the mobile station
 29 shall process the remaining fields in the message as described in 2.6.2.2.1.1, 2.6.2.2.1.2,
 30 2.6.2.2.1.3, 2.6.2.2.1.4, 2.6.2.2.1.5, ~~and~~ 2.6.2.2.1.6, 2.6.2.2.1.7, 2.6.2.2.1.8, and
 31 2.6.2.2.1.9.

32 If PAGE_CHAN, REG_PRD, BASE_LAT, BASE_LONG, or PWR_REP_THRESH are not within
 33 the valid ranges specified in 3.7.2.3.2.1, then the mobile station shall ignore the *System*
 34 *Parameters Message* that contains them.

35 If BAND_CLASS is equal to '00001' and if either EXT_SYS_PARAMETERS_r is not equal to '1'
 36 or EXT_NGHBR_LST_r is not equal to '1', or both, the mobile station shall ignore the *System*
 37 *Parameters Message* containing these fields.

38 2.6.2.2.1.1 Stored Parameters

39 The mobile station shall store the following parameters:

- 1 • Configuration message sequence number
(CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_r,
2 SYS_PAR_MSG_SEQ_S = CONFIG_MSG_SEQ_r)
- 3
- 4 • Base station identification (BASE_ID_S = BASE_ID_r)
- 5 • Base station class (BASE_CLASS_S = BASE_CLASS_r)
- 6 • Maximum slot cycle index
(MAX_SLOT_CYCLE_INDEX_S = MAX_SLOT_CYCLE_INDEX_r)
- 7
- 8 • Home registration indicator (HOME_REG_S = HOME_REG_r)
- 9 • SID roamer registration indicator (FOR_SID_REG_S = FOR_SID_REG_r)
- 10 • NID roamer registration indicator (FOR_NID_REG_S = FOR_NID_REG_r)
- 11 • Power-up registration indicator (POWER_UP_REG_S = POWER_UP_REG_r)
- 12 • Power-down registration indicator (POWER_DOWN_REG_S = POWER_DOWN_REG_r)
- 13 • Parameter-change registration indicator (PARAMETER_REG_S = PARAMETER_REG_r)
- 14 • Search window size for the Active Set and Candidate Set
(SRCH_WIN_A_S = SRCH_WIN_A_r)
- 15
- 16 • Search window size for the Neighbor Set (SRCH_WIN_N_S = SRCH_WIN_N_r)
- 17 • Search window size for the Remaining Set (SRCH_WIN_R_S = SRCH_WIN_R_r)
- 18 • Maximum age for retention of Neighbor Set members
(NGHBR_MAX_AGE_S = NGHBR_MAX_AGE_r)
- 19
- 20 • Power control reporting threshold (PWR REP THRESH_S = PWR REP THRESH_r)
- 21 • Power control reporting frame count (PWR REP FRAMES_S = PWR REP FRAMES_r)
- 22 • Threshold report mode indicator
(PWR_THRESH_ENABLE_S = PWR_THRESH_ENABLE_r)
- 23
- 24 • Periodic report mode indicator (PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_r).
25
- 25 • Power report delay (PWR REP DELAY_S = PWR REP DELAY_r)
- 26 • Pilot detection threshold (T_ADD_S = T_ADD_r)
- 27 • Pilot drop threshold (T_DROP_S = T_DROP_r)
- 28 • Active Set versus Candidate Set comparison threshold (T_COMP_S = T_COMP_r)
- 29 • Drop timer value (T_TDROPO_S = T_TDROPO_r)
- 30 • *Extended System Parameters Message sent*
(EXT_SYS_PARAMETER_S = EXT_SYS_PARAMETER_r)
- 31
- 32 • *Global Service Redirection Message sent*
(GLOBAL_REDIRECT_S = GLOBAL_REDIRECT_r)
- 33
- 34 • *Extended Global Service Redirection Message sent*
(EXT_GLOBAL_REDIRECT_S = EXT_GLOBAL_REDIRECT_r)
- 35

- 1 • *Extended Neighbor List Message* sent
(EXT_NGHBR_LST_S = EXT_NGHBR_LST_r)
- 2 • *General Neighbor List Message* sent
(GEN_NGHBR_LST_S = GEN_NGHBR_LST_r)
- 3 • *User Zone Identification Message* sent
(USER_ZONE_ID_S = USER_ZONE_ID_r)
- 4 • *Private Neighbor List Message* sent
(PRI_NGHBR_LST_S = PRI_NGHBR_LST_r)
- 5 • *Extended CDMA Channel List Message* sent
(EXT_CHAN_LIST_S = EXT_CHAN_LIST_r)
- 6 • *Extended CDMA Channel List Message* sent
(EXT_CHAN_LIST_S = EXT_CHAN_LIST_r)

7 The mobile station shall also store the following parameters if the mobile station is not in
8 the *Origination Attempt Substate* or *Page Response Substate*:

- 9 • System identification (SID_S = SID_r)
- 10 • Network identification (NID_S = NID_r)
- 11 • Registration zone (REG_ZONE_S = REG_ZONE_r)
- 12 • Number of registration zones to be retained (TOTAL_ZONES_S = TOTAL_ZONES_r)
- 13 • Zone timer length (ZONE_TIMER_S = ZONE_TIMER_r)
- 14 • Multiple SID storage indicator (MULT_SIDS_S = MULT_SIDS_r)
- 15 • Multiple NID storage indicator (MULT_NIDS_S = MULT_NIDS_r)
- 16 • Registration period (REG_PRD_S = REG_PRD_r)
- 17 • Base station latitude (BASE_LAT_S = BASE_LAT_r)
- 18 • Base station longitude (BASE_LONG_S = BASE_LONG_r)
- 19 • Registration distance (REG_DIST_S = REG_DIST_r)

20 If EXT_SYS_PARAMETER_S is equal to '0', then the mobile station shall perform the
21 following:

- 22 • Set EXT_SYS_PAR_MSG_SEQ_S to CONFIG_MSG_SEQ_S,
- 23 • Set BCAST_INDEX_S to MAX_SLOT_CYCLE_INDEX_S,
- 24 • Set IMSI_O to IMSI_M by setting IMSI_O_S_S to IMSI_M_S_p (i.e., setting IMSI_O_S1_S
25 to IMSI_M_S1_p and IMSI_O_S2_S to IMSI_M_S2_p), MCC_O_S to MCC_M_p,
26 IMSI_O_11_12_S to IMSI_M_11_12_p, and IMSI_O_ADDR_NUM_S to
27 IMSI_M_ADDR_NUM_p,
- 28 • Set RESELECT_INCLUDED_S to '0',
- 29 • For Band Class 0, if the mobile station determines it is operating in Korea, set
30 P_REV_S to '00000010'; otherwise, set P_REV_S to '00000011'. **For Band Class 2**
31 **and** Band Class 3, set P_REV_S to '00000011'. For Band Class 1 and Band Class 4,
32 set P_REV_S to '00000001', and

- 1 • Set P_REV_IN_USE_s to the lesser value of P_REV_s and MOB_P_REV_p of the current
 2 band class.

3 If EXT_CHAN_LIST_s is equal to '0', then the mobile station shall set
 4 EXT_CHAN_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

5 If GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set GLOB_SERV-
 6 _REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

7 If EXT_GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set
 8 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

9 If EXT_NGHBR_LIST_s is equal to '0', then the mobile station shall set
 10 EXT_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

11 If GEN_NGHBR_LIST_s is equal to '0', then the mobile station shall perform the following:

- 12 • Set GEN_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 13 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_s for all entries.
- 14 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all entries.
- 15 • Set the TIMING_INCL field of NGHBR_REC to '0' for all entries.
- 16 • Set NUM_ANALOG_NGHBR_s to '000' and ANALOG_NGHBR_LIST to NULL.
- 17 • If EXT_NGHBR_LIST_s is equal to '0':
 - 18 – Set the SEARCH_PRIORITY field of the NGHBR_REC to '10' (high) for all entries.
 - 19 – Set the NGHBR_BAND field of the NGHBR_REC to CDMABAND_s for all entries.
 - 20 – Set the NGHBR_FREQ field of the NGHBR_REC to CDMACH_s for all entries.

21 If GEN_NGHBR_LIST_s is equal to '1', GEN_NGHBR_LST_MSG_SEQ_s is equal to
 22 CONFIG_MSG_SEQ_s, and SETTING_SEARCH_WIN is equal to '1', the mobile station shall
 23 perform the following:

- 24 • Set the SRCH_WIN_NGHBR field of each NGHBR_REC to SEARCH_WIN_N_s for all
 25 NGHBR_SET_SIZE_s entries.
- 26 • Set SETTING_SEARCH_WIN to '0'.

27 If USER_ZONE_ID_s is equal to '0', then the mobile station shall perform the following:

- 28 • Set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 29 • Set the UZID field of the UZ_REC to '0000000000000000' for all entries.
- 30 • Set the UZ_REV field of the UZ_REC to '0000' for all entries.
- 31 • Set the TEMP_SUB field of the UZ_REC to '0' for all entries.

32 If USER_ZONE_ID_s is equal to '1' and the mobile station does not support Tiered Services,
 33 then the mobile station shall set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

34 If PRI_NGHBR_LIST_s is equal to '0', then the mobile station shall set
 35 PRI_NGHBR_LIST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

1 If PRI_NGHBR_LST_s is equal to ‘1’ and the mobile station does not support Tiered Services,
 2 then the mobile station shall set PRI_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

3 The mobile station shall ignore any fields at the end of the *System Parameters Message* that
 4 are not defined according to the protocol revision level (MOB_P_REV_p of the current band
 5 class) being used by the mobile station.

6 2.6.2.2.1.2 Paging Channel Assignment Change

7 If the number of Paging Channels specified in the *System Parameters Message*
 8 (PAGE_CHAN_r) is different from PAGE_CHAN_s, the mobile station shall use the hash
 9 algorithm specified in 2.6.7.1 to select a new Paging Channel number in the range 1 to
 10 PAGE_CHAN_r. The mobile station shall store the new Paging Channel number as
 11 PAGECH_s. The mobile station shall then set PAGE_CHAN_s to PAGE_CHAN_r. The mobile
 12 station shall set ACC_MSG_SEQ_s to NULL. If the mobile station has not stored
 13 configuration parameters for the new Paging Channel, or if the stored parameters are not
 14 current (see 2.6.2.2), the mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG-
 15 _SEQ_s, NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 16 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
 17 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, and
 18 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, and
 19 GLOB_SERV_REDIR_MSG_SEQ_s to NULL. The mobile station shall then begin monitoring
 20 the new Paging Channel as specified in 2.6.2.1.1.

21 2.6.2.2.1.3 RESCAN Parameter

22 If the RESCAN_r field in the *System Parameters Message* equals ‘1’, the mobile station shall
 23 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
 24 rescan indication (see 2.6.1.1).

25 2.6.2.2.1.4 Roaming Status

26 The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
 27 The mobile station should indicate to the user whether the mobile station is roaming.

28 2.6.2.2.1.5 Registration

29 The mobile station shall update stored variables and perform other registration procedures
 30 as specified in 2.6.5.5.2.2.

31 2.6.2.2.1.6 Slot Cycle Index

32 The mobile station shall set SLOT_CYCLE_INDEX_s to the smaller of: the preferred slot cycle
 33 index SLOT_CYCLE_INDEX_p and the maximum slot cycle index
 34 MAX_SLOT_CYCLE_INDEX_s. If the mobile station is operating in the slotted mode, it shall
 35 set its slot cycle length as described in 2.6.2.1.1.3.

1 2.6.2.2.1.7 PACA Disable for SID Change

2 If PACA_S is equal to enabled, and SID_S is not equal to PACA_SID_S , the mobile station shall
 3 set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and
 4 should indicate to the user that the PACA call has been canceled.

5 2.6.2.2.1.8 Retry Delay Disable for Packet Zone ID or SID/NID Change

6 The mobile station shall set $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}]$ to 0 when the mobile station
 7 determines that the Packet Zone Identification or the System Identification/Network
 8 Identification (SID/NID pair) has been changed, where RETRY_TYPE is equal to '001', '010',
 9 or '011'.

10 [2.6.2.2.1.9 Encryption key reset for SID/NID Change](#)

11 [The mobile station shall reset \$\text{ENC_KEY}_S\$ to NULL when the mobile station determines that](#)
 12 [the System Identification/Network Identification \(SID/NID pair\) has been changed.](#)

13 2.6.2.2 Access Parameters Message

14 Whenever an *Access Parameters Message* is received on the Paging Channel, the sequence
 15 number, ACC_MSG_SEQ_r , shall be compared to ACC_MSG_SEQ_S . If the comparison
 16 results in a match, the mobile station may ignore the message. If the comparison results in
 17 a mismatch, then the mobile station shall process the remaining fields in the message as
 18 follows.

19 If PROBE_PN_RAN , MAX_REQ_SEQ , or MAX_RSP_SEQ are not within the valid ranges
 20 specified in 3.7.2.3.2.2, then the mobile station shall ignore the *Access Parameters Message*
 21 that contains them.

22 The mobile station shall store the following parameters:

- 23 • *Access Parameters Message* sequence number ($\text{ACC_MSG_SEQ}_S = \text{ACC_MSG_SEQ}_r$)
- 24 • Number of Access Channels ($\text{ACC_CHAN}_S = \text{ACC_CHAN}_r$)
- 25 • Nominal transmit power offset ($\text{NOM_PWR}_S = \text{NOM_PWR}_r$)
- 26 • Initial power offset for access ($\text{INIT_PWR}_S = \text{INIT_PWR}_r$)
- 27 • Power increment ($\text{PWR_STEP}_S = \text{PWR_STEP}_r$)
- 28 • Number of access probes ($\text{NUM_STEP}_S = \text{NUM_STEP}_r$)
- 29 • Maximum Access Channel message capsule size ($\text{MAX_CAP_SZ}_S = \text{MAX_CAP_SZ}_r$)
- 30 • Access Channel preamble length ($\text{PAM_SZ}_S = \text{PAM_SZ}_r$)
- 31 • Persistence modifier for Access Channel attempts for registrations which are not
 32 responses to the *Registration Request Order* ($\text{REG_PSIST}_S = \text{REG_PSIST}_r$)
- 33 • Persistence modifier for Access Channel attempts for message transmissions
 34 ($\text{MSG_PSIST}_S = \text{MSG_PSIST}_r$)

- If PSIST_EMG_INCL_r is equal to '0', the mobile station shall set the persistence modifier for emergency calls from mobile stations in access overload classes 0 to 9 (PSIST_EMG_s) to '000'; otherwise, the mobile station shall set PSIST_EMG_s equal to PSIST_EMG_r.
- Time randomization for Access Channel probes (PROBE_PN_RAN_s = PROBE_PN_RAN_r)
- Acknowledgment timeout (ACH_ACC_TMO_s = ACC_TMO_r)
- Access Channel probe backoff range (PROBE_BKOFF_s = PROBE_BKOFF_r)
- Access Channel probe sequence backoff range (BKOFF_s = BKOFF_r)
- Maximum number of probe sequences for an Access Channel request (MAX_REQ_SEQ_s = MAX_REQ_SEQ_r)
- Maximum number of probe sequences for an Access Channel response (MAX_RSP_SEQ_s = MAX_RSP_SEQ_r)
- If CDMABAND_s is equal to '0', the mobile station shall set extended nominal transmit power NOM_PWR_EXT_s to '0'; otherwise, the mobile station shall store extended nominal transmit power (NOM_PWR_EXT_s = NOM_PWR_EXT_r).
- IC threshold (IC_THRESH_s = -7)

The mobile station shall also store the following parameters if the mobile station is not in the *Origination Attempt Substate* or *Page Response Substate*:

- Authentication mode (if AUTH_r is equal to '00' or '01', then AUTH_s = AUTH_r; otherwise AUTH_s = '01')
- Random challenge value (RAND_s = RAND_r)

The mobile station shall ignore any fields at the end of the *Access Parameters Message* which are not defined according to the protocol revision level (MOB_P_REV_p of the current band class) being used by the mobile station.

The mobile station shall store the persistence parameter number according to the following rule: If the mobile station's access overload class is in the range 0-9, set PSIST_s equal to PSIST(0-9)_r; otherwise set PSIST_s equal to PSIST(n)_r, where n is equal to the mobile station access overload class.

The mobile station shall store the Access Control based on Call Type (ACCT) information as follows:

- Set ACCT_SO_LIST to NULL.
- Set ACCT_SO_GRP_LIST to NULL.
- If ACCT_INCL_r is equal to '1' and ACCOLC_p is in the range 0 to 9, then the mobile station shall perform the following:
 - Set ACCT_INCL_EMG_s to ACCT_INCL_EMG_r.
 - If ACCT_SO_INCL_r is equal to '1', then for each ACCT_SO_r included in this message:

- + If ACCT AOC_BITMAP INCL_r is equal to '0', or if ACCT AOC_BITMAP INCL_r is equal to '1' and the bit in the associated ACCT AOC_BITMAP1_r corresponding to the mobile station's ACCOLC_p (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT SO_r to ACCT SO LIST.
- If ACCT SO_GRP INCL_r is equal to '1', then for each ACCT SO_GRP_r included in this message:
 - + If ACCT AOC_BITMAP INCL_r is equal to '0', or if ACCT AOC_BITMAP INCL_r is equal to '1' and the bit in the associated ACCT AOC_BITMAP2_r corresponding to the mobile station's ACCOLC_p (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT SO_GRP_r to ACCT SO_GRP LIST.

11 The mobile station shall set CURR_ACC_MSG_SEQ equal to ACC_MSG_SEQ_s.

12 2.6.2.2.3 Neighbor List Message

13 Whenever a valid *Neighbor List Message* is received on the current Paging Channel
 14 (PAGECH_s), the configuration message sequence number, CONFIG_MSG_SEQ_r, shall be
 15 compared to that stored in NGHBR_LST_MSG_SEQ_s. If the comparison results in a match,
 16 the mobile station shall ignore the message. If the comparison results in a mismatch, then
 17 the mobile station shall process the remaining fields in the message as follows.

18 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.3, then the mobile
 19 station shall ignore the *Neighbor List Message* that contains it.

20 The mobile station shall store the following parameters:

- Configuration message sequence number
 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- Pilot PN sequence offset increment (PILOT_INC_s = PILOT_INC_r)

25 The mobile station shall set NGHBR_SET_SIZE_s to the number of neighboring base stations
 26 contained in the *Neighbor List Message*.

27 For each of the neighboring base stations contained in the *Neighbor List Message*, the
 28 mobile station shall do the following:

- If the ith occurrence of NGHBR_CONFIG_r is equal to '000', '001', or '010', set the
 NGHBR_CONFIG field of NGHBR_REC[i] to the ith occurrence of NGHBR_CONFIG_r;
 otherwise, set the NGHBR_CONFIG field of NGHBR_REC [i] to '011'.
- Set the NGHBR_PN field of NGHBR_REC [i] to the ith occurrence of NGHBR_PN_r.

33 If GEN_NGHBR_LST_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s, the mobile station
 34 shall perform the following:

- Set the SEARCH_PRIORITY field of the NGHBR_REC to '10' (high) for all
 NGHBR_SET_SIZE_s entries.
- Set the NGHBR_BAND field of NGHBR_REC to CDMABAND_s for all
 NGHBR_SET_SIZE_s entries.

- 1 • Set the NGHBR_FREQ field of NGHBR_REC to CDMACH_s for all NGHBR_SET_SIZE_s entries.
- 2 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_s for all NGHBR_SET_SIZE_s entries.
- 3 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all entries.
- 4 • Set NUM_ANALOG_NGHBR_s to '000' and set ANALOG_NGHBR_LIST to NULL.

7 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to '0' for all
8 NGHBR_SET_SIZE_s entries if any of the following conditions are met:

- 9 • EXT_SYS_PARAMETER_s is equal to '0',
- 10 • NGHBR_SET_ENTRY_INFO_s is equal to '0', or
- 11 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

12 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
13 all NGHBR_SET_SIZE_s entries if any of the following conditions are met:

- 14 • EXT_SYS_PARAMETER_s is equal to '0',
- 15 • NGHBR_SET_ACCESS_INFO_s is equal to '0', or
- 16 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

17 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
18 consists only of pilot offsets listed in the *Neighbor List Message*. If the *Neighbor List*
19 Message contains more pilot offsets than the mobile station can store, the mobile station
20 shall store the pilot offsets beginning at the start of the *Neighbor List Message*, up to the
21 limits of the mobile station's Neighbor Set storage capacity.

22 2.6.2.2.4 CDMA Channel List Message

23 Whenever a *CDMA Channel List Message* is received on the Paging Channel, the
24 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
25 stored in CHAN_LST_MSG_SEQ_s. If the comparison results in a match, the mobile station
26 may ignore the message. If the comparison results in a mismatch, then the mobile station
27 shall process the remaining fields in the message as follows.

28 The mobile station shall store the following parameters:

- 29 • Configuration message sequence number
(CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
30 CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

32 The mobile station shall perform the following:

- 33 • If both SYS_PAR_MSG_SEQ_s and EXT_SYS_PAR_MSG_SEQ_s are is current,
34 – If EXT_CHAN_LIST_s is equal to '1', the mobile station shall ignore this message.
35 – If EXT_CHAN_LIST_s is equal to '0', the mobile station shall process this message
36 as described below.

- 1 • Otherwise, the mobile station shall process this message after SYS_PAR_MSG_SEQ_s
 2 and EXT_SYS_PAR_MSG_SEQ_s become current.

3 The mobile station shall use the hash algorithm specified in 2.6.7.1 and the number of
 4 channels listed in the *CDMA Channel List Message* to determine the CDMA Channel
 5 (Frequency Assignment) for its Paging Channel. If the CDMA Frequency Assignment has
 6 changed (the computed CDMA Channel is different from CDMACH_S), the mobile station
 7 shall perform the following actions:

- 8 • Set CDMACH_S to the new CDMA Channel.
- 9 • Set PAGE_CHAN_S to '1'.
- 10 • Set PAGECH_S to the Primary Paging Channel.
- 11 • If the stored configuration parameters is not current (see 2.6.2.2) for the
 corresponding base station and frequency assignment, set CONFIG_MSG_SEQ_S,
 SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
 EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S,
 EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, USER_ZONE_ID-
 _MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 EXT_GLOB_SERV_REDIR_MSG_SEQ_S, and ACC_MSG_SEQ_S to NULL.
- 18 • Tune to the new CDMA Channel.

19 2.6.2.2.5 Extended System Parameters Message

20 Whenever an *Extended System Parameters Message* is received on the Paging Channel, the
 21 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
 22 stored in EXT_SYS_PAR_MSG_SEQ_S. If the comparison results in a match, the mobile
 23 station may ignore the message. If the comparison results in a mismatch, then the mobile
 24 station shall process the remaining fields in the message as follows.

25 If the protocol revision level supported by the mobile station (MOB_P_REV_p) is less than the
 26 minimum protocol revision level supported by the base station (MIN_P_REV_r), the mobile
 27 station shall enter the *System Determination Substate* of the *Mobile Station Initialization State*
 28 with a protocol mismatch indication (see 2.6.1.1). Otherwise, the mobile station shall store
 29 the following parameters:

- 30 • Configuration message sequence number
 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_r,
 EXT_SYS_PAR_MSG_SEQ_S = CONFIG_MSG_SEQ_r)
- 33 • Preferred Access Channel MSID type (PREF_MSID_TYPE_S = PREF_MSID_TYPE_r)
- 34 • Broadcast slot cycle index (BCAST_INDEX_S = BCAST_INDEX_r)
- 35 • The mobile station shall set its operational IMSI, IMSI_O, as follows:
 - 36 – If IMSI_T_SUPPORTED_r is equal to '0', the mobile station shall set IMSI_O to
 IMSI_M_p.
 - 38 – If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_T_p has been
 programmed, the mobile station shall set IMSI_O to IMSI_T_p.

- If $\text{IMSI_T_SUPPORTED}_r$ is equal to '1' and the mobile station's IMSI_T_p has not been programmed, the mobile station shall set IMSI_O to IMSI_M_p .
- ~~If IMSI_O has been changed, the mobile station shall set SYS_PAR_MSG_SEQ_s and $\text{CHAN_LST_MSG_SEQ}_s$, and $\text{EXT_CHAN_LST_MSG_SEQ}_s$, to NULL, and set PAGE_CHAN_s to '1'.~~
- If $\text{MCC}_r = '1111111111'$ and $\text{IMSI_11_12}_r = '1111111'$, the mobile station shall set the IMSI_O to IMSI_M_p and store:
 - Mobile Country Code ($\text{MCC}_s = \text{MCC}_p$) and
 - IMSI 11th and 12th digits ($\text{IMSI_11_12}_s = \text{IMSI_M_11_12}_p$); otherwise, the mobile station shall store:
 - Mobile Country Code ($\text{MCC}_s = \text{MCC}_r$) and
 - IMSI 11th and 12th digits ($\text{IMSI_11_12}_s = \text{IMSI_11_12}_r$).
- If IMSI_O is set to the IMSI_M , the mobile station shall set:
 - IMSI_O_S_s to IMSI_M_S_p (i.e., IMSI_O_S1_s to IMSI_M_S1_p and IMSI_O_S2_s to IMSI_M_S2_p)
 - IMSI_O_11_12_s to IMSI_M_11_12_p
 - MCC_O_s to MCC_M_p
 - IMSI_O_ADDR_NUM_s to IMSI_M_ADDR_NUM_p
- If IMSI_O is set to the IMSI_T , the mobile station shall set:
 - IMSI_O_S_s to IMSI_T_S_p (i.e., IMSI_O_S1_s to IMSI_T_S1_p and IMSI_O_S2_s to IMSI_T_S2_p).
 - IMSI_O_11_12_s to IMSI_T_11_12_p
 - MCC_O_s to MCC_T_p
 - IMSI_O_ADDR_NUM_s to IMSI_T_ADDR_NUM_p
- ~~If IMSI_O has been changed, the mobile station shall set SYS_PAR_MSG_SEQ_s , $\text{CHAN_LST_MSG_SEQ}_s$, $\text{EXT_CHAN_LST_MSG_SEQ}_s$, to NULL, and set PAGE_CHAN_s to '1', and set PAGECH_s to the Primary Paging Channel.~~
- Protocol revision level ($\text{P_REV}_s = \text{P_REV}_r$) if included in the message; otherwise, set P_REV_s as follows:
 - For Band Class 0, if the mobile station determines it is operating in Korea, set P_REV_s to '00000010'; otherwise, set P_REV_s to '00000011'.
 - For ~~Band Class 2 and~~ Band Class 3, set P_REV_s to '00000011'.
 - For Band Class 1 and Band Class 4, set P_REV_s to '00000001'.

- Minimum protocol revision level ($\text{MIN_P_REV}_s = \text{MIN_P_REV}_r$) if included in the message; otherwise, $\text{MIN_P_REV}_s = '00000010'$ for Band Class 0, $\text{MIN_P_REV}_s = '00000001'$ for Band Class 1 and Band Class 4, and $\text{MIN_P_REV}_s = '00000011'$ for Band Class 3.
- Protocol revision level currently in use ($\text{P_REV_IN_USE}_s = \text{the lesser value of P_REV}_s \text{ and MOB_P_REV}_p$ of the current band class)
- Slope of the handoff add/drop criterion ($\text{SOFT_SLOPE}_s = \text{SOFT_SLOPE}_r$) if included in the message; otherwise, $\text{SOFT_SLOPE}_s = '000000'$.
- Intercept of the handoff add criterion ($\text{ADD_INTERCEPT}_s = \text{ADD_INTERCEPT}_r$)
- Intercept of the handoff drop criterion ($\text{DROP_INTERCEPT}_s = \text{DROP_INTERCEPT}_r$)
- Delete foreign TMSI ($\text{DELETE_FOR_TMSI}_s = \text{DELETE_FOR_TMSI}_r$)
- Use TMSI ($\text{USE_TMSI}_s = \text{USE_TMSI}_r$)
- TMSI zone length ($\text{TMSI_ZONE_LEN}_s = \text{TMSI_ZONE_LEN}_r$)
- TMSI zone number ($\text{TMSI_ZONE}_s = \text{TMSI_ZONE}_r$)
- Maximum number of alternative service options ($\text{MAX_NUM_ALT_SO}_s = \text{MAX_NUM_ALT_SO}_r$) ~~if included in the message; otherwise, $\text{MAX_NUM_ALT_SO}_s = '000'$.~~
- System reselection indicator ($\text{RESELECT_INCLUDED}_s = \text{RESELECT_INCLUDED}_r$) if included in the message; otherwise, $\text{RESELECT_INCLUDED}_s = '0'$.
- Pilot reporting indicator ($\text{PILOT_REPORT}_s = \text{PILOT_REPORT}_r$)
- Neighbor Set access entry handoff information indicator ($\text{NGHBR_SET_ENTRY_INFO}_s = \text{NGHBR_SET_ENTRY_INFO}_r$) if included in the message; otherwise, $\text{NGHBR_SET_ENTRY_INFO}_s = '0'$.
- Neighbor Set access handoff information indicator ($\text{NGHBR_SET_ACCESS_INFO}_s = \text{NGHBR_SET_ACCESS_INFO}_r$) if included in the message; otherwise, $\text{NGHBR_SET_ACCESS_INFO}_s = '0'$.
- Short Data Burst supported indicator ($\text{SDB_SUPPORTED}_s = \text{SDB_SUPPORTED}_r$)
- Nominal reverse traffic channel output power offset relative to Reverse Pilot Channel power ($\text{RLGAIN_TRAFFIC_PILOT}_s = \text{RLGAIN_TRAFFIC_PILOT}_r$)
- Broadcast GPS Assist Indicator ($\text{BROADCAST_GPS_ASST}_s = \text{BROADCAST_GPS_ASST}_r$)
- Reverse Power Control Delay ($\text{REV_PWR_CNTL_DELAY}_s = \text{REV_PWR_CNTL_DELAY}_r$) if included
- Permission for the mobile station to request QoS settings in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message* ($\text{MOB_QOS}_s = \text{MOB_QOS}_r$)
- If ENC_SUPPORTED_r is equal to '1', the mobile station shall store:

- Signal encryption supported indicator ($SIG_ENCRYPT_SUP_s = SIG_ENCRYPT_SUP_r$)
- User information encryption supported indicator ($UI_ENCRYPT_SUP_s = UI_ENCRYPT_SUP_r$)
 - Store encryption key indicator ($STORE_KEY_s = STORE_KEY_r$)**
- Sync ID supported indicator ($USE_SYNC_ID_s = USE_SYNC_ID_r$)
- Concurrent services supported indicator ($CS_SUPPORTED_s = CS_SUPPORTED_r$)
- Primary Broadcast Control Channel supported indicator ($BCCH_SUPPORTED_s = BCCH_SUPPORTED_r$).**
- Pilot information request supported indicator ($PILOT_INFO_REQ_SUPPORTED_s = PILOT_INFO_REQ_SUPPORTED_r$).**

If $BCCH_SUPPORTED_s$ equals ‘1’, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a new system indication.

If $P_REV_IN_USE_s$ has been changed, the mobile station shall set $ACC_MSG_SEQ_s$, $CURR_ACC_MSG_SEQ$, $SYS_PAR_MSG_SEQ_s$, $EXT_NGHBR_LST_MSG_SEQ_s$, $GEN_NGHBR_LST_MSG_SEQ_s$, and $GLOB_SERV_REDIR_MSG_SEQ_s$ to NULL.

If $NGHBR_SET_ENTRY_INFO$ is equal to ‘1’, the mobile station shall store the access entry handoff in order and message processing operation indicator ($ACC_ENT_HO_ORDER_s = ACC_ENT_HO_ORDER_r$).

If the mobile station supports packet data service options and the $PACKET_ZONE_ID$ field is included in the message, the mobile station shall store the packet data services zone identifier ($PACKET_ZONE_ID_s = PACKET_ZONE_ID_r$); otherwise, the mobile station shall set $PACKET_ZONE_ID_s$ to ‘00000000’.

If $RESELECT_INCLUDED_s$ is equal to ‘1’, the mobile station shall store:

- Pilot power threshold ($EC_THRESH_s = EC_THRESH_r$)
- Pilot E_c/I_o threshold ($EC_IO_THRESH_s = EC_IO_THRESH_r$)

If $NGHBR_SET_ACCESS_INFO_s$ is equal to ‘1’, the mobile station shall store:

- Access handoff permitted indicator ($ACCESS_HO_s = ACCESS_HO_r$)
- Access probe handoff permitted indicator ($ACCESS_PROBE_HO_s = ACCESS_PROBE_HO_r$)
- If $ACCESS_PROBE_HO_s$ is equal to ‘1’, access handoff list update permitted indicator ($ACC_HO_LIST_UPD_s = ACC_HO_LIST_UPD_r$)
- Maximum number of times that the mobile station is permitted to perform an access probe handoff ($MAX_NUM_PROBE_HO_s = MAX_NUM_PROBE_HO_r$)
- Access handoff permitted for message response indicator ($ACCESS_HO_MSG_RSP_s = ACCESS_HO_MSG_RSP_r$)

- Access probe handoff permitted for other messages indicator
(ACC_PROBE_HO_OTHER_MSG_s = ACC_PROBE_HO_OTHER_MSG_r)
- If NGHBR_SET_ENTRY_INFO_s or NGHBR_SET_ACCESS_INFO_s is equal to '1', the mobile station shall store the size of the Neighbor Set (NGHBR_SET_SIZE_s = NGHBR_SET_SIZE_r).
If NGHBR_SET_ENTRY_INFO_s is equal to '0', then for all NGHBR_SET_SIZE_s occurrences of ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of NGHBR_REC[i] to '0'.
If NGHBR_SET_ENTRY_INFO_s is equal to '1', then for all NGHBR_SET_SIZE_s occurrences of ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of NGHBR_REC[i] to the ith occurrence of ACCESS_ENTRY_HO_r.
If NGHBR_SET_ACCESS_INFO_s is equal to '0', then for all NGHBR_SET_SIZE_s occurrences of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of NGHBR_REC[i] to '0'.
If NGHBR_SET_ACCESS_INFO_s is equal to '1', then for all NGHBR_SET_SIZE_s occurrences of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of NGHBR_REC[i] to the ith occurrence of ACCESS_HO_ALLOWED_r.
- The mobile station shall set all bits of TMSI_CODE_{s-p} to '1' if all of the following conditions are met:
- The bits of TMSI_CODE_{s-p} are not all equal to '1',
 - DELETE_FOR_TMSI_s is equal to '1', and
 - ASSIGNING_TMSI_ZONE_LEN_{s-p} is not equal to TMSI_ZONE_LEN_s, or the least significant ASSIGNING_TMSI_ZONE_LEN_{s-p} octets of ASSIGNING_TMSI_ZONE_{s-p} are not equal to TMSI_ZONE_s.
- If the mobile station supports the Quick Paging Channel operation:
- The mobile station shall set QPCH_SUPPORTED_s to QPCH_SUPPORTED_r.
 - If QPCH_SUPPORTED_r = '1':
 - The mobile station shall set QPCH_RATE_s to QPCH_RATE_r.
 - If the number of Quick Paging Channels specified in the received message (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Quick Paging Channel number in the range 1 to NUM_QPCH_r. The mobile station shall store the new Quick Paging Channel number as QPAGECH_s and as ASSIGNED_QPAGECH_s. The mobile station shall then set NUM_QPCH_s to NUM_QPCH_r.
 - The mobile station shall set QPCH_POWER_LEVEL_PAGE_s to QPCH_POWER_LEVEL_PAGE_r.
 - The mobile station shall set QPCH_CCI_SUPPORTED_s to QPCH_CCI_SUPPORTED_r.

- 1 – If QPCH_CCI_SUPPORTED_r = ‘1’, the mobile station shall set
 2 QPCH_POWER_LEVEL_CONFIG_s to QPCH_POWER_LEVEL_CONFIG_r.

3 If the mobile station supports the *Device Information Message* on the r-csch, the mobile
 4 station shall store:

- 5 • Autonomous message supported indicator
 6 (AUTO_MSG_SUPPORTED_s = AUTO_MSG_SUPPORTED_r)

7 If AUTO_MSG_SUPPORTED_r is equal to ‘1’ and the mobile station supports the *Device*
 8 *Information Message* on the r-csch, the mobile station shall store:

- 9 • Autonomous message interval
 10 (AUTO_MSG_INTERVAL_s = AUTO_MSG_INTERVAL_r)

11 The mobile station shall store mobile station initiated position location determination
 12 supported indicator (MS_INIT_POS_LOC_SUP_IND_s = MS_INIT_POS_LOC_SUP_IND_r).

13 2.6.2.2.6 Global Service Redirection Message

14 Whenever a *Global Service Redirection Message* is received on the Paging Channel, the
 15 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
 16 stored in GLOB_SERV_REDIR_MSG_SEQ_s. If the comparison results in a match or if
 17 SYS_PAR_MSG_SEQ_s is not current, the mobile station may ignore the message; otherwise,
 18 the mobile station shall store the following parameters:

- 19 • Configuration message sequence number
 20 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 21 GLOB_SERV_REDIR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 22 • ~~If the P_REV_IN_USE_s is equal to or greater than 6, the~~ The mobile station shall
 23 ignore this message, if any of the following conditions is true:
 - 24 – EXT_GLOBAL_REDIRECT_s = ‘1’
 - 25 – EXCL_P_REV_MS_r = ‘1’

26 If the subfield corresponding to the access overload class, ACCOLC_p, of the mobile station
 27 is set equal to ‘1’ in the REDIRECT_ACCOLC_r field of the received message, the mobile
 28 station shall store the following parameters and then shall enter the *System Determination*
 29 *Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1):

- 30 • Return if fail indicator (RETURN_IF_FAIL_s = RETURN_IF_FAIL_r)
- 31 • If DELETE_TMSI_r is equal to ‘1’, the mobile station shall set all the bits of
 32 TMSI_CODE_{s-p} to ‘1’
- 33 • Redirection record (REDIRECT_REC_s = redirection record from received message)
- 34 • If RECORD_TYPE_r = ‘00000001’, the mobile station shall:
 - 35 – Set CDMA_MODE_s to ‘1’
 - 36 – Set DIGITAL_REG_{s-p} to ‘00000000’
 - 37 – Max delay upon redirection (MAX_REDIRECT_DELAY_s =
 38 MAX_REDIRECT_DELAY_r)

1 2.6.2.2.7 Extended Neighbor List Message

2 Whenever a valid *Extended Neighbor List Message* is received on the current Paging Channel
 3 (PAGECH_S), the configuration message sequence number, CONFIG_MSG_SEQ_r , shall be
 4 compared to that stored in $\text{EXT_NGHBR_LST_MSG_SEQ}_S$. If the comparison results in a
 5 match, the mobile station may ignore the message. If the comparison results in a
 6 mismatch, then the mobile station shall process the remaining fields in the message as
 7 follows.

8 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.14, then the mobile
 9 station shall ignore the *Extended Neighbor List Message* that contains it.

10 The mobile station shall store the following parameters:

- 11 • Configuration message sequence number
 12 ($\text{CONFIG_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_r$,
 13 $\text{EXT_NGHBR_LST_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_r$,
 14 $\text{NGHBR_LST_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_r$)
- 15 • Pilot PN sequence offset increment ($\text{PILOT_INC}_S = \text{PILOT_INC}_r$)

16 The mobile station shall set NGHBR_SET_SIZE_S to the number of neighboring base stations
 17 contained in the *Extended Neighbor List Message*.

18 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
 19 if FREQ_INCL_r equals ‘0’, or if FREQ_INCL_r equals ‘1’ and NGHBR_BAND_r is supported, the
 20 mobile station shall do the following:

- 21 • If the i^{th} occurrence of NGHBR_CONFIG_r is equal to ‘000’, ‘001’, or ‘010’, set the
 22 NGHBR_CONFIG field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of NGHBR_CONFIG_r ;
 23 otherwise, set the NGHBR_CONFIG field of $\text{NGHBR_REC}[i]$ to ‘011’.
- 24 • Set the NGHBR_PN field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of NGHBR_PN_r .
- 25 • Set the SEARCH_PRIORITY field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
 26 SEARCH_PRIORITY_r .

27 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
 28 if FREQ_INCL_r equals ‘1’ and NGHBR_BAND_r is supported, the mobile station shall also do
 29 the following:

- 30 • Set the NGHBR_BAND field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
 31 NGHBR_BAND_r .
- 32 • Set the NGHBR_FREQ field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
 33 NGHBR_FREQ_r .

34 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
 35 if FREQ_INCL_r equals ‘0’, the mobile station shall also do the following:

- 36 • Set the NGHBR_BAND field of $\text{NGHBR_REC}[i]$ to CDMABAND_S .
- 37 • Set the NGHBR_FREQ field of $\text{NGHBR_REC}[i]$ to CDMACH_S .

1 If GEN_NGHBR_LST_MSG_SEQ_S is not equal to CONFIG_MSG_SEQ_S, the mobile station
 2 shall do the following:

- 3 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_S for all
 4 NGHBR_SET_SIZE_S entries.
- 5 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all entries.
- 6 • Set NUM_ANALOG_NGHBR_S to '000' and set ANALOG_NGHBR_LIST to NULL.

7 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to '0' for all
 8 NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 9 • EXT_SYS_PARAMETER_S is equal to '0',
 10 • NGHBR_SET_ENTRY_INFO_S is equal to '0', or
 11 • EXT_SYS_PAR_MSG_SEQ_S is not equal to CONFIG_MSG_SEQ_S.

12 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
 13 all NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 14 • EXT_SYS_PARAMETER_S is equal to '0',
 15 • NGHBR_SET_ACCESS_INFO_S is equal to '0', or
 16 • EXT_SYS_PAR_MSG_SEQ_S is not equal to CONFIG_MSG_SEQ_S.

17 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 18 consists only of pilot offsets listed in the *Extended Neighbor List Message*. If the *Extended*
 19 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 20 mobile station shall store the pilot offsets beginning at the start of the *Extended Neighbor*
 21 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

22 2.6.2.2.8 General Neighbor List Message

23 Whenever a valid *General Neighbor List Message* is received on the current Paging Channel
 24 (PAGECH_S), the configuration message sequence number, CONFIG_MSG_SEQ_R shall be
 25 compared to that stored in GEN_NGHBR_LST_MSG_SEQ_S. If the comparison results in a
 26 mismatch, then the mobile station shall process the remaining fields in the message as
 27 follows.

28 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.22, then the mobile
 29 station shall ignore the *General Neighbor List Message* that contains it.

30 The mobile station shall store the following parameters:

- 31 • Configuration message sequence number
 32 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_R,
 33 GEN_NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_R).
- 34 • Pilot PN sequence offset increment (PILOT_INC_S = PILOT_INC_R).

35 If NGHBR_CONFIG_PN_INCL_R is equal to '1' and FREQ_FIELDS_INCL_R is equal to '1', the
 36 mobile station shall store the following parameters:

- 1 • Configuration message sequence number
 2 (EXT_NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 3 NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

4 The mobile station shall set NGHBR_SET_SIZE_s to the number of neighboring base stations
 5 contained in the *General Neighbor List Message*.

6 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
 7 FREQ_INCL_r equal ‘0’, or if FREQ_INCL_r equal ‘1’ and NGHBR_BAND_r is supported, the
 8 mobile station shall do the following:

- 9 • If NGHBR_CONFIG_PN_INCL_r is equal to ‘1’, set the NGHBR_CONFIG and
 10 NGHBR_PN fields as follows:
 - 11 – If the ith occurrence of NGHBR_CONFIG_r is equal to ‘000’, ‘001’, or ‘010’, set the
 12 NGHBR_CONFIG field of NGHBR_REC[i] to the ith occurrence of
 13 NGHBR_CONFIG_r; otherwise, set the NGHBR_CONFIG field of NGHBR_REC[i] to
 14 ‘011’.
 - 15 – Set the NGHBR_PN field of NGHBR_REC[i] to the ith occurrence of NGHBR_PN_r.
- 16 • If NGHBR_SRCH_MODE_r = ‘00’ or ‘10’ and EXT_NGHBR_LST_MSG_SEQ_s is not
 17 equal to CONFIG_MSG_SEQ_r, set SEARCH_PRIORITY field of each NGHBR_REC to
 18 ‘10’ (high) for all NGHBR_SET_SIZE_s entries.
- 19 • If NGHBR_SRCH_MODE_r = ‘01’ or ‘11’, set the SEARCH_PRIORITY field of
 20 NGHBR_REC[i] to the ith occurrence of SEARCH_PRIORITY_r.
- 21 • If NGHBR_SRCH_MODE_r = ‘00’ or ‘01’, set the SRCH_WIN_NGHBR field of each
 22 NGHBR_REC to SEARCH_WIN_s for all NGHBR_SET_SIZE_s entries if
 23 SYS_PAR_MSG_SEQ_s is equal to CONFIG_MSG_SEQ_r; otherwise, set
 24 SETTING_SEARCH_WIN to ‘1’.
- 25 • If NGHBR_SRCH_MODE_r = ‘00’ or ‘01’, set the SRCH_OFFSET_NGHBR field of each
 26 NGHBR_REC to ‘000’.
- 27 • If NGHBR_SRCH_MODE_r = ‘10’ or ‘11’:
 - 28 – set the SRCH_WIN_NGHBR field of NGHBR_REC[i] to the ith occurrence of
 29 SRCH_WIN_NGHBR_r
 - 30 – if SRCH_OFFSET_INCL_r equals to ‘1’, set the SRCH_OFFSET_NGHBR field of
 31 NGHBR_REC[i] to the ith occurrence of SRCH_OFFSET_NGHBR_r, and
 - 32 – if SRCH_OFFSET_INCL_r equals to ‘0’, set the SRCH_OFFSET_NGHBR field of
 33 each NGHBR_REC to ‘000’.
- 34 • If USE_TIMING_r is equal to ‘1’, set the TIMING_INCL field of NGHBR_REC[i] to the
 35 ith occurrence of TIMING_INCL_r; otherwise, set the TIMING_INCL field of
 36 NGHBR_REC to ‘0’ for all entries.

- If BCCH_IND_INCL_r is equal to ‘1’, set the BCCH_SUPPORT field of NGHBR_REC[i] to the ith occurrence of BCCH_SUPPORT_r; otherwise, set the BCCH_IND_INCL field of NGHBR_REC to ‘0’ for all entries.

For each of the neighboring base stations contained in the *General Neighbor List Message*, if FREQ_FIELDS_INCL_r equals ‘1’, FREQ_INCL_r equals ‘1’, and NGHBR_BAND_r is supported, the mobile station shall also perform the following:

- Set the NGHBR_BAND field of NGHBR_REC[i] to the ith occurrence of NGHBR_BAND_r.
- Set the NGHBR_FREQ field of NGHBR_REC[i] to the ith occurrence of NGHBR_FREQ_r.

For each of the neighboring base stations contained in the *General Neighbor List Message*, if USE_TIMING_r is equal to ‘1’ and TIMING_INCL_r equals ‘1’, the mobile station shall also perform the following:

- Set the NGHBR_TX_OFFSET field of NGHBR_REC[i] to the ith occurrence of NGHBR_TX_OFFSET_r.
- If GLOBAL_TIMING_INCL_r is equal to ‘1’, then the mobile station shall:
 - Set the NGHBR_TX_DURATION field of NGHBR_REC to GLOBAL_TX_DURATION_r for all entries.
 - Set the NGHBR_TX_PERIOD field of NGHBR_REC to GLOBAL_TX_PERIOD_r for all entries.
- If GLOBAL_TIMING_INCL_r is equal to ‘0’, then the mobile station shall:
 - Set the NGHBR_TX_DURATION field of NGHBR_REC[i] to the ith occurrence of NGHBR_TX_DURATION_r.
 - Set the NGHBR_TX_PERIOD field of NGHBR_REC[i] to the ith occurrence of NGHBR_TX_PERIOD_r.

For each of the neighboring base stations contained in the *General Neighbor List Message*, if FREQ_FIELDS_INCL_r equals ‘1’ and FREQ_INCL_r equals ‘0’, or if FREQ_FIELDS_INCL_r equals ‘0’ and EXT_NGHBR_LST_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_r, the mobile station shall also do the following:

- Set the NGHBR_BAND field of NGHBR_REC[i] to CDMABAND_s.
- Set the NGHBR_FREQ field of NGHBR_REC[i] to CDMACH_s.

The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to ‘0’ for all NGHBR_SET_SIZE_s entries if any of the following conditions are met:

- EXT_SYS_PARAMETER_s is equal to ‘0’
- NGHBR_SET_ENTRY_INFO_s is equal to ‘0’, or
- EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

1 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
 2 all NGHBR_SET_SIZE_s entries if any of the following conditions are met:

- 3 • EXT_SYS_PARAMETER_s is equal to '0'
- 4 • NGHBR_SET_ACCESS_INFO_s is equal to '0', or
- 5 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

6 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 7 consists only of pilot offsets listed in the *General Neighbor List Message*. If the *General*
 8 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 9 mobile station shall store the pilot offsets beginning at the start of the *General Neighbor List*
 10 *Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

11 The mobile station shall set NUM_ANALOG_NGHBR_s to NUM_ANALOG_NGHBR_r, the
 12 number of neighboring analog systems contained in the *General Neighbor List Message*. For
 13 each of the neighboring analog systems contained in the *General Neighbor List Message*, the
 14 mobile station shall perform the following:

- 15 • Set the BAND_CLASS field of ANALOG_NGHBR_LIST[i] to the ith occurrence of
 16 BAND_CLASS_r.
- 17 • Set the SYS_A_B field of ANALOG_NGHBR_LIST[i] to the ith occurrence of SYS_A_B_r.

18 For each of the neighboring base stations contained in the *General Neighbor List Message*,
 19 the mobile station shall set the ADD_PILOT_REC_INCL field of NGHBR_REC[i] to the ith
 20 occurrence of ADD_PILOT_REC_INCL_r. If ADD_PILOT_REC_INCL_r equals '1', for each pilot
 21 included in the message, the mobile station shall also perform the following:

- 22 • Set the NGHBR_PILOT_REC_TYPE field of NGHBR_PILOT_REC to
 23 NGHBR_PILOT_REC_TYPE_r.
- 24 • If NGHBR_PILOT_REC_TYPE_r is equal to '000'. The mobile station shall:
 - 25 – Set the TD_POWER_LEVEL field of NGHBR_PILOT_REC to TD_POWER_LEVEL_r.
 - 26 – Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 27 • If NGHBR_PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
 - 28 – Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
 - 29 – Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
 30 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 31 • If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 32 – Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
 - 33 – Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
 34 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - 35 – Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
 36 AUX_TD_POWER_LEVEL_r.
 - 37 – Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.

- If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to SR3_PRIMARY_PILOT_r.
 - Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to SR3_PILOT_POWER1_r.
 - Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to SR3_PILOT_POWER2_r.
- If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to SR3_PRIMARY_PILOT_r.
 - Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to SR3_PILOT_POWER1_r.
 - Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to SR3_PILOT_POWER2_r.
 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length specified by WALSH_LENGTH1_r.
 - Otherwise, set the AUX_PILOT_QOF1 field of NGHBR_PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE1 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2 field of NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh Code length specified by WALSH_LENGTH2_r.
 - Otherwise, set the AUX_PILOT_QOF2 field of NGHBR_PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE2 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.

2.6.2.2.9 User Zone Identification Message

Whenever a *User Zone Identification Message* is received on the Paging Channel or Primary Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r, to that stored in USER_ZONE_ID_MSG_SEQs. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows.

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number
(CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_r,
3 USER_ZONE_ID_MSG_SEQ_S = CONFIG_MSG_SEQ_r)
- 4
- 5 • UZ_EXIT_RCVD_S = UZ_EXIT_r

6 The mobile station shall set NUM_UZID_S to the number of User Zones contained in the *User*
7 *Zone Identification Message*.

8 For each User Zone contained in the *User Zone Identification Message*, the mobile station
9 shall do the following:

- 10 • Set the UZID field of UZ_REC(i) to the ith occurrence of UZID_r.
- 11 • Set the UZ_REV field of the UZ_REC(i) to the ith occurrence of UZ_REV_r.
- 12 • Set the TEMP_SUB field of the UZ_REC(i) to the ith occurrence of TEMP_SUB_r.

13 2.6.2.2.10 Private Neighbor List Message

14 Whenever a *Private Neighbor List Message* is received on the Paging Channel or Primary
15 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile
16 station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r, to
17 that stored in PRI_NGHBR_LST_MSG_SEQ_S. If the comparison results in a match, the
18 mobile station may ignore the message. If the comparison results in a mismatch, then the
19 mobile station shall process the remaining fields in the message as follows.

20 The mobile station shall store the following parameters:

- 21 • Configuration message sequence number
(CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_r,
22 PRI_NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_r)
- 23
- 24 • Common configuration included indicator (COMMON_INCL_S = COMMON_INCL_r)

25 The mobile station shall set NUM_PRI_NGHBR_S to the number of Private Neighbor base
26 stations contained in the *Private Neighbor List Message*.

27 For each Private Neighbor base station contained in the *Private Neighbor List Message* the
28 mobile station shall do the following:

- 29 • Set the SRCH_WIN_PRI_NGHBR field of PRI_NGHBR_REC(i) to SRCH_WIN_PN_r.
- 30 • Set the SID field of PRI_NGHBR_REC(i) to the ith occurrence SID_r.
- 31 • Set the NID field of PRI_NGHBR_REC(i) to the ith occurrence NID_r.
- 32 • Set the PRI_NGHBR_PN field of PRI_NGHBR_REC(i) to the ith occurrence
33 PRI_NGHBR_PN_r.
- 34 • If COMMON_INCL_r is equal to ‘1’, then the mobile station shall:
 - 35 – Set the BAND_CLASS field of PRI_NGHBR_REC(i) to COMMON_BAND_CLASS_r.
 - 36 – Set the NGHBR_FREQ field of PRI_NGHBR_REC(i) to COMMON_NGHBR_FREQ_r.

- If COMMON_INCL_r is equal to ‘0’, then the mobile station shall:
 - Set the BAND_CLASS field of PRI_NGHBR_REC(i) to the ith occurrence of BAND_CLASS_r.
 - Set the NGHBR_FREQ field of PRI_NGHBR_REC(i) to the ith occurrence of NGHBR_FREQ_r.
- If ith occurrence of UZID_INCL_r is equal to ‘0’, then the mobile station shall set the PS_NUM_UZID field of PRI_NGHBR_REC(i) to ‘0000’.
- If ith occurrence of UZID_INCL_r is equal to ‘1’, then the mobile station shall set the PS_NUM_UZID field of PRI_NGHBR_REC(i) to the NUM_UZID_r associated with the ith occurrence of UZID_INCL_r.
- For each User Zone supported by the ith private system, the mobile station shall do the following:
 - Set the PS_UZID(j) field of PRI_NGHBR_REC(i) to the jth occurrence of UZID_r.
 - Set the PS_UZ_REV(j) field of PRI_NGHBR_REC(i) to the jth occurrence of UZ_REV_r.
 - Set the PS_TEMP_SUB(j) field of PRI_NGHBR_REC(i) to the jth occurrence of TEMP_SUB_r.

2.6.2.2.11 Extended Global Service Redirection Message

Whenever an *Extended Global Service Redirection Message* is received on the Paging Channel or Primary Broadcast Control Channel, the configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that stored in EXT_GLOB_SERV_REDIR_MSG_SEQ_s. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, the mobile station shall store the following parameters:

- Configuration message sequence number
(CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
GLOB_SERV_REDIR_MSG_SEQ_s= CONFIG_MSG_SEQ_r,
EXT_GLOB_SERV_REDIR_MSG_SEQ_s= CONFIG_MSG_SEQ_r)

The mobile station shall ignore the rest of the message if any of the following conditions is satisfied:

- The subfield corresponding to the access overload class, ACCOLC_p, of the mobile station is set equal to ‘0’ in the REDIRECT_ACCOLC_r field of the received message,
- MOB_P_REV_p is not in the redirection mobile protocol revision range (i.e., REDIRECT_P_REV_INCL_r = ‘1’ and EXCL_P_REV_IND_r = ‘0’, and MOB_P_REV_p < REDIRECT_P_MIN_r or MOB_P_REV_p >REDIRECT_P_MAX_r), or
- MOB_P_REV_p is in the excluded mobile protocol revision range (i.e., REDIRECT_P_REV_INCL_r = ‘1’ and EXCL_P_REV_IND_r = ‘1’ and (REDIRECT_P_MIN_r ≤ MOB_P_REV_p ≤ REDIRECT_P_MAX_r)).

Otherwise, the mobile station shall store the following parameters and then shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1):

- If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of TMSI_CODE_{s-p} to '1'.
- Return if fail indicator ($\text{RETURN_IF_FAIL}_s = \text{RETURN_IF_FAIL}_r$).
- Redirection record ($\text{REDIRECT_REC}_s = \text{redirection record from received message}$)
- If $\text{RECORD_TYPE}_r = '00000001'$, the mobile station shall:
 - Set CDMA_MODE_s to '1'
 - Set DIGITAL_REG_{s-p} to '00000000'
 - Max delay upon redirection ($\text{MAX_REDIRECT_DELAY}_s = \text{MAX_REDIRECT_DELAY}_r$)

2.6.2.2.12 Extended CDMA Channel List Message Overview

The mobile station may receive the *Extended CDMA Channel List Message* from the Paging Channel or from the Primary Broadcast Control Channel. The mobile station shall follow requirements defined in 2.6.2.2.12.1 or 2.6.2.2.12.2 to process the *Extended CDMA Channel List Message*.

2.6.2.2.12.1 Extended CDMA Channel List Message on Paging Channel

Whenever an *Extended CDMA Channel List Message* is received on the Paging Channel, the mobile station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r , to that stored in $\text{EXT_CHAN_LST_MSG_SEQ}_s$. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows:

The mobile station shall store the following parameters:

- Configuration message sequence number ($\text{CONFIG_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r$, $\text{EXT_CHAN_LST_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r$, $\text{CHAN_LST_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r$).

The mobile station shall determine the CDMA Channel (Frequency Assignment) for its Paging Channel as follows:

- If $\text{RC_QPCH_SEL_INCL}_r$ is equal to '1' and the mobile station is capable of RC greater than 2 or capable of supporting Quick Paging Channel, the mobile station shall eliminate those channels with $\text{RC_QPCH_HASH_IND}_r$ equal to '0' from the CDMA channel list and use the hash algorithm specified in 2.6.7.1 and the number of channels whose $\text{RC_QPCH_HASH_IND}_r$ is equal to '1' in the *Extended CDMA Channel List Message* to determine the CDMA Channel (Frequency Assignment) for its Paging Channel.

- If $RC_{QPCH_SEL_INCL_r}$ is equal to ‘1’ and the mobile station is not capable of RC greater than 2 and not capable of supporting Quick Paging Channel, the mobile station shall use the hash algorithm specified in 2.6.7.1 and the number of channels in the *Extended CDMA Channel List Message* to determine the CDMA Channel (Frequency Assignment) for its Paging Channel.
- If $RC_{QPCH_SEL_INCL_r}$ is equal to ‘0’, the mobile station shall use the hash algorithm specified in 2.6.7.1 and the number of channels in the *Extended CDMA Channel List Message* to determine the CDMA Channel (Frequency Assignment) for its Paging Channel.

If the CDMA Frequency Assignment has changed (the computed CDMA Channel is different from $CDMACH_s$), the mobile station shall perform the following actions:

- If the stored configuration parameters is not current (see 2.6.2.2) for the corresponding base station and frequency assignment, the mobile station shall perform the following actions:
 - Set $CDMACH_s$ to the new CDMA Channel.
 - Set $PAGE_CHAN_s$ to ‘1’.
 - Set $PAGECH_s$ to the Primary Paging Channel.
 - Set $CONFIG_MSG_SEQ_s$, $SYS_PAR_MSG_SEQ_s$, $NGHBR_LST_MSG_SEQ_s$, $CHAN_LST_MSG_SEQ_s$, $EXT_CHAN_LST_MSG_SEQ_s$, $EXT_NGHBR_LST_MSG_SEQ_s$, $GEN_NGHBR_LST_MSG_SEQ_s$, $EXT_SYS_PAR_MSG_SEQ_s$, $GLOB_SERV_REDIR_MSG_SEQ_s$, $EXT_GLOB_SERV_REDIR_MSG_SEQ_s$, $USER_ZONE_IDMSG_SEQ_s$, $PRI_NGHBR_LST_MSG_SEQ_s$, and $ACC_MSG_SEQ_s$ to NULL.
- Tune to the new CDMA Channel.
- Otherwise, the mobile station shall perform the following actions:
 - Set $CDMACH_s$ to the new CDMA Channel.
 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Paging Channel number in the range 1 to $PAGE_CHAN_s$, where $PAGE_CHAN_s$ is the value stored for the Paging Channel whose stored information is current. The mobile station shall store the new Paging Channel number as $PAGECH_s$.
 - Tune to the new CDMA Channel and shall begin monitoring the new Paging Channel.

2.6.2.2.12.2 Extended CDMA Channel List Message on Primary Broadcast Control Channel

Whenever the *Extended CDMA Channel List Message* is received on the Primary Broadcast Control Channel, the mobile station shall compare the configuration message sequence number, $CONFIG_MSG_SEQ_r$, to that stored in $CONFIG_MSG_SEQ_s$. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, the mobile station shall process the remaining fields in the message as follows:

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number
 3 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_r,
 4 EXT_CHAN_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_r).

5 To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast Control
 6 Channel, the mobile station shall first select a subset of CDMA channels from the *Extended*
 7 *CDMA Channel List Message* that will be used for channel hashing. The attributes for
 8 channel selection are support for RC greater than 2, Quick Paging Channel and transmit
 9 diversity. The mobile station shall first select the entire CDMA channel list for channel
 10 hashing. The mobile station shall then select the first subset as follows:

- 11 • If TD_SEL_INCL_r is equal to '1', the mobile station shall perform the following:
 - 12 – If the mobile station is capable of supporting the transmit diversity mode
 13 specified by TD_MODE_r, the mobile station shall select those CDMA channels
 14 that have TD_HASH_IND_r set to '1' from the CDMA channel list for the first
 15 subset.
 - 16 – If the mobile station is not capable of supporting the transmit diversity mode
 17 specified by TD_MODE_r, the mobile station shall select those CDMA channels
 18 that have TD_HASH_IND_r set to '0' from the CDMA channel list for the first
 19 subset. If this selected subset is empty, the mobile station shall not perform the
 20 remaining procedures in this section.
- 21 • If TD_SEL_INCL_r is equal to '0', the mobile station shall select the entire list for the
 22 first subset.

23 From this first subset, the mobile station shall select the final subset as follows:

- 24 • If RC_QPCH_SEL_INCL_r is equal to '1' and the mobile station is capable of RC
 25 greater than 2 or capable of supporting QPCH, the mobile station shall select those
 26 CDMA channels with RC_QPCH_HASH_IND_r set to '1' for the final subset for CDMA
 27 channel hashing. If this list is empty, the mobile station shall use the first subset as
 28 the final subset for CDMA channel hashing.
- 29 • Otherwise, the mobile station shall use the first subset as the final subset for CDMA
 30 channel hashing.

31 After the final subset has been selected, the mobile station shall use the hash algorithm
 32 specified in 2.6.7.1 with the number of channels in the final subset of the CDMA channel
 33 list to determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast
 34 Control Channel.

35 If the CDMA Frequency Assignment has changed (the computed CDMA Channel is different
 36 from CDMACH_S), the mobile station shall perform the following:

- 37 • Set CDMACH_S to the new CDMA Channel.

- Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and PRI_NGHBR_LST_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL
- If the mobile station is operating in the Spreading Rate 1:
 - If the assigned CDMA channel supports transmit diversity, the mobile station shall set the following fields corresponding to the assigned CDMA channel:
 - + SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.
 - + SR1_TD_MODE_s = TD_MODE_r.
 - + BRAT_s = SR1_BRAT_TD_s.
 - + BCCH_CODE_RATE_s = SR1_CRAT_TD_s.
 - + BCCH_s = BCCH_CODE_CHAN_TD_s.
 - Otherwise, the mobile station shall set the following fields corresponding to the assigned CDMA channel:
 - + BRAT_s = SR1_BRAT_NON_TD_s,
 - + BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_s,
 - + BCCH_s = BCCH_CODE_CHAN_NON_TD_s,
- Tune to the new CDMA Channel

2.6.2.2.13 ANSI-41 System Parameters Message

Whenever an *ANSI-41 System Parameters Message* is received, the configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that stored in A41_SYS_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as described in 2.6.2.2.13.1, 2.6.2.2.13.2, 2.6.2.2.13.3, and 2.6.2.2.13.4.

If REG_PRD is not within the valid range specified in 3.7.2.3.2.[31](#), then the mobile station shall ignore the *ANSI-41 System Parameters Message* that contains it.

2.6.2.2.13.1 Stored Parameters

The mobile station shall store the following parameters:

- Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r, A41_SYS_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- Home registration indicator (HOME_REG_s = HOME_REG_r)
- SID roamer registration indicator (FOR_SID_REG_s = FOR_SID_REG_r)
- NID roamer registration indicator (FOR_NID_REG_s = FOR_NID_REG_r)

- 1 • Power-up registration indicator ($\text{POWER_UP_REG}_S = \text{POWER_UP_REG}_R$)
- 2 • Power-down registration indicator ($\text{POWER_DOWN_REG}_S = \text{POWER_DOWN_REG}_R$)
- 3 • Parameter-change registration indicator ($\text{PARAMETER_REG}_S = \text{PARAMETER_REG}_R$)
- 4 • Preferred Enhanced Access Channel MSID type
($\text{PREF_MSID_TYPE}_S = \text{PREF_MSID_TYPE}_R$)
- 5
 - 6 • The mobile station shall set its operational IMSI, IMSI_O , as follows:
 - 7 – If $\text{IMSI_T_SUPPORTED}_R$ is equal to '0', the mobile station shall set IMSI_O to IMSI_M_p .
 - 8 – If $\text{IMSI_T_SUPPORTED}_R$ is equal to '1' and the mobile station's IMSI_T_p has been programmed, the mobile station shall set IMSI_O to IMSI_T_p .
 - 9 – If $\text{IMSI_T_SUPPORTED}_R$ is equal to '1' and the mobile station's IMSI_T_p has not been programmed, the mobile station shall set IMSI_O to IMSI_M_p .
 - 10 – If IMSI_O has been changed, the mobile station shall set [A41-SYSMC RR_PAR_MSG_SEQ_S](#) and [EXT_CHAN_LST_MSG_SEQ_S](#) to [NULL](#) [and set NUM_FCCCH_S to '1'](#) and [FCCCH ID_S to '1'](#).
- 11
 - 12 • If OTHER_INFO_INCL_R is set to '1', the mobile station shall store:
 - 13 – Base station identification ($\text{BASE_ID}_S = \text{BASE_ID}_R$)
 - 14 – If $\text{MCC}_R = '1111111111'$ and $\text{IMSI_11_12}_R = '11111111'$, the mobile station shall set the IMSI_O to IMSI_M_p and store:
 - 15 + Mobile Country Code ($\text{MCC}_S = \text{MCC}_M_p$) and
 - 16 + IMSI 11th and 12th digits ($\text{IMSI_11_12}_S = \text{IMSI_M_11_12}_p$);
 - 17 – Otherwise, the mobile station shall store:
 - 18 + Mobile Country Code ($\text{MCC}_S = \text{MCC}_R$) and
 - 19 + IMSI 11th and 12th digits ($\text{IMSI_11_12}_S = \text{IMSI_11_12}_R$).
 - 20 – Broadcast GPS assist indicator ($\text{BROADCAST_GPS_ASST}_S = \text{BROADCAST_GPS_ASST}_R$)
 - 21 – Signaling encryption supported indicator ($\text{SIG_ENCRYPT_SUP}_S = \text{SIG_ENCRYPT_SUP}_R$)
 - 22 – [Store encryption key indicator \(STORE_KEY_S = STORE_KEY_R\)](#)
 - 23 – [Concurrent services supported indicator \(CS_SUPPORTED_S = CS_SUPPORTED_R\)](#)
 - 24 • If IMSI_O is set to the IMSI_M , the mobile station shall set:
 - 25 – IMSI_O_S_S to IMSI_M_S_p (i.e., IMSI_O_S1_S to IMSI_M_S1_p and IMSI_O_S2_S to IMSI_M_S2_p)
 - 26 – IMSI_O_11_12_S to IMSI_M_11_12_p
 - 27 – MCC_O_S to MCC_M_p

- IMSI_O_ADDR_NUM_s to IMSI_M_ADDR_NUM_p
- If IMSI_O is set to the IMSI_T, the mobile station shall set:
 - IMSI_O_S_s to IMSI_T_S_p (i.e., IMSI_O_S1_s to IMSI_T_S1_p and IMSI_O_S2_s to IMSI_T_S2_p).
 - IMSI_O_11_12_s to IMSI_T_11_12_p
 - MCC_O_s to MCC_T_p
 - IMSI_O_ADDR_NUM_s to IMSI_T_ADDR_NUM_p
- Delete foreign TMSI (DELETE_FOR_TMSI_s = DELETE_FOR_TMSI_r)
- Use TMSI (USE_TMSI_s = USE_TMSI_r)
- TMSI zone length (TMSI_ZONE_LEN_s = TMSI_ZONE_LEN_r)
- TMSI zone number (TMSI_ZONE_s = TMSI_ZONE_r)
- Maximum number of alternative service options (MAX_NUM_ALT_SO_s = MAX_NUM_ALT_SO_r) ~~if included in the message; otherwise, MAX_NUM_ALT_SO_s = 000~~.
- The mobile station shall set all bits of TMSI_CODE_{s-p} to '1' if all of the following conditions are met:
 - The bits of TMSI_CODE_{s-p} are not all equal to '1',
 - DELETE_FOR_TMSI_s is equal to '1', and
 - ASSIGNING_TMSI_ZONE_LEN_{s-p} is not equal to TMSI_ZONE_LEN_s, or the least significant ASSIGNING_TMSI_ZONE_LEN_{s-p} octets of ASSIGNING_TMSI_ZONE_{s-p} are not equal to TMSI_ZONE_s.

If the mobile station supports packet data service, the mobile station shall store the packet data services zone identifier (PACKET_ZONE_ID_s = PACKET_ZONE_ID_r); otherwise, the mobile station shall set PACKET_ZONE_ID_s to '00000000'.

If the mobile station supports the *Device Information Message* on the r-csch, the mobile station shall store:

- Autonomous message supported indicator (AUTO_MSG_SUPPORTED_s = AUTO_MSG_SUPPORTED_r)

If AUTO_MSG_SUPPORTED_r is equal to '1' and the mobile station supports the *Device Information Message* on the r-csch, the mobile station shall store:

- Autonomous message interval (AUTO_MSG_INTERVAL_s = AUTO_MSG_INTERVAL_r)

The mobile station shall store concurrent service supported indicator (CS_SUPPORTED_s = CS_SUPPORTED_r).

The mobile station shall store mobile station initiated position location determination supported indicator (MS_INIT_POS_LOC_SUP_IND_s = MS_INIT_POS_LOC_SUP_IND_r).

The mobile station shall also store the following parameters if the mobile station is not in

- 1 the *Origination Attempt Substate* or *Page Response Substate*:
- 2 • System identification ($SID_s = SID_r$)
- 3 • Network identification ($NID_s = NID_r$)
- 4 • Registration zone ($REG_ZONE_s = REG_ZONE_r$)
- 5 • Number of registration zones to be retained ($TOTAL_ZONES_s = TOTAL_ZONES_r$)
- 6 • Zone timer length ($ZONE_TIMER_s = ZONE_TIMER_r$)
- 7 • Multiple SID storage indicator ($MULT_SIDS_s = MULT_SIDS_r$)
- 8 • Multiple NID storage indicator ($MULT_NIDS_s = MULT_NIDS_r$)
- 9 • Registration period ($REG_PRD_s = REG_PRD_r$)
- 10 • If $DIST_REG_INCL$ is equal to ‘1’, the mobile station shall store:
- 11 – Registration distance ($REG_DIST_s = REG_DIST_r$)
- 12 • If $DIST_REG_INCL$ is equal to ‘0’, then the mobile station shall set REG_DIST equal
- 13 to ‘0000000000’.

14 The mobile station shall ignore any fields at the end of the *ANSI-41 System Parameters*
 15 *Message* that are not defined according to the protocol revision level ($MOB_P_REV_p$ of the
 16 current band class) being used by the mobile station.

17 2.6.2.2.13.2 Roaming Status

18 The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
 19 The mobile station should indicate to the user whether the mobile station is roaming.

20 2.6.2.2.13.3 Registration

21 The mobile station shall update stored variables and perform other registration procedures
 22 as specified in 2.6.5.5.2.2.

23 2.6.2.2.13.4 PACA Disable for SID Change

24 If $PACA_s$ is equal to enabled, and SID_s is not equal to $PACA_SID_s$, the mobile station shall
 25 set $PACA_s$ to disabled and $PACA_CANCEL$ to ‘0’, shall disable the PACA state timer, and
 26 should indicate to the user that the PACA call has been canceled

27 2.6.2.2.14 MC-RR Parameters Message

28 Whenever an *MC-RR Parameters Message* is received, the configuration message sequence
 29 number, $CONFIG_MSG_SEQ_r$, shall be compared to that stored in $MC_RR_PAR_MSG_SEQ_s$.
 30 If the comparison results in a match, the mobile station may ignore the message. If the
 31 comparison results in a mismatch, then the mobile station shall process the remaining
 32 fields in the message as described in 2.6.2.2.14.1, 2.6.2.2.14.2, and 2.6.2.2.14.3.

33 If the protocol revision level supported by the mobile station ($MOB_P_REV_p$) is less than the
 34 minimum protocol revision level supported by the base station ($MIN_P_REV_r$), the mobile
 35 station shall enter the *System Determination Substate* of the *Mobile Station Initialization State*

1 with a protocol mismatch indication (see 2.6.1.1).

2 If BASE LAT, BASE LONG, or PWR REP THRESH ~~is-are~~ not within the valid ranges
 3 specified in 3.7.2.3.2.31, then the mobile station shall ignore the *MC-RR Parameters*
 4 *Message* that contains them.

5 If the mobile station supports Spreading Rate 3 on the common channel and SR3_INCL_s is
 6 equal to '1', the mobile station shall set:

- 7 • BRAT_s = SR3_BRAT_r,
- 8 • BCCH_s = SR3_BCCH_CODE_CHAN_r;
- 9 • BCCH_CODE_RATE_s = 1/3;
- 10 • SR3_PRIMARY_PILOT_s = SR3_PRIMARY_PILOT_r;
- 11 • SR3_PILOT_POWER1_s = SR3_PILOT_POWER1_r;
- 12 • SR3_PILOT_POWER2_s = SR3_PILOT_POWER2_r;
- 13 • If SR3_CENTER_FREQ_INCL_r is equal to '1', POTENTIAL_CDMACH_s =
 14 SR3_CENTER_FREQ_r.

15 If POTENTIAL_CDMACH_s is different from CDMACH_s, the mobile station shall set
 16 CDMACH_s = POTENTIAL_CDMACH_s and then tune to the CDMA Channel (CDMACH_s).

17 2.6.2.2.14.1 Stored Parameters

18 The mobile station shall store the following parameters:

- 19 • Configuration message sequence number
 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 MC_RR_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 20 • Base station identification (BASE_ID_s = BASE_ID_r)
- 21 • Protocol revision level (P_REV_s = P_REV_r)
- 22 • Protocol revision level currently in use (P_REV_IN_USE_s = the lesser value of
 P_REV_s and MOB_P_REV_r of the current band class)
- 23 • Minimum protocol revision level (MIN_P_REV_s = MIN_P_REV_r).
 24
- 25 • Search window size for the Active Set and Candidate Set
 (SRCH_WIN_A_s = SRCH_WIN_A_r)
- 26 • Search window size for the Remaining Set (SRCH_WIN_R_s = SRCH_WIN_R_r)
- 27 • Pilot detection threshold (T_ADD_s = T_ADD_r)
- 28 • Pilot drop threshold (T_DROP_s = T_DROP_r)
- 29 • Active Set versus Candidate Set comparison threshold (T_COMP_s = T_COMP_r)
- 30 • Drop timer value (T_TDROPO_s = T_TDROPO_r)

- 1 • Maximum age for retention of Neighbor Set members
(NGHBR_MAX_AGE_S = NGHBR_MAX_AGE_R)
- 2
- 3 • Slope of the handoff add/drop criterion (SOFT_SLOPE_S = SOFT_SLOPE_R) **if included in the message; otherwise, SOFT_SLOPE_S = '000000'.**
- 4
- 5 • Intercept of the handoff add criterion (ADD_INTERCEPT_S = ADD_INTERCEPT_R)
- 6 • Intercept of the handoff drop criterion (DROP_INTERCEPT_S = DROP_INTERCEPT_R)
- 7 • If ENC_SUPPORTED_R is equal to '1', the mobile station shall store:
 - 8 – Signaling encryption supported indicator (SIG_ENCRYPT_SUP_S = SIG_ENCRYPT_SUP_R)
 - 9
 - 10 – User information encryption supported indicator (UI_ENCRYPT_SUP_S = UI_ENCRYPT_SUP_R)
 - 11
 - 12 – **Store encryption key indicator (STORE_KEY_S = STORE_KEY_R)**

13 If P_REV_IN_USE_S has been changed, the mobile station shall set ACC_MSG_SEQ_S,
14 CURR_ACC_MSG_SEQ, A41_SYS_PAR_MSG_SEQ_S, UNI_NGHBR_LST_MSG_SEQ_S, and
15 EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.

16 If CCH_INFO_INCL_R is equal to '1', the mobile station shall store:

- 17 • If MCC_R = '1111111111' and IMSI_11_12_R = '1111111', the mobile station shall set
18 the IMSI_O to IMSI_M_P and store:
 - 19 – Mobile Country Code (MCC_S = MCC_M_P) and
 - 20 – IMSI 11th and 12th digits (IMSI_11_12_S = IMSI_M_11_12_P);
- 21 • Otherwise, the mobile station shall store:
 - 22 – Mobile Country Code (MCC_S = MCC_R) and
 - 23 – IMSI 11th and 12th digits (IMSI_11_12_S = IMSI_11_12_R).
- 24 • **If IMSI_O has been changed, the mobile station shall set EXT_CHAN_LST_MSG_SEQ_S to NULL, and set NUM_FCCCH_S to '1' and FCCCH_ID_S to '1'.**

- 27 • *Extended Global Service Redirection Message* sent
(EXT_GLOBAL_REDIRECT_S = EXT_GLOBAL_REDIRECT_R) if included; otherwise,
28 EXT_GLOBAL_REDIRECT_S = '0'
- 29
- 30 • *User Zone Identification Message* sent
(USER_ZONE_ID_S = USER_ZONE_ID_R) if included; otherwise, USER_ZONE_ID_S = '0'
- 31
- 32 • *Private Neighbor List Message* sent
(PRI_NGHBR_LST_S = PRI_NGHBR_LST_R) if included; otherwise,
33 PRI_NGHBR_LST_S = '0'
- 34
- 35 • *ANSI-41 RAND Message* sent
(SENDING_RAND_S = SENDING_RAND_R) if included; otherwise,
36 SENDING_RAND_S = '0'
- 37

- Maximum slot cycle index ($\text{MAX_SLOT_CYCLE_INDEX}_s = \text{MAX_SLOT_CYCLE_INDEX}_r$)
- Power control reporting threshold ($\text{PWR_REP_THRESH}_s = \text{PWR_REP_THRESH}_r$)
- Power control reporting frame count ($\text{PWR_REP_FRAMES}_s = \text{PWR_REP_FRAMES}_r$)
- Threshold report mode indicator ($\text{PWR_THRESH_ENABLE}_s = \text{PWR_THRESH_ENABLE}_r$)
- Periodic report mode indicator ($\text{PWR_PERIOD_ENABLE}_s = \text{PWR_PERIOD_ENABLE}_r$).
- Power report delay ($\text{PWR_REP_DELAY}_s = \text{PWR_REP_DELAY}_r$)
- System reselection indicator ($\text{RESELECT_INCLUDED}_s = \text{RESELECT_INCLUDED}_r$).
 - Base station latitude ($\text{BASE_LAT}_s = \text{BASE_LAT}_r$)
 - Base station longitude ($\text{BASE_LONG}_s = \text{BASE_LONG}_r$)
- Pilot reporting indicator ($\text{PILOT_REPORT}_s = \text{PILOT_REPORT}_r$)
- Short Data Burst supported indicator ($\text{SDB_SUPPORTED}_s = \text{SDB_SUPPORTED}_r$)
- Broadcast GPS Assist Indicator ($\text{BROADCAST_GPS_ASST}_s = \text{BROADCAST_GPS_ASST}_r$)
- Nominal reverse traffic channel output power offset relative to Reverse Pilot Channel power ($\text{RLGAIN_TRAFFIC_PILOT}_s = \text{RLGAIN_TRAFFIC_PILOT}_r$)
- If NUM_FCCCH_r is not equal to '0':
 - Number of the Forward Common Control Channels ($\text{NUM_FCCCH}_s = \text{NUM_FCCCH}_r$)
 - Data rate for the Forward Common Control Channels ($\text{FCCCH_RATE}_s = \text{FCCCH_RATE}_r$)
 - Code rate for the Forward Common Control Channels ($\text{FCCCH_CODE_RATE}_s = \text{FCCCH_CODE_RATE}_r$)
 - For $i = 0$ to $\text{NUM_FCCCH}_r - 1$, store the channel code index for each Forward Common Control Channel ($\text{FCCCH_CODE_CHAN}_s[i] = \text{FCCCH_CODE_CHAN}_r$)
- Number of Forward Common Control Channels ($\text{NUM_FCCCH}_s = \text{NUM_FCCCH}_r$)
- Data rate for the Forward Common Control Channels ($\text{FCCCH_RATE}_s = \text{FCCCH_RATE}_r$)
- Code rate for the Forward Common Control Channels ($\text{FCCCH_CODE_RATE}_s = \text{FCCCH_CODE_RATE}_r$)
- If NUM_FCCCH_r is not equal to '0', then for $i = 0$ to $\text{NUM_FCCCH}_r - 1$, store the channel code index for each Forward Common Control Channel ($\text{FCCCH_CODE_CHAN}_s[i] = \text{FCCCH_CODE_CHAN}_r$)
- Broadcast index ($\text{BCAST_INDEX}_s = \text{BCAST_INDEX}_r$)

- If NUM_BCCH_BCAST_r is greater than '000', i occurrences of the following fields, where i ranges from 1 to NUM_BCCH_BCAST_r:
 - Set the index number of the Broadcast Control Channel Number (BCN) to i+1
 - BCCH walsh code index (BCCH_CODE_CHAN[BCN_i]_s = BCCH_CODE_CHAN[i]_r)
 - BCCH data rate (BRAT[BCN_i]_s = BRAT[i]_r)
 - BCCH code rate (BCCH_CODE_RATE[BCN_i]_s = BCCH_CODE_RATE[i]_r)
 - Set the index number of the Broadcast Control Channel (BCN)[i] to i+1
- Sync ID supported indicator (USE_SYNC_ID_s = USE_SYNC_ID_r)
- Pilot information request supported indicator (PILOT_INFO_REQ_SUPPORTED_s = PILOT_INFO_REQ_SUPPORTED_r).
- Access entry handoff in order and message processing operation indicator (ACC_ENT_HO_ORDER_s = ACC_ENT_HO_ORDER_r).
- If REV_PWR_CNTL_DELAY_INCL is equal to '1', reverse power control delay (REV_PWR_CNTL_DELAY_s = REV_PWR_CNTL_DELAY_r)
- Permission indicator for the mobile station to request QoS settings in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message* (MOB_QOS_s = MOB_QOS_r)
- If RESELECT_INCLUDED_s is equal to '1', the mobile station shall store:
 - Pilot power threshold (EC_THRESH_s = EC_THRESH_r)
 - Pilot E_c/I_o threshold (EC_IO_THRESH_s = EC_IO_THRESH_r)
- Access handoff permitted indicator (ACCESS_HO_s = ACCESS_HO_r)
- Access probe handoff permitted indicator (ACCESS_PROBE_HO_s = ACCESS_PROBE_HO_r)
- If ACCESS_PROBE_HO_s is equal to '1', access handoff list update permitted indicator (ACC_HO_LIST_UPD_s = ACC_HO_LIST_UPD_r)
- Maximum number of times that the mobile station is permitted to perform an access probe handoff (MAX_NUM_PROBE_HO_s = MAX_NUM_PROBE_HO_r)
- Access handoff permitted for message response indicator (ACCESS_HO_MSG_RSP_s = ACCESS_HO_MSG_RSP_r)
- Access probe handoff permitted for other messages indicator (ACC_PROBE_HO_OTHER_MSG_s = ACC_PROBE_HO_OTHER_MSG_r)
- If USER_ZONE_ID_s is equal to '0', then the mobile station shall perform the following:
 - Set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
 - Set the UZID field of the UZ_REC to '0000000000000000' for all entries.
 - Set the UZ_REV field of the UZ_REC to '0000' for all entries.

- 1 – Set the TEMP_SUB field of the UZ_REC to ‘0’ for all entries.
- 2 • If USER_ZONE_ID_s is equal to ‘1’ and the mobile station does not support Tiered Services, then the mobile station shall set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 3 • If PRI_NGHBR_LIST_s is equal to ‘0’, then the mobile station shall set PRI_NGHBR_LIST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 4 • If PRI_NGHBR_LIST_s is equal to ‘1’ and the mobile station does not support Tiered Services, then the mobile station shall set PRI_NGHBR_LIST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 5 • If EXT GLOBAL REDIRECT_s is equal to ‘0’, then the mobile station shall set EXT GLOB SERV REDIR MSG SEQ_s to CONFIG MSG SEQ_s.
- 6 • If SENDING RAND_s is equal to ‘1’ and the mobile station is not in the *Origination Attempt Substate* or *Page Response Substate*, then the mobile station shall perform the following:set AUTH_s to ‘01’. Otherwise, the mobile station shall set AUTH_s to ‘00’.
 - 7 – If SENDING RAND_s is equal to ‘1’, the mobile station shall set AUTH_s to ‘01’;
otherwise, the mobile station shall set AUTH_s to ‘00’.
- 8 • If the mobile station is not in the Origination Attempt Substate or Page Response Substate, then the mobile station shall store the following:
 - 9 – Base station latitude (BASE LAT_s = BASE LAT_r)
 - 10 – Base station longitude (BASE LONG_s = BASE LONG_r)

22 If CCH_INFO_INCL_r is equal to ‘1’ and the mobile station supports the Quick Paging
23 Channel operation:

- 24 • The mobile station shall set QPCH_SUPPORTED_s to QPCH_SUPPORTED_r.
- 25 • If QPCH_SUPPORTED_r = ‘1’:
 - 26 – The mobile station shall set QPCH_RATE_s to QPCH_RATE_r.
 - 27 – If the mobile station is monitoring the Primary Broadcast Control Channel in
28 Spreading Rate 1 and the number of Quick Paging Channels specified in the
29 received message (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile
30 station shall use the hash algorithm specified in 2.6.7.1 to select a new Quick
31 Paging Channel number in the range 1 to NUM_QPCH_r. The mobile station shall
32 store the new Quick Paging Channel number as QPAGECH_s and as
33 ASSIGNED_QPAGECH_s. The mobile station shall then set NUM_QPCH_s to
34 NUM_QPCH_r.
 - 35 – If the mobile station is monitoring the Primary Broadcast Control Channel in
36 Spreading Rate 3 and the number of Quick Paging Channels specified in the
37 received message (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile
38 station shall perform the following:

- + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Quick Paging Channel number in the range 1 to NUM_QPCH_r.
- + The mobile station shall store the new Quick Paging Channel number as QPAGECH_s and as ASSIGNED_QPAGECH_s.
- + For i = 0 to NUM_QPCH_s - 1, store the channel code index for each Quick Paging Channel (QPCH_CODE_CHAN_s[i] = QPCH_CODE_CHAN_r).
- The mobile station shall set QPCH_POWER_LEVEL_PAGE_s to QPCH_POWER_LEVEL_PAGE_r.
- The mobile station shall set QPCH_CCI_SUPPORTED_s to QPCH_CCI_SUPPORTED_r.
- If QPCH_CCI_SUPPORTED_r = '1', the mobile station shall set QPCH_POWER_LEVEL_CONFIG_s to QPCH_POWER_LEVEL_CONFIG_r.
- The mobile station shall set QPCH_BI_SUPPORTED_s to QPCH_BI_SUPPORTED_r.
- If QPCH_BI_SUPPORTED_r = '1', the mobile station shall set QPCH_POWER_LEVEL_BCAST_s to QPCH_POWER_LEVEL_BCAST_r.

The mobile station shall ignore any fields at the end of the *MC-RR Parameters Message* that are not defined according to the protocol revision level (MOB_P_REV_p of the current band class) being used by the mobile station.

2.6.2.2.14.2 Slot Cycle Index

The mobile station shall set SLOT_CYCLE_INDEX_s to the smaller of: the preferred slot cycle index SLOT_CYCLE_INDEX_p and the maximum slot cycle index MAX_SLOT_CYCLE_INDEX_s. If the mobile station is operating in the slotted mode, it shall set its slot cycle length as described in 2.6.2.1.1.3.

2.6.2.2.14.3 Forward Common Control Channel Assignment Change

If the number of Forward Common Control Channels specified in the *MC-RR Parameters Message* (NUM_FCCCH_r) is not equal to '0' and is different from NUM_FCCCH_s, the mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Forward Common Control Channel number in the range 1 to NUM_FCCCH_r and shall store this value as FCCCH_ID_s. If NUM_FCCCH_r is not equal to '0'-, The mobile station shall store the FCCCH rate (FCCCH RATE_s = FCCCH RATE_r), the FCCCH code rate (FCCCH CODE RATE_s = FCCCH_CODE_RATE_r), and store FCCCH_CODE_CHAN_r of the corresponding Forward Common Control Channel as FCCCH_CODE_RATE_s and FCCCH_CODE_CHAN_s. The mobile station shall then set NUM_FCCCH_s to NUM_FCCCH_r.

The mobile station shall set ACC_MSG_SEQ_s to NULL.

2.6.2.2.15 Enhanced Access Parameters Message

Whenever an *Enhanced Access Parameters Message* is received on the f-csch, the sequence number, ACC_MSG_SEQ_r, shall be compared to ACC_MSG_SEQ_s. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as

1 follows:

2 If PROBE_PN_RAN, MAX_REQ_SEQ, or MAX_RSP_SEQ are not within the valid ranges
 3 specified in 3.7.2.3.2.2, then the mobile station shall ignore the *Enhanced Access*
 4 *Parameters Message* that contains them.

5 The mobile station shall store the following parameters:

- 6 • *Enhanced Access Parameters Message* sequence number
 7 (ACC_MSG_SEQ_S = ACC_MSG_SEQ_r)
- 8 • Persistence related parameters:
 - 9 – If PSIST_PARMS_INCL is equal to '1', store the following:
 - 10 + Persistence parameter number according to the following rule: If the mobile
 11 station's access overload class is in the range 0-9 inclusive, set PSIST_S equal
 12 to PSIST(0-9)_EACH_r; otherwise set PSIST_S equal to PSIST(n)_EACH_r, where
 13 n is equal to the mobile station access overload class.
 - 14 + Persistence modifier for Enhanced Access Channel attempts for registrations
 15 which are not responses to the *Registration Request Order* (REG_PSIST_S = REG_PSIST_EACH_r).
 - 16 + Persistence modifier for Enhanced Access Channel attempts for message
 17 transmissions (MSG_PSIST_S = MSG_PSIST_EACH_r).
 - 18 + Persistence modifier for emergency calls by the mobile stations in access
 19 overload classes 0 to 9 (PSIST_EMG_S = PSIST_EMG_r).
 - 20 – If PSIST_PARMS_INCL_r is equal to '0', store the following:
 - 21 + Set PSIST_S to '0'.
 - 22 + Persistence modifier for emergency calls by a mobile station in access
 23 overload classes 0 to 9 (PSIST_EMG_S = '0').
 - 24 + Persistence modifier for Enhanced Access Channel attempts for message
 25 transmissions (MSG_PSIST_S = '0').
 - 26 + Persistence modifier for Enhanced Access Channel attempts for registrations
 27 which are not responses to the *Registration Request Order* (REG_PSIST_S = '0').
- 28 • The mobile station shall store the Access Control based on Call Type (ACCT) information as follows:
 - 29 – Set ACCT SO LIST to NULL.
 - 30 – Set ACCT SO GRP LIST to NULL.
 - 31 – If ACCT INCL_r is equal to '1' and ACCOLC_p is in the range 0 to 9, then the mobile station shall perform the following:
 - 32 + Set ACCT INCL EMG_S to ACCT INCL EMG_r.
 - 33 + If ACCT SO INCL_r is equal to '1', then for each ACCT SO_r included in this message:

- 1 o If ACCT_AOC_BITMAP_INCL_r is equal to '0', or if
 2 ACCT_AOC_BITMAP_INCL_r is equal to '1' and the bit in the associated
 3 ACCT_AOC_BITMAP1_r corresponding to the mobile station's ACCOLC_p
 4 (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT_SO_r to
 5 ACCT_SO_LIST.
 6 + If ACCT_SO_GRP_INCL_r is equal to '1', then for each ACCT_SO_GRP_r
 7 included in this message:
 8 o If ACCT_AOC_BITMAP_INCL_r is equal to '0', or if
 9 ACCT_AOC_BITMAP_INCL_r is equal to '1' and the bit in the associated
 10 ACCT_AOC_BITMAP2_r corresponding to the mobile station's ACCOLC_p
 11 (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT_SO_GRP_r to
 12 ACCT_SO_GRP_LIST.

- 13
- 14 • Link Access Control related parameters:
 - 15 – Acknowledgment timeout (EACH_ACC_TMO_s = ACC_TMO_r)
 - 16 ~~Time randomization for Enhanced Access Channel probes~~
 17 ~~(PROBE_PN_RAN_s = PROBE_PN_RAN_r)~~
 - 18 – Maximum number of probe sequences for an Enhanced Access Channel request
 19 (MAX_REQ_SEQ_s = MAX_REQ_SEQ_r)
 - 20 – Maximum number of probe sequences for an Enhanced Access Channel
 21 response (MAX_RSP_SEQ_s = MAX_RSP_SEQ_r)
 - 22 • Mode Selection Table:

23 NUM_MODE_SELECTION_ENTRIES_s = (NUM_MODE_SELECTION_ENTRIES_r + 1)

24 For i = 1 to NUM_MODE_SELECTION_ENTRIES_s
 25 NUM_MODE_SELECTION_ENTRIES
 +1:

 - 26 – MODE_SELECTION_s[i].ACCESS_MODE = ACCESS_MODE field of the ith
 27 occurrence of the record
 - 28 – MODE_SELECTION_s[i].MIN_DURATION = ACCESS_MODE_MIN_DURATION field
 29 of the ith occurrence of the record
 - 30 – MODE_SELECTION_s[i].MAX_DURATION = ACCESS_MODE_MAX_DURATION
 31 field of the ith occurrence of the record
 - 32 • Reverse gain adjustment of the Enhanced Access Channel or Reverse Common
 33 Control Channel relative to the Reverse Pilot Channel (RLGAIN_COMMON_PILOT_s =
 34 RLGAIN_COMMON_PILOT_r)
 - 35 • The threshold level at which the interference correction begins to be applied
 36 (IC_THRESH_s = - IC_THRESH_r)
 - 37 • The maximum interference correction that can be applied (IC_MAX_s = IC_MAX_r)
 - 38 • Mode-specific parameters for the Enhanced Access Channel:

```

1   For i = 1 to NUM_MODE_PARM_REC + 1:
2     For j = 0 to 7:
3       If the (j+1)th subfield of APPLICABLE_MODES is equal to '1', store the
4         following parameters:
5         - Nominal transmit power offset on the Enhanced Access Channel
6           (MODE_PARMSS[j].EACH_NOM_PWR = EACH_NOM_PWR field of the ith
7             occurrence of the record)
8         - Initial power offset for access on the Enhanced Access Channel
9           (MODE_PARMSS[j].EACH_INIT_PWR = EACH_INIT_PWR field of the ith
10            occurrence of the record)
11        - Power increment on the Enhanced Access Channel
12          (MODE_PARMSS[j].EACH_PWR_STEP = EACH_PWR_STEP field of the ith
13            occurrence of the record )
14        - Number of access probes on the Enhanced Access Channel
15          (MODE_PARMSS[j].EACH_NUM_STEP = EACH_NUM_STEP field of the ith
16            occurrence of the record)
17        - Preamble enabled indicator on the Enhanced Access Channel
18          (MODE_PARMSS[j].EACH_PREAMBLE_ENABLED = EACH_PREAMBLE_E
19            NABLED field of the ith occurrence of the record)
20        - Number of preamble fractions sent on the Enhanced Access Channel if
21          MODE_PARMSS[j].EACH_PREAMBLE_ENABLED is equal to '1'
22          (MODE_PARMSS[j].EACH_PREAMBLE_NUM_FRAC =
23            EACH_PREAMBLE_NUM_FRAC field of the ith occurrence of the record)
24        - Fractional preamble duration on the Enhanced Access Channel if
25          MODE_PARMSS[j].EACH_PREAMBLE_ENABLED is equal to '1'
26          (MODE_PARMSS[j].EACH_PREAMBLE_FRAC_DURATION = EACH_PREAM
27            BLE_FRAC_DURATION field of the ith occurrence of the record)
28        - Preamble gated-off duration on the Enhanced Access Channel if
29          MODE_PARMSS[j].EACH_PREAMBLE_ENABLED is equal to '1'
30          (MODE_PARMSS[j].EACH_PREAMBLE_OFF_DURATION = EACH_PREAMB
31            LE_OFF_DURATION field of the ith occurrence of the record)
32        - Additional preamble duration on the Enhanced Access Channel if
33          MODE_PARMSS[j].EACH_PREAMBLE_ENABLED is equal to '1'
34          (MODE_PARMSS[j].EACH_PREAMBLE_ADD_DURATION =
35            EACH_PREAMBLE_ADD_DURATION field of the ith occurrence of the
36            record)
37
38  - Access threshold on the Enhanced Access Channel
39    (MODE_PARMSS[j].EACH_ACCESS_THRESH = EACH_ACCESS_THRESH
40    field of the ith occurrence of the record)
41
42  - Enhanced Access Channel probe backoff range

```

- (MODE_PARMS_S[j].EACH_PROBE_BKOFF = EACH_PROBE_BKOFF field of the ith occurrence of the record)
 - Enhanced Access Channel probe sequence backoff range
(MODE_PARMS_S[j].EACH_BKOFF = EACH_BKOFF field of the ith occurrence of the record)
 - Enhanced Access Channel slot (MODE_PARMS_S[j].EACH_SLOT = 1 + EACH_SLOT field of the ith occurrence of the record)
 - Enhanced Access Channel first slot offset
(MODE_PARMS_S[j].EACH_SLOT_OFFSET1 = EACH_SLOT_OFFSET1 field of the ith occurrence of the record)
 - Enhanced Access Channel second slot offset
(MODE_PARMS_S[j].EACH_SLOT_OFFSET2 = EACH_SLOT_OFFSET2 field of the ith occurrence of the record)

• Additional parameters for the Basic Access Mode:

If BA_PARMS_LEN_r is equal to '000', set the Basic Access Mode supported indicator, BA_SUPPORTED_S, to '0'; otherwise store the following parameters:

 - Basic Access Mode supported indicator (BA_SUPPORTED_S = '1')
 - Number of Enhanced Access Channels (NUM_EACH_BA_S = NUM_EACH_BA_r + 1)
 - Rate words supported on the Enhanced Access Channels
(EACH_BA_RATES_SUPPORTED_S = EACH_BA_RATES_SUPPORTED_r)

• Additional parameters for the Reservation Access Mode:

If RA_PARMS_LEN_r is equal to '00000', set the Reservation Access Mode supported indicator, RA_SUPPORTED_S, to '0'; otherwise store the following parameters, if included in the message:

 - Reservation Access Mode supported indicator (RA_SUPPORTED_S = '1')
 - Number of Enhanced Access Channels (NUM_EACH_RA_S = NUM_EACH_RA_r + 1)
 - Number of Common Assignment Channels (NUM_CACH_S = NUM_CACH_r + 1)
 - Code rate of Common Assignment Channels (CACH_CODE_RATE_S = CACH_CODE_RATE_r)
 - For i = 0 to NUM_CACH_S - 1, store the channel code index for each Common Assignment Channel (CACH_CODE_CHAN_S[i] = CACH_CODE_CHAN_r)
 - Number of Reverse Common Control Channels (NUM_RCCCH_S = NUM_RCCCH_r + 1)
 - Rate words supported on the Reverse Common Control Channels
(RCCCH_RATES_SUPPORTED_S = RCCCH_RATES_SUPPORTED_r)

- Preamble enabled indicator on the Reverse Common Control Channels
($\text{RCCCH_PREAMBLE_ENABLED}_s = \text{RCCCH_PREAMBLE_ENABLED}_r$)
- Number of preamble fractions sent on the Reverse Common Control Channel if
 $\text{RCCCH_PREAMBLE_ENABLED}_r$ is equal to '1'
($\text{RCCCH_PREAMBLE_NUM_FRAC}_s = \text{RCCCH_PREAMBLE_NUM_FRAC}_r$)
- Fractional preamble duration on the Reverse Common Control Channel if
 $\text{RCCCH_PREAMBLE_ENABLED}_r$ is equal to '1'
($\text{RCCCH_PREAMBLE_FRAC_DURATION}_s = \text{RCCCH_PREAMBLE_FRAC_DURATION}_r$)
- Preamble gated-off duration on the Reverse Common Control Channel if
 $\text{RCCCH_PREAMBLE_ENABLED}_r$ is equal to '1'
($\text{RCCCH_PREAMBLE_OFF_DURATION}_s = \text{RCCCH_PREAMBLE_OFF_DURATION}_r$)
- Additional preamble duration on the Reverse Common Control Channel if
 $\text{RCCCH_PREAMBLE_ENABLED}_r$ is equal to '1'
($\text{RCCCH_PREAMBLE_ADD_DURATION}_s = \text{RCCCH_PREAMBLE_ADD_DURATION}_r$)
- Slot duration on the Reverse Common Control Channel ($\text{RCCCH_SLOT}_s = \underline{1} + \text{RCCCH_SLOT}_r$)
- First slot offset of the Reverse Common Control Channel
($\text{RCCCH_SLOT_OFFSET1}_s = \text{RCCCH_SLOT_OFFSET1}_r$)
- Second slot offset of the Reverse Common Control Channel
($\text{RCCCH_SLOT_OFFSET2}_s = \text{RCCCH_SLOT_OFFSET2}_r$)
- Nominal transmit power offset on the Reverse Common Control Channel
($\text{RCCCH_NOM_PWR}_s = \text{RCCCH_NOM_PWR}_r$)
- Initial power offset for access on the Reverse Common Control Channel
($\text{RCCCH_INIT_PWR}_s = \text{RCCCH_INIT_PWR}_r$)
- Power Control delay for the Reservation Access Mode
($\text{RA_PC_DELAY}_s = \text{RA_PC_DELAY}_r$)
- Maximum delay to receive the *Early Acknowledgment Channel Assignment Message* on the Common Assignment Channel
($\text{EACAM_CACH_DELAY}_s = \text{EACAM_CACH_DELAY}_r$)
- Indicator for handoff supported on the Reverse Common Control Channels
($\text{RCCCH_HO_SUPPORTED}_s = \text{RCCCH_HO_SUPPORTED}_r$)
- Threshold for handoff on the Reverse Common Control Channels if
 $\text{RCCCH_HO_SUPPORTED}_r$ is equal to '1'
($\text{RCCCH_HO_THRESH}_s = \text{RCCCH_HO_THRESH}_r$)
- Maximum delay to receive the *Early Acknowledgment Channel Assignment Message* and the *Power Control Channel Assignment Message* if
 $\text{RCCCH_HO_SUPPORTED}_r$ is equal to '1'
($\text{EACAM_PCCAM_DELAY}_s = \text{EACAM_PCCAM_DELAY}_r$)

- 1 – Number of Common Power Control Channels ($\text{NUM_CPCCH}_S = \text{NUM_CPCCH}_R + 1$)
- 3 – Power control rate for the Common Power Control Channels ($\text{CPCCH_RATE}_S = \text{CPCCH_RATE}_R$)
- 5 – For $i = 0$ to $\text{NUM_CPCCH}_S - 1$, store the channel code index for each Common
6 Power Control Channel ($\text{CPCCH_CODE_CHAN}_S[i] = \text{CPCCH_CODE_CHAN}_R$,
- 7 – Number of Power Control Subchannels for the Reservation Access Mode
8 ($\text{NUM_PCSCH_RA}_S = \text{NUM_PCSCH_RA}_R + 1$)

9 2.6.2.2.16 ANSI-41 RAND Message

10 Whenever an *ANSI-41 RAND Message* is received, the mobile station shall process the fields
11 in the message as follows.

12 The mobile station shall store the following parameter if the mobile station is not in the
13 *Origination Attempt Substate* or *Page Response Substate*:

- 14 • Random challenge value ($\text{RAND}_S = \text{RAND}_R$)
- 15 • Pilot PN sequence offset increment ($\text{PILOT_PN}_S = \text{PILOT_PN}_R$)

16 The mobile station shall ignore any fields at the end of the *ANSI-41 RAND Message* which
17 are not defined according to the protocol revision level (MOB_P_REV_p of the current band
18 class) being used by the mobile station.

19 2.6.2.2.17 Universal Neighbor List Message

20 Whenever a valid *Universal Neighbor List Message* is received on the Primary Broadcast
21 Control Channel, the configuration message sequence number, CONFIG_MSG_SEQ_R shall
22 be compared to that stored in $\text{UNIV_NGHBR_LST_MSG_SEQ}_S$. If the comparison results in
23 a mismatch, then the mobile station shall process the remaining fields in the message as
24 described below.

25 The mobile station shall store the following parameters:

- 26 • Configuration message sequence number
($\text{CONFIG_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_R$,
27 $\text{UNIV_NGHBR_LST_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_R$).

29 If $\text{RADIO_INTERFACE_TYPE}_R$ is equal to '0000' but the PILOT_INC field is not within the
30 valid range specified in 3.7.2.3.2.33, then the mobile station shall ignore the entire record
31 that contains it.

32 If $\text{RADIO_INTERFACE_TYPE}_R$ is equal to '0000' and the PILOT_INC field is within the valid
33 range specified in 3.7.2.3.2.33, the mobile station shall perform the following:

34 The mobile station shall store the Pilot PN sequence offset increment ($\text{PILOT_INC}_S =$
35 PILOT_INC_R).

36 The mobile station shall set NGHBR_SET_SIZE_S to NUM_NGHBR_R .

1 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
 2 if FREQ_INCL_r is equal to '0', or if FREQ_INCL_r is equal to '1' and NGHBR_BAND_r is
 3 supported, the mobile station shall do the following:

- 4 • If the ith occurrence of NGHBR_CONFIG_r is equal to '000', '001', '010', or '100', set
 5 the NGHBR_CONFIG field of NGHBR_REC[i] to the ith occurrence of
 6 NGHBR_CONFIG_r; otherwise, set the NGHBR_CONFIG field of NGHBR_REC[i] to
 7 '011'.
 - 8 • Set the NGHBR_PN field of NGHBR_REC[i] to the ith occurrence of NGHBR_PN_r.
 - 9 • If NGHBR_CONFIG_r is equal to '011', set the BCCH_SUPPORT field of NGHBR_
 10 REC[i] to BCCH_SUPPORT_r of the corresponding record.
 - 11 • Set the ADD_PILOT_REC_INCL field of NGHBR_REC[i] to the ith occurrence of
 12 ADD_PILOT_REC_INCL_r. If ADD_PILOT_REC_INCL_r equals '1', for each pilot
 13 included in the message, the mobile station shall also perform the following:
 - 14 – Set the NGHBR_PILOT_REC_TYPE field of NGHBR_PILOT_REC to
 15 NGHBR_PILOT_REC_TYPE_r.
 - 16 – If NGHBR_PILOT_REC_TYPE_r is equal to '000'. The mobile station shall:
 - 17 + Set the TD_POWER_LEVEL field of NGHBR_PILOT_REC to
 18 TD_POWER_LEVEL_r.
 - 19 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
 - 20 – If NGHBR_PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
 - 21 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
 - 22 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
 23 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 24 WALSH_LENGTH_r.
 - 25 – If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 26 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
 - 27 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
 28 AUX_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - 29 + Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
 30 AUX_TD_POWER_LEVEL_r.
 - 31 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
 - 32 – If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
 - 33 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
 34 SR3_PRIMARY_PILOT_r.
 - 35 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
 36 SR3_PILOT_POWER1_r.

- 1 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
2 SR3_PILOT_POWER2_r.
- 3 – If NGHBR_PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
- 4 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
5 SR3_PRIMARY_PILOT_r.
- 6 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
7 SR3_PILOT_POWER1_r.
- 8 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
9 SR3_PILOT_POWER2_r.
- 10 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 11 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
12 AUX_PILOT_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
- 14 + If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1 field of
15 NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field
16 of NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length
17 specified by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1 field of
18 NGHBR_PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
19 NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length
20 specified by WALSH_LENGTH_r.
- 21 + If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2 field of
22 NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2 field
23 of NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh Code length
24 specified by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2 field of
25 NGHBR_PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
26 NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length
27 specified by WALSH_LENGTH_r.
- 28 • If NGHBR_SRCH_MODE_r = ‘00’ or ‘10’, set the SEARCH_PRIORITY field of each
29 NGHBR_REC to ‘10’ (high) for all NGHBR_SET_SIZE_s entries.
- 30 • If NGHBR_SRCH_MODE_r = ‘01’ or ‘11’, set the SEARCH_PRIORITY field of
31 NGHBR_REC[i] to the ith occurrence of SEARCH_PRIORITY_r.
- 32 • If NGHBR_SRCH_MODE_r = ‘00’ or ‘01’, set the SRCH_WIN_NGHBR field of each
33 NGHBR_REC to SRCH_WIN_N_r for all NGHBR_SET_SIZE_s entries.
- 34 • If NGHBR_SRCH_MODE_r = ‘00’ or ‘01’, set the SRCH_OFFSET_NGHBR field of each
35 NGHBR_REC to ‘000’.
- 36 • If NGHBR_SRCH_MODE_r = ‘10’ or ‘11’:
 - 37 – set the SRCH_WIN_NGHBR field of NGHBR_REC[i] to the ith occurrence of
38 SRCH_WIN_NGHBR_r

- if SRCH_OFFSET_INCL_r equals to '1', set the SRCH_OFFSET_NGHBR field of NGHBR_REC[i] to the ith occurrence of SRCH_OFFSET_NGHBR_r, and
- if SRCH_OFFSET_INCL_r equals to '0', set the SRCH_OFFSET_NGHBR field of each NGHBR_REC to '000'.
- If USE_TIMING_r is equal to '1', set the TIMING_INCL field of NGHBR_REC[i] to the ith occurrence of TIMING_INCL_r; otherwise, set the TIMING_INCL field of NGHBR_REC to '0' for all entries.

For each of the neighboring base stations contained in the *Universal Neighbor List Message*, if FREQ_FIELDS_INCL_r equals '1', FREQ_INCL_r equals '1', and NGHBR_BAND_r is supported, the mobile station shall also perform the following:

- Set the NGHBR_BAND field of NGHBR_REC[i] to the ith occurrence of NGHBR_BAND_r.
- Set the NGHBR_FREQ field of NGHBR_REC[i] to the ith occurrence of NGHBR_FREQ_r.

For each of the neighboring base stations contained in the *Universal Neighbor List Message*, if USE_TIMING_r is equal to '1' and TIMING_INCL_r equals '1', the mobile station shall also perform the following:

- Set the NGHBR_TX_OFFSET field of NGHBR_REC[i] to the ith occurrence of NGHBR_TX_OFFSET_r.
- If GLOBAL_TIMING_INCL_r is equal to '1', then the mobile station shall:
 - Set the NGHBR_TX_DURATION field of NGHBR_REC to GLOBAL_TX_DURATION_r for all entries.
 - Set the NGHBR_TX_PERIOD field of NGHBR_REC to GLOBAL_TX_PERIOD_r for all entries.
- If GLOBAL_TIMING_INCL_r is equal to '0', then the mobile station shall:
 - Set the NGHBR_TX_DURATION field of NGHBR_REC[i] to the ith occurrence of NGHBR_TX_DURATION_r.
 - Set the NGHBR_TX_PERIOD field of NGHBR_REC[i] to the ith occurrence of NGHBR_TX_PERIOD_r.

For each of the neighboring base stations contained in the *Universal Neighbor List Message*, if FREQ_FIELDS_INCL_r equals '1' and FREQ_INCL_r equals '0' the mobile station shall also do the following:

- Set the NGHBR_BAND field of NGHBR_REC[i] to CDMABAND_s.
- Set the NGHBR_FREQ field of NGHBR_REC[i] to CDMACH_s.

If NGHBR_SET_ENTRY_INFO_r is equal to '0', then for all NGHBR_SET_SIZE_s occurrences of ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of NGHBR_REC[i] to '0'.

1 If NGHBR_SET_ENTRY_INFO_r is equal to '1', then for all NGHBR_SET_SIZE_s occurrences of
 2 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
 3 NGHBR_REC[i] to the ith occurrence of ACCESS_ENTRY_HO_r.

4 If NGHBR_SET_ACCESS_INFO_r is equal to '0', then for all NGHBR_SET_SIZE_s occurrences
 5 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
 6 NGHBR_REC[i] to '0'.

7 If NGHBR_SET_ACCESS_INFO_r is equal to '1', then for all NGHBR_SET_SIZE_s occurrences
 8 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
 9 NGHBR_REC[i] to the ith occurrence of ACCESS_HO_ALLOWED_r.

10 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 11 consists only of pilot offsets listed in the *Universal Neighbor List Message*. If the *Universal*
 12 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 13 mobile station shall store the pilot offsets beginning at the start of the *Universal Neighbor*
 14 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

15 If RADIO_INTERFACE_TYPE_r is equal to '0001', the mobile station shall process the fields
 16 contained in the record as follows:

17 The mobile station shall set NUM_ANALOG_NGHBR_s to NUM_ANALOG_NGHBR_r, the
 18 number of neighboring analog systems contained in the *Universal Neighbor List Message*.
 19 For each of the neighboring analog systems contained in the *Universal Neighbor List*
 20 *Message*, the mobile station shall perform the following:

- 21 • Set the BAND_CLASS field of ANALOG_NGHBR_LIST[i] to the ith occurrence of
 22 BAND_CLASS_r.
- 23 • Set the SYS_A_B field of ANALOG_NGHBR_LIST[i] to the ith occurrence of SYS_A_B_r.

24 2.6.2.3 Mobile Station Page Match Operation

25 The *Mobile Station Page Match Operation* is performed whenever the mobile station receives
 26 a mobile-station-addressed page or a broadcast page. If the mobile station receives a
 27 mobile-station-addressed page that contains the IMSI or TMSI assigned to the mobile
 28 station (see [4]) on the Paging Channel, the mobile station transmits a *Page Response*
 29 *Message* on the Access Channel. If the mobile station receives a mobile-station-addressed
 30 page that contains the IMSI or TMSI assigned to the mobile station (see [4]) on the Forward
 31 Common Control Channel, the mobile station transmits a *Page Response Message* on the r-
 32 csch. If the mobile station is configured to receive broadcast messages and it receives a
 33 *General Page Message* that contains a burst type and broadcast address that the mobile
 34 station has been configured to receive (see [4]) on the Paging Channel, the mobile station
 35 performs the broadcast page procedures as described in 2.6.2.1.1.3.4. If the mobile station
 36 is configured to receive broadcast messages and it receives a *General Page Message* or a
 37 *Universal Page Message* that contains a burst type and broadcast address that the mobile
 38 station has been configured to receive (see [4]) on the Forward Common Control Channel,
 39 the mobile station performs the enhanced broadcast page procedures as described in
 40 2.6.2.1.1.3.6.

When the mobile station receives a page message, it shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r, to CONFIG_MSG_SEQ_s. If the comparison results in a mismatch, then the mobile station shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r. The mobile station shall also compare the *Access Parameters Message* or the *Enhanced Access Parameters Message* sequence number, ACC_MSG_SEQ_r, with that stored in ACC_MSG_SEQ_s. If the comparison results in a mismatch, then the mobile station shall set ACC_MSG_SEQ_s to NULL (see 2.6.2.2). The mobile station shall set CURR_ACC_MSG_SEQ to ACC_MSG_SEQ_s.

The mobile station shall process each record for which it declares a page match (see [4]).

If the mobile station receives a broadcast page that contains a burst type and broadcast address that the mobile station has been configured to receive on the Paging Channel, the mobile station should perform the broadcast page procedures described in 2.6.2.1.1.3.4. If the mobile station receives a broadcast page that contains a burst type and broadcast address that the mobile station has been configured to receive on the Forward Common Control Channel, the mobile station should perform the enhanced broadcast page procedures as described in 2.6.2.1.1.3.6.

If a page match is declared, [the mobile station shall perform the following:](#)

- [• The mobile station shall set SYNC_ID_s to NULL if the mobile station is currently in a different SID, NID, or CDMA Channel than where the SYNC_ID_s was stored.](#)
- [• the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* \(see 2.6.3.2\) with a page response indication within T33m seconds after the page message is received.](#)

If a page match is declared and the mobile station determines that it should be monitoring a neighboring base station, the mobile station may perform an access entry handoff to the neighboring base station, if all of the following conditions hold:

- The neighboring base station is listed in NGHBR_REC.
- The ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the neighboring base station is equal to '1'.
- If the mobile station performs an access entry handoff on the Access Channel, none of CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.
- If the mobile station performs an access entry handoff on the Enhanced Access Channel, none of CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.

Otherwise, the mobile station shall not perform an access entry handoff to the neighboring base station.

- 1 The mobile station need not perform an access entry handoff to a base station operating on
 2 another frequency.
- 3 If the mobile station performs an access entry handoff, it shall follow the procedures
 4 specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the
 5 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2).
- 6 If PACA is enabled, and if the mobile station performs an access entry handoff, the mobile
 7 station shall respond to the mobile-station-addressed page first and shall then re-originate
 8 the PACA call on the new base station.

9 2.6.2.4 Mobile Station Order and Message Processing Operation

10 During the *Mobile Station Order and Message Processing Operation*, the mobile station
 11 processes all messages except overhead messages (see 2.6.2.2) and page messages (see
 12 2.6.2.3).

13 The mobile station shall set CURR_ACC_MSG_SEQ to NULL.

14 The mobile station shall perform address matching as described in 2.1.2.2 of [4].

15 If Layer 3 receives a message that requires acknowledgement, the mobile station shall enter
 16 the *Update Overhead Information Substate* of the *System Access State* with an
 17 order/message response indication within T_{33m} seconds, unless otherwise specified for a
 18 particular message.

19 If Layer 3 receives a message that does not require acknowledgement, the mobile station
 20 shall transmit a response only if it is required by the message or order. If a response is
 21 required, the mobile station shall enter the *Update Overhead Information Substate* of the
 22 *System Access State* with an order/message response indication within T_{33m} seconds,
 23 unless otherwise specified for a particular message.

24 If the mobile station is to enter the *Update Overhead Information Substate* of the *System
 25 Access State* with an order/message response indication and the mobile station determines
 26 that it should be monitoring a neighboring base station, the mobile station may perform an
 27 access entry handoff to the neighboring base station, if all of the following conditions hold:

- 28 • The neighboring base station is listed in NGHBR_REC.
- 29 • The ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the neighboring
 30 base station is equal to '1'.
- 31 • ACC_ENT_HO_ORDER_S is equal to '1'.
- 32 • If the mobile station performs an access entry handoff on the Access Channel, none
 33 of CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
 34 EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S,
 35 CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
 36 PRI_NGHBR_LST_MSG_SEQ_S, and EXT_SYS_PAR_MSG_SEQ_S are equal to NULL.

- 1 • If the mobile station performs an access entry handoff on the Enhanced Access
 2 Channel, none of CONFIG_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S,
 3 MC_RR_PAR_MSG_SEQ_S, UNI_NGHBR_LST_MSG_SEQ_S,
 4 EXT_CHAN_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, and
 5 PRI_NGHBR_LST_MSG_SEQ_S are equal to NULL.

6 Otherwise, the mobile station shall not perform an access entry handoff to the neighboring
 7 base station.

8 The mobile station need not perform an access entry handoff to a base station operating on
 9 another frequency.

10 If the mobile station performs an access entry handoff, it shall follow the procedures
 11 specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the
 12 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2). If PACA is
 13 enabled and the mobile station performs an access entry handoff, the mobile station shall
 14 respond to the order/message first and then re-originate the PACA call in the new base
 15 station.

16 The following directed messages and orders can be received. If any field value of the
 17 message or order is outside its permissible range, the mobile station shall send a *Mobile*
 18 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 19 1. *Abbreviated Alert Order*: The mobile station may alert the user.
- 20 2. *Audit Order*
- 21 3. *Authentication Challenge Message*: The mobile station shall process the message
 22 and shall respond with an *Authentication Challenge Response Message* as specified
 23 in 2.3.12.1.4, regardless of the value of AUTH_S. The mobile station shall enter the
 24 *Update Overhead Information Substate* of the *System Access State* with an
 25 order/message response indication within T32m seconds.
- 26 4. *Base Station Challenge Confirmation Order*: The mobile station shall process the
 27 message and shall respond with an *SSD Update Confirmation Order* or *SSD Update*
 28 *Rejection Order* as specified in 2.3.12.1.5. The mobile station shall enter the *Update*
 29 *Overhead Information Substate* of the *System Access State* with an order/message
 30 response indication within T32m seconds.

31 5. *Base Station Reject Order*:

- 32 • If ORDQ_r = '00000001', the mobile station shall send a *Security Mode Request*
 33 *Message* with the ENC SIG H field included in it. If the mobile receives two *Base*
 34 *Station Reject Orders* without successfully decrypting any encrypted messages
 35 from the base station between the orders, the mobile station shall set
 36 REG_ENCRYPT RESYNC to YES and enter the *System Determination Substate*
 37 with an encryption failure indication.

38 5.6. *Channel Assignment Message*: The mobile station shall process the message as
 39 follows:

- 40 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
 41 actions:

- If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
- If a CDMA channel (CDMA_FREQ) is specified in the assignment, the mobile station shall set CDMACH_S = CDMA_FREQ_r, tune to the new Frequency Assignment, and measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2.
- The mobile station shall set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL (see 2.6.2.2) and shall set PILOT_PN_S to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r).
- If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL. The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. If the mobile station was monitoring Forward Common Control Channel, the mobile station shall set the PRAT_S to '00'. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
- If ASSIGN_MODE_r equals '101' and FREQ_INCL_r equals '0', the mobile station shall perform the following actions:
 - If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
 - The mobile station shall measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_S to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL (see 2.6.2.2).

- If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL. The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
- If ASSIGN_MODE_r equals '101', FREQ_INCL_r equals '1', and the band class is not supported by the mobile station, the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication within T33m seconds and send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station).
- If ASSIGN_MODE_r equals '101', FREQ_INCL_r equals '1', and the band class is supported by the mobile station, the mobile station shall perform the following actions:
 - If the message requires acknowledgment, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.
 - The mobile station shall set CDMACH_S = CDMA_FREQ_r and CDMABAND_S = BAND_CLASS_r. Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_S to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL (see 2.6.2.2).
 - If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL. The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.

- 1 • If ASSIGN_MODE_r is not equal to ‘001’ or ‘101’, the mobile station shall enter
 2 the *Update Overhead Information Substate* of the *System Access State* with an
 3 order/message response indication within T_{33m} seconds and send a *Mobile*
 4 *Station Reject Order* with ORDQ field set to ‘00000010’ (message not accepted in
 5 this state).

6 6.7. Data Burst Message

7 7.8. Extended Channel Assignment Message: The mobile station shall process the
 8 message as follows:

- 9 • If ASSIGN_MODE_r equals ‘001’, FREQ_INCL_r equals ‘0’, the mobile station shall
 10 perform the following actions:
 11 - If the message requires acknowledgement, the mobile station shall wait until
 12 Layer 3 receives an indication from Layer 2 that the acknowledgement to the
 13 message has been sent and acknowledged.
 14 - The mobile station shall measure the strength of each pilot listed in the
 15 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
 16 and 2.6.6.2.2 set PILOT_PNs to the pilot PN sequence offset of the strongest
 17 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQs and
 18 ACC_MSG_SEQs to NULL (see 2.6.2.2).
 19 - If the mobile station has not stored configuration parameters for the Primary
 20 Paging Channel of the new base station, or if the stored information is not
 21 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQs,
 22 NGHBR_LST_MSG_SEQs, EXT_NGHBR_LST_MSG_SEQs,
 23 GEN_NGHBR_LST_MSG_SEQs, CHAN LST MSG SEQs,
 24 EXT CHAN LST MSG SEQs, EXT_SYS_PAR_MSG_SEQs,
 25 USER_ZONE_ID_MSG_SEQs, PRI_NGHBR_LST_MSG_SEQs,
 26 GLOB_SERV_REDIR_MSG_SEQs, and EXT_GLOB_SERV_REDIR_MSG_SEQs
 27 to NULL. The mobile station shall set PAGE_CHANs to ‘1’ and PAGECHs to
 28 the Primary Paging Channel. If the mobile station was monitoring Forward
 29 Common Control Channel, the mobile station shall set the PRATs to ‘00’. The
 30 mobile station shall then begin monitoring the Primary Paging Channel of
 31 the selected base station.
 32 • If ASSIGN_MODE_r equals ‘001’, FREQ_INCL_r equals ‘1’, and the band class is
 33 not supported by the mobile station, the mobile station shall enter the *Update*
 34 *Overhead Information Substate* of the *System Access State* with an
 35 order/message response indication within T_{33m} seconds and send a *Mobile*
 36 *Station Reject Order* with ORDQ field set to ‘00000110’ (capability not supported
 37 by the mobile station).
 38 • If ASSIGN_MODE_r equals ‘001’, FREQ_INCL_r equals ‘1’, and the band class is
 39 supported by the mobile station, the mobile station shall perform the following
 40 actions:

- If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
- The mobile station shall set $CDMACH_s = CDMA_FREQ_r$ and $CDMABAND_s = BAND_CLASS_r$. The mobile station shall set $CONFIG_MSG_SEQ_s$ and $ACC_MSG_SEQ_s$ to NULL (see 2.6.2.2). Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, and set $PILOT_PN_s$ to the pilot PN sequence offset of the strongest pilot in the list ($PILOT_PN_r$).
- If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set $SYS_PAR_MSG_SEQ_s$, $NGHBR_LST_MSG_SEQ_s$, $EXT_NGHBR_LST_MSG_SEQ_s$, $GEN_NGHBR_LST_MSG_SEQ_s$, $CHAN_LST_MSG_SEQ_s$, $EXT_CHAN_LST_MSG_SEQ_s$, $EXT_SYS_PAR_MSG_SEQ_s$, $USER_ZONE_ID_MSG_SEQ_s$, $PRI_NGHBR_LST_MSG_SEQ_s$, $GLOB_SERV_REDIR_MSG_SEQ_s$, and $EXT_GLOB_SERV_REDIR_MSG_SEQ_s$ to NULL. The mobile station shall set $PAGE_CHAN_s$ to '1' and $PAGECH_s$ to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
- If $ASSIGN_MODE_r$ is not equal to '001', the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication within T_{33m} seconds and send a *Mobile Station Reject Order* with $ORDQ$ field set to '00000010' (message not accepted in this state).

8.9. Feature Notification Message

9.10. Local Control Order

10.11 Lock Until Power-Cycled Order: The mobile station shall record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory ($LCKRSN_{Ps-p}$ equals the least significant four bits of $ORDQ_r$). After a mobile station receives this order, it shall not enter the *System Access State* (see 2.6.3) until it has received an *Unlock Order* or until after power-cycling the mobile station (i.e., after the next mobile station power-up). This requirement shall take precedence over any other mobile station requirement specifying entry to the *System Access State*. The mobile station should notify the user of the locked condition. The mobile station shall exit the *Mobile Station Idle State* and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a lock indication (see 2.6.1.1). This allows the mobile station to operate in an alternate operating mode while locked.

11.12 Maintenance Required Order: The mobile station shall record the reason for the *Maintenance Required Order* in the mobile station's semi-permanent memory ($MAINTRSN_{s-p}$ equals the least significant four bits of $ORDQ_r$). If the mobile station has previously received a *Lock Until Power-Cycled Order*, it shall remain in the locked

1 condition; otherwise the mobile station shall remain in the unlocked condition. The
 2 mobile station should notify the user of the maintenance required condition.

3 **12.13 PACA Message:** If P_REV_IN_USE_S is less than or equal to four, and if the
 4 mobile station does not support PACA capability, the mobile station shall send a *Mobile*
 5 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
 6 capability that is not supported by the mobile station); otherwise, the mobile station
 7 shall process the message as follows:

- 8 • If PACA_S is equal to disabled, the mobile station shall enter the *Update Overhead*
 9 *Information Substate* of the *System Access State* with an order/message response
 10 indication within T_{33m} seconds and shall send a *Mobile Station Reject Order* with
 11 the ORDQ field set to '00000010' (message not accepted in this state).
- 12 • If PACA_S is equal to enabled, the mobile station shall perform the following:
 - 13 – If the purpose of the message is to respond to an *Origination Message*
 14 (PURPOSE_r is equal to '0000'), the mobile station shall enter the *Update*
 15 *Overhead Information Substate* of the *System Access State* with an
 16 order/message response indication within T_{33m} seconds and send a *Mobile*
 17 *Station Reject Order* with the ORDQ field set to '00000010' (message not
 18 accepted in this state).
 - 19 – If the purpose of the message is to provide the queue position of the PACA
 20 call (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA
 21 state timer to the duration shown in Table 3.7.2.3.2.20-2, corresponding to
 22 the value of PACA_TIMEOUT_S, should indicate to the user that the PACA call
 23 is still queued, and should indicate the current queue position (Q_POS_r) of
 24 the call.
 - 25 – If the purpose of the message is to instruct the mobile station to re-originate
 26 the PACA call (PURPOSE_r is equal to '0010'), the mobile station shall set the
 27 PACA state timer to the duration shown in Table 3.7.2.3.2.20-2
 28 corresponding to the value of PACA_TIMEOUT_S, and the mobile station shall
 29 enter the *Update Overhead Information Substate* of the *System Access State*
 30 (see 2.6.3) with a PACA response indication within T_{33m} seconds to re-
 31 originate the PACA call.
 - 32 – If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
 33 to '0011'), the mobile station shall set PACA_S to disabled and PACA_CANCEL
 34 to '0', shall disable the PACA state timer, and should indicate to the user
 35 that the PACA call has been canceled.

36 **13.14 Registration Accepted Order:**

- 37 • If ORDQ_r = '00000101', the mobile station shall set ROAM_INDI_S = ROAM_INDI_r
 38 and should display the roaming condition.
- 39 • If ORDQ_r = '00000111', the mobile station shall perform the following
 - 40 – The mobile station shall set ROAM_INDI_S =to ROAM_INDI_r and should
 41 display the roaming condition.

- The mobile station shall set C_SIG_ENCRYPT_MODE_s =to C_SIG_ENCRYPT_MODE_r.
- If USE_NEW_KEY_r is not included, or is included and is set to ‘1’, the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_{s-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s. The mobile station shall increment the variable KEY_SEQ_NEW_{s-p} by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station shall set ENC KEY SIZE_s to ENC KEY SIZE_r.
If USE_NEW_KEY_r is included and is set to ‘0’, then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.
- If C SIG ENCRYPT MODE_r is not equal to ‘000’, the mobile station shall set ENC KEY_s to the most recently generated CMEAKEY in the mobile station associated with the AUTHR of the *Registration Message*, and EXT ENCRYPT SEQ[0] and EXT ENCRYPT SEQ[1] to $256 \times$ ENC SEQ H (the ENC SEQ H field in the *Registration Message*).

14.15 Registration Rejected Order: This order indicates that normal service is not available on this system. The mobile station shall disable the full-TMSI timer. If the received order specifies to delete the TMSI (ORDQ = ‘00000100’), the mobile station shall set all the bits of the TMSI_CODE_{s-p} to ‘1’. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).

15.16 Registration Request Order: The mobile station shall process the message and perform registration procedures as specified in 2.6.5.5.2.3.

16.17 Security Mode Command Message: The mobile station shall process the message as follows:

- The mobile station shall set C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- If USE_NEW_KEY_r is not included, or is included and is set to ‘1’, the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_{s-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s. The mobile station shall then increment the variable KEY_SEQ_NEW_{s-p} by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station shall set ENC KEY SIZE_s to ENC KEY SIZE_r.
- If USE_NEW_KEY_r is included and is set to ‘0’, then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.

17. 18 Service Redirection Message: The mobile station shall process the message as follows:

- 1 • If the mobile station is directed to an unsupported operation mode or band class,
2 the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ
3 equal to '00000110' (message requires a capability that is not supported by the
4 mobile station).
- 5 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
6 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 7 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 8 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
9 *System Determination Substate* of the *Mobile Station Initialization State* with an
10 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
11 redirection record received in the message as REDIRECT_REC_s and shall enter
12 the *System Determination Substate* of the *Mobile Station Initialization State* with a
13 redirection indication (see 2.6.1.1).

14 18.19 *Retry Order*: The mobile station shall process the message as follows:

- 15 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
16 RETRY_DELAY_s[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
17 or '011'.
- 18 • If RETRY_TYPE_r is equal to '001', the mobile station shall perform the following:
19 – If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
20 RETRY_DELAY_s[RETRY_TYPE_r] to 0.
21 – If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
22 RETRY_DELAY_s[RETRY_TYPE_r] as follows:
23 + If the most significant bit of the RETRY_DELAY_r is '0', set
24 RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the
25 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_s to 6000ms.
26 + The mobile station shall set RETRY_DELAY_VALUE_s to the seven least
27 significant bits of RETRY_DELAY_r.
28 + The mobile station shall store the next system time 80 ms boundary +
29 RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as
30 RETRY_DELAY_s[RETRY_TYPE_r].

31 19.20 *Slotted Mode Order*: After receiving this order, the mobile station shall set
32 SLOTTED_s to YES. The mobile station shall disable the TMS_Slotted timer.

33 20.21 *SSD Update Message*: The mobile station shall process the message and shall
34 respond with a *Base Station Challenge Order* as specified in 2.3.12.1.5. The mobile
35 station shall enter the *Update Overhead Information Substate* of the *System Access*
36 *State* with an order/message response indication within T_{32m} seconds.

37 21.22 *Status Request Message*: The mobile station shall process the message. If
38 P_REV_IN_USE_s is less than or equal to three, the mobile station shall respond with a
39 *Status Response Message*. If P_REV_IN_USE_s is greater than three, the mobile station
40 shall respond with an *Extended Status Response Message*. The mobile station shall

1 enter the *Update Overhead Information Substate* of the *System Access State* with an
 2 order/message response indication within T_{33m} seconds. If the message does not
 3 specify any qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the
 4 mobile station shall include the requested information records in the response. If the
 5 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the mobile
 6 station shall only include the requested information records for the specified band class
 7 (BAND_CLASS_r) in the response. If the message specifies a band class and an
 8 operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile station shall
 9 only include the requested information records for the specified band class
 10 (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response. If the message
 11 specifies a band class or a band class and an operating mode which is not supported
 12 by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with
 13 ORDQ set to '00000110' (message requires a capability that is not supported by the
 14 mobile station). If the response to this message exceeds the allowable length, the
 15 mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000'
 16 (response message would exceed the allowable length). If the message specifies an
 17 information record which is not supported by the mobile station for the specified band
 18 class and operating mode, the mobile station shall send a *Mobile Station Reject Order*
 19 with ORDQ set to '00001001' (information record is not supported for the specified
 20 band class and operating mode).

21 | **22.23 TMSI Assignment Message:** The mobile station shall store the TMSI zone and
 22 code as follows:

- 23 • The mobile station shall store the length of the TMSI zone field by setting
 24 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 25 • The mobile station shall store the assigning TMSI zone number by setting the
 26 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 27 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 28 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 29 TMSI_CODE_r.

30 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 31 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 32 mobile station shall then respond with a *TMSI Assignment Completion Message*
 33 within T_{56m} seconds.

34 | **23.24 Unlock Order:** After receiving this order, the mobile station is no longer locked.
 35 The mobile station should notify the user that the locked condition has been removed.
 36 The mobile station shall enter the *System Determination Substate of the Mobile Station*
 37 *Initialization State* with an *unlock indication* (see 2.6.1.1).

38 | **24.25 User Zone Reject Message**

39 | **9. Base Station Reject Order:**

- 1 • If $\text{ORDQ}_F = '00000001'$, the mobile station shall send a *Security Mode Request*
 2 Message with the *ENC_SIC_H* field included in it. If the mobile reeeives two *Base*
 3 *Station Reject Orders* without successfully decrypting any encrypted messages
 4 from the base station between the orders, the mobile station shall set
 5 $\text{REG_ENCRYPT_RESYNC}$ to YES and enter the *System Determination Substate*
 6 with an encryption failure indication.

7 The mobile station shall ignore all other messages and orders.

8 2.6.2.5 Mobile Station Origination Operation

9 The *Mobile Station Origination Operation* is performed when the mobile station is directed by
 10 the user to initiate a call, or if the *Mobile Station Idle State* is entered with NDSS_ORIG_S
 11 enabled.

12 If the mobile station is directed by the user to initiate a call, the mobile station shall
 13 perform the following:

- 14 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 15 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 16 user that the PACA call has been canceled.
- 17 • The mobile station shall set CURR_ACC_MSG_SEQ to NULL.
- 18 • The mobile station shall set SYNC_ID_S to NULL if the mobile station is currently in a
 19 different SID, NID, or CDMA Channel than where the SYNC_ID_S was stored.

20 The mobile station shall enter the *Update Overhead Information Substate* of the *System*
 21 *Access State* (see 2.6.3) with an origination indication within T_{33m} seconds.

22 2.6.2.6 Mobile Station Message Transmission Operation

23 Support of this operation is optional. If the mobile station supports the *Mobile Station*
 24 *Message Transmission Operation*, the operation is performed when the user directs the
 25 mobile station to transmit a *Data Burst Message*, or when the mobile station detects a
 26 change in hook status since the last time when the mobile station sent hook status
 27 information and the mobile station supports the *Device Information Message* on the r-csch.

28 If the mobile station supports this operation, the mobile station shall set
 29 CURR_ACC_MSG_SEQ to NULL.

30 If the mobile station supports this operation and the operation is performed when the user
 31 directs the mobile station to transmit a *Data Burst Message*, the mobile station shall enter
 32 the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a
 33 message transmission indication within T_{33m} seconds.

34 If the mobile station supports this operation and the operation is performed when the
 35 mobile station detects a change in hook status since the last time when the mobile station
 36 sent hook status information, the mobile station shall enter the *Update Overhead*
 37 *Information Substate* of the *System Access State* (see 2.6.3.2) with a hook status indication
 38 within T_{33m} seconds.

1 2.6.2.7 Mobile Station Power-Down Operation

2 The *Mobile Station Power-Down Operation* is performed when the user directs the mobile
 3 station to power down.

4 The mobile station shall update stored parameters and perform other registration
 5 procedures as specified in 2.6.5.5.2.4.

6 If no power-down registration is performed (see 2.6.5.5.2.4), the mobile station may power
 7 down.

8 2.6.2.8 Mobile Station PACA Cancel Operation

9 The *Mobile Station PACA Cancel Operation* is performed when the user directs the mobile
 10 station to cancel a PACA call.

11 If PACAs is equal to enabled, the mobile station shall perform the following:

- 12 • The mobile station shall set PACAs to disabled.
- 13 • The mobile station shall set PACA_CANCEL to '0', if PACA_CANCEL is equal to '1'.
- 14 • The mobile station shall disable the PACA state timer.
- 15 • The mobile station should indicate to the user that the PACA call has been canceled.
- 16 • The mobile station shall set CURR_ACC_MSG_SEQ to NULL.
- 17 • The mobile station shall enter the *Update Overhead Information Substate* of the
 System Access State (see 2.6.3) with a PACA cancel indication within T_{33m} seconds.

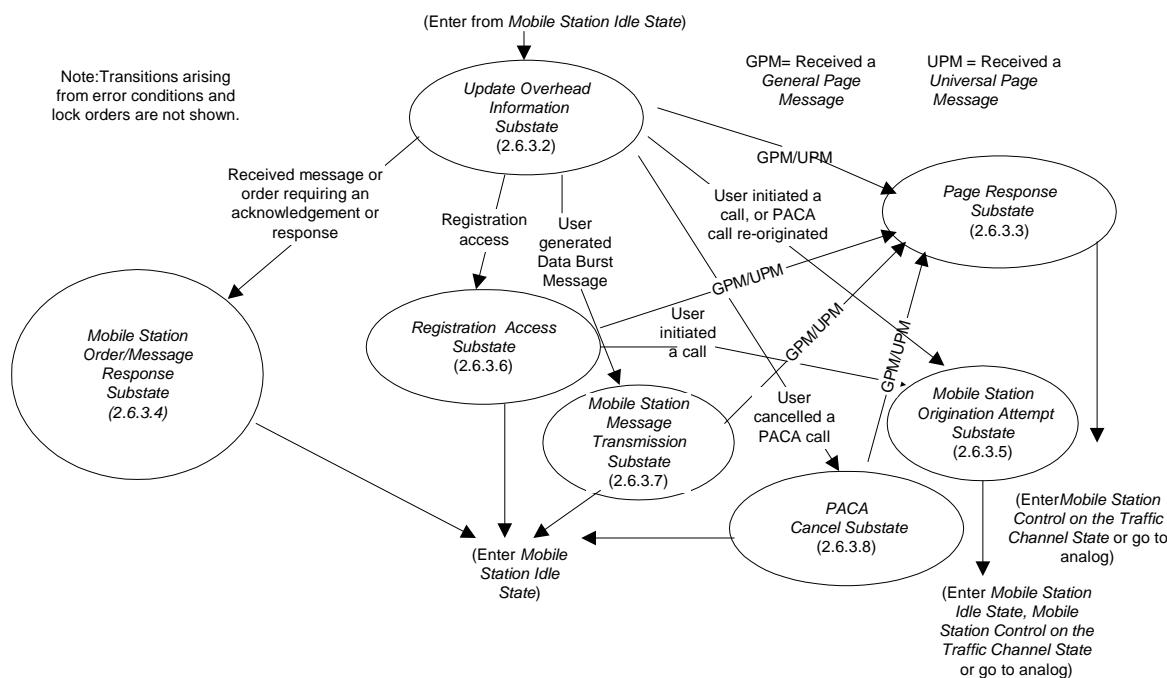

19 2.6.3 System Access State

20 In this state, the mobile station sends messages to the base station on the r-csch and
 21 receives messages from the base station on the f-csch.

22 As illustrated in Figure 2.6.3-1, the *System Access State* consists of the following substates:

- 23 • *Update Overhead Information Substate* - In this substate, if the base station supports
 the Primary Broadcast Control Channel for Spreading Rate 1 or if both the base
 station and mobile station supports the Primary Broadcast Control Channel for
 Spreading Rate 3 and if the protocol revision level in use is greater than six, the
 mobile station will monitor the [Primary](#) Broadcast Control Channel until it has
 received a current set of overhead messages; otherwise, the mobile station will
 monitor the Paging Channel until it has a current set of overhead messages.
- 30 • *Mobile Station Origination Attempt Substate* - In this substate, the mobile station
 sends an *Origination Message* to the base station.
- 32 • *Page Response Substate* - In this substate, the mobile station sends a *Page*
 Response Message to the base station.
- 34 • *Mobile Station Order/Message Response Substate* - In this substate, the mobile
 station sends a response to a message received from the base station.

- 1 • *Registration Access Substate* - In this substate, the mobile station sends a
2 *Registration Message* to the base station.
- 3 • *Mobile Station Message Transmission Substate* - In this substate, the mobile station
4 sends a *Data Burst Message* or a *Device Information Message* to the base station.
- 5 • *PACA Cancel Substate* - In this substate, the mobile station sends a *PACA Cancel*
6 *Message* to the base station.

**Figure 2.6.3-1. System Access State**

2.6.3.1 Access Procedures

2.6.3.1.1 Access Attempts

If the mobile station monitors the Paging Channel, the mobile station transmits on the Access Channel using a random access procedure. Many parameters of the random access procedure are supplied by the base station in the *Access Parameters Message*. The random access procedure is described in [4] and [3].

If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast Control Channel, the mobile station transmits on the Enhanced Access Channel using a random access procedure. Many parameters of the random access procedure are supplied by the base station in the *Enhanced Access Parameters Message*.

1 If Layer 3 receives an indication from Layer 2 that the system access is denied, the mobile
2 station shall update its registration variables using SID_S, NID_S, REG ZONE_S, and
3 ZONE TIMER_S that were stored from the first base station to which the mobile station sent
4 an Access Probe, as specified in 2.6.5.5.3.2, and enter the *System Determination Substate* of
5 the *Mobile Station Initialization State* with an access denied indication (see 2.6.1.1).

6 If Layer 3 receives an indication from Layer 2 that the system is lost, the mobile station
7 shall update its registration variables using SID_S, NID_S, REG ZONE_S, and ZONE TIMER_S
8 that were stored from the first base station to which the mobile station transmitted an
9 Access Probe, as specified in 2.6.5.5.3.2 and enter the *System Determination Substate* of the
10 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1)

11 2.6.3.1.2 Reserved

12 2.6.3.1.3 Handoffs

13 While in the *System Access State*, the mobile station shall continue its pilot search
14 (see 2.6.3.1.3.1), and may perform access handoffs (see 2.6.3.1.3.2) and/or access probe
15 handoffs (see 2.6.3.1.3.3).

16 —If the mobile station performs access handoffs and/or access probe handoffs, the mobile
17 station shall maintain the following variables:

- 18 • CURRENT_ACTIVE_PILOT_S
- 19 • PREVIOUS_ACTIVE_PILOT_S
- 20 • FIRST_ACTIVE_PILOT_S

21 Upon entering the *System Access State* the mobile station shall set
22 CURRENT_ACTIVE_PILOT_S, PREVIOUS_ACTIVE_PILOT_S and FIRST_ACTIVE_PILOT_S to
23 NULL. Prior to starting an access attempt, the mobile station shall set
24 CURRENT_ACTIVE_PILOT_S and PREVIOUS_ACTIVE_PILOT_S to NULL. When the mobile
25 station selects a base station for transmission of an access probe, the mobile station shall
26 proceed as follows:

- 27 • If CURRENT_ACTIVE_PILOT_S is not the same as the pilot of the selected base
28 station, the mobile station shall set PREVIOUS_ACTIVE_PILOT_S to the value of
29 CURRENT_ACTIVE_PILOT_S.
- 30 • The mobile station shall set CURRENT_ACTIVE_PILOT_S to the identity of the pilot
31 corresponding to the selected base station.
- 32 • If FIRST_ACTIVE_PILOT_S is NULL, the mobile station shall set
33 FIRST_ACTIVE_PILOT_S to the value of CURRENT_ACTIVE_PILOT_S.

34 Before the mobile station transmits an access probe to a new base station on the Access
35 Channel, the mobile station shall update parameters based on the *System Parameters*
36 Message, the *Access Parameters Message* and the *Extended System Parameters Message* on
37 the associated new Paging Channel and process parameters from the messages (see
38 2.6.2.2.1, 2.6.2.2.2, and 2.6.2.2.5).

1 Before the mobile station transmits an access probe to a new base station on the Enhanced
 2 Access Channel, the mobile station shall update parameters based on the *ANSI-41 System*
 3 *Parameters Message*, the *Enhanced Access Parameters Message*, and the *MC-RR System*
 4 *Parameters Message* on the associated new Primary Broadcast Control Channel and process
 5 parameters from the messages (see 2.6.2.2.13, 2.6.2.2.14, and 2.6.2.2.15).

6 If the mobile station monitors the Paging Channel, the mobile station shall update
 7 parameters based on the *Neighbor List Message*, the *Extended Neighbor List Message*, or the
 8 *General Neighbor List Message* on the associated new Paging Channel and process
 9 parameters from the message (see 2.6.2.2.3, 2.6.2.2.7, and 2.6.2.2.8).

10 If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast
 11 Control Channel, the mobile station shall update parameters based on the *Universal*
 12 *Neighbor List Message* on the associated new Primary Broadcast Control Channel and
 13 process parameters from the message (see 2.6.2.2.17).

14 If the mobile station receives the *User Zone Identification Message* or the *Private Neighbor*
 15 *List Message*, the mobile station shall update parameters based on these messages on the
 16 associated new Paging Channel or Primary Broadcast Control Channel and process
 17 parameters from the messages (see 2.6.2.2.9 and 2.6.2.2.10). If the mobile station receives
 18 a *Global Service Redirection Message* (see 2.6.2.2.6) which directs the mobile station away
 19 from the new base station, the mobile station shall not access the new base station. If the
 20 mobile station receives an *Extended Global Service Redirection Message* (see 2.6.2.2.11)
 21 which directs the mobile station away from the new base station, the mobile station shall
 22 not access the new base station. The mobile station shall process these messages only once
 23 after each access handoff.

24 2.6.3.1.3.1 Pilot Search

25 The following sets of pilot offsets are defined for a mobile station in the *System Access State*.
 26 Each pilot offset is a member of only one set.

- 27 • Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or
 28 Forward Common Control Channel/ Primary Broadcast Control Channel is being
 29 monitored.
- 30 • Neighbor Set: The pilots that are not currently in the Active Set and are likely
 31 candidates for access handoff or access probe handoff. The members of the
 32 Neighbor Set are specified in the *Neighbor List Message*, the *Extended Neighbor List*
 33 *Message*, and the *General Neighbor List Message on the Paging Channel*. The
 34 members of the Neighbor Set are specified in the *Universal Neighbor List Message* on
 35 the Primary Broadcast Control Channel.
- 36 • Remaining Set: The set of all possible pilot offsets in the current system (integer
 37 multiples of PILOT_INC_S) on the current CDMA Frequency Assignment, excluding
 38 the pilots in the Neighbor Set and the Active Set.

39 2.6.3.1.3.2 Access Handoff

40 The mobile station is permitted to perform an access handoff to use the Paging Channel
 41 with the best pilot strength and an associated Access Channel. The mobile station is

1 permitted to perform an access handoff to use the Forward Common Control Channel with
 2 the best pilot strength and an associated Enhanced Access Channel. The mobile station is
 3 permitted to perform an access handoff when waiting for a response from the base station
 4 or before sending a response to the base station. An access handoff is permitted after an
 5 access attempt while the mobile station is in the *Page Response Substate* or the *Mobile*
 6 *Station Origination Attempt Substate*.

7 When the mobile station declares a loss of the Paging Channel or the Forward Common
 8 Control Channel while waiting for a response from the base station in the *Page Response*
 9 *Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station shall
 10 perform an access handoff, if all of the following conditions hold:

- 11 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 12 • ACCESS_HOs is equal to ‘1’, and
- 13 • The mobile station is not already in the process of performing an access attempt.

14 When the mobile station declares a loss of the Paging Channel or the Forward Common
 15 Control Channel, after receiving a message but before responding to that message while in
 16 the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile
 17 station shall perform an access handoff if the following conditions hold:

- 18 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 19 • ACCESS_HOs is equal to ‘1’,
- 20 • ACCESS_HO_MSG_RSPs is equal to ‘1’, and
- 21 • The mobile station is not already in the process of performing an access attempt.

22 When the mobile station declares an insufficiency of the Paging Channel³ or the Forward
 23 Common Control Channel, while waiting for a response from the base station in the *Page*
 24 *Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station
 25 may perform an access handoff if all of the following conditions hold:

- 26 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 27 • ACCESS_HOs is equal to ‘1’, and
- 28 • The mobile station is not already in the process of performing an access attempt.

29 When the mobile station declares an insufficiency of the Paging Channel⁴ or the Forward
 30 Common Control Channel, after receiving a message but before responding to that message
 31 while in the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*,
 32 the mobile station may perform an access handoff if all of the following conditions hold:

³ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

⁴ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

- 1 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 2 • ACCESS_HOs is equal to '1',
- 3 • ACCESS_HO_MSG_RSPs is equal to '1', and
- 4 • The mobile station is not already in the process of performing an access attempt.

5 If ACCESS_PROBE_HOs is equal to '0' and ACCESS_HOs is equal to '1', and the mobile
 6 station declares a loss of the Paging Channel or the Forward Common Control Channel
 7 during an access attempt, after sending at least one complete access probe, the mobile
 8 station may monitor other Paging Channels or the Forward Common Control Channels
 9 which are in ACCESS_HO_LIST for T42m seconds after the loss of the Paging Channel or
 10 the Forward Common Control Channel on which the access attempt was made⁵.

11 2.6.3.1.3.3 Access Probe Handoff

12 The mobile station is permitted to perform an access probe handoff when the mobile station
 13 is in the *Page Response Substate* or the *Mobile Station Origination Attempt Substate*.

14 The mobile station may perform an access probe handoff during an access attempt to a
 15 pilot in ACCESS_HO_LIST when the message being sent is the *Origination Message* or the
 16 *Page Response Message*, if all of the following conditions hold:

- 17 • ACCESS_PROBE_HOs is equal to '1',
- 18 • The mobile station is in the *Page Response Substate* or the *Mobile Station Origination*
 Attempt Substate, and
- 20 • The mobile station has performed fewer than (MAX_NUM_PROBE_HOs +1) access
 probe handoffs during the current access attempt.

22 The mobile station may also perform an access probe handoff during an access attempt to a
 23 pilot in ACCESS_HO_LIST when the message being sent is a message other than the
 24 *Origination Message* or the *Page Response Message*, if all of the preceding conditions hold
 25 and ACC_PROBE_HO_OTHER_MSGs is equal to '1'.

26 The mobile station may also perform an access probe handoff during an access attempt to a
 27 pilot not in ACCESS_HO_LIST when the message being sent is the *Origination Message* or
 28 the *Page Response Message*, if all of the following conditions hold:

- 29 • ACC_HO_LIST_UPDs is equal to '1',
- 30 • ACCESS_PROBE_HOs is equal to '1',
- 31 • The new pilot is stronger than any pilot in ACCESS_HO_LIST,
- 32 • The new pilot has the corresponding ACCESS_HO_ALLOWED field in the
 NGHBR_REC equal to '1',

⁵ The mobile station would be waiting for a response to the message transmitted in the access probe.

- Inclusion of the new pilot in ACCESS_HO_LIST does not cause the Access Channel or Enhanced Access Channel message to exceed the maximum capsule size,
- Inclusion of the new pilot in ACCESS_HO_LIST does not cause the number of members to exceed N13m,
- The mobile station is in the *Page Response Substate* or the *Mobile Station Origination Attempt Substate*, and
- The mobile station has performed fewer than $(\text{MAX_NUM_PROBE_HO}_S + 1)$ access probe handoffs during the current access attempt.

The mobile station may also perform an access probe handoff during an access attempt to a pilot not in ACCESS_HO_LIST when the message being sent is a message other than the *Origination Message* or the *Page Response Message*, if all of the preceding conditions hold and ACC_PROBE_HO_OTHER_MSG_S is equal to '1'.

If the above conditions are met, the mobile station may perform an access probe handoff when the mobile station declares a loss of the Paging Channel or Forward Common Control Channel (see [2.6.2.1.1.4](#) [2.6.3.1.8](#)); the mobile station may also perform an access probe handoff after getting an indication that the TA timer expired (see 2.1.1.2.2 of [4]) and the mobile station declares an insufficiency of the Paging Channel⁶ or the Forward Common Control Channel.

If the mobile station performs an access probe handoff, the mobile station shall suspend the access attempt on the old pilot and shall restart the access attempt on the new pilot (*i.e.* starting with the first probe of the first probe sequence of the access sub-attempt), as specified in 2.1.1.2.2 of [4]. The mobile station shall record the identity of the pilots to which access probes have been transmitted within the current access attempt.

The mobile station shall not reset its access probe handoff count until the access attempt ends.

Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to cancel the access attempt if the length of the message to be sent exceeds MAX_CAP_SIZE of the new base station. The mobile station may monitor other Paging Channels or Forward Common Control Channels which are in ACCESS_HO_LIST for T42m seconds after aborting the access attempt⁷.

[2.6.3.1.4](#) System Access State Exit Procedures

Upon exiting the *System Access State*, the mobile station shall direct Layer 2 to cancel (see 2.1.1.2.2 of [4]) any access attempt in progress and discard the associated message. The mobile station shall then disable the *System Access State* timer.

⁶ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

⁷ The mobile station would be waiting for a response to the message transmitted in the access probe.

1 2.6.3.1.5 Reserved

2 2.6.3.1.6 Full-TMSI Timer

3 Whenever the mobile station sends its full TMSI, the mobile station enables a timer, called
 4 the full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by
 5 setting all of the bits in the TMSI_CODE_{s-p} field to '1'.

6 The mobile station shall maintain the full-TMSI timer. The mobile station shall provide a
 7 means for enabling or disabling the full-TMSI timer.

8 If the mobile station sends a message with an address including the
 9 ASSIGNING_TMSI_ZONE_{s-p} and the full-TMSI timer is disabled, the mobile station shall
 10 enable the full-TMSI timer with a duration equal to $T_{69m} + 2.56 \times 2^i$ seconds where i is
 11 equal to SLOT_CYCLE_INDEX_S.

12 2.6.3.1.7 Monitoring Pilots

13 The mobile station assists the base station in the Traffic Channel assignment process by
 14 monitoring and reporting (see 2.1.1.4.1.2 of [4]) the pilot strength of the pilot in the mobile
 15 station's Paging Channel or Forward Common Control Channel Active Set (see 2.6.3.1.3.1).
 16 The mobile station can also monitor and report (see 2.1.1.4.1.2 of [4]) other pilots on the
 17 same frequency; in such cases, the mobile station shall create ACCESS_HO_LIST and
 18 OTHER_REPORTED_LIST and shall monitor the pilots on those lists, if any.

19 For each monitored pilot, the mobile station shall record the pilot PN phase and the pilot
 20 strength PS, using the most recent measurements from the searcher element (see 2.2.2.1 of
 21 [2]), as they become available. The mobile station shall identify each pilot through its pilot
 22 PN phase (the phase of the pilot PN sequence, in units of one chip, relative to the zero offset
 23 pilot PN sequence of the pilot (see 2.6.6.2.4)). The mobile station shall determine the pilot
 24 strength, PS, as specified in 2.6.6.2.2.

25 2.6.3.1.7.1 Generation of the Initial Access Handoff List

26 ACCESS_HO_LIST is created immediately before transmitting the first access probe after
 27 entering the *System Access State*. When it is created, ACCESS_HO_LIST is defined as a set
 28 of at most N_{13m} pilots, having the greatest pilot strength in comparison with other
 29 qualifying pilots and for which all of the following apply:

- 30 • The strength of each member exceeds T_ADD.
- 31 • Each member, other than the Active Set pilot, has the corresponding
 32 ACCESS_HO_ALLOWED field in the NGHBR_REC equal to '1'.
- 33 • The Active Set pilot that the mobile station monitors when the mobile station enters
 34 the *System Access State* is a member.
- 35 • All members can be contained in the Access Channel or Enhanced Access Channel
 36 message without exceeding the maximum capsule size.

1 2.6.3.1.7.2 Update of the Access Handoff List

2 When the mobile station performs an access probe handoff to a pilot which was not
 3 previously included in ACCESS_HO_LIST (see 2.6.3.1.3.3), it adds the pilot to
 4 ACCESS_HO_LIST.

5 If ACC_HO_LIST_UPD_s is equal to '1', the mobile station can update ACCESS_HO_LIST, as
 6 follows:

- 7 • The mobile station can add one or more new pilots other than the Active Set pilot to
 8 ACCESS_HO_LIST before transmitting an access probe.
- 9 • The mobile station can also drop from ACCESS_HO_LIST pilots to which access
 10 probes have not been transmitted since entering the *System Access State* and whose
 11 strength have fallen below T_ADD.

12 When it is updated before transmitting a subsequent access probe, ACCESS_HO_LIST is
 13 defined as a set of at most N_{13m} pilots, having the greatest pilot strength in comparison
 14 with other qualifying pilots and for which all of the following apply:

- 15 • The strength of each member to which access probes have not been transmitted
 16 exceeds T_ADD.
- 17 • Each member other than the pilot to which the first access probe in the System
 18 Access State was transmitted has the corresponding ACCESS_HO_ALLOWED field
 19 in the NGHBR_REC equal to '1'.
- 20 • The Active Set pilot to which the next access probe is to be transmitted is a member.
- 21 • All pilots to which access probes have been transmitted since entering the *System*
 22 *Access State* are members.
- 23 • All members can be contained in the Access Channel or Enhanced Access Channel
 24 message without exceeding the maximum capsule size.

25 2.6.3.1.7.3 Generation of the Other Reported List

26 OTHER_REPORTED_LIST (specified by NUM_ADD_PILOTS and NUM_AUX_PILOTS, see
 27 2.1.1.4.1.5.1 of [4]) is defined as a set of no more than N_{13m} minus the number of pilots in
 28 ACCESS_HO_LIST pilots, having the greatest pilot strength in comparison with other
 29 qualifying pilots and for which all of the following apply:

- 30 • The strength of each member exceeds T_ADD.
- 31 • No member is included in ACCESS_HO_LIST.
- 32 • All members can be contained in the Access Channel or Enhanced Access Channel
 33 message without exceeding the maximum capsule size.

34 2.6.3.1.7.4 Update of OTHER_REPORTED_LIST

35 Before transmitting each access probe, the mobile station shall generate
 36 OTHER_REPORTED_LIST according to section 2.6.3.1.7.3, using the most recent pilot
 37 strength information available from its searcher element (see 2.2.2.1 of [2]). If the mobile

1 station updates ACCESS_HO_LIST before transmitting an access probe, it shall update
 2 OTHER_REPORTED_LIST after updating ACCESS_HO_LIST.

3 2.6.3.1.8 Paging Channel and Forward Common Control Channel/ Primary Broadcast
 4 Control Channel Monitoring

5 When in the *System Access State*, the mobile station shall monitor the Paging Channel or
 6 the Forward Common Control Channel/ Primary Broadcast Control Channel at all times.

7 The mobile station shall set a timer for T_{72m} seconds, when it begins to monitor the Paging
 8 Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel and whenever it gets an indication that a valid message was received on the Paging Channel
 9 or the Forward Common Control Channel/ Primary Broadcast Control Channel, whether
 10 addressed to the mobile station or not (see 2.1.2.3.2 of [4]).

12 If the T_{72m} timer expires:

- 13 • The mobile station shall first finish transmitting the access probe in progress, if any.
- 14 • ~~The mobile station shall declare a loss of the Paging Channel or the Forward~~
 15 ~~Common Control Channel/ Primary Broadcast Control Channel if:~~
 - 16 — ~~ACCESS_HO_s is equal to '1' and ACCESS_HO_LIST contains more than one~~
 17 ~~pilot,~~
 - 18 — ~~ACC_HO_LIST_UPD_s is equal to '1', and Access Probe Handoff is supported by~~
 19 ~~the mobile station, or~~
 - 20 — ~~ACC_HO_LIST_UPD_s is equal to '0' and the following conditions are met:~~
 - 21 + ~~ACCESS_HO_LIST contains more than one pilot, and~~
 - 22 + ~~Access Probe Handoff is supported by the mobile station and is enabled by~~
 23 ~~the base station.~~
- 24 • ~~If by declaring a loss of the Paging Channel or the Forward Common Control~~
 25 ~~Channel, the eligibility requirements for performing access handoff are met (see~~
 26 ~~2.6.3.1.3.2), then the mobile station shall declare a loss of the Paging Channel or~~
 27 ~~the Forward Common Control Channel, and perform an access handoff if the~~
 28 ~~requirements in 2.6.3.1.3.2 are met. If by declaring a loss of the Paging Channel or~~
 29 ~~the Forward Common Control Channel, the eligibility requirements for performing~~
 30 ~~access probe handoff are met (see 2.6.3.1.3.3), then the mobile station may~~
 31 ~~declare a loss of the Paging Channel or the Forward Common Control Channel, and~~
 32 ~~perform an access probe handoff if the requirements in 2.6.3.1.3.3 are met.~~ If the
 33 mobile station performs an access handoff or an access probe handoff, the mobile
 34 station restarts the Paging Channel or the Forward Common Control Channel/
 35 Primary Broadcast Control Channel monitoring procedure for the new base station.

- If an access attempt was in progress when the timer expired and that access attempt had already been suspended and resumed previously (see below), the mobile station shall declare a loss of the Paging Channel⁸ or the Forward Common Control Channel and shall disable its transmitter.
- If an access attempt was in progress when the timer expired and that access attempt had not been suspended and resumed before and the mobile station does not perform access probe handoff, the mobile station shall declare a temporary econsider the loss of the Paging Channel or the Forward Common Control Channelas temporary, shall direct Layer 2 to suspend the access attempt (see 2.1.1.2.2 of [4]), and shall perform the following:
 - The mobile station shall set the timer to $(T_{40m}-T_{72m})$ seconds.
 - If the mobile station receives an indication that a valid message on the Paging Channel or the Forward Common Control Channel, whether addressed to the mobile station or not, was received (see 2.1.2.3.2 of [4]) prior to the expiration of the $(T_{40m}-T_{72m})$ timer, the mobile station shall re-enable the transmitter, shall direct Layer 2 to resume operation from the beginning of the interrupted access probe sequence of the access sub-attempt (see 2.1.1.2.2 of [4]), and shall transmit the first probe of the new access probe sequence immediately after re-enabling the transmitter.
 - If the $(T_{40m}-T_{72m})$ timer expires, the mobile station shall direct Layer 2 to cancel any access attempt (see 2.1.1.2.2 of [4]) and shall declare a loss of the Paging Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel.
- If an access attempt was not in progress when the timer expired and the mobile station does not perform access handoff, the mobile station shall perform the following:
 - The mobile station shall set the timer to $(T_{40m}-T_{72m})$ seconds.
 - If the $(T_{40m}-T_{72m})$ timer expires, the mobile station shall declare a loss of the Paging Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel.

2.6.3.2 Update Overhead Information Substate

In this substate, if the base station supports the Primary Broadcast Control Channel for Spreading Rate 1, or if both the mobile station and base station support Spreading Rate 3 on the common channels, then the mobile station shall monitor the Primary Broadcast Control Channel until it has received the current configuration messages; otherwise, the mobile station shall monitor the Paging Channel until it has received the current

⁸ Requirements for processing the loss of Paging Channel are given separately for each substate of the *System Access State*, in the sections describing the substates.

1 configuration messages. The mobile station compares sequence numbers to determine
 2 whether all of the configuration messages are up-to-date. To make sure it has the latest
 3 access parameters, the mobile station receives at least one message containing the
 4 ACC_MSG_SEQ field (except in case of a page response, since the initiating page contains
 5 ACC_MSG_SEQ), and waits, if necessary, for an *Access Parameters Message* or an *Enhanced*
 6 *Access Parameters Message*. In addition, if the mobile station is monitoring the Primary
 7 Broadcast Control Channel and SENDING_RAND_S is equal to '1', then it shall also wait for
 8 an *ANSI-41 RAND Message*.

9 Upon entering the *Update Overhead Information Substate*, the mobile station shall set the
 10 *System Access State* timer to a value of T41m seconds. The mobile station shall set PAGED
 11 to NO.

12 If the *System Access State* timer expires while in this substate, the mobile station shall
 13 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
 14 system lost indication (see 2.6.1.1).

15 If the mobile station declares a loss of the Paging Channel or the Primary Broadcast Control
 16 Channel (see [2.6.2.1.1.4](#) [2.6.3.1.8](#)), the mobile station shall perform the following:

- 17 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 18 PACA_CANCEL to '[04](#)', shall disable the PACA state timer, and should indicate to the
 19 user that the PACA call has been canceled.
- 20 • The mobile station shall declare an access attempt failure and update its
 21 registration variables as specified in 2.6.5.5.3.2.
- 22 • The mobile station shall enter the *Mobile Station Idle State*.

23 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
 24 user directs the mobile station to cancel a PACA call.

25 If the mobile station receives any of the following messages, it shall process the message as
 26 follows:

- 27 1. *System Parameters Message*: The mobile station shall process the parameters from
 28 the message (see 2.6.2.2.1).
- 29 2. *Access Parameters Message*: The mobile station shall process the parameters from
 30 the message (see 2.6.2.2.2).
- 31 3. *Neighbor List Message*: The mobile station shall process the parameters from the
 32 message (see 2.6.2.2.3).
- 33 4. *CDMA Channel List Message*: The mobile station shall process the parameters from
 34 the message (see 2.6.2.2.4).
- 35 5. *Extended System Parameters Message*: The mobile station shall process the
 36 parameters from the message (see 2.6.2.2.5).
- 37 6. *Global Service Redirection Message*: The mobile station shall process the
 38 parameters from the message (see 2.6.2.2.6).

- 1 7. *Extended Neighbor List Message*: The mobile station shall process the parameters
2 from the message (see 2.6.2.2.7).
- 3 8. *General Neighbor List Message*: The mobile station shall process the parameters
4 from the message (see 2.6.2.2.8).
- 5 9. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the
6 *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory
7 ($LCKRSN_{P_{s-p}}$ equals the least-significant four bits of $ORDQ_r$). The mobile station
8 should notify the user of the locked condition. The mobile station shall then enter
9 the *System Determination Substate* of the *Mobile Station Initialization State* with a
10 lock indication (see 2.6.1.1), and shall not enter the *System Access State* again until
11 after the next mobile station power-up or until it has received an *Unlock Order*.
12 This requirement shall take precedence over any other mobile station requirement
13 specifying entry to the *System Access State*.
- 14 10. *General Page Message* or *Universal Page Message*: If $CURR_ACC_MSG_SEQ$ is equal
15 to NULL, the mobile station shall set $CURR_ACC_MSG_SEQ$ to $ACC_MSG_SEQ_r$.
16 The mobile station shall compare $CONFIG_MSG_SEQ_s$ to $CONFIG_MSG_SEQ_r$. If
17 the comparison results in a mismatch, the mobile station shall set
18 $CONFIG_MSG_SEQ_s$ to $CONFIG_MSG_SEQ_r$. The mobile station may ignore the
19 rest of the message. If this substate was not entered with an origination or page
20 response indication, the mobile station may also determine whether there is a page
21 match. If the mobile station attempts to determine whether there is a page match,
22 it shall use the procedure as defined in 2.6.2.3. If a match is declared, the mobile
23 station shall set PAGED to YES.
- 24 11. *User Zone Identification Message*: The mobile station shall process the parameters
25 from the message (see 2.6.2.2.9).
- 26 12. *Private Neighbor List Message*: The mobile station shall process the parameters from
27 the message (see 2.6.2.2.10).
- 28 13. *Extended Global Service Redirection Message*: The mobile station shall process the
29 parameters from the message (see 2.6.2.2.11).
- 30 14. *Extended CDMA Channel List Message*: The mobile station shall process the
31 parameters from the message (see 2.6.2.2.12).
- 32 15. *ANSI-41 System Parameters Message*: The mobile station shall process the
33 parameters from the message (see 2.6.2.2.13).
- 34 16. *MC-RR Parameters Message*: The mobile station shall process the parameters from
35 the message (see 2.6.2.2.14).
- 36 17. *Enhanced Access Parameters Message*: The mobile station shall process the
37 parameters from the message (see 2.6.2.2.15).
- 38 18. *ANSI-41 RAND Message*: The mobile station shall process the parameters from the
39 message (see 2.6.2.2.16).
- 40 19. *Universal Neighbor List Message*: The mobile station shall process the parameters
41 from the message (see 2.6.2.2.17).

1 If the mobile station receives a message which is not included in the above list, the mobile
 2 station shall ignore the message.

3 When all of the following conditions are met:

- 4 • the stored configuration parameters are current (see 2.6.2.2)
- 5 • CURR_ACC_MSG_SEQ_S and ACC_MSG_SEQ_S are equal and are not NULL, and
- 6 • if the mobile station is monitoring the Primary Broadcast Control Channel and
 7 SENDING_RAND_S is equal to '1', the *ANSI-41 RAND Message* has been received,

8 then the mobile station shall disable the *System Access State* timer and shall do one of
 9 the following:

- 10 • If PAGED is equal to YES, the mobile station shall determine whether the message
 resulting in the page match was received on the current Paging Channel or Forward
 Common Control Channel. If the message was received on the current Paging
 Channel or Forward Common Control Channel, the mobile station shall enter the
 Page Response Substate; otherwise, the mobile station shall enter the *Mobile Station
 Idle State*.
- 16 • If this substate was entered with a page response indication and the mobile station
 has not performed an access entry handoff, the mobile station shall determine
 whether the message resulting in the page match was received on the current
 Paging Channel or Forward Common Control Channel. If the message was received
 on the current Paging Channel or Forward Common Control Channel, the mobile
 station shall enter the *Page Response Substate*; otherwise, the mobile station shall
 enter the *Mobile Station Idle State*.
- 23 • If this substate was entered with a page response indication and the mobile station
 has performed an access entry handoff, the mobile station shall enter the *Page
 Response Substate*.
- 26 • If this substate was entered with a page response retransmission indication, the
 mobile station shall enter the *Page Response Substate*.
- 28 • If this substate was entered with an origination indication, the mobile station shall
 enter the *Mobile Station Origination Attempt Substate* with an origination indication.
- 30 • If this substate was entered with a PACA response indication, the mobile station
 shall enter the *Mobile Station Origination Attempt Substate* with a PACA response
 indication.
- 33 • If this substate was entered with an order/message response indication and the
 mobile station has not performed an access entry handoff, the mobile station shall
 determine whether the message resulting in the response was received on the
 current Paging Channel or Forward Common Control Channel. If the message was
 received on the current Paging Channel or Forward Common Control Channel, the
 mobile station shall enter the *Mobile Station Order/Message Response Substate*;
 otherwise, the mobile station shall discard the response and enter the *Mobile Station
 Idle State*.

- If this substate was entered with an order/message response indication and the mobile station has performed an access entry handoff, the mobile station shall enter the *Mobile Station Order/Message Response Substate*.
- If this substate was entered with a registration indication, the mobile station shall enter the *Registration Access Substate*.
- If this substate was entered with a message transmission indication, the mobile station shall enter the *Mobile Station Message Transmission Substate* with a message transmission indication.
- If this substate was entered with a hook status indication, the mobile station shall enter the *Mobile Station Message Transmission Substate* with a hook status indication.
- If this substate was entered with a PACA cancel indication, the mobile station shall enter the *PACA Cancel Substate*.

2.6.3.3 Page Response Substate

In this substate, the mobile station sends a *Page Response Message* in response to a mobile-station-addressed page from a base station. If a base station responds to the *Page Response Message* with an authentication request, the mobile station responds in this substate.

If a message received from the base station requires a Layer 2 acknowledgment and does not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is outstanding (see 2.1.1.2.2.1 of [4]).

If a message received from the base station requires a Layer 2 acknowledgment and also a Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see 2.1.1.2.2.1 of [4]).

When transmitting a response to a message received from the base station, Layer 3 shall indicate to Layer 2 that the type of the message is a response (see 2.1.1.2.2.1 of [4]).

When transmitting an autonomous message (i.e., a message that is not sent as a response to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type of the message is a request other than a registration request or a message transmission request (see 2.1.1.2.2.1 of [4]).

If the mobile station has a stored service configuration (that is, parameters conveyed by both the Service Configuration information record and the Non-negotiable Service Configuration information record, SYNC_ID_S is not equal to NULL, and USE_SYNC_ID_S is equal to '1', the mobile station may include the SYNC_ID field in the *Page Response Message* and, if included, shall set it to the 16-bit CRC computed over the entire stored service configuration as specified in 2.6.11 SYNC_ID_S corresponding to the stored service configuration.

Upon entering the *Page Response Substate*, the mobile station shall set RLGAIN_ADJ_S to '0000' and send a *Page Response Message*.

1 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
 2 Common Control Channel. The mobile station may perform an access probe handoff or
 3 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a
 4 loss of the Paging Channel or the Forward Common Control Channel (see [2.6.2.1.1.4](#)
 5 [2.6.3.1.8](#)) during an access attempt, the mobile station may perform an access probe
 6 handoff; otherwise, it shall declare an access attempt failure and shall perform the following
 7 actions:

- 8 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2,
- 9 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 10 SYS_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL,
- 11 • If the mobile station is monitoring the Forward Common Control Channel, the
 12 mobile station shall set MC_RR_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- 13 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 14 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 15 user that the PACA call has been canceled.
- 16 • The mobile station shall disable its transmitter, and
- 17 • The mobile station shall enter the *Mobile Station Idle State*.

18 If the mobile station receives confirmation of delivery of any message sent by the mobile
 19 station in this substate, the mobile station shall perform an access handoff if all of the
 20 following conditions hold:

- 21 • The mobile station declares a loss of the Paging Channel or the Forward Common
 22 Control Channel, and
- 23 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2), and
 24 there are pilots other than the active pilot in the access handoff list (see 2.6.3.1.3.2).

25 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
 26 Channel and does not perform an access handoff, the mobile station shall perform the
 27 following:

- 28 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 29 SYS_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- 30 • If the mobile station is monitoring the Forward Common Control Channel, the
 31 mobile station shall set MC_RR_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- 32 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 33 PACA_CANCEL to 0, shall disable the PACA state timer, and should indicate to the
 34 user that the PACA call has been canceled,
- 35 • The mobile station shall disable its transmitter, and
- 36 • The mobile station shall enter the *Mobile Station Idle State*.

37 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
 38 user directs the mobile station to cancel a PACA call.

If the mobile station receives confirmation of delivery of the *Page Response Message* sent in this substate, the mobile station shall update its registration variables with respect to the base station to which the first access probe was transmitted after entering the *System Access State*, as specified in 2.6.5.5.3.1.

If the *System Access State* timer expires while in this substate, the mobile station shall perform the following:

- If PACAs is equal to enabled, the mobile station shall set PACAs to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- If the mobile station is monitoring the Paging Channel, the mobile station shall set SYS_PAR_MSG_SEQs and ACC_MSG_SEQs to NULL, and shall enter the *Mobile Station Idle State*.
- If the mobile station is monitoring the Forward Common Control Channel, the mobile station shall set $\text{MC_RR_PAR_MSG_SEQs}$ and ACC_MSG_SEQs to NULL and enter the *Mobile Station Idle State*.

The mobile station shall set and disable the *System Access State* timer as follows:

- The mobile station shall disable the timer whenever it begins an access attempt.
- The mobile station shall set the timer to T_{42m} seconds whenever it ends an access attempt.
- The mobile station shall disable the timer whenever it exits the *System Access State*.

If the mobile station receives a *Channel Assignment Message* or the *Extended Channel Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer 2 (see 2.1.2.1.2 of [4]). If the mobile station has not received confirmation of delivery of the *Page Response Message*, before receiving the *Channel Assignment Message* or the *Extended Channel Assignment Message*, the mobile station shall update its registration variables with respect to the base station to which the first access probe was transmitted after entering the *System Access State*, as specified in 2.6.5.5.3.1.

If the mobile station is to exit the *System Access State* as a result of processing Layer 3 fields of a message requiring an acknowledgment, the mobile station shall exit the *System Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.

If Layer 3 receives a message other than a *Channel Assignment Message* or an *Extended Channel Assignment Message* with an indication from Layer 2 that an access attempt for a message being transmitted was not terminated as a result of processing the Layer 2 fields of the received message, the mobile station shall ignore the received message.

The following directed messages and orders can be received. If any field value of the message or order is outside its permissible range, the mobile station may send a *Mobile Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

1. *Authentication Challenge Message*: The mobile station shall respond to the message as specified in 2.3.12.1.4, regardless of the value of AUTHs .

1 2. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 2 message as specified in 2.3.12.1.5.

3 3. *Base Station Reject Order*:

- 4 • If $\text{ORDQ}_r = '00000001'$, the mobile station shall send a *Security Mode Request*
 5 *Message* with the ENC_SIG_H field included in it. If the mobile receives two *Base*
 6 *Station Reject Orders* without successfully decrypting any encrypted messages
 7 from the base station between the orders, the mobile station shall set
 8 $\text{REG_ENCRYPT_RESYNC}$ to YES and enter the *System Determination Substate*
 9 with an encryption failure indication

10 3.4. *Channel Assignment Message*: The mobile station shall process the message as
 11 follows:

- 12 • If ASSIGN_MODE_r equals '000', the mobile station shall perform the following
 13 actions:
- 14 – The mobile station shall set CH_IND_s to '01'.
- 15 – The mobile station shall store the frame offset ($\text{FRAME_OFFSET}_s =$
 16 FRAME_OFFSET_r), the message encryption mode indicator
 17 ($\text{ENCRYPT_MODE}_s = \text{ENCRYPT_MODE}_r$), and, if FREQ_INCL_r equals '1', the
 18 Frequency Assignment ($\text{CDMACH}_s = \text{CDMA_FREQ}_r$).
- 19 – The mobile station shall perform the following procedures in the order listed
 20 below:
- 21 + If $\text{D_SIG_ENCRYPT_MODE}_r$ is included, the mobile station shall perform
 22 the following:
- 23 o If $\text{D_SIG_ENCRYPT_MODE}_r$ is equal to '000', the mobile station shall
 24 set $\text{D_SIG_ENCRYPT_MODE}_s$ to $\text{C_SIG_ENCRYPT_MODE}_s$; otherwise,
 25 the mobile station shall set $\text{D_SIG_ENCRYPT_MODE}_s$ to
 26 $\text{D_SIG_ENCRYPT_MODE}_r$, ENC_KEY_s to the most recently generated
 27 CMEAKEY in the mobile station associated with the AUTHR of the
 28 *Page Response Message*, and $\text{EXT_ENCRYPT_SEQ[0]}$ and
 29 $\text{EXT_ENCRYPT_SEQ[1]}$ to $256 \times \text{ENC_SEQ_H}$ (the ENC_SEQ_H field
 30 in the *Page Response Message*).
- 31 ± If USE_NEW_KEY_r is not included, or is included and is set to '1', the
 32 mobile station shall use the session key generated at the most recent
 33 registration for encryption of signaling and user information. The mobile
 34 station shall store the session key in $\text{KEY}_s[\text{KEY_SEQ_NEW}_{s,p}]$. The
 35 mobile station shall store KEY_SIZE_r to KEY_SIZE_s . The mobile station
 36 shall then increment the variable $\text{KEY_SEQ_NEW}_{s,p}$ by one (modulo 16).
 37 If ENC_KEY_SIZE_r is included, the mobile station shall set
 38 ENC_KEY_SIZE_s to ENC_KEY_SIZE_r .
- 39 — If USE_NEW_KEY_r is included and is set to '0' then the mobile station shall
 40 use $\text{KEY}_s[\text{KEY_SEQ}_r]$ as the session key.

1 + If C SIG ENCRYPT MODE is included, the mobile station shall set
 2 C SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_r.

- 3 – The mobile station shall set SERV_NEG_S to disabled.
- 4 – If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
 5 and PACA_CANCEL to ‘0’, shall disable the PACA state timer, and should
 6 indicate to the user that the PACA call has been canceled.
- 7 – The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8.
- 8 – The mobile station shall enter the *Traffic Channel Initialization Substate* of
 9 the *Mobile Station Control on the Traffic Channel State*.
- 10 • If ASSIGN_MODE_r equals ‘001’, the mobile station shall perform the following
 11 actions:
- 12 – If FREQ_INCL_r equals ‘1’, the mobile station shall perform the following:
- 13 + If the message requires acknowledgement, the mobile station shall wait
 14 until Layer 3 receives an indication from Layer 2 that the
 15 acknowledgement to the message has been sent and acknowledged.
- 16 + The mobile station shall set CDMACH_S to CDMA_FREQ_r, tune to the new
 17 Frequency Assignment, and measure the strength of each pilot listed in
 18 the assignment using the Neighbor Set search procedures specified in
 19 2.6.6.2.1 and 2.6.6.2.2.
- 20 – The mobile station shall set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to
 21 NULL (see 2.6.2.2) and shall set PILOT_PN_S to the pilot PN sequence offset of
 22 the strongest pilot in the list (PILOT_PN_r).
- 23 – If the mobile station has not stored configuration parameters for the Primary
 24 Paging Channel of the new base station, or if the stored information is not
 25 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S,
 26 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 27 GEN_NGHBR_LIST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
 28 PRI_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
 29 EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 30 GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S
 31 to NULL.
- 32 – The mobile station shall set PAGE_CHAN_S to ‘1’ and PAGECH_S to the Primary
 33 Paging Channel. If the mobile station was monitoring Forward Common
 34 Control Channel, the mobile station shall set the PRAT_S to ‘00’. The mobile
 35 station shall then begin monitoring the Primary Paging Channel of the
 36 selected base station.
- 37 – If RESPOND_r is equal to ‘1’, the mobile station shall enter the *Update*
 38 *Overhead Information Substate* with a page response retransmission
 39 indication within T34m seconds after receiving the *Channel Assignment*
 40 *Message*.

- If RESPOND_r is equal to '0', the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Channel Assignment Message*.
- If ASSIGN_MODE_r equals '010', the mobile station shall perform the following actions:
 - If the mobile station does not support analog operation in the requested band class, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and shall remain in the *Page Response Substate*.
 - If the mobile station supports analog operation in the requested band class, the mobile station shall perform the following actions:
 - + If USE_ANALOG_SYS_r equals '1', the mobile station shall set SERVSYSS to SYS_A if ANALOG_SYS_r is equal to '0', or shall set SERVSYSS to SYS_B if ANALOG_SYS_r is equal to '1'.
 - + If PACAs is equal to enabled, the mobile station shall set PACAs to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
 - + If RESPOND_r equals '0', the mobile station shall enter the analog Initialization Task with a wait-for-page indication (see 2.6.1). If RESPOND_r equals '1', the mobile station shall enter the analog Initialization Task with a page response indication (see 2.6.1).
- If ASSIGN_MODE_r equals '011', the mobile station shall perform the following actions:
 - If the mobile station does not support analog operation in the requested band class, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Page Response Substate*.
 - If the mobile station supports analog operation in the requested band class:
 - + If PACAs is equal to enabled, the mobile station shall set PACAs to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
 - + If the analog channel type is '00', the mobile station shall store the system identification (SID_s = SID_r), voice mobile station attenuation code (VMAC_s = VMAC_r), voice channel number (ANALOG_CHAN_s = ANALOG_CHAN_r), SAT color code (SCC_s = SCC_r), and message encryption mode indicator (MEM_s = MEM_r), shall set DTX_s to '00' and shall enter the Confirm Initial Voice Channel Task (see 2.6.4.2) with a page response indication.
 - + If the analog channel type is not '00':

- o If the mobile station supports narrow analog mode, the mobile station shall store the system identification ($SID_S = SID_R$), voice mobile station attenuation code ($VMAC_S = VMAC_R$), voice channel number ($ANALOG_CHAN_S = ANALOG_CHAN_R$), message encryption mode indicator ($MEM_S = MEM_R$), analog channel type ($AN_CHAN_TYPE_S = AN_CHAN_TYPE_R$) and the digital SAT code ($DSCC_S = DSCC_MSB_R \times 4 + SCC_R$), shall set DTX_S to '00', and shall enter the Confirm Initial Narrow Analog Voice Channel Task (see 2.6.5.2A of [22]) with a page response indication.
- o If the mobile station does not support narrow analog mode, the mobile station shall send a *Mobile Station Reject Order* with the $ORDQ$ field set to '00000110' (capability not supported by the mobile station) and the mobile station shall remain in the *Page Response Substate* of the *System Access State*.
- If $ASSIGN_MODE_R$ equals '100', the mobile station shall perform the following actions:
 - The mobile station shall set CH_IND_S to '01'.
 - If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and $PACA_CANCEL$ to '0', shall disable the $PACA$ state timer, and should indicate to the user that the $PACA$ call has been canceled.
 - If $GRANTED_MODE_R$ equals '00', and the multiplex option and radio configuration combination specified in the $DEFAULT_CONFIG$ field is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with $ORDQ$ field set to '00000110' (capability not supported by the mobile station) and remain in the *Page Response Substate*.
 - If $FREQ_INCL_R$ equals '0', the mobile station shall perform the following actions:
 - + The mobile station shall store the frame offset ($FRAME_OFFSET_S = FRAME_OFFSET_R$), the message encryption mode indicator ($ENCRYPT_MODE_S = ENCRYPT_MODE_R$), the granted mode ($GRANTED_MODE_S = GRANTED_MODE_R$), and default configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_R$).
 - + The mobile station shall perform the following procedures in the order listed below:
 - o If D SIG ENCRYPT MODE_R is included, the mobile station shall perform the following:
 - ◊ If D SIG ENCRYPT MODE_R is equal to '000', the mobile station shall set D SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_S; otherwise, the mobile station shall set D SIG ENCRYPT MODE_S to D SIG ENCRYPT MODE_R, ENC KEY_S to the most recently generated CMEAKEY in the mobile station associated with AUTHR

1 of the *Page Response Message*, and EXT_ENCRYPT_SEQ[0] and
 2 EXT_ENCRYPT_SEQ[1] to 256 × ENC SEQ H (the ENC SEQ H
 3 field in the *Page Response Message*).

- 4 o If USE_NEW_KEY_r is not included, or is included and is set to ‘1’, the
 5 mobile station shall use the session key generated at the most recent
 6 registration for encryption of signaling and user information. The
 7 mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_s
 8 p]. The mobile station shall store KEY_SIZE_r to KEY_SIZE_s. The
 9 mobile station shall then increment the variable KEY_SEQ_NEW_s_p
 10 by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station
 11 shall set ENC KEY SIZE_s to ENC KEY SIZE_r.
- 12 + If USE_NEW_KEY_r is included and is set to ‘0’ then the mobile station
 13 shall use KEY_s[KEY_SEQ_r] as the session key.
- 14 o If C SIG ENCRYPT MODE is included, the mobile station shall set
 15 C SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_r.
- 16 + The mobile station shall set SERV_NEG_s to enabled.
- 17 + The mobile station shall initialize CODE_CHAN_LIST as described in
 18 2.6.8 and shall then enter the *Traffic Channel Initialization Substate* of
 19 the *Mobile Station Control on the Traffic Channel State*.
- 20 - If FREQ_INCL_r equals ‘1’, the mobile station shall perform the following
 21 actions:
 - 22 + If the band class is not supported by the mobile station, the mobile
 23 station shall send a *Mobile Station Reject Order* with ORDQ field set to
 24 ‘00000110’ (capability not supported by the mobile station) and shall
 25 remain in the *Page Response Substate*.
 - 26 + If the band class is supported by the mobile station, the mobile station
 27 shall perform the following actions:
 - 28 o The mobile station shall store the frame offset (FRAME_OFFSET_s =
 29 FRAME_OFFSET_r), the message encryption mode indicator
 30 (ENCRYPT_MODE_s = ENCRYPT_MODE_r), the bypass indicator
 31 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r), the
 32 granted mode (GRANTED_MODE_s = GRANTED_MODE_r), the default
 33 configuration (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r), the band
 34 class (CDMABAND_s = BAND_CLASS_r), and the Frequency Assignment
 35 (CDMACH_s = CDMA_FREQ_r).
 - 36 o The mobile station shall perform the following procedures in the order
 37 listed below:
 - 38 ◊ If D SIG ENCRYPT MODE_r is included, the mobile station shall
 39 perform the following:

1 – If D SIG ENCRYPT MODE_r is equal to ‘000’, the mobile
 2 station shall set D SIG ENCRYPT MODE_s to
 3 C SIG ENCRYPT MODE_s; otherwise, the mobile station shall
 4 set D SIG ENCRYPT MODE_s to D SIG ENCRYPT MODE_r,
 5 ENC KEY_s to the most recently generated CMEAKEY in the
 6 mobile station associated with AUTHR of the *Page Response*
 7 *Message*, and EXT ENCRYPT SEQ[0] and
 8 EXT ENCRYPT SEQ[1] to $256 \times \text{ENC SEQ H}$ (the
 9 ENC SEQ H field in the *Page Response Message*).

- 10 ◊ If USE_NEW_KEY_r is not included, or is included and is set to ‘1’,
 11 the mobile station shall use the session key generated at the most
 12 recent registration for encryption of signaling and user
 13 information. The mobile station shall store the session key in
 14 KEY_s[KEY_SEQ_NEW_{s,p}]. The mobile station shall store
 15 KEY_SIZE_r to KEY_SIZE_s. The mobile station shall then
 16 increment the variable KEY_SEQ_NEW_{s,p} by one (modulo 16). If
 17 ENC KEY SIZE_r is included, the mobile station shall set
 18 ENC KEY SIZE_s to ENC KEY SIZE_r.
- 19 ◊ If USE_NEW_KEY_r is included and is set to ‘0’ then the mobile
 20 station shall use KEY_s[KEY_SEQ_r] as the session key.

21 o If C SIG ENCRYPT MODE is included, the mobile station shall set
 22 C SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_r.

- 23 o The mobile station shall initialize CODE_CHAN_LIST as described in
 24 2.6.8, and shall set SERV_NEG_s to enabled.
- 25 o The mobile station shall then tune to the new Frequency Assignment
 26 and shall enter the *Traffic Channel Initialization Substate* of the *Mobile*
 27 *Station Control on the Traffic Channel State*.

- 28 • If ASSIGN_MODE_r equals ‘101’, the mobile station shall perform the following
 29 actions:
 - 30 – If FREQ_INCL_r equals ‘0’, the mobile station shall perform the following
 31 actions:
 - 32 + If the message requires acknowledgement, the mobile station shall wait
 33 until Layer 3 receives an indication from Layer 2 that the
 34 acknowledgement to the message has been sent and acknowledged.
 - 35 + The mobile station shall set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to
 36 NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot PN sequence
 37 offset of the strongest pilot in the list (PILOT_PN_r).

- + If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LIST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
- + The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
- + If RESPOND_T is equal to '1', the mobile station shall perform the following:
 - o If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Channel Assignment Message*.
 - o If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.
- + If RESPOND_T is equal to '0', the mobile station shall perform the following:
 - o If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Channel Assignment Message*.
 - o If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.
- If FREQ_INCL_T equals '1', the mobile station shall perform the following actions:
 - + If the band class is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and shall remain in the *Page Response Substate*.

- + If the band class is supported by the mobile station, the mobile station shall perform the following actions:
 - o If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
 - o The mobile station shall set $CDMACH_s$ to $CDMA_FREQ_r$ and $CDMABAND_s$ to $BAND_CLASS_r$. Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set $PILOT_PN_s$ to the pilot PN sequence offset of the strongest pilot in the list ($PILOT_PN_r$), and set $CONFIG_MSG_SEQ_s$ and $ACC_MSG_SEQ_s$ to NULL (see 2.6.2.2).
 - o If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set $SYS_PAR_MSG_SEQ_s$, $NGHBR_LST_MSG_SEQ_s$, $EXT_NGHBR_LST_MSG_SEQ_s$, $GEN_NGHBR_LIST_MSG_SEQ_s$, $USER_ZONE_ID_MSG_SEQ_s$, $PRI_NGHBR_LST_MSG_SEQ_s$, $CHAN_LST_MSG_SEQ_s$, $EXT_CHAN_LST_MSG_SEQ_s$, $EXT_SYS_PAR_MSG_SEQ_s$, $GLOB_SERV_REDIR_MSG_SEQ_s$, and $EXT_GLOB_SERV_REDIR_MSG_SEQ_s$ to NULL.
 - o The mobile station shall set $PAGE_CHAN_s$ to '1' and $PAGECH_s$ to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
 - o If $RESPOND_r$ is equal to '1', the mobile station shall perform the following:
 - ◊ If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Channel Assignment Message*.
 - ◊ If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.
 - o If $RESPOND_r$ is equal to '0', the mobile station perform the following:
 - ◊ If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Channel Assignment Message*.

- 1 ◊ If the *Channel Assignment Message* requires an acknowledgement,
 2 the mobile station shall enter the *Mobile Station Idle State* within
 3 T_{34m} seconds after Layer 3 receives an indication from Layer 2
 4 that the acknowledgement to the *Channel Assignment Message*
 5 has been sent and acknowledged.

6 **4.5. Data Burst Message**

7 **5.6. Extended Channel Assignment Message:** The mobile station shall process the
 8 message as follows:

- 9 • If ASSIGN_MODE_r equals '000', the mobile station shall perform the following
 10 actions:
 - 11 – The mobile station shall set CH_IND_s to '01'.
 - 12 – If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled
 13 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 14 indicate to the user that the PACA call has been canceled.
 - 15 – If GRANTED_MODE_r equals '00', and the multiplex option and radio
 16 configuration specified in the DEFAULT_CONFIG field are not supported by
 17 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
 18 with ORDQ field set to '00000110' (capability not supported by the mobile
 19 station) and shall remain in the *Page Response Substate*.
 - 20 – If GRANTED_MODE_r is equal to '00' and DEFAULT_CONFIG_r is not equal to
 21 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
 22 field set to '00001110' (RC does not match with DEFAULT_CONFIG_r) and
 23 shall remain in the *Page Response Substate* if any of the following conditions
 24 is true:
 - 25 + FOR_FCH_RC_r is not equal to the RC associated with
 26 DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
 - 27 + REV_FCH_RC_r is not equal to the RC associated with DEFAULT_CONFIG_r
 28 (see Table 3.7.2.3.2.21-2).
 - 29 – If the mobile station does not support either of the Fundamental Channel
 30 Radio Configurations (FOR_FCH_RC or REV_FCH_RC), the mobile shall send
 31 a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
 32 (capability not supported by the mobile station) and remain in the *Page
 33 Response Substate*.
 - 34 – If P_REV_IN_USE_s is equal to or greater than 6, the mobile station shall store
 35 the Forward Fundamental Channel Radio Configuration (FOR_FCH_RC_s =
 36 FOR_FCH_RC_r) and the Reverse Fundamental Channel Radio Configuration
 37 (REV_FCH_RC_s = REV_FCH_RC_r).
 - 38 – If FREQ_INCL_r equals '0', the mobile station shall perform the following
 39 actions:
 - 40 – If P_REV_IN_USE_s is equal to or greater than 6, the mobile station shall store
 41 the Forward Fundamental Channel Radio Configuration (FOR_FCH_RC_s =
 42 FOR_FCH_RC_r) and the Reverse Fundamental Channel Radio Configuration
 43 (REV_FCH_RC_s = REV_FCH_RC_r).

- 1 + The mobile station shall store the frame offset (FRAME_OFFSET_s =
 2 FRAME_OFFSET_r); the message encryption mode indicator
 3 (ENCRYPT_MODE_s = ENCRYPT_MODE_r); the bypass indicator
 4 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r); the granted
 5 mode (GRANTED_MODE_s = GRANTED_MODE_r); the default configuration
 6 (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r); and the occurrences of
 7 PILOT_PN and PWR_COMB for each included member of the Active Set.
- 8 + The mobile station shall perform the following procedures in the order
 9 listed below:
- 10 o If D SIG ENCRYPT MODE_r is included, the mobile station shall
 11 perform the following:
- 12 ◊ If D SIG ENCRYPT MODE_r is equal to '000', the mobile station
 13 shall set D SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_s;
 14 otherwise, the mobile station shall set D SIG ENCRYPT MODE_s
 15 to D SIG ENCRYPT MODE_r, ENC KEY_s to the most recently
 16 generated CMEAKEY in the mobile station associated with AUTHR
 17 of the *Page Response Message*, and EXT ENCRYPT SEQ[0] and
 18 EXT ENCRYPT SEQ[1] to 256 × ENC SEQ H (the ENC SEQ H
 19 field in the *Page Response Message*).
- 20 o If USE_NEW_KEY_r is not included, or is included and is set to '1', the
 21 mobile station shall use the session key generated at the most recent
 22 registration for encryption of signaling and user information. The
 23 mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_s
 24 p]. The mobile station shall store KEY_SIZE_r to KEY_SIZE_s. The
 25 mobile station shall then increment the variable KEY_SEQ_NEW_s p
 26 by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station
 27 shall set ENC KEY SIZE_s to ENC KEY SIZE_r.
- 28 + ~~If USE_NEW_KEY_r is included and is set to '0' then the mobile station~~
 29 ~~shall use KEY_s[KEY_SEQ_r] as the session key.~~
- 30 + If C SIG ENCRYPT MODE is included, the mobile station shall set
 31 C SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_r.
- 32 + The mobile station shall initialize CODE_CHAN_LIST as described in
 33 2.6.8, and shall set SERV_NEG_s to enabled.
- 34 + The mobile station shall set FPC_FCH_INIT_SETPT_s to
 35 FPC_FCH_INIT_SETPT_r, FPC_FCH_CURR_SETPT_s to
 36 FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to FPC_FCH_FER_r,
 37 FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
 38 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and FPC_PRI_CHAN_s
 39 to '0' if the mobile station supports any Radio Configuration greater than
 40 2.
- 41 + The mobile station shall set FPC_SUBCHAN_GAIN_s to
 42 FPC_SUBCHAN_GAIN_r.

- 1 + The mobile station shall set RLGAIN_ADJS to RLGAIN_ADJ_r.
- 2 + The mobile station shall set REV_FCH_GATING_MODES to
3 REV_FCH_GATING_MODE_r.
- 4 + The mobile station shall set REV_PWR_CNTL_DELAY_s to
5 REV_PWR_CNTL_DELAY_r if REV_PWR_CNTL_DELAY_INCL_r is equal to
6 '1'.
- 7 + The mobile station shall then enter the *Traffic Channel Initialization*
8 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 9 - If FREQ_INCL_r equals '1', and the band class is not supported by the mobile
10 station, the mobile station shall send a *Mobile Station Reject Order* with
11 ORDQ field set to '00000110' (capability not supported by the mobile station)
12 and remain in the *Page Response Substate*.
- 13 - If FREQ_INCL_r equals '1', and the band class is supported by the mobile
14 station, the mobile station shall perform the following actions:
- 15 + The mobile station shall store the frame offset (FRAME_OFFSET_s =
16 FRAME_OFFSET_r); the message encryption mode indicator
17 (ENCRYPT_MODE_s = ENCRYPT_MODE_r); the bypass indicator
18 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r); the granted
19 mode (GRANTED_MODE_s = GRANTED_MODE_r); the default configuration
20 (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r); the band class
21 (CDMABAND_s = BAND_CLASS_r); the Frequency Assignment
22 (CDMACH_s = CDMA_FREQ_r); and the occurrences of PILOT_PN and
23 PWR_COMB_IND for each included member of the Active Set.
- 24 + The mobile station shall perform the following procedures in the order
25 listed below:
- 26 o If D SIG ENCRYPT MODE_r is included, the mobile station shall
27 perform the following:
- 28 ◊ If D SIG ENCRYPT MODE_r is equal to '000', the mobile station
29 shall set D SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_s;
30 otherwise, the mobile station shall set D SIG ENCRYPT MODE_s
31 to D SIG ENCRYPT MODE_r, ENC KEY_s to the most recently
32 generated CMEAKEY in the mobile station associated with AUTHR
33 of the Page Response Message, and EXT_ENCRYPT_SEQ[0] and
34 EXT_ENCRYPT_SEQ[1] to 256 × ENC SEQ_H (the ENC SEQ_H
35 field in the Page Response Message).

- 1 o If USE_NEW_KEY_r is not included, or is included and is set to '1', the
 2 mobile station shall use the session key generated at the most recent
 3 registration for encryption of signaling and user information. The
 4 mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_s
 5 p]. The mobile station shall store KEY_SIZE_r to KEY_SIZE_s. The
 6 mobile station shall then increment the variable KEY_SEQ_NEW_s p
 7 by one (modulo 16). If ENC_KEY_SIZE_r is included, the mobile station
 8 shall set ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- 9 + If USE_NEW_KEY_r is included and is set to '0' then the mobile station
 10 shall use KEY_s[KEY_SEQ_r] as the session key.
- 11 o If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
 12 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 13 + The mobile station shall set FPC_FCH_INIT_SETPT_s to
 14 FPC_FCH_INIT_SETPT_r, FPC_FCH_CURR_SETPT_s to
 15 FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to FPC_FCH_FER_r,
 16 FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
 17 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and FPC_PRI_CHAN_s
 18 to '0' if the mobile station supports any Radio Configuration greater than
 19 2.
- 20 + The mobile station shall set FPC_SUBCHAN_GAIN_s to
 21 FPC_SUBCHAN_GAIN_r.
- 22 + The mobile station shall set RLGAIN_ADJ_s to RLGAIN_ADJ_r.
- 23 + The mobile station shall set REV_FCH_GATING_MODE_s to
 24 REV_FCH_GATING_MODE_r.
- 25 + The mobile station shall set REV_PWR_CNTL_DELAY_s to
 26 REV_PWR_CNTL_DELAY_r if REV_PWR_CNTL_DELAY_INCL_r is equal to
 27 '1'.
- 28 + The mobile station shall initialize CODE_CHAN_LIST as described in
 29 2.6.8, and shall set SERV_NEG_s to enabled.
- 30 + The mobile station shall then tune to the new Frequency Assignment and
 31 shall enter the *Traffic Channel Initialization Substate* of the *Mobile Station*
 32 *Control on the Traffic Channel State*.
- 33 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
 34 actions:
- 35 – If FREQ_INCL_r equals '0', the mobile station shall perform the following
 36 actions:
- 37 + If the message requires acknowledgement, the mobile station shall wait
 38 until Layer 3 receives an indication from Layer 2 that the
 39 acknowledgement to the message has been sent and acknowledged.

- + The mobile station shall set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL (see 2.6.2.2) and shall set PILOT_PN_S to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_R). If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LIST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
- + The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. If the mobile station was monitoring the Forward Common Control Channel, the mobile station shall set the PRAT_S to '00'. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
- + If RESPOND_R is equal to '1', the mobile station shall perform the following:
 - o If the *Extended Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Extended Channel Assignment Message*.
 - o If the *Extended Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Extended Channel Assignment Message* has been sent and acknowledged.
- + If RESPOND_R is equal to '0', the mobile station shall perform the following:
 - o If the *Extended Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Extended Channel Assignment Message*.
 - o If the *Extended Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Extended Channel Assignment Message* has been sent and acknowledged.

- If FREQ_INCL_r equals ‘1’, and the band class is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If FREQ_INCL_r equals ‘1’, and the band class is supported by the mobile station, the mobile station shall perform the following actions:
 - + If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
 - + The mobile station shall set CDMACH_s to CDMA_FREQ_r and CDMABAND_s to BAND_CLASS_r. Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_s to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
 - + If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - + The mobile station shall set PAGE_CHAN_s to ‘1’ and PAGECH_s to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
 - + If RESPOND_r is equal to ‘1’, the mobile station shall perform the following:
 - o If the *Extended Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Extended Channel Assignment Message*.
 - o If the *Extended Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Extended Channel Assignment Message* has been sent and acknowledged.

- + If RESPOND_r is equal to '0', the mobile station shall perform the following:
 - o If the *Extended Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Extended Channel Assignment Message*.
 - o If the *Extended Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Extended Channel Assignment Message* has been sent and acknowledged.
- If ASSIGN_MODE_r equals '010', the mobile station shall perform the following actions:
 - If the mobile station does not support analog operation in the requested band class, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Page Response Substate*.
 - If the mobile station supports analog operation in the requested band class, the mobile station shall perform the following actions:
 - + If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
 - + If RESPOND_r equals '0', and USE_ANALOG_SYS_r equals '1', the mobile station shall set SERVSYS_s to SYS_A if ANALOG_SYS_r is equal to '0', or set SERVSYS_s to SYS_B if ANALOG_SYS_r is equal to '1'. The mobile station shall then enter the analog Initialization Task with a wait-for-page indication (see 2.6.1 of [6]).
 - + If RESPOND_r equals '1', and USE_ANALOG_SYS_r equals '1', the mobile station shall set SERVSYS_s to SYS_A if ANALOG_SYS_r is equal to '0', or set SERVSYS_s to SYS_B if ANALOG_SYS_r is equal to '1'. The mobile station shall then enter the analog Initialization Task with a page response indication (see 2.6.1 of [6]).
 - + If RESPOND_r equals '0', and USE_ANALOG_SYS_r equals '0' the mobile station shall enter the analog Initialization Task with a wait for page indication (see 2.6.1 of [6]).
 - + If RESPOND_r equals '1', and USE_ANALOG_SYS_r equals '0' the mobile station shall enter the analog Initialization Task with a page response indication (see 2.6.1 of [6]).
- If ASSIGN_MODE_r equals '011', the mobile station shall perform the following actions:

- If the mobile station does not support analog operation in the requested band class, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If the mobile station supports analog operation in the requested band class, and the analog channel type is '00', the mobile station shall store the system identification ($SID_s = SID_r$), voice mobile station attenuation code ($VMAC_s = VMAC_r$), voice channel number ($ANALOG_CHAN_s = ANALOG_CHAN_r$), SAT color code ($SCC_s = SCC_r$), and message encryption mode indicator ($MEM_s = MEM_r$), shall set DTX_s to '00', and shall enter the Confirm Initial Voice Channel Task (see 2.6.4.2) with a page response indication. If $PACA_s$ is equal to enabled, the mobile station shall set $PACA_s$ to disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- If the mobile station supports analog operation in the requested band class, the analog channel type is not '00':
 - + If the mobile supports narrow analog mode, the mobile station shall store the system identification ($SID_s = SID_r$), voice mobile station attenuation code ($VMAC_s = VMAC_r$), voice channel number ($ANALOG_CHAN_s = ANALOG_CHAN_r$), message encryption mode indicator ($MEM_s = MEM_r$), analog channel type ($AN_CHAN_TYPE_s = AN_CHAN_TYPE_r$) and the digital SAT code ($DSCC_s = DSCC_MSB_r \times 4 + SCC_r$), shall set DTX_s to '00', and shall enter the Confirm Initial Narrow Analog Voice Channel Task (see 2.6.5.2A of [22]) with a page response indication. If $PACA_s$ is equal to enabled, the mobile station shall set $PACA_s$ to disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
 - + If the mobile station does not support narrow analog mode, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported by the mobile station) and the mobile station shall remain in the *Page Response Substate* of the *System Access State*.
- If $ASSIGN_MODE_r$ equals '100', the mobile station shall perform the following actions:
 - If $PACA_s$ is equal to enabled, the mobile station shall set $PACA_s$ to disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
 - If $GRANTED_MODE_r$ equals '00' and the multiplex option and radio configuration specified in the $DEFAULT_CONFIG_r$ field are not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and shall remain in the *Page Response Substate*.

- If GRANTED_MODE_r equals ‘00’ and DEFAULT_CONFIG_r is not equal to ‘100’, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00001110’ (RC does not match with DEFAULT_CONFIG) and shall remain in the *Page Response Substate* if one of the following conditions is true:
 - + FOR_RC_r is not equal to the RC associated with DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
 - + REV_RC_r is not equal to the RC associated with DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
- If the mobile station does not support either of the Radio Configurations (FOR_RC or REV_RC), the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If CH_IND_r = ‘01’ and the mobile station does not support Fundamental Channel, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If CH_IND_r = ‘10’ and the mobile station does not support the Dedicated Control Channel, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If CH_IND_r = ‘11’ and the mobile station does not support the Dedicated Control Channel and Fundamental Channel concurrently, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If FREQ_INCL_r equals ‘1’ and if the band class (BAND_CLASS_r) is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Page Response Substate*.
- If the mobile station does not send a Mobile Station Reject Order as specified above, it shall continue to perform the actions specified below.
- If FREQ_INCL_r equals ‘1’, the mobile station shall set
 - + CDMABAND_s = BAND_CLASS_r
 - + CDMACH_s = CDMA_FREQ_r
- The mobile station shall store the bypass indicator (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r).
- The mobile station shall store granted mode (GRANTED_MODE_s = GRANTED_MODE_r)
- The mobile station shall store the default configuration (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r).

- The mobile station shall store the Forward Traffic Channel Radio Configuration ($\text{FOR_RC}_S = \text{FOR_RC}_R$) and the Reverse Traffic Channel Radio Configuration ($\text{REV_RC}_S = \text{REV_RC}_R$).
- The mobile station shall store the frame offset ($\text{FRAME_OFFSET}_S = \text{FRAME_OFFSET}_R$).
- The mobile station shall store the message encryption mode indicator ($\text{ENCRYPT_MODE}_S = \text{ENCRYPT_MODE}_R$).
- The mobile station shall perform the following procedures in the order listed below:
 - + If $\text{D SIG ENCRYPT MODE}_R$ is included, the mobile station shall perform the following:
 - o If $\text{D SIG ENCRYPT MODE}_R$ is equal to '000', the mobile station shall set $\text{D SIG ENCRYPT MODE}_S$ to $\text{C SIG ENCRYPT MODE}_S$; otherwise, the mobile station shall set $\text{D SIG ENCRYPT MODE}_S$ to $\text{D SIG ENCRYPT MODE}_R$, ENC KEY_S to the most recently generated CMEAKEY in the mobile station associated with AUTHR of the Page Response Message, and $\text{EXT ENCRYPT SEQ}[0]$ and $\text{EXT ENCRYPT SEQ}[1]$ to $256 \times \text{ENC SEQ H}$ (the ENC SEQ H field in the Page Response Message).
 - + If USE_NEW_KEY_F is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in $\text{KEY}_S[\text{KEY_SEQ_NEW}_S,p]$. The mobile station shall store KEY_SIZE_F to KEY_SIZE_S . The mobile station shall then increment the variable $\text{KEY_SEQ_NEW}_S,p$ by one (modulo 16). If ENC KEY SIZE_R is included, the mobile station shall set ENC KEY SIZE_S to ENC KEY SIZE_R .
 - + If USE_NEW_KEY_F is included and is set to '0' then the mobile station shall use $\text{KEY}_S[\text{KEY_SEQ}_F]$ as the session key.
 - + If $\text{C SIG ENCRYPT MODE}$ is included, the mobile station shall set $\text{C SIG ENCRYPT MODE}_S$ to $\text{C SIG ENCRYPT MODE}_R$.
 - The mobile station shall store the Forward power control subchannel relative gain [$\text{FPC_SUBCHAN_GAIN}_S = \text{FPC_SUBCHAN_GAIN}_R$].
 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_R .
 - The mobile station shall set $\text{REV_FCH_GATING_MODE}_S$ to $\text{REV_FCH_GATING_MODE}_R$.
 - The mobile station shall set $\text{REV_PWR_CNTL_DELAY}_S$ to $\text{REV_PWR_CNTL_DELAY}_R$ if $\text{REV_PWR_CNTL_DELAY_INCL}_R$ is equal to '1'.
 - If 3XFL_1XRL_INCL_R is equal to '1', the mobile station shall set $\text{1XRL_FREQ_OFFSET}_S$ to $\text{1XRL_FREQ_OFFSET}_R$.

- The mobile station shall store the channel indicator ($\text{CH_IND}_s = \text{CH_IND}_r$) and the mobile station shall perform the following actions:
 - + If CH_IND_r equals '01', the mobile station shall set $\text{FPC_FCH_INIT_SETPT}_s$ to $\text{FPC_FCH_INIT_SETPT}_r$, $\text{FPC_FCH_CURR_SETPT}_s$ to $\text{FPC_FCH_INIT_SETPT}_s$, FPC_FCH_FER_s to FPC_FCH_FER_r , $\text{FPC_FCH_MIN_SETPT}_s$ to $\text{FPC_FCH_MIN_SETPT}_r$, $\text{FPC_FCH_MAX_SETPT}_s$ to $\text{FPC_FCH_MAX_SETPT}_r$, and FPC_PRI_CHAN_s to '0' if the mobile station supports any Radio Configuration greater than 2. Then for each included member of the Active Set, the mobile station shall store the following:
 - o Set the PILOT_PN field to PILOT_PN_r .
 - o Set the $\text{ADD_PILOT_REC_INCL}$ field to $\text{ADD_PILOT_REC_INCL}_r$. If $\text{ADD_PILOT_REC_INCL}_r$ equals '1', the mobile station shall store the following:
 - ◊ Set the PILOT_REC_TYPE field of PILOT_REC to PILOT_REC_TYPE_r .
 - ◊ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r and set the TD_MODE field of PILOT_REC to TD_MODE_r .
 - ◊ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
 - Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r .
 - Set the $\text{AUX_PILOT_WALSH_CODE}$ field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r .
 - ◊ If $\text{NGHBR_PILOT_REC_TYPE}_r$ is equal to '010', the mobile station shall:
 - Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r .
 - Set the $\text{AUX_PILOT_WALSH_CODE}$ field of PILOT_REC to AUX_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r .
 - Set the $\text{AUX_TD_POWER_LEVEL}$ field of PILOT_REC to $\text{AUX_TD_POWER_LEVEL}_r$.
 - Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r .
 - ◊ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of PILOT_REC to $\text{SR3_PRIMARY_PILOT}_r$.
 - Set the SR3_PILOT_POWER1 field of PILOT_REC to $\text{SR3_PILOT_POWER1}_r$.
 - Set the SR3_PILOT_POWER2 field of PILOT_REC to $\text{SR3_PILOT_POWER2}_r$.

- 1 ◊ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 2 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
3 SR3_PRIMARY_PILOT_r.
- 4 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
5 SR3_PILOT_POWER1_r.
- 6 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
7 SR3_PILOT_POWER2_r.
- 8 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 9 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
10 AUX_PILOT_WALSH_r with the Walsh Code length specified by
11 WALSH_LENGTH_r.
- 12 – If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
13 field of PILOT_REC to QOF1_r and set the
14 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
15 AUX_PILOT_WALSH1_r with the Walsh Code length specified by
16 WALSH_LENGTH1_r.
- 17 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to QOF_r
18 and set the AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
19 AUX_PILOT_WALSH_r with the Walsh Code length specified by
20 WALSH_LENGTH_r.
- 21 – If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2
22 field of PILOT_REC to QOF2_r and set the
23 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
24 AUX_PILOT_WALSH2_r with the Walsh Code length specified by
25 WALSH_LENGTH2_r.
- 26 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to QOF_r
27 and set the AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
28 AUX_PILOT_WALSH_r with the Walsh Code length specified by
29 WALSH_LENGTH_r.
- 30 o Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 31 o Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 32 o Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 33 + If CH_IND_r equals '01' and 3X_FCH_INFO_INCL_r equals to '1', for each
34 included member of the Active Set, the mobile station store the following:
- 35 o If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW field
36 to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW field to
37 CODE_CHAN_FCH_LOW_r. Otherwise, set the QOF_MASK_ID_FCH_LOW
38 field to QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_LOW to
39 CODE_CHAN_FCH_r.

- 1 o If $3X_FCH_HIGH_INCL_r$ equals ‘1’, set the $QOF_MASK_ID_FCH_HIGH$
 2 field to $QOF_MASK_ID_FCH_HIGH_r$ and the $CODE_CHAN_FCH_HIGH$
 3 field to $CODE_CHAN_FCH_HIGH_r$. Otherwise, set the
 4 $QOF_MASK_ID_FCH_HIGH$ field to $QOF_MASK_ID_FCH_r$ and the
 5 $CODE_CHAN_FCH_HIGH$ to $CODE_CHAN_FCH_r$.
- 6 + If CH_IND_r equals ‘10’, the mobile station shall set $FPC_DCCH_INIT_SETPT_s$
 7 to $FPC_DCCH_INIT_SETPT_r$, $FPC_DCCH_CURR_SETPT_s$ to
 8 $FPC_DCCH_INIT_SETPT_s$, $FPC_DCCH_FER_s$ to $FPC_DCCH_FER_r$,
 9 $FPC_DCCH_MIN_SETPT_s$ to $FPC_DCCH_MIN_SETPT_r$,
 10 $FPC_DCCH_MAX_SETPT_s$ to $FPC_DCCH_MAX_SETPT_r$, and $FPC_PRI_CHAN_s$
 11 to ‘1’ if the mobile station supports any Radio Configuration greater than 2.
 12 Then for each included member of the Active Set, the mobile station shall
 13 store the following:
 - 14 o Set the $PILOT_PN$ to $PILOT_PN_r$.
 - 15 o Set the $ADD_PILOT_REC_INCL$ field to $ADD_PILOT_REC_INCL_r$. If
 16 $ADD_PILOT_REC_INCL$ is equal to ‘1’, the mobile station shall store the
 17 following:
 - 18 ♦ Set the $PILOT_REC_TYPE$ field of $PILOT_REC$ to $PILOT_REC_TYPE_r$.
 - 19 ♦ If $PILOT_REC_TYPE_r$ equals ‘000’, the mobile station shall set the
 20 TD_POWER_LEVEL field of $PILOT_REC$ to $TD_POWER_LEVEL_r$ and
 21 set the TD_MODE field of $PILOT_REC$ to TD_MODE_r .
 - 22 ♦ If $PILOT_REC_TYPE_r$ is equal to ‘001’, the mobile station shall:
 - 23 – Set the AUX_PILOT_QOF field of $PILOT_REC$ to QOF_r .
 - 24 – Set the $AUX_PILOT_WALSH_CODE$ field of $PILOT_REC$ to
 25 $AUX_PILOT_WALSH_r$ with the Walsh Code length specified by
 26 $WALSH_LENGTH_r$.
 - 27 ♦ If $PILOT_REC_TYPE_r$ is equal to ‘010’, the mobile station shall:
 - 28 – Set the $AUX_PILOT_TD_QOF$ field of $PILOT_REC$ to QOF_r .
 - 29 – Set the $AUX_PILOT_WALSH_CODE$ field of $PILOT_REC$ to
 30 AUX_WALSH_r with the Walsh Code length specified by
 31 $WALSH_LENGTH_r$.
 - 32 – Set the $AUX_TD_POWER_LEVEL$ field of $PILOT_REC$ to
 33 $AUX_TD_POWER_LEVEL_r$.
 - 34 – Set the TD_MODE field of $PILOT_REC$ to TD_MODE_r .
 - 35 ♦ If $PILOT_REC_TYPE_r$ is equal to ‘011’, the mobile station shall:
 - 36 – Set the $SR3_PRIMARY_PILOT$ field of $PILOT_REC$ to
 37 $SR3_PRIMARY_PILOT_r$.
 - 38 – Set the $SR3_PILOT_POWER1$ field of $PILOT_REC$ to
 39 $SR3_PILOT_POWER1_r$.

- 1 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
2 SR3_PILOT_POWER2_r.
- 3 ◊ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
- 4 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
5 SR3_PRIMARY_PILOT_r.
- 6 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
7 SR3_PILOT_POWER1_r.
- 8 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
9 SR3_PILOT_POWER2_r.
- 10 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 11 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_PILOT_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
- 14 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
15 field of PILOT_REC to QOF1_r and set the
16 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
17 AUX_PILOT_WALSH1_r with the Walsh Code length specified by
18 WALSH_LENGTH1_r.
- 19 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to QOF_r
20 and set the AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
21 AUX_PILOT_WALSH_r with the Walsh Code length specified by
22 WALSH_LENGTH_r.
- 23 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
24 field of PILOT_REC to QOF2_r and set the
25 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
26 AUX_PILOT_WALSH2_r with the Walsh Code length specified by
27 WALSH_LENGTH2_r.
- 28 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to QOF_r
29 and set the AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
30 AUX_PILOT_WALSH_r with the Walsh Code length specified by
31 WALSH_LENGTH_r.
- 32 o Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 33 o Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 34 o Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 35 o Set the DCCH_INCL field to DCCH_INCL_r. If DCCH_INCL_r equals ‘1’, the
36 mobile station shall store the following:
37 ◊ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
38 ◊ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH_r.

- + If CH_IND_r equals ‘10’ and 3X_DCCH_INFO_INCL_r equals to ‘1’, for each included member of the Active Set, the mobile station store the following:
 - o If 3X_DCCH_LOW_INCL_r equals ‘1’, set the QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r and the CODE_CHAN_DCCH_LOW field to CODE_CHAN_DCCH_LOW_r. Otherwise, set the QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
 - o If 3X_DCCH_HIGH_INCL_r equals ‘1’, set the QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r and the CODE_CHAN_DCCH_HIGH field to CODE_CHAN_DCCH_HIGH_r. Otherwise, set the QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.
- + If CH_IND_r equals ‘11’, the mobile station shall set FPC_FCCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r, FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_r, FPC_FCH_FER_s to FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r, FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r, FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_r, FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to FPC_DCCH_MAX_SETPT_r and FPC_PRI_CHAN_s to FPC_PRI_CHAN_r. Then for each included member of the Active Set, the mobile station shall store the following:
 - o Set the PILOT_PN to PILOT_PN_r.
 - o Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC. If ADD_PILOT_REC_INCL is equal to ‘1’, the mobile station shall store the following:
 - ◊ Set the PILOT_REC_TYPE field of PILOT_REC to PILOT_REC_TYPE_r.
 - ◊ If PILOT_REC_TYPE_r equals ‘000’, the mobile station shall set the TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r and set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - ◊ If PILOT_REC_TYPE_r is equal to ‘001’, the mobile station shall:
 - Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - ◊ If PILOT_REC_TYPE_r is equal to ‘010’, the mobile station shall:
 - Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.

- Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to AUX_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- Set the AUX_TD_POWER_LEVEL field of PILOT_REC to AUX_TD_POWER_LEVEL_r.
- Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- ◊ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of PILOT_REC to SR3_PRIMARY_PILOT_r.
 - Set the SR3_PILOT_POWER1 field of PILOT_REC to SR3_PILOT_POWER1_r.
 - Set the SR3_PILOT_POWER2 field of PILOT_REC to SR3_PILOT_POWER2_r.
- ◊ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of PILOT_REC to SR3_PRIMARY_PILOT_r.
 - Set the SR3_PILOT_POWER1 field of PILOT_REC to SR3_PILOT_POWER1_r.
 - Set the SR3_PILOT_POWER2 field of PILOT_REC to SR3_PILOT_POWER2_r.
 - Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field of PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length specified by WALSH_LENGTH1_r.
 - Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE1 field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2 field of PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2 field of PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh Code length specified by WALSH_LENGTH2_r.

- Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE2 field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- o Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- o Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- o Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- o Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- o Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH.
- + If CH_IND_r equals '11' and 3X_FCH_INFO_INCL_r equals to '1', for each included member of the Active Set, the mobile station store the following:
 - o If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW field to CODE_CHAN_FCH_LOW_r. Otherwise, set the QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
 - o If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH field to QOF_MASK_ID_FCH_HIGH_r and the CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r. Otherwise, set the QOF_MASK_ID_FCH_HIGH field to QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to CODE_CHAN_FCH_r.
- + If CH_IND_r equals '11' and 3X_DCCH_INFO_INCL_r equals to '1', for each included member of the Active Set, the mobile station store the following:
 - o If 3X_DCCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r and the CODE_CHAN_DCCH_LOW field to CODE_CHAN_DCCH_LOW_r. Otherwise, set the QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
 - o If 3X_DCCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r and the CODE_CHAN_DCCH_HIGH field to CODE_CHAN_DCCH_HIGH_r. Otherwise, set the QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.
- The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8, and shall set SERV_NEG_S to enabled.
- If FREQ_INCL_r equals '1', the mobile station shall then tune to the new frequency assignment.
- The mobile station shall then enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*.

1 **6.6. Feature Notification Message**

2 **7.7. Local Control Order**

3 **8.8. Lock Until Power-Cycled Order:** The mobile station shall disable its transmitter
 4 and record the reason for the *Lock Until Power-Cycled Order* in the mobile station's
 5 semi-permanent memory ($LCKRSN_{S-p}$ equals the least significant four bits of
 6 $ORDQ_r$). The mobile station should notify the user of the locked condition. The
 7 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
 8 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
 9 *Access State* again until after the next mobile station power-up or until it has
 10 received an *Unlock Order*. This requirement shall take precedence over any other
 11 mobile station requirement specifying entry to the *System Access State*.

12 **9.10. Maintenance Required Order:** The mobile station shall record the reason for the
 13 *Maintenance Required Order* in the mobile station's semi-permanent memory
 14 ($MAINRSN_{S-p}$ equals the least significant four bits of $ORDQ_r$). The mobile station
 15 shall remain in the unlocked condition. The mobile station should notify the user of
 16 the maintenance required condition.

17 **10.11. Registration Accepted Order:**

- If $ORDQ_r = '00000101'$, the mobile station shall set $ROAM_INDI_s =to ROAM_INDI_r$ and should display the roaming condition.
- If $ORDQ_r = '00000111'$, the mobile station shall perform the following:
 - The mobile station shall set $ROAM_INDI_s =to ROAM_INDI_r$ and should display the roaming condition.
 - The mobile station shall set $C_SIG_ENCRYPT_MODE_s =to C_SIG_ENCRYPT_MODE_r$.
 - ~~If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in $KEY_s[KEY_SEQ_NEW_{S-p}]$. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s . The mobile station shall increment the variable $KEY_SEQ_NEW_{S-p}$ by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station shall set $ENC_KEY_SIZE_s$ to $ENC_KEY_SIZE_r$.~~
 - ~~If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use $KEY_s[KEY_SEQ_r]$ as the session key.~~
 - ~~If C SIG ENCRYPT MODE_r is not equal to '000', the mobile station shall set ENC_KEY_s to the most recently generated CMEAKEY in the mobile station, associated with the AUTHR of the *Registration Message*, and EXT ENCRYPT SEQ[0] and EXT ENCRYPT SEQ[1] to $256 \times ENC_SEQ_H$ (the ENC_SEQ_H field in the *Registration Message*)~~

39 **11.12. Registration Rejected Order:** This order indicates that normal service is not
 40 available on this system. The mobile station shall disable the full-TMSI timer. If the
 41 received order specifies to delete the TMSI ($ORDQ = '00000100'$), the mobile station

1 shall set all the bits of the TMSI_CODE_{s-p} to ‘1’. The mobile station shall enter the
 2 *System Determination Substate* of the *Mobile Station Initialization State* with a
 3 registration rejected indication (see 2.6.1.1).

4 **12.13.** *Release Order:* If NDSS_ORIG_s is equal to enabled, the mobile station shall set
 5 NDSS_ORIG_s to disabled, and should indicate to the user that the call origination
 6 has been canceled. The mobile station shall enter the *Mobile Station Idle State* or the
 7 *System Determination Substate* of the *Mobile Station Initialization State* with a release
 8 indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle State*,
 9 and if PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 10 PACA_CANCEL to ‘0’, shall disable the PACA state timer, and should indicate to the
 11 user that the PACA call has been canceled.

12 **13.14.** *Retry Order:* The mobile station shall process the message as follows:

- 13 • If RETRY_TYPE_r is equal to ‘000’, the mobile station shall set
 14 RETRY_DELAY_s[RETRY_TYPE] to 0, where RETRY_TYPE is equal to ‘001’, ‘010’,
 15 or ‘011’.
- 16 • If RETRY_TYPE_r is equal to ‘001’, the mobile station shall perform the following:
 - 17 – If RETRY_DELAY_r is equal to ‘00000000’, then the mobile station shall set
 18 RETRY_DELAY_s[RETRY_TYPE_r] to 0.
 - 19 – If RETRY_DELAY_r is not equal to ‘00000000’, the mobile station shall set
 20 RETRY_DELAY_s[RETRY_TYPE_r] as follows:
 - 21 + If the most significant bit of the RETRY_DELAY_r is ‘0’, set
 22 RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the
 23 RETRY_DELAY_r is ‘1’, set RETRY_DELAY_UNIT_s to 60000ms.
 - 24 + The mobile station shall set RETRY_DELAY_VALUE_s to the seven least
 25 significant bits of RETRY_DELAY_r.
 - 26 + The mobile station shall store the next system time 80 ms boundary +
 27 RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as
 28 RETRY_DELAY_s[RETRY_TYPE_r].

29 **14.15.** *Security Mode Command Message:* The mobile station shall process the message
 30 as follows:

- 31 • The mobile station shall set C_SIG_ENCRYPT_MODE_s
 32 =C_SIG_ENCRYPT_MODE_r.
- 33 • ~~If USE_NEW_KEY_r is not included, or is included and is set to ‘1’, the mobile
 34 station shall use the session key generated at the most recent registration for
 35 encryption of signaling and user information. The mobile station shall store the
 36 session key in KEY_s[KEY_SEQ_NEW_{s-p}]. The mobile station shall store
 37 KEY_SIZE_r in KEY_SIZE_s. The mobile station shall then increment the variable
 38 KEY_SEQ_NEW_{s-p} by one (modulo 16). If ENC_KEY_SIZE_r is included, the
 39 mobile station shall set ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.~~

- 1 • If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use
 2 KEY_s[KEY_SEQ_r] as the session key.

3 **15.16. Service Redirection Message:** The mobile station shall process the message as
 4 follows:

- 5 • If the mobile station is directed to an unsupported operation mode or band class,
 6 the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ
 7 equal to '00000110' (message requires a capability that is not supported by the
 8 mobile station).
- 9 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
 10 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 11 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 12 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
 13 *System Determination Substate* of the *Mobile Station Initialization State* with an
 14 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
 15 redirection record received in the message as REDIRECT_REC_s and shall enter
 16 the *System Determination Substate* of the *Mobile Station Initialization State* with a
 17 redirection indication (see 2.6.1.1).

18 **16.17. SSD Update Message:** The mobile station shall respond to the message as
 19 specified in 2.3.12.1.5.

20 **17.18. Status Request Message:** The mobile station shall disable the *System Access*
 21 *State* timer and respond to the message. If P_REV_IN_USE_s is less than or equal to
 22 three, the mobile station shall respond with a *Status Response Message*. If
 23 P_REV_IN_USE_s is greater than three, the mobile station shall respond with an
 24 *Extended Status Response Message*. If the message does not specify any
 25 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
 26 station shall include the requested information records in the response. If the
 27 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 28 mobile station shall only include the requested information records for the specified
 29 band class (BAND_CLASS_r) in the response. If the message specifies a band class
 30 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
 31 station shall only include the requested information records for the specified band
 32 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response. If the
 33 message specifies a band class or a band class and an operating mode which is not
 34 supported by the mobile station, the mobile station shall send a *Mobile Station Reject*
 35 *Order* with ORDQ set to '00000110' (message requires a capability that is not
 36 supported by the mobile station). If the response to this message exceeds the
 37 allowable length, the mobile station shall send a *Mobile Station Reject Order* with
 38 ORDQ set to '00001000' (response message would exceed the allowable length). If
 39 the message specifies an information record which is not supported by the mobile
 40 station for the specified band class and operating mode, the mobile station shall
 41 send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record
 42 is not supported for the specified band class and operating mode).

1 **18.19. TMSI Assignment Message:** The mobile station shall store the TMSI zone and
 2 code as follows:

- 3 • The mobile station shall store the length of the TMSI zone field by setting
 4 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r;
- 5 • The mobile station shall store the assigning TMSI zone number by setting the
 6 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 7 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 8 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 9 TMSI_CODE_r.

10 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 11 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 12 mobile station shall then respond with a *TMSI Assignment Completion Message*
 13 within T56m seconds.

14 **19.20. User Zone Reject Message**

15 **20. Base Station Reject Order:**

16 ————— If ORDO_r = '00000001', the mobile station shall send a *Security Mode*
 17 *Request Message* with the ENC_SIC_H field included in it. If the mobile
 18 receives two *Base Station Reject Orders* without successfully decrypting any
 19 encrypted messages from the base station between the orders, the mobile
 20 station shall set REG_ENCRYPT_RESYNC to YES and enter the *System*
 21 *Determination Substate* with an encryption failure indication

22 **21. Any other message:** If the mobile station receives any other message specified in
 23 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
 24 other messages.

25 If the mobile station performs an access probe handoff or access handoff and
 26 receives any of the following messages, it shall process the message as specified in
 27 2.6.3.1.3:

28 • If the mobile station is currently monitoring the Paging Channel:

- 29 1. *System Parameters Message*
- 30 2. *Access Parameters Message*
- 31 3. *Neighbor List Message*
- 32 4. *Extended System Parameters Message*
- 33 5. *Extended Neighbor List Message*
- 34 6. *General Neighbor List Message*
- 35 7. *Global Service Redirection Message*
- 36 ————— 8. *Extended Global Service Redirection Message*

37 • If the mobile station is currently monitoring the Primary Broadcast Control Channel:

1. ANSI-41 System Parameters Message
2. Enhanced Access Parameters Message
3. Universal Neighbor List Message
4. MC-RR Parameters Message
5. Extended Global Service Redirection Message

6 2.6.3.4 Mobile Station Order/Message Response Substate

7 In this substate, the mobile station sends a message that is a response to a message
 8 received from the base station. If the base station responds to the mobile station's message
 9 with an authentication request, the mobile station responds in this substate.

10 If a message received from the base station requires a Layer 2 acknowledgment and does
 11 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
 12 outstanding (see 2.1.1.2.2.1 of [4]).

13 If a message received from the base station requires a Layer 2 acknowledgment and also a
 14 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see
 15 2.1.1.2.2.1 of [4]).

16 When transmitting a response to a message received from the base station, Layer 3 shall
 17 indicate to Layer 2 that the type of the message is a response (see 2.1.1.2.2.1 of [4]).

18 When transmitting an autonomous message (i.e., a message that is not sent as a response
 19 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
 20 of the message is a request other than a registration request or a message transmission
 21 request (see 2.1.1.2.2.1 of [4]).

22 Upon entering the *Mobile Station Order/Message Response Substate*, the mobile station
 23 shall send the response message.

24 ~~If this substate was entered with a service release message response with success
 25 indication, the mobile station shall send a Service Release Response Message to the base
 26 station. The mobile station shall set the SUCCESS_IND field to '1'.~~

27 ~~If this substate was entered with a service release message response with failure indication,
 28 the mobile station shall send a Service Release Response Message to the base station. The
 29 mobile station shall set the SUCCESS_IND field to '0'.~~

30 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
 31 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
 32 the Forward Common Control Channel (see [2.6.2.1.1.4 2.6.3.1.8](#)), the mobile station shall
 33 perform the following:

- 34 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 35 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 36 user that the PACA call has been canceled.
- 37 • The mobile station shall declare an access attempt failure and update its
 38 registration variables as specified in 2.6.5.5.3.2.

- 1 • The mobile station shall disable its transmitter.
 2 • The mobile station shall enter the *Mobile Station Idle State*.

3 If the mobile station receives confirmation of delivery of any message sent by the mobile
 4 station in this substate, it shall send a response in this substate if required, and shall then
 5 enter the *Mobile Station Idle State*.

6 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
 7 user directs the mobile station to cancel a PACA call.

8 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
 9 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
 10 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
 11 the message has been sent and acknowledged.

12 If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a
 13 message being transmitted was not terminated as a result of processing the Layer 2 fields of
 14 the received message, the mobile station shall ignore the received message.

15 The following directed messages and orders can be received. If any field value of the
 16 message or order is outside its permissible range, the mobile station may send a *Mobile*
 17 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 18 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 19 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
 20 2. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 21 message as specified in 2.3.12.1.5.

22 3. *Base Station Reject Order*:

- 23 • If ORDQ_R = '00000001', the mobile station shall send a *Security Mode Request*
 24 *Message* with the ENC SIG H field included in it. If the mobile receives two *Base*
 25 *Station Reject Orders* without successfully decrypting any encrypted messages
 26 from the base station between the orders, the mobile station shall set
 27 REG ENCRYPT RESYNC to YES and the mobile station shall go to the *System*
 28 *Determination Substate* with an encryption failure indication.

29 3.4. *Data Burst Message*

30 4.5. *Feature Notification Message*

31 5.6. *Local Control Order*

- 32 6.7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter
 33 and record the reason for the *Lock Until Power-Cycled Order* in the mobile station's
 34 semi-permanent memory (LCKRSN_P_{s-p} equals the least significant four bits of
 35 ORDQ_R). The mobile station should notify the user of the locked condition. The
 36 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
 37 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
 38 *Access State* again until after the next mobile station power-up or until it has
 39 received an *Unlock Order*. This requirement shall take precedence over any other
 40 mobile station requirement specifying entry to the *System Access State*.

1 **7-8. Maintenance Required Order:** The mobile station shall record the reason for the
 2 *Maintenance Required Order* in the mobile station's semi-permanent memory
 3 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). The mobile station
 4 shall remain in the unlocked condition. The mobile station should notify the user of
 5 the maintenance required condition.

6 **8-9. Registration Accepted Order:**

- 7 • If $\text{ORDQ}_r = '00000101'$, the mobile station shall set $\text{ROAM_INDI}_S \rightarrow \text{to}$
 8 ROAM_INDI_r and should display the roaming condition.
- 9 • If $\text{ORDQ}_r = '00000111'$, the mobile station shall perform the following:
 - 10 - The mobile station shall set $\text{ROAM_INDI}_S \rightarrow \text{to} \text{ ROAM_INDI}_r$ and should
 11 display the roaming condition.
 - 12 - The mobile station shall set $\text{C_SIG_ENCRYPT_MODE}_S \rightarrow \text{to}$
 13 $\text{C_SIG_ENCRYPT_MODE}_r$.
 - 14 - ~~If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile
 15 station shall use the session key generated at the most recent registration for
 16 encryption of signaling and user information. The mobile station shall store
 17 the session key in $\text{KEY}_S[\text{KEY_SEQ_NEW}_{S,p}]$. The mobile station shall store
 18 KEY_SIZE_r in KEY_SIZE_S . The mobile station shall increment the variable
 19 $\text{KEY_SEQ_NEW}_{S,p}$ by one (modulo 16). If ENC_KEY_SIZE_r is included, the
 20 mobile station shall set ENC_KEY_SIZE_S to ENC_KEY_SIZE_r .~~
 - 21 - ~~If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall
 22 use $\text{KEY}_S[\text{KEY_SEQ}_r]$ as the session key.~~
 - 23 - ~~If $\text{C_SIG_ENCRYPT_MODE}_r$ is not equal to '000', the mobile station shall set
 24 ENC_KEY_S to the most recently generated CMFAKEY in the mobile station,
 25 associated with the AUTHR of the *Registration Message*, and
 26 $\text{EXT_ENCRYPT_SEQ}[0]$ and $\text{EXT_ENCRYPT_SEQ}[1]$ to $256 \times \text{ENC_SEQ_H}$
 27 (the ENC_SEQ_H field in the *Registration Message*).~~

28 **9-10. Registration Rejected Order:** This order indicates that normal service is not
 29 available on this system. The mobile station shall disable the full-TMSI timer. If the
 30 received order specifies to delete the TMSI ($\text{ORDQ} = '00000100'$), the mobile station
 31 shall set all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the
 32 *System Determination Substate* of the *Mobile Station Initialization State* with a
 33 registration rejected indication (see 2.6.1.1).

34 **10-11. Retry Order:** The mobile station shall process the message as follows:

- 35 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
 36 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}]$ to 0, where RETRY_TYPE is equal to '001', '010',
 37 or '011'.
- 38 • If RETRY_TYPE_r is equal to '001', the mobile station shall perform the following:
 - 39 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
 40 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_r]$ to 0.

- If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set RETRY_DELAY_S[RETRY_TYPE_r] as follows:
 - + If the most significant bit of the RETRY_DELAY_r is '0', set RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_S to 60000ms.
 - + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least significant bits of RETRY_DELAY_r.
 - + The mobile station shall store the next system time 80 ms boundary + RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as RETRY_DELAY_S[RETRY_TYPE_r].

11.12. Security Mode Command Message: The mobile station shall process the message as follows:

- The mobile station shall set C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_r.
- ~~If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_S[KEY_SEQ_NEW_S.p]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_S. The mobile station shall then increment the variable KEY_SEQ_NEW_S.p by one (modulo 16) If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_S to ENC_KEY_SIZE_r.~~
- ~~If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_S[KEY_SEQ_r] as the session key.~~

12.13. Service Redirection Message: The mobile station shall process the message as follows:

- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).
- If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of TMSI_CODE_{S-p} to '1'. The mobile station shall disable the full-TMSI timer.
- The mobile station shall set RETURN_IF_FAIL_S = RETURN_IF_FAIL_r.
- If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the redirection record received in the message as REDIRECT_REC_S and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).

13.14. SSD Update Message: The mobile station shall respond to the message as specified in 2.3.12.1.5.

1 **14-15. Status Request Message:** The mobile station shall disable the *System Access*
 2 *State* timer and respond to the message. If P_REV_IN_USE_S is less than or equal to
 3 three, the mobile station shall respond with a *Status Response Message*. If
 4 P_REV_IN_USE_S is greater than three, the mobile station shall respond with an
 5 *Extended Status Response Message*. If the message does not specify any
 6 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
 7 station shall include the requested information records in the response. If the
 8 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 9 mobile station shall only include the requested information records for the specified
 10 band class (BAND_CLASS_r) in the response. If the message specifies a band class
 11 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
 12 station shall only include the requested information records for the specified band
 13 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response. If the
 14 message specifies a band class or a band class and an operating mode which is not
 15 supported by the mobile station, the mobile station shall send a *Mobile Station Reject*
 16 *Order* with ORDQ set to '00000110' (message requires a capability that is not
 17 supported by the mobile station). If the response to this message exceeds the
 18 allowable length, the mobile station shall send a *Mobile Station Reject Order* with
 19 ORDQ set to '00001000' (response message would exceed the allowable length). If
 20 the message specifies an information record which is not supported by the mobile
 21 station for the specified band class and operating mode, the mobile station shall
 22 send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record
 23 is not supported for the specified band class and operating mode).

24 **15-16. TMSI Assignment Message:** The mobile station shall store the TMSI zone and
 25 code as follows:

- 26 • The mobile station shall store the length of the TMSI zone field by setting
 27 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 28 • The mobile station shall store the assigning TMSI zone number by setting the
 29 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 30 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 31 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 32 TMSI_CODE_r.

33 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 34 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 35 mobile station shall then respond with a *TMSI Assignment Completion Message*
 36 within T_{56m} seconds.

37 **16-17. User Zone Reject Message**

38 **17-18. Any other message:** If the mobile station receives any other message specified
 39 in Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore
 40 all other messages.

41 **18. Base Station Reject Order:**

- 1 • If $\text{ORDQ}_F = '00000001'$, the mobile station shall send a *Security Mode Request*
 2 Message with the *ENC_SIC_H* field included in it. If the mobile receives two *Base*
 3 *Station Reject Orders* without successfully decrypting any encrypted messages
 4 from the base station between the orders, the mobile station shall set
 5 $\text{REC_ENCRYPT_RESYNC}$ to YES and the mobile station shall go to the *System*
 6 *Determination Substate* with an encryption failure indication.

7 2.6.3.5 Mobile Station Origination Attempt Substate

8 In this substate, the mobile station sends an *Origination Message*. If the base station
 9 responds to the *Origination Message* with an authentication request, the mobile station
 10 responds in this substate.

11 If a message received from the base station requires a Layer 2 acknowledgment and does
 12 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
 13 outstanding (see 2.1.1.2.2.1 of [4]).

14 If a message received from the base station requires a Layer 2 acknowledgment and also a
 15 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see
 16 2.1.1.2.2.1 of [4]).

17 When transmitting a response to a message received from the base station, Layer 3 shall
 18 indicate to Layer 2 that the type of the message is a response (see 2.1.1.2.2.1 of [4]).

19 When transmitting an autonomous message (i.e., a message that is not sent as a response
 20 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
 21 of the message is a request other than a registration request or a message transmission
 22 request (see 2.1.1.2.2.1 of [4]).

23 Upon entering the *Mobile Station Origination Attempt Substate*, the mobile station shall set
 24 RLGAIN_ADJ_S to '0000' and perform the following:

- 25 • The mobile station shall exit the *Mobile Station Origination Attempt Substate*, shall
 26 enter either the *Mobile Station Idle State* or the *System Determination Substate* with
 27 an ACCT blocked indication, and should indicate to the user that the call has
 28 terminated if all of the following conditions are true:
 - 29 – P_REV_IN_USE_S is greater than six,
 - 30 – ACCT_INCL_EMG_S is equal to '1' or the mobile station determines that the call is
 31 not an emergency call,
 - 32 – ACCT is enabled for the requested service option number, due to either of the
 33 following two conditions:
 - 34 + the requested service option number is equal to an ACCT SO entry in
 35 ACCT SO LIST, or
 - 36 + the service option group number of the requested service option is equal to
 37 an ACCT SO GRP entry in ACCT SO GRP LIST.
- 38 • If the substate was entered with an origination indication, the mobile station shall
 39 send the *Origination Message* as an r-csch request.

- If the substate was entered with a PACA response indication, the mobile station shall send the *Origination Message* as an r-csch response using the access procedures specified in 2.6.3.1-~~1.2~~. The mobile station shall include the dialed digits (if any) from the previous origination attempt in the *Origination Message*.
- If the origination is a result of NDSS_ORIG_S being equal to enabled, the mobile station shall include in the *Origination Message* the dialed digits (if any) recorded from the previous origination attempt.
- If the mobile station has a stored service configuration (that is, parameters conveyed by both the Service Configuration information record and the Non-negotiable Service Configuration information record), SYNC_ID_S is not equal to NULL, and USE_SYNC_ID_S is equal to '1', the mobile station may include the SYNC_ID field in the *Origination Message* and, if included, shall set it to the ~~16-bit CRC computed over the entire stored service configuration as specified in 2.6.11~~SYNC_ID_S corresponding to the stored service configuration.
- The mobile station shall include in the *Origination Message* as many of the dialed digits as possible without exceeding the message capsule size. When calculating the number of dialed digits to be included in the *Origination Message*, the mobile station shall assume the following if P_REV_IN_USE_S is greater than three:
 - The number of additional reported pilots (NUM_ADD_PILOTS) is equal to five (see 2.6.3.1.7 and 2.7.1.3.1.3) so that up to five additional pilots may be reported in any access probe, and
 - The number of alternative service option numbers (NUM_ALT_SO) is less than or equal to the maximum alternative service option numbers (MAX_NUM_ALT_SO_S).
- If PACA_S is equal to enabled, the mobile station shall set the PACA_REORIG field of the *Origination Message* to '1'; otherwise, the mobile station shall set the field to '0'.

While in this substate, the mobile station shall monitor the Paging Channel or the Forward Common Control Channel. The mobile station may perform an access probe handoff or an access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel (see ~~2.6.2.1.1.4~~ 2.6.3.1.8) during an access attempt, the mobile station may perform an access probe handoff; otherwise, it shall declare an access attempt failure and shall perform the following:

- If the mobile station is monitoring the Paging Channel, the mobile station shall set SYS_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- If the mobile station is monitoring the Forward Common Control Channel, the mobile station shall set MC_RR_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- If NDSS_ORIG_S is equal to enabled, the mobile station shall set NDSS_ORIG_S to disabled, and should indicate to the user that the call origination is canceled.

- 1 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2.
- 2 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
- 3 *State*.

4 If the mobile station receives confirmation of delivery of any message sent by the mobile
 5 station in this substate, the mobile station shall perform an access handoff if all of the
 6 following conditions hold:

- 7 • The mobile station declares a loss of the Paging Channel or the Forward Common
 8 Control Channel,
- 9 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2) and
 10 there are pilots other than the active pilot in the access handoff list (see 2.6.3.1.3.2).

11 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
 12 Channel and does not perform an access handoff, the mobile station shall perform the
 13 following:

- 14 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 15 SYS_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- 16 • If the mobile station is monitoring the Forward Common Control Channel, the
 17 mobile station shall set MC_RR_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL.
- 18 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 19 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 20 user that the PACA call has been canceled.
- 21 • If NDSS_ORIG_S is equal to enabled, the mobile station shall set NDSS_ORIG_S to
 22 disabled and should indicate to the user that the call origination is canceled.
- 23 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
 24 *State*.

25 If the mobile station receives confirmation of delivery of the *Origination Message*, the mobile
 26 station shall update its registration variables with respect to the base station to which the
 27 first access probe was transmitted after entering the *System Access State* as specified in
 28 2.6.5.5.3.1.

29 The mobile station shall set and disable the *System Access State* timer as follows:

- 30 • The mobile station shall disable the timer whenever it begins an access attempt.
- 31 • The mobile station shall set the timer to T_{42m} seconds whenever it ends an access
 32 attempt.
- 33 • The mobile station shall disable the timer whenever it exits the *System Access State*.

34 If the *System Access State* timer expires while in this substate, the mobile station shall
 35 perform the following:

- 36 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 37 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 38 user that the PACA call has been canceled.

- If NDSS_ORIG_S is equal to enabled, the mobile station shall set NDSS_ORIG_S to disabled, and should indicate to the user that the call origination is canceled.
- If the mobile station is monitoring the Paging Channel, the mobile station shall set SYS_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL and enter the *Mobile Station Idle State*.
- If the mobile station is monitoring the Forward Common Control Channel, the mobile station shall set MC_RR_PAR_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL and enter the *Mobile Station Idle State*.

If the mobile station is directed by the user to disconnect the call, the mobile station shall perform the following actions:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall send the *Release Order* (normal release) in assured mode requiring confirmation of delivery.
- After receiving confirmation of delivery of the *Release Order*, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a release indication (see 2.6.1.1).

If the mobile station is directed by the user to power off, the mobile station shall perform the following actions:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall send the *Release Order* (with power-down indication) in assured mode requiring confirmation of delivery.
- After receiving confirmation of delivery of the *Release Order*, the mobile station shall perform power-down registration procedures (see 2.6.5.1.2).
- The mobile station may power off.

If the mobile station receives a *Channel Assignment Message* or the *Extended Channel Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer 2 (see 2.1.2.1.2 of [4]). If the mobile station has not received confirmation of delivery of the *Origination Message* before receiving the *Channel Assignment Message* or the *Extended Channel Assignment Message*, the mobile station shall update its registration variables with respect to the base station to which the first access probe was transmitted after entering the *System Access State*, as specified in 2.6.5.3.1.

If the mobile station is to exit the *System Access State* as a result of processing Layer 3 fields of a message requiring an acknowledgment, the mobile station shall exit the *System Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.

If Layer 3 receives a message other than a *Channel Assignment Message* or an *Extended Channel Assignment Message* with an indication from Layer 2 that an access attempt for a message being transmitted was not terminated as a result of processing the Layer 2 fields of

1 the received message, the mobile station shall ignore the received message.

2 The following directed messages and orders can be received. If any field value of the
3 message or order is outside its permissible range, the mobile station may send a *Mobile*
4 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 5 1. *Authentication Challenge Message*: The mobile station shall respond to the message
6 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 7 2. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the message
8 as specified in 2.3.12.1.5.

9 **3. Base Station Reject Order:**

- 10 • If ORDQ_r = '00000000', the mobile station shall set ENC KEY_S to NULL and set
11 C SIG ENCRYPT MODE to '000'. The mobile station shall re-originate by
12 sending a new *Origination Message*.
- 13 • If ORDQ_r = '00000001', the mobile station shall send a *Security Mode Request*
14 *Message* with the ENC SIG H field included in it. If the mobile receives two *Base*
15 *Station Reject Orders* without successfully decrypting any encrypted messages
16 from the base station between the orders, the mobile station shall set
17 REG ENCRYPT RESYNC to YES and the mobile station shall go to the *System*
18 *Determination Substate* with an encryption failure indication.

19 **3.4. Channel Assignment Message**: The mobile station shall process the message as
20 follows:

- 21 • If ASSIGN_MODE_r equals '000', the mobile station shall perform the following
22 actions:
 - 23 – The mobile station shall set CH_IND_S to '01'.
 - 24 – The mobile station shall store the frame offset (FRAME_OFFSET_S =
25 FRAME_OFFSET_r), the message encryption mode indicator
26 (ENCRYPT_MODE_S = ENCRYPT_MODE_r), and, if FREQ_INCL_r equals '1', the
27 Frequency Assignment (CDMACH_S = CDMA_FREQ_r).
 - 28 – The mobile station shall perform the following procedures in the order listed
29 below:
 - 30 + If D SIG ENCRYPT MODE_r is included, the mobile station shall perform
31 the following:
 - 32 o If D SIG ENCRYPT MODE_r is equal to '000', the mobile station shall
33 set D SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_S; otherwise,
34 the mobile station shall set D SIG ENCRYPT MODE_S to
35 D SIG ENCRYPT MODE_r, ENC KEY_S to the most recently generated
36 CMEAKEY in the mobile station associated with the AUTHR of the
37 *Origination Message*, and EXT ENCRYPT SEQ[0] and
38 EXT ENCRYPT SEQ[1] to 256 × ENC SEQ H (the ENC SEQ H field
39 in the *Origination Message*).

- 1 ± If USE_NEW_KEY_r is not included, or is included and is set to '1', the
 2 mobile station shall use the session key generated at the most recent
 3 registration for encryption of signaling and user information. The mobile
 4 station shall store the session key in KEY_s[KEY_SEQ_NEW_{s,p}]. The
 5 mobile station shall store KEY_SIZE_r to KEY_SIZE_s. The mobile station
 6 shall then increment the variable KEY_SEQ_NEW_{s,p} by one (modulo 16).
 7 If ENC_KEY_SIZE_r is included, the mobile station shall set
 8 ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- 9 — If USE_NEW_KEY_r is included and is set to '0' then the mobile station
 10 shall use KEY_s[KEY_SEQ_r] as the session key.
- 11 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
 12 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 13 – If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
 14 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 15 indicate to the user that the PACA call is proceeding.
 - 16 – The mobile station shall initialize the CODE_CHAN_LIST as described in
 17 2.6.8, shall set SERV_NEG_S to disabled, and shall enter the *Traffic Channel*
 18 Initialization Substate of the *Mobile Station Control on the Traffic Channel*
 19 State.
 - 20 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
 21 actions:
 - 22 – If the message requires acknowledgement, the mobile station shall wait until
 23 Layer 3 receives an indication from Layer 2 that the acknowledgement to the
 24 message has been sent and acknowledged.
 - 25 – If a CDMA channel (CDMA_FREQ) is specified in the assignment, the mobile
 26 station shall set CDMACH_S = CDMA_FREQ_r, tune to the new Frequency
 27 Assignment, and measure the strength of each pilot listed in the assignment
 28 using the Neighbor Set search procedures specified in 2.6.6.2.1 and
 29 2.6.6.2.2.
 - 30 – The mobile station shall set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to
 31 NULL (see 2.6.2.2) and shall set PILOT_PN_S to the pilot PN sequence offset of
 32 the strongest pilot in the list.
 - 33 – If the mobile station has not stored configuration parameters for the Primary
 34 Paging Channel of the new base station, or if the stored information is not
 35 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S,
 36 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 37 GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
 38 EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 39 USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LIST_MSG_SEQ_S,
 40 GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S
 41 to NULL.

- 1 — ~~If the mobile station has not stored configuration parameters for the Primary~~
 2 ~~Forward Common Control Channel of the new base station, or if the stored~~
 3 ~~information is not current (see 2.6.2.2), the mobile station shall set~~
 4 ~~EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S,~~
 5 ~~EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,~~
 6 ~~USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LIST_MSG_SEQ_S,~~
 7 ~~GLOB_SERV_REDIR_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S,~~
 8 ~~MC_RR_PAR_MSG_SEQ_S, UNIV_NGHBR_LIST_MSG_SEQ_S and~~
 9 ~~EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.~~
- 10 — The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary
 11 Paging Channel. ~~If the mobile station was monitoring Forward Common~~
 12 ~~Control Channel, the mobile station shall set the PRAT_S to '00'~~. The mobile
 13 station shall then begin monitoring the Primary Paging Channel of the
 14 selected base station.
- 15 — ~~The mobile station shall set FCCCH_CHAN_S to '1' and FCCCH_ID_S to the~~
 16 ~~Primary Forward Common Control Channel. The mobile station shall then~~
 17 ~~begin monitoring the Primary Forward Common Control Channel of the~~
 18 ~~selected base station.~~
- 19 — If RESPOND_r is equal to '1', the mobile station shall enter the *Update*
 20 *Overhead Information Substate* with an origination indication.
- 21 • If ASSIGN_MODE_r equals '010', the mobile station shall perform the following
 22 actions:
- 23 — If the mobile station does not support analog operation in the requested
 24 band class, the mobile station shall send a *Mobile Station Reject Order* with
 25 the ORDQ field set to '00000110' (capability not supported by the mobile
 26 station) and the mobile station shall remain in the *Mobile Station Origination*
 27 *Attempt Substate*.
- 28 — If the mobile station supports analog operation in the requested band class
 29 and RESPOND_r equals '1', the mobile station shall perform the following
 30 actions:
- 31 + If USE_ANALOG_SYS_r equals '0', the mobile station shall perform the
 32 following actions:
- 33 o If PACA_S is equal to enabled, the mobile station shall set PACA_S to
 34 disabled and PACA_CANCEL to '0', shall disable the PACA state timer,
 35 and should indicate to the user that the PACA call has been canceled.
- 36 o The mobile station shall enter the analog Initialization Task with an
 37 origination indication (see 2.6.1).
- 38 + If USE_ANALOG_SYS_r equals '1', the mobile station shall perform the
 39 following actions:

- 1 o The mobile station shall set SERVSYS_S to SYS_A if ANALOG_SYS_r is
2 equal to '0', or shall set SERVSYS_S to SYS_B if ANALOG_SYS_r is equal
3 to '1'.
- 4 o If PACA_S is equal to enabled, the mobile station shall set PACA_S to
5 disabled and PACA_CANCEL to '0', shall disable the PACA state timer,
6 and should indicate to the user that the PACA call has been canceled.
- 7 o The mobile station shall then enter the analog Initialization Task with
8 an origination indication (see 2.6.1).
- 9 • If ASSIGN_MODE_r equals '011', the mobile station shall perform the following
10 actions:
 - 11 – If the mobile station does not support analog operation in the requested
12 band class, the mobile station shall send a *Mobile Station Reject Order* with
13 the ORDQ field set to '00000110' (capability not supported by the mobile
14 station) and the mobile station shall remain in the *Mobile Station Origination*
15 *Attempt Substate*.
 - 16 – If the mobile station supports analog operation in the requested band class:
 - 17 + If the analog channel type is '00', the mobile station shall perform the
18 following actions:
 - 19 o The mobile station shall store the system identification (SID_S = SID_r),
20 the voice mobile station attenuation code (VMAC_S = VMAC_r), the voice
21 channel number (ANALOG_CHAN_S = ANALOG_CHAN_r), the SAT color
22 code (SCC_S = SCC_r), and the message encryption mode indicator
23 (MEM_S = MEM_r).
 - 24 o The mobile station shall set DTX_S to '00'.
 - 25 o If PACA_S is equal to enabled, the mobile station shall set PACA_S to
26 disabled and PACA_CANCEL to '0', shall disable the PACA state timer,
27 and should indicate to the user that the PACA call is proceeding.
 - 28 o The mobile station shall enter the Confirm Initial Voice Channel Task
29 (see 2.6.4.2) with an origination indication.
 - 30 + If the analog channel type is not '00', the mobile station shall perform the
31 following actions:
 - 32 o If the mobile supports narrow analog mode, the mobile station shall
33 perform the following actions:
 - 34 ◊ The mobile station shall store the system identification (SID_S =
35 SID_r), the voice mobile station attenuation code (VMAC_S =
36 VMAC_r), the voice channel number (ANALOG_CHAN_S =
37 ANALOG_CHAN_r), the message encryption mode indicator (MEM_S
38 = MEM_r), the analog channel type (AN_CHAN_TYPE_S =
39 AN_CHAN_TYPE_r) and the digital SAT code (DSCC_S = DSCC_MSBR
40 × 4 + SCC_r).

- 1 ◊ The mobile station shall set DTX_S to '00'.
- 2 ◊ If PACA_S is equal to enabled, the mobile station shall set PACA_S to
3 disabled, shall disable the PACA state timer, and should indicate
4 to the user that the PACA call is proceeding.
- 5 ◊ The mobile station shall enter the Confirm Initial Narrow Analog
6 Voice Channel Task (see 2.6.5.2A of [22]) with an origination
7 indication.
- 8 o If the mobile station does not support narrow analog mode, the
9 mobile station shall send a *Mobile Station Reject Order* with the ORDQ
10 field set to '00000110' (capability not supported by the mobile station)
11 and the mobile station shall remain in the *Mobile Station Origination*
12 *Attempt Substate* of the *System Access State*.
- 13 • If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
14 actions:
- 15 – The mobile station shall set CH_IND_S to '01'.
- 16 – If GRANTED_MODE_r equals '00', and the multiplex option or radio
17 configuration specified in the DEFAULT_CONFIG field is not supported by
18 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
19 with ORDQ field set to '00000110' (capability not supported by the mobile
20 station) and remain in *Mobile Station Origination Attempt Substate*.
- 21 – If FREQ_INCL_r equals '0', the mobile station shall perform the following
22 actions:
- 23 + The mobile station shall store the frame offset (FRAME_OFFSET_S =
24 FRAME_OFFSET_r), the message encryption mode indicator
25 (ENCRYPT_MODE_S = ENCRYPT_MODE_r), the granted mode
26 (GRANTED_MODE_S = GRANTED_MODE_r), and the default configuration
27 (DEFAULT_CONFIG_S = DEFAULT_CONFIG_r).
- 28 + The mobile station shall perform the following procedures in the order
29 listed below:
- 30 o If D SIG ENCRYPT MODE_r is included, the mobile station shall
31 perform the following:
- 32 ◊ If D SIG ENCRYPT MODE_r is equal to '000', the mobile station
33 shall set D SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_S;
34 otherwise, the mobile station shall set D SIG ENCRYPT MODE_S
35 to D SIG ENCRYPT MODE_r, ENC KEY_S to the most recently
36 generated CMEAKEY in the mobile station, associated with the
37 AUTHR of the *Origination Message*, and EXT ENCRYPT SEQ[0]
38 and EXT ENCRYPT SEQ[1] to 256 × ENC SEQ H (the
39 ENC SEQ H field in the *Origination Message*).

1 o If USE_NEW_KEY_r is not included, or is included and is set to '1', the
 2 mobile station shall use the session key generated at the most recent
 3 registration for encryption of signaling and user information. The
 4 mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_s
 5 p]. The mobile station shall store KEY_SIZE_r to KEY_SIZE_s. The
 6 mobile station shall then increment the variable KEY_SEQ_NEW_sp
 7 by one (modulo 16). If ENC_KEY_SIZE_r is included, the mobile station
 8 shall set ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.

9 + If USE_NEW_KEY_r is included and is set to '0' then the mobile station
 10 shall use KEY_s[KEY_SEQ_r] as the session key.

11 o If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
 12 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.

- 13 + The mobile station shall set SERV_NEG_s to enabled.
- 14 + If PACA_S is equal to enabled, the mobile station shall set PACA_S equal to
 15 disabled and PACA_CANCEL to '0', shall disable the PACA state timer,
 16 and should indicate to the user that the PACA call is proceeding.
- 17 + The mobile station shall initialize CODE_CHAN_LIST as described in
 18 2.6.8.
- 19 + The mobile station shall then enter the *Traffic Channel Initialization*
 20 *Substate* of the *Mobile Station Control on the Traffic Channel State*.

- 21 - If FREQ_INCL_r equals '1', the mobile station shall perform the following
 22 actions:
 - 23 + If the band class is not supported by the mobile station, the mobile
 24 station shall send a *Mobile Station Reject Order* with ORDQ field set to
 25 '00000110' (capability not supported by the mobile station) and remain in
 26 the *Mobile Station Origination Attempt Substate*.
 - 27 + If the band class is supported by the mobile station, the mobile station
 28 shall perform the following actions:
 - 29 o The mobile station shall store the frame offset (FRAME_OFFSET_s =
 30 FRAME_OFFSET_r), the message encryption mode indicator
 31 (ENCRYPT_MODE_s = ENCRYPT_MODE_r), the granted mode
 32 (GRANTED_MODE_s = GRANTED_MODE_r), the default configuration
 33 (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r), the band class
 34 (CDMABAND_s = BAND_CLASS_r), and the Frequency Assignment
 35 (CDMACH_s = CDMA_FREQ_r).

36 o The mobile station shall perform the following procedures in the order
 37 listed below:

38 ◊ If D_SIG_ENCRYPT_MODE_r is included, the mobile station shall
 39 perform the following:

40 - If D_SIG_ENCRYPT_MODE_r is equal to '000', the mobile

1 station shall set D SIG ENCRYPT MODE_S to
 2 C SIG ENCRYPT MODE_S; otherwise, the mobile station shall
 3 set D SIG ENCRYPT MODE_S to D SIG ENCRYPT MODE_r.
 4 ENC KEY_S to the most recently generated CMEAKEY in the
 5 mobile station, associated with the AUTHR of the *Origination*
 6 Message, and EXT ENCRYPT SEQ[0] and
 7 EXT ENCRYPT SEQ[1] to 256 × ENC SEQ H (the
 8 ENC SEQ H field in the *Origination Message*).

- 9 ◊ ~~If USE_NEW_KEY_r is not included, or is included and is set to '1',~~
 10 ~~the mobile station shall use the session key generated at the most~~
 11 ~~recent registration for encryption of signaling and user~~
 12 ~~information. The mobile station shall store the session key in~~
 13 ~~KEY_S[KEY_SEQ_NEW_S.pl]. The mobile station shall store~~
 14 ~~KEY_SIZE_r to KEY_SIZE_S. The mobile station shall then~~
 15 ~~increment the variable KEY_SEQ_NEW_S.p by one (modulo 16). If~~
 16 ~~ENC KEY SIZE_r is included, the mobile station shall set~~
 17 ~~ENC KEY SIZE_S to ENC KEY SIZE_r.~~
- 18 ◊ ~~If USE_NEW_KEY_r is included and is set to '0' then the mobile~~
 19 ~~station shall use KEY_S[KEY_SEQ_r] as the session key.~~
- 20 ◊ If C SIG ENCRYPT MODE is included, the mobile station shall
 21 set C SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_r.

- 22 o The mobile station shall set SERV_NEG_S to enabled.
 23 o If PACA_S is equal to enabled, the mobile station shall set PACA_S to
 24 disabled and PACA_CANCEL to '0', shall disable the PACA state timer,
 25 and should indicate to the user that the PACA call is proceeding.
 26 o The mobile station shall initialize the CODE_CHAN_LIST as described
 27 in 2.6.8.
 28 o The mobile station shall then tune to the new Frequency Assignment
 29 and enter the *Traffic Channel Initialization Substate* of the *Mobile*
 30 *Station Control on the Traffic Channel State*.

- 31 • If ASSIGN_MODE_r equals '101', the mobile station shall perform the following
 32 actions:
 33 – If FREQ_INCL_r equals '0', the mobile station shall perform the following
 34 actions:
 35 + If the message requires acknowledgement, the mobile station shall wait
 36 until Layer 3 receives an indication from Layer 2 that the
 37 acknowledgement to the message has been sent and acknowledged.
 38 + The mobile station shall set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to
 39 NULL (see 2.6.2.2) and shall set PILOT_PNs to the pilot PN sequence
 40 offset of the strongest pilot in the list (PILOT_PN_r).

- + If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
- + ~~If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, A41_SYS_PAR_MSG_SEQ_S, MC_RR_PAR_MSG_SEQ_S, UNIV_NGBHR_LST_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.~~
- + The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
- + ~~The mobile station shall set FCCCH_CHAN_S to '1' and FCCCH_ID_S to the Primary Forward Common Control Channel. The mobile station shall then begin monitoring the Primary Forward Common Control Channel of the selected base station.~~
- + If RESPOND_r is equal to '1', the mobile station shall perform the following:
 - o If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Channel Assignment Message*.
 - o If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.
- + If RESPOND_r is equal to '0', the mobile station shall perform the following:

- o If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Channel Assignment Message*.
 - o If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.
- If FREQ_INCL_r equals '1', the mobile station shall perform the following actions:
- + If the band class is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
 - + If the band class is supported by the mobile station, the mobile station shall perform the following actions:
 - o If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
 - o The mobile station shall set CDMACH_s to CDMA_FREQ_r and CDMABAND_s to BAND_CLASS_r. Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PNs to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PNr), and set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
 - o If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - o The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
 - o If RESPOND_r is equal to '1', the mobile station shall perform the following:

- ◊ If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Channel Assignment Message*.
- ◊ If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.
- o If $RESPOND_r$ is equal to '0', the mobile station shall perform the following:
 - ◊ If the *Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after receiving the *Channel Assignment Message*.
 - ◊ If the *Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Mobile Station Idle State* within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Channel Assignment Message* has been sent and acknowledged.

4.5. Data Burst Message

5-6. Extended Channel Assignment Message: The mobile station shall process the message as follows:

- If $ASSIGN_MODE_r$ equals '000', the mobile station shall perform the following actions:
 - The mobile station shall set CH_IND_s to '01'.
 - If $P_REV_IN_USE_s$ is equal to or greater than six, the mobile station shall store the Forward Fundamental Channel Radio Configuration ($FOR_FCH_RC_s = FOR_FCH_RC_r$) and the Reverse Fundamental Channel Radio Configuration ($REV_FCH_RC_s = REV_FCH_RC_r$)
 - If $FREQ_INCL_r$ equals '0', the mobile station shall perform the following actions:
 - + The mobile station shall store the frame offset ($FRAME_OFFSET_s = FRAME_OFFSET_r$), the message encryption mode indicator ($ENCRYPT_MODE_s = ENCRYPT_MODE_r$), the granted mode ($GRANTED_MODE_s = GRANTED_MODE_r$), the default configuration ($DEFAULT_CONFIG_s = DEFAULT_CONFIG_r$), and the occurrences of PILOT_PN and PWR_COMB for each included member of the Active Set.

- + The mobile station shall perform the following procedures in the order listed below:
- o If D SIG ENCRYPT MODE_r is included, the mobile station shall perform the following:
 - ◊ If D SIG ENCRYPT MODE_r is equal to '000', the mobile station shall set D SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_s; otherwise, the mobile station shall set D SIG ENCRYPT MODE_s to D SIG ENCRYPT MODE_r, ENC KEY_s to the most recently generated CMEAKEY in the mobile station, associated with the AUTHR of the *Origination Message*, and EXT ENCRYPT SEQ[0] and EXT ENCRYPT SEQ[1] to $256 \times$ ENC SEQ H (the ENC SEQ H field in the *Origination Message*).
 - o If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_s_p]. The mobile station shall store KEY_SIZE_r to KEY_SIZE_s. The mobile station shall then increment the variable KEY_SEQ_NEW_s_p by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station shall set ENC KEY SIZE_s to ENC KEY SIZE_r.
 - + If USE_NEW_KEY_r is included and is set to '0' then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.
 - o If C SIG ENCRYPT MODE is included, the mobile station shall set C SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_r.
 - + The mobile station shall set SERV_NEG_s to enabled.
 - + If PACA_S is equal to enabled, the mobile station shall set PACA_S equal to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call is proceeding.
 - + The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8.
 - + The mobile station shall set FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r, FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r, FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and FPC_PRI_CHAN_s to '0' if the mobile station supports any Radio Configuration greater than 2.
 - + The mobile station shall set FPC_SUBCHAN_GAIN_s to FPC_SUBCHAN_GAIN_r.
 - + The mobile station shall set REV_FCH_GATING_MODE_s to REV_FCH_GATING_MODE_r.

- + The mobile station shall set REV_PWR_CNTL_DELAY_s to REV_PWR_CNTL_DELAY_r if REV_PWR_CNTL_DELAY_INCL_r is equal to '1'.
- + The mobile station shall set RLGAIN_ADJ_s to RLGAIN_ADJ_r.
- + The mobile station shall then enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*.
- If FREQ_INCL_r equals '1', the mobile station shall perform the following actions:
 - + If the band class is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
 - + If the band class is supported by the mobile station, the mobile station shall perform the following actions:
 - o The mobile station shall store the frame offset (FRAME_OFFSET_s = FRAME_OFFSET_r); the message encryption mode indicator (ENCRYPT_MODE_s = ENCRYPT_MODE_r); the granted mode (GRANTED_MODE_s = GRANTED_MODE_r); the default configuration (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r); the band class (CDMABAND_s = BAND_CLASS_r); the Frequency Assignment (CDMACH_s = CDMA_FREQ_r); and the occurrences of PILOT_PN and PWR_COMB_IND for each included member of the Active Set.
 - o The mobile station shall perform the following procedures in the order listed below:
 - ◊ If D SIG ENCRYPT MODE_r is included, the mobile station shall perform the following:
 - If D SIG ENCRYPT MODE_r is equal to '000', the mobile station shall set D SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_s; otherwise, the mobile station shall set D SIG ENCRYPT MODE_s to D SIG ENCRYPT MODE_r. ENC KEY_s to the most recently generated CMEKEY in the mobile station, associated with the AUTHR of the *Origination Message*, and EXT_ENCRYPT_SEQ[0] and EXT_ENCRYPT_SEQ[1] to 256 × ENC SEQ H (the ENC SEQ H field in the *Origination Message*).

- 1 ◊ If USE_NEW_KEY_r is not included, or is included and is set to '1',
 2 the mobile station shall use the session key generated at the most
 3 recent registration for encryption of signaling and user
 4 information. The mobile station shall store the session key in
 5 KEY_s[KEY_SEQ_NEW_{s,p}]. The mobile station shall store
 6 KEY_SIZE_r to KEY_SIZE_s. The mobile station shall then
 7 increment the variable KEY_SEQ_NEW_{s,p} by one (modulo 16). If
 8 ENC_KEY_SIZE_r is included, the mobile station shall set
 9 ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- 10 e If USE_NEW_KEY_r is included and is set to '0' then the mobile
 11 station shall use KEY_s[KEY_SEQ_r] as the session key.
- 12 ◊ If C SIG ENCRYPT MODE is included, the mobile station shall
 13 set C SIG ENCRYPT MODE_s to C SIG ENCRYPT MODE_r.
- 14 o The mobile station shall set SERV_NEG_s to enabled.
- 15 o The mobile station shall initialize CODE_CHAN_LIST as described in
 16 2.6.8.
- 17 o The mobile station shall set FPC_FCH_INIT_SETPT_s to
 18 FPC_FCH_INIT_SETPT_r, FPC_FCH_CURR_SETPT_s to
 19 FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to FPC_FCH_FER_r,
 20 FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
 21 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and
 22 FPC_PRI_CHAN_s to '0' if the mobile station supports any Radio
 23 Configuration greater than 2.
- 24 o The mobile station shall set FPC_SUBCHAN_GAIN_s to
 25 FPC_SUBCHAN_GAIN_r.
- 26 o The mobile station shall set RLGAIN_ADJ_s to RLGAIN_ADJ_r.
- 27 o The mobile station shall set REV_FCH_GATING_MODE_s to
 28 REV_FCH_GATING_MODE_r.
- 29 o The mobile station shall set REV_PWR_CNTL_DELAY_s to
 30 REV_PWR_CNTL_DELAY_r if REV_PWR_CNTL_DELAY_INCL_r is equal
 31 to '1'.
- 32 o The mobile station shall then tune to the new Frequency Assignment
 33 and enter the *Traffic Channel Initialization Substate* of the *Mobile*
 34 *Station Control on the Traffic Channel State*.
- 35 – If GRANTED_MODE_r equals '00', and the multiplex option and radio
 36 configuration specified in the DEFAULT_CONFIG field is not supported by
 37 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
 38 with ORDQ field set to '00000110' (capability not supported by the mobile
 39 station) and remain in the *Mobile Station Origination Attempt Substate*.

- If GRANTED_MODE_r equals '00' and DEFAULT_CONFIG_r is not equal to '100', the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001110' (RC does not match with DEFAULT_CONFIG_r) and shall remain in the *Mobile Station Origination Attempt Substate* if any of the following conditions is true:
 - + FOR_FCH_RC_r is not equal to the Radio Configuration associated with DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
 - + REV_FCH_RC_r is not equal to the Radio Configuration associated with DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
- If the mobile station does not support either of the Fundamental Channel Radio Configurations (FOR_FCH_RC or REV_FCH_RC), the mobile shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- If ASSIGN_MODE_r equals '001', the mobile station shall perform the following actions:
 - If FREQ_INCL_r equals '0', the mobile station shall perform the following actions:
 - + If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
 - + The mobile station shall set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL (see 2.6.2.2) and shall set PILOT_PNs to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r).
 - + If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
 - + The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the Primary Paging Channel. If the mobile station was monitoring Forward Common Control Channel, the mobile station shall set the PRAT_S to '00'. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
 - + If RESPOND_r is equal to '1', the mobile station shall perform the following:

- o If the *Extended Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after receiving the *Extended Channel Assignment Message*.
 - o If the *Extended Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with a page response retransmission indication within T_{34m} seconds after Layer 3 receives an indication from Layer 2 that the acknowledgement to the *Extended Channel Assignment Message* has been sent and acknowledged.
- If FREQ_INCL_r equals ‘1’, the mobile station shall perform the following actions:
- + If the band class is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
 - + If the band class is supported by the mobile station, the mobile station shall perform the following actions:
 - o If the message requires acknowledgement, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgement to the message has been sent and acknowledged.
 - o The mobile station shall set CDMACH_S to CDMA_FREQ_r and CDMABAND_S to BAND_CLASS_r. Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_S to the pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_S and ACC_MSG_SEQ_S to NULL (see 2.6.2.2).
 - o If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S, GEN_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S, and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
 - o The mobile station shall set PAGE_CHAN_S to ‘1’ and PAGECH_S to the Primary Paging Channel. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.

- 1 o If RESPOND_r is equal to '1', the mobile station shall perform the
2 following:
 - 3 ◊ If the *Extended Channel Assignment Message* does not require an
4 acknowledgment, the mobile station shall enter the *Update
5 Overhead Information Substate* with a page response
6 retransmission indication within T_{34m} seconds after receiving the
7 *Extended Channel Assignment Message*.
 - 8 ◊ If the *Extended Channel Assignment Message* requires an
9 acknowledgment, the mobile station shall enter the *Update
10 Overhead Information Substate* with a page response
11 retransmission indication within T_{34m} seconds after Layer 3
12 receives an indication from Layer 2 that the acknowledgement to
13 the *Extended Channel Assignment Message* has been sent and
14 acknowledged.
- 15 • If ASSIGN_MODE_r equals '010', the mobile station shall perform the following
16 actions:
 - 17 – If the mobile station does not support analog operation in the requested
18 band class, the mobile station shall send a *Mobile Station Reject Order* with
19 ORDQ field set to '00000110' (capability not supported by the mobile station)
20 and remain in the *Mobile Station Origination Attempt Substate*.
 - 21 – If the mobile station supports analog operation in the requested band class,
22 the mobile station shall perform the following actions:
 - 23 + If RESPOND_r equals '1' and USE_ANALOG_SYS_r equals '0', the mobile
24 station shall enter the analog Initialization Task with an origination
25 indication (see 2.6.1).
 - 26 + If RESPOND_r equals '1' and USE_ANALOG_SYS_r equals '1', the mobile
27 station shall perform the following actions:
 - 28 o The mobile station shall set SERVSYSS to SYS_A if ANALOG_SYS_r is
29 equal to '0', or set SERVSYSS to SYS_B if ANALOG_SYS_r is equal to
30 '1'.
 - 31 o The mobile station shall then enter the analog Initialization Task with
32 an origination indication (see 2.6.1).
 - 33 • If ASSIGN_MODE_r equals '011', the mobile station shall perform the following
34 actions:
 - 35 – If the mobile station does not support analog operation in the requested
36 band class, the mobile station shall send a *Mobile Station Reject Order* with
37 the ORDQ field set to '00000110' (capability not supported by the mobile
38 station) and the mobile station shall remain in the *Mobile Station Origination
39 Attempt Substate*.
 - 40 – If the mobile station supports analog operation in the requested band class,
41 the mobile station shall perform the following actions:

- + If the analog channel type is '00', the mobile station shall perform the following actions:
 - o The mobile station shall store the system identification ($SID_S = SID_r$), voice mobile station attenuation code ($VMAC_S = VMAC_r$), voice channel number ($ANALOG_CHAN_S = ANALOG_CHAN_r$), SAT color code ($SCC_S = SCC_r$), and message encryption mode indicator ($MEM_S = MEM_r$).
 - o The mobile station shall set DTX_S to '00'.
 - o If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and $PACA_CANCEL$ to '0', shall disable the $PACA$ state timer, and should indicate to the user that the $PACA$ call is proceeding.
 - o The mobile station shall enter the Confirm Initial Voice Channel Task (see 2.6.4.2) with an origination indication.
- + If the analog channel type is not '00', the mobile station shall perform the following actions:
 - o If the mobile supports narrow analog mode, the mobile station shall perform the following actions:
 - ◊ The mobile station shall store the system identification ($SID_S = SID_r$), voice mobile station attenuation code ($VMAC_S = VMAC_r$), voice channel number ($ANALOG_CHAN_S = ANALOG_CHAN_r$), message encryption mode indicator ($MEM_S = MEM_r$), analog channel type ($AN_CHAN_TYPE_S = AN_CHAN_TYPE_r$) and the digital SAT code ($DSCC_S = DSCC_MSB_r \times 4 + SCC_r$).
 - ◊ The mobile station shall set DTX_S to '00'.
 - ◊ If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and $PACA_CANCEL$ to '0', shall disable the $PACA$ state timer, and should indicate to the user that the $PACA$ call is proceeding.
 - ◊ The mobile station shall enter the Confirm Initial Narrow Analog Voice Channel Task (see 2.6.5.2A of [22]) with an origination indication.
 - o If the mobile station does not support narrow analog mode, the mobile station shall send a *Mobile Station Reject Order* with the $ORDQ$ field set to '00000110' (capability not supported by the mobile station) and the mobile station shall remain in the *Mobile Station Origination Attempt Substate* of the *System Access State*.
- If $ASSIGN_MODE_r$ equals '100', the mobile station shall perform the following actions:

- If PACAs is equal to enabled, the mobile station shall set PACAs to disabled and PACA_CANCEL to ‘0’, shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- If GRANTED_MODE_r equals ‘00’ and the multiplex option and radio configuration specified in the DEFAULT_CONFIG_r field are not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and shall remain in the *Mobile Station Origination Attempt Substate*.
- If GRANTED_MODE_r equals ‘00’ and DEFAULT_CONFIG_r is not equal to ‘100’, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00001110’ (RC does not match with DEFAULT_CONFIG) and shall remain in the *Mobile Station Origination Attempt Substate* if one of the following conditions is true:
 - + FOR_RC_r is not equal to the Radio Configuration associated with DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
 - + REV_RC_r is not equal to the Radio Configuration associated with DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
- If the mobile station does not support either of the Radio Configurations (FOR_RC or REV_RC), the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- If CH_IND_r = ‘01’ and the mobile station does not support the Fundamental Channel, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- If CH_IND_r = ‘10’ and the mobile station does not support the Dedicated Control Channel, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- If CH_IND_r = ‘11’ and the mobile station does not support the Dedicated Control Channel and Fundamental Channel concurrently, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- If FREQ_INCL_r equals ‘1’ and if the band class (BAND_CLASS_r) is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00000110’ (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- If the mobile station does not send a Mobile Station Reject Order as specified above, it shall continue to perform the actions specified below.

- If FREQ_INCL_r equals '1', the mobile station shall set
 - + CDMABAND_S = BAND_CLASS_r
 - + CDMACH_S = CDMA_FREQ_r
- The mobile station shall store the bypass indicator (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_r).
- The mobile station shall store granted mode (GRANTED_MODE_S = GRANTED_MODE_r)
- The mobile station shall store the default configuration (DEFAULT_CONFIG_S = DEFAULT_CONFIG_r).
- The mobile station shall store the Forward Traffic Channel Radio Configuration (FOR_RC_S = FOR_RC_r) and the Reverse Traffic Channel Radio Configuration (REV_RC_S = REV_RC_r).
- The mobile station shall store the frame offset (FRAME_OFFSET_S = FRAME_OFFSET_r).
- The mobile station shall store the message encryption mode indicator (ENCRYPT_MODE_S = ENCRYPT_MODE_r).
- The mobile station shall perform the following procedures in the order listed below:
 - + If D SIG ENCRYPT MODE_r is included, the mobile station shall perform the following:
 - o If D SIG ENCRYPT MODE_r is equal to '000', the mobile station shall set D SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_S; otherwise, the mobile station shall set D SIG ENCRYPT MODE_S to D SIG ENCRYPT MODE_r, ENC KEY_S to the most recently generated CMEAKEY in the mobile station, associated with the AUTHR of the *Origination Message*, and EXT ENCRYPT SEQ[0] to 256 × ENC SEQ H (the ENC SEQ H field in the *Origination Message*).
 - + If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_S[KEY_SEQ_NEW_{s,p}]. The mobile station shall store KEY_SIZE_r to KEY_SIZE_S. The mobile station shall then increment the variable KEY_SEQ_NEW_{s,p} by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station shall set ENC KEY SIZE_S to ENC KEY SIZE_r.
 - ~~If USE_NEW_KEY_r is included and is set to '0' then the mobile station shall use KEY_S[KEY_SEQ_r] as the session key.~~
 - + If C SIG ENCRYPT MODE is included, the mobile station shall set C SIG ENCRYPT MODE_S to C SIG ENCRYPT MODE_r.

- The mobile station shall store the Forward power control subchannel relative gain ($FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_r$).
- The mobile station shall set $RLGAIN_ADJ_S$ to $RLGAIN_ADJ_r$.
- The mobile station shall set $REV_FCH_GATING_MODE_S$ to $REV_FCH_GATING_MODE_r$.
- The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to $REV_PWR_CNTL_DELAY_r$ if $REV_PWR_CNTL_DELAY_INCL_r$ is equal to ‘1’.
- If $3XFL_1XRL_INCL_r$ is equal to ‘1’, the mobile station shall set $1XRL_FREQ_OFFSET_S$ to $1XRL_FREQ_OFFSET_r$.
- The mobile station shall store the channel indicator ($CH_IND_S = CH_IND_r$) and the mobile station shall perform the following actions:
 - + If CH_IND_r equals ‘01’, the mobile station shall set $FPC_FCH_INIT_SETPT_S$ to $FPC_FCH_INIT_SETPT_r$, $FPC_FCH_CURR_SETPT_S$ to $FPC_FCH_INIT_SETPT_S$, $FPC_FCH_FER_S$ to $FPC_FCH_FER_r$, $FPC_FCH_MIN_SETPT_S$ to $FPC_FCH_MIN_SETPT_r$, $FPC_FCH_MAX_SETPT_S$ to $FPC_FCH_MAX_SETPT_r$, and $FPC_PRI_CHAN_S$ to ‘0’ if the mobile station supports any Radio Configuration greater than 2. Then for each included member of the Active Set, the mobile station shall store the following:
 - o Set the PILOT_PN field to $PILOT_PN_r$.
 - o Set the ADD_PILOT_REC_INCL field to $ADD_PILOT_REC_INCL_r$. If $ADD_PILOT_REC_INCL_r$ equals ‘1’, the mobile station shall store the following:
 - ◊ Set the PILOT_REC_TYPE field of PILOT_REC to $PILOT_REC_TYPE_r$.
 - ◊ If $PILOT_REC_TYPE_r$ equals ‘000’, the mobile station shall set the TD_POWER_LEVEL field of PILOT_REC to $TD_POWER_LEVEL_r$ and set the TD_MODE field of PILOT_REC to TD_MODE_r .
 - ◊ If $PILOT_REC_TYPE_r$ is equal to ‘001’, the mobile station shall
 - Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r .
 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to $AUX_PILOT_WALSH_r$ with the Walsh Code length specified by $WALSH_LENGTH_r$.
 - ◊ If $PILOT_REC_TYPE_r$ is equal to ‘010’, the mobile station shall:
 - Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r .
 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to AUX_WALSH_r with the Walsh Code length specified by $WALSH_LENGTH_r$.

- 1 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
2 AUX_TD_POWER_LEVEL_r.
- 3 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ◊ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 5 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
6 SR3_PRIMARY_PILOT_r.
- 7 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
8 SR3_PILOT_POWER1_r.
- 9 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
10 SR3_PILOT_POWER2_r.
- 11 ◊ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 12 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
13 SR3_PRIMARY_PILOT_r.
- 14 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
15 SR3_PILOT_POWER1_r.
- 16 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
17 SR3_PILOT_POWER2_r.
- 18 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 19 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
20 AUX_PILOT_WALSH_r with the Walsh Code length specified by
21 WALSH_LENGTH_r.
- 22 – If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
23 field of PILOT_REC to QOF1_r and set the
24 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
25 AUX_PILOT_WALSH1_r with the Walsh Code length specified
26 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
27 field of PILOT_REC to QOF_r and set the
28 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
29 AUX_PILOT_WALSH_r with the Walsh Code length specified by
30 WALSH_LENGTH_r.
- 31 – If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2
32 field of PILOT_REC to QOF2_r and set the
33 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
34 AUX_PILOT_WALSH2_r with the Walsh Code length specified
35 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
36 field of PILOT_REC to QOF_r and set the
37 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
38 AUX_PILOT_WALSH_r with the Walsh Code length specified by
39 WALSH_LENGTH_r.
- 40 o Set the PWR_COMB_IND field to PWR_COMB_IND_r.

- 1 o Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 2 o Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 3 + If CH_IND_r equals '01' and 3X_FCH_INFO_INCL_r equals to '1', for each
4 included member of the Active Set, the mobile station store the following:
- 5 o If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
6 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
7 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
8 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
9 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 10 o If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
11 field to QOF_MASK_ID_FCH_HIGH_r and the CODE_CHAN_FCH_HIGH
12 field to CODE_CHAN_FCH_HIGH_r. Otherwise, set the
13 QOF_MASK_ID_FCH_HIGH field to QOF_MASK_ID_FCH_r and the
14 CODE_CHAN_FCH_HIGH to CODE_CHAN_FCH_r.
- 15 + If CH_IND_r equals '10', the mobile station shall set
16 FPC_DCCH_INIT_SETPT_S to FPC_DCCH_INIT_SETPT_r,
17 FPC_DCCH_CURR_SETPT_S to FPC_DCCH_INIT_SETPT_S,
18 FPC_DCCH_FER_S to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_S to
19 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_S to
20 FPC_DCCH_MAX_SETPT_r, and FPC_PRI_CHAN_S to '1' if the mobile station
21 supports any Radio Configuration greater than 2. Then for each included
22 member of the Active Set, the mobile station shall store the following:
- 23 o Set the PILOT_PN to PILOT_PN_r.
- 24 o Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL. If
25 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
26 the following:
 - 27 ◊ Set the PILOT_REC_TYPE field of PILOT_REC to
28 PILOT_REC_TYPE_r.
 - 29 ◊ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
30 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
31 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - 32 ◊ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
 - 33 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 34 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
35 AUX_PILOT_WALSH_r with the Walsh Code length specified by
36 WALSH_LENGTH_r.
 - 37 ◊ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 38 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.

- Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to AUX_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- Set the AUX_TD_POWER_LEVEL field of PILOT_REC to AUX_TD_POWER_LEVEL_r.
- Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- ◊ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of PILOT_REC to SR3_PRIMARY_PILOT_r.
 - Set the SR3_PILOT_POWER1 field of PILOT_REC to SR3_PILOT_POWER1_r.
 - Set the SR3_PILOT_POWER2 field of PILOT_REC to SR3_PILOT_POWER2_r.
- ◊ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
 - Set the SR3_PRIMARY_PILOT field of PILOT_REC to SR3_PRIMARY_PILOT_r.
 - Set the SR3_PILOT_POWER1 field of PILOT_REC to SR3_PILOT_POWER1_r.
 - Set the SR3_PILOT_POWER2 field of PILOT_REC to SR3_PILOT_POWER2_r.
 - Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field of PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length specified by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE1 field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.

- If ADD_INFO_INCL_{2r} is equal to '1', set the AUX_PILOT_QOF2 field of PILOT_REC to QOF_{2r} and set the AUX_PILOT_WALSH_CODE2 field of PILOT_REC to AUX_PILOT_WALSH_{2r} with the Walsh Code length specified by WALSH_LENGTH_{2r}; otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE2 field of PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
 - o Set the PWR_COMB_IND field to PWR_COMB_IND_r.
 - o Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
 - o Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
 - o Set the DCCH_INCL field to DCCH_INCL_r. If DCCH_INCL_r equals '1', the mobile station shall store the following:
 - ◊ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
 - ◊ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH_r.
- + If CH_IND_r equals '10' and 3X_DCCH_INFO_INCL_r equals to '1', for each included member of the Active Set, the mobile station shall store the following:
 - o If 3X_DCCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r and the CODE_CHAN_DCCH_LOW field to CODE_CHAN_DCCH_LOW_r. Otherwise, set the QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
 - o If 3X_DCCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r and the CODE_CHAN_DCCH_HIGH field to CODE_CHAN_DCCH_HIGH_r. Otherwise, set the QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.

- 1 + If CH_IND_r equals '11', the mobile station shall set
 2 FPC_FCCH_INIT_SETPT_S to FPC_FCH_INIT_SETPT_r,
 3 FPC_FCH_CURR_SETPT_S to FPC_FCH_INIT_SETPT_S, FPC_FCH_FER_S to
 4 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_r,
 5 FPC_FCH_MAX_SETPT_S to FPC_FCH_MAX_SETPT_r,
 6 FPC_DCCH_INIT_SETPT_S to FPC_DCCH_INIT_SETPT_r,
 7 FPC_DCCH_CURR_SETPT_S to FPC_DCCH_INIT_SETPT_S,
 8 FPC_DCCH_FER_S to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_S to
 9 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_S to
 10 FPC_DCCH_MAX_SETPT_r and FPC_PRI_CHAN_S to FPC_PRI_CHAN_r.
 11 Then for each included member of the Active Set, the mobile station shall
 12 store the following:
- 13 o Set the PILOT_PN to PILOT_PN_r.
- 14 o Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC. If
 15 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
 16 the following:
- 17 ◊ Set the PILOT_REC_TYPE field of PILOT_REC to
 18 PILOT_REC_TYPE_r.
- 19 ◊ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
 20 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
 21 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 22 ◊ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
- 23 - Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 24 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
 25 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 26 WALSH_LENGTH_r.
- 27 ◊ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 28 - Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 29 - Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
 30 AUX_WALSH_r with the Walsh Code length specified by
 31 WALSH_LENGTH_r.
- 32 - Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
 33 AUX_TD_POWER_LEVEL_r.
- 34 - Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 35 ◊ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 36 - Set the SR3_PRIMARY_PILOT field of PILOT_REC to
 37 SR3_PRIMARY_PILOT_r.
- 38 - Set the SR3_PILOT_POWER1 field of PILOT_REC to
 39 SR3_PILOT_POWER1_r.

- 1 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
2 SR3_PILOT_POWER2_r.
- 3 ◊ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 4 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
5 SR3_PRIMARY_PILOT_r.
- 6 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
7 SR3_PILOT_POWER1_r.
- 8 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
9 SR3_PILOT_POWER2_r.
- 10 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 11 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_PILOT_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
- 14 – If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
15 field of PILOT_REC to QOF1_r and set the
16 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
17 AUX_PILOT_WALSH1_r with the Walsh Code length specified
18 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
19 field of PILOT_REC to QOF_r and set the
20 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
21 AUX_PILOT_WALSH_r with the Walsh Code length specified by
22 WALSH_LENGTH_r.
- 23 – If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2
24 field of PILOT_REC to QOF2_r and set the
25 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
26 AUX_PILOT_WALSH2_r with the Walsh Code length specified
27 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
28 field of PILOT_REC to QOF_r and set the
29 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
30 AUX_PILOT_WALSH_r with the Walsh Code length specified by
31 WALSH_LENGTH_r
- 32 o Set the PWR_COMB_IND field to PWR_COMB_IND_r
- 33 o Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 34 o Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 35 o Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- 36 o Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH_r.
- 37 + If CH_IND_r equals '11' and 3X_FCH_INFO_INCL_r equals to '1', for each
38 included member of the Active Set, the mobile station store the following:

- 1 o If $3X_{FCH_LOW_INCL_r}$ equals '1', set the $QOF_MASK_ID_FCH_LOW$
2 field to $QOF_MASK_ID_FCH_LOW_r$ and the $CODE_CHAN_FCH_LOW$
3 field to $CODE_CHAN_FCH_LOW_r$. Otherwise, set the
4 $QOF_MASK_ID_FCH_LOW$ field to $QOF_MASK_ID_FCH_r$ and the
5 $CODE_CHAN_FCH_LOW$ to $CODE_CHAN_FCH_r$.
- 6 o If $3X_{FCH_HIGH_INCL_r}$ equals '1', set the $QOF_MASK_ID_FCH_HIGH$
7 field to $QOF_MASK_ID_FCH_HIGH_r$ and the $CODE_CHAN_FCH_HIGH$
8 field to $CODE_CHAN_FCH_HIGH_r$. Otherwise, set the
9 $QOF_MASK_ID_FCH_HIGH$ field to $QOF_MASK_ID_FCH_r$ and the
10 $CODE_CHAN_FCH_HIGH$ to $CODE_CHAN_FCH_r$.
- 11 + If CH_IND_r equals '11' and $3X_{DCCH_INFO_INCL_r}$ equals to '1', for each
12 included member of the Active Set, the mobile station store the following:
- 13 o If $3X_{DCCH_LOW_INCL_r}$ equals '1', set the
14 $QOF_MASK_ID_DCCH_LOW$ field to $QOF_MASK_ID_DCCH_LOW_r$ and
15 the $CODE_CHAN_DCCH_LOW$ field to $CODE_CHAN_DCCH_LOW_r$.
16 Otherwise, set the $QOF_MASK_ID_DCCH_LOW$ field to
17 $QOF_MASK_ID_FCH_r$ and the $CODE_CHAN_DCCH_LOW$ to
18 $CODE_CHAN_FCH_r$.
- 19 o If $3X_{DCCH_HIGH_INCL_r}$ equals '1', set the
20 $QOF_MASK_ID_DCCH_HIGH$ field to $QOF_MASK_ID_DCCH_HIGH_r$
21 and the $CODE_CHAN_DCCH_HIGH$ field to
22 $CODE_CHAN_DCCH_HIGH_r$. Otherwise, set the
23 $QOF_MASK_ID_DCCH_HIGH$ field to $QOF_MASK_ID_FCH_r$ and the
24 $CODE_CHAN_DCCH_HIGH$ to $CODE_CHAN_FCH_r$.
- 25 - The mobile station shall initialize $CODE_CHAN_LIST$ as described in 2.6.8,
26 and shall set $SERV_NEG_S$ to enabled.
- 27 - If $FREQ_INCL_r$ equals '1', the mobile station shall then tune to the new
28 frequency assignment.
- 29 - The mobile station shall then enter the *Traffic Channel Initialization Substate*
30 of the *Mobile Station Control on the Traffic Channel State*.

31 **6.7. Feature Notification Message:** If $RELEASE_r$ is equal to '1', the mobile station
32 shall enter the *Mobile Station Idle State* or the *System Determination Substate* of the
33 *Mobile Station Initialization State* with a release indication (see 2.6.1.1).

34 **7.8. Intercept Order:** The mobile station shall enter the *Mobile Station Idle State*.

35 **8.9. Local Control Order**

36 **9.10. Lock Until Power-Cycled Order:** The mobile station shall disable its transmitter
37 and record the reason for the *Lock Until Power-Cycled Order* in the mobile station's
38 semi-permanent memory ($LCKRSN_{P_{S-p}}$ equals the least significant four bits of
39 $ORDQ_r$). The mobile station should notify the user of the locked condition. The
40 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
41 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*

1 Access State again until after the next mobile station power-up or until it has
 2 received an *Unlock Order*. This requirement shall take precedence over any other
 3 mobile station requirement specifying entry to the *System Access State*.

4 **10-11. Maintenance Required Order:** The mobile station shall record the reason for the
 5 *Maintenance Required Order* in the mobile station's semi-permanent memory
 6 ($\text{MAINTRSN}_{\text{S-p}}$ equals the least significant four bits of ORDQ_r). The mobile station
 7 shall remain in the unlocked condition. The mobile station should notify the user of
 8 the maintenance required condition.

9 **11-12. PACA Message:** If P_REV_IN_USE_S is less than or equal to four and the mobile
 10 station does not support PACA capability, the mobile station shall send a *Mobile*
 11 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
 12 capability that is not supported by the mobile station); otherwise, the mobile station
 13 shall process the message as follows:

- 14 • If PACAS_S is equal to disabled, the mobile station shall perform the following
 15 actions:
 - 16 – If the purpose of the message is to respond to an *Origination Message*
 (PURPOSE_r is equal to '0000'), the mobile station shall perform the following
 actions:
 - 19 + The mobile station shall set PACAS_S to enabled and shall set PACA_SID_S to
 SID_S .
 - 21 + The mobile station shall set the PACA state timer to the duration shown
 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_S .
 - 23 + The mobile station should indicate to the user that the call has been
 queued as a PACA call, and should indicate the current queue position
 (Q_POS_r) of the call.
 - 26 + The mobile station shall enter the *Mobile Station Idle State*.
 - 27 – If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
 to '0011'), the mobile station shall perform the following actions:
 - 29 + The mobile station shall set PACAS_S to disabled and PACA_CANCEL to '0',
 shall disable the PACA state timer, and should indicate to the user that
 the PACA call has been canceled.
 - 32 + The mobile station shall enter the *Mobile Station Idle State*.
 - 33 – If the purpose of the message is anything else (PURPOSE_r is not equal to
 '0000' or '0011'), the mobile station shall ignore the message. The mobile
 station shall remain in the *Mobile Station Origination Attempt Substate*.
- 36 • If PACAS_S is equal to enabled, the mobile station shall perform the following
 37 actions:
 - 38 – If the purpose of the message is to respond to an *Origination Message*
 (PURPOSE_r is equal to '0000'), the mobile station shall perform the following
 actions:

- + The mobile station should indicate to the user that the PACA call is still queued, and should indicate to the user the current queue position (Q_{POS_r}) of the call.
- + The mobile station shall set the PACA state timer to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of $PACA_TIMEOUT_s$.
- + The mobile station shall enter the *Mobile Station Idle State*.
- If the purpose of the message is to provide the queue position of the PACA call ($PURPOSE_r$ is equal to '0001'), the mobile station shall perform the following actions:
 - + The mobile station should indicate to the user that the PACA call is still queued, and should indicate the current queue position (Q_{POS_r}) of the call.
 - + The mobile station shall set the PACA state timer to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of $PACA_TIMEOUT_s$.
 - + The mobile station shall enter the *Mobile Station Idle State*.
- If the purpose of the message is to instruct the mobile station to re-originate the PACA call ($PURPOSE_r$ is equal to '0010'), the mobile station shall remain in the *Mobile Station Origination Attempt Substate*.
- If the purpose of the message is to cancel the PACA call ($PURPOSE_r$ is equal to '0011'), the mobile station shall perform the following actions:
 - + The mobile station shall set $PACAs$ to disabled, shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
 - + The mobile station shall enter the *Mobile Station Idle State*.

4.2.13. Registration Accepted Order:

- If $ORDQ_r = '00000101'$, the mobile station shall set $ROAM_INDI_s = \text{to ROAM_INDI}_r$ and should display the roaming condition.
- If $ORDQ_r = '00000111'$, the mobile station shall perform the following
 - The mobile station shall set $ROAM_INDI_s = ROAM_INDI_r$ and should display the roaming condition.
 - The mobile station shall set $C_SIG_ENCRYPT_MODE_s = \text{to } C_SIG_ENCRYPT_MODE_r$.
 - ~~If $USE_NEW_KEY_r$ is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in $KEY_s[KEY_SEQ_NEW_{s,p}]$. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s . The mobile station shall increment the variable $KEY_SEQ_NEW_{s,p}$ by one (modulo 16). If $ENC_KEY_SIZE_r$ is included, the mobile station shall set $ENC_KEY_SIZE_s$ to $ENC_KEY_SIZE_r$.~~

- If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.
- If C SIG ENCRYPT MODE_r is not equal to '000', the mobile station shall set ENC KEY_s to the most recently generated CMKEY in the mobile station associated with the AUTHR of the *Registration Message*, and EXT ENCRYPT SEQ[0] and EXT ENCRYPT SEQ[1] to $256 \times \text{ENC SEQ H}$ (the ENC SEQ H field in the *Registration Message*).

13-14. Registration Rejected Order: This order indicates that normal service is not available on this system. The mobile station shall disable the full-TMSI timer. If the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set all the bits of the TMSI_CODE_{s-p} to '1'. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).

14-15. Release Order: If NDSS_ORIG_S is equal to enabled, the mobile station shall set NDSS_ORIG_S to disabled, and should indicate to the user that the call origination has been canceled. The mobile station shall enter the *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile Station Initialization State* with a release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle State*, and if PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.

15-16. Reorder Order: If NDSS_ORIG_S is equal to enabled, the mobile station shall set NDSS_ORIG_S to disabled, and should indicate to the user that the call origination has been canceled. If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled. The mobile station shall enter the *Mobile Station Idle State*.

16-17. Retry Order: ~~This order indicates that the origination is rejected and specifies the time before which the mobile station shall not send an Origination Message containing the same packet data Service Option.~~ The mobile station shall process the order as follows:

- If RETRY_TYPE_r is equal to '000', the mobile station shall set RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010', or '011'.
- If RETRY_TYPE_r is equal to '001', then the mobile station shall perform the following:
 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set RETRY_DELAY_S[RETRY_TYPE_r] to 0.
 - If RETRY_DELAY_r is not equal to '00000000' the mobile station shall set RETRY_DELAY_S as follows:

- + If the most significant bit of the RETRY_DELAY_r is '0', set RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_s to 60000ms.
- + The mobile station shall set RETRY_DELAY_VALUE_s to the seven least significant bits of RETRY_DELAY_r.
- + The mobile station shall store the next system time 80 ms boundary + RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as RETRY_DELAY_s[RETRY_TYPE_r].
- + If NDSS_ORIG_s is equal to enabled, the mobile station shall set NDSS_ORIG_s to disabled, and should indicate to the user that the call origination has been canceled. If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- + The mobile station shall enter the *Mobile Station Idle State*.

17.18. Security Mode Command Message: The mobile station shall process the message as follows:

- The mobile station shall set C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- ~~If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_{s-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s. The mobile station shall then increment the variable KEY_SEQ_NEW_{s-p} by one (modulo 16). If ENC KEY SIZE_r is included, the mobile station shall set ENC KEY SIZE_s to ENC KEY SIZE_r.~~
- ~~If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.~~

18.19. Service Redirection Message: The mobile station shall process the message as follows:

- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).
- If DELETE TMSI_r is equal to '1', the mobile station shall set all the bits of TMSI_CODE_{s-p} to '1'.
- The mobile station shall disable the full-TMSI timer.
- The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.

- If RECORD_TYPE_r is '00000000', the mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r, and enter the *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise:
 - if REDIRECT_TYPE_r is '0', the mobile station shall store the redirection record received in the message as REDIRECT_REC_s and shall enter the System Determination Substate of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).
 - if REDIRECT_TYPE_r is '1', the mobile station shall store the redirection record received in the message as REDIRECT_REC_s and shall enable NDSS_ORIG_s, and shall record the dialed digits (if any). The mobile station shall enter the System Determination Substate of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).

19-20. SSD Update Message: The mobile station shall respond to the message as specified in 2.3.12.1.5.

20-21. Status Request Message: The mobile station shall disable the *System Access State* timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three, the mobile station shall respond with a *Status Response Message*. If P_REV_IN_USE_s is greater than three, the mobile station shall respond with an *Extended Status Response Message*. If the message does not specify any qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile station shall include the requested information records in the response. If the message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the mobile station shall only include the requested information records for the specified band class (BAND_CLASS_r) in the response. If the message specifies a band class and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile station shall only include the requested information records for the specified band class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response. If the message specifies a band class or a band class and an operating mode which are not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a capability that is not supported by the mobile station). If the response to this message exceeds the allowable length, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).

21-22. TMSI Assignment Message: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,

- 1 • The mobile station shall store the assigning TMSI zone number by setting the
2 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
3 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 4 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
5 TMSI_CODE_r.

6 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
7 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
8 mobile station shall then respond with a *TMSI Assignment Completion Message*
9 within T56m seconds.

10 [22.23. User Zone Reject Message](#)

11 [23.24. Any other message:](#) If the mobile station receives any other message specified in
12 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
13 other messages.

14 [24. Base Station Reject Order:](#)

- 15 • ~~If ORDQ_r = '00000000', the mobile station shall set KEY_s to NULL and set
16 C_SIG_ENCRYPT_MODE to '000'. The mobile station shall re originate by
17 sending a new Origination Message.~~
- 18 • ~~If ORDQ_r = '00000001', the mobile station shall send a Security Mode Request
19 Message with the ENC_SIG_H field included in it. If the mobile receives two Base
20 Station Reject Orders without successfully decrypting any encrypted messages
21 from the base station between the orders, the mobile station shall set
22 REG_ENCRYPT_RESYN to YES and the mobile station shall go to the System
23 Determination Substate with an encryption failure indication.~~

24 If the mobile station performs an access probe handoff or access handoff and receives any
25 of the following messages, it shall process the message as specified in 2.6.3.1.3:

26 • [If the mobile station is currently monitoring the Paging Channel:](#)

- 27 1. *System Parameters Message*
- 28 2. *Access Parameters Message*
- 29 3. *Neighbor List Message*
- 30 4. *Extended System Parameters Message*
- 31 5. *Extended Neighbor List Message*
- 32 6. *General Neighbor List Message*
- 33 7. *Global Service Redirection Message*
- 34 8. *Extended Global Service Redirection Message*

35 • [If the mobile station is currently monitoring the Primary Broadcast Control Channel:](#)

- 36 1. *ANSI-41 System Parameters Message*
- 37 2. *Enhanced Access Parameters Message*

3. Universal Neighbor List Message
4. MC-RR Parameters Message
5. Extended Global Service Redirection Message

2.6.3.6 Registration Access Substate

In this substate, the mobile station sends a *Registration Message*. If the base station responds with an authentication request, the mobile station responds in this substate.

Upon entering the *Registration Access Substate*, the mobile station shall send the *Registration Message*.

If a message received from the base station requires a Layer 2 acknowledgment and does not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is outstanding (see 2.1.1.2.2.1 of [4]).

If a message received from the base station requires a Layer 2 acknowledgment and also a Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see 2.1.1.2.2.1 of [4]).

When transmitting a response to a message received from the base station, Layer 3 shall indicate to Layer 2 that the type of the message is a response (see 2.1.1.2.2.1 of [4]).

When transmitting an autonomous message (i.e., a message that is not sent as a response to a message received from the base station) other than the *Registration Message*, Layer 3 shall indicate to Layer 2 that the type of the message is a request other than a registration request or a message transmission request (see 2.1.1.2.2.1 of [4]).

When transmitting an autonomous *Registration Message* (i.e., it is not sent as a response to a *Registration Request Order* received from the base station), Layer 3 shall indicate to Layer 2 that the type of the message is a request that is a registration (see 2.1.1.2.2.1 of [4]).

While in this substate, the mobile station shall monitor the Paging Channel or the Forward Common Control Channel. If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel (see [2.6.2.1.1.4](#) [2.6.3.1.8](#)), the mobile station shall perform the following:

- If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- The mobile station shall declare an access attempt failure and update its registration variables as specified in 2.6.5.5.3.2.
- The mobile station shall disable its transmitter and enter the *Mobile Station Idle State*.

If the mobile station receives confirmation of delivery of any message sent by the mobile station in this substate, it shall then enter the *Mobile Station Idle State* unless:

- 1 • If the registration access was initiated due to a user direction to power down, the
2 mobile station shall update registration variables as specified in 2.6.5.5.3.3 and may
3 power down.
- 4 • If the mobile station has included the ENC_SEQ_H field in the *Registration Message*,
5 then the mobile station should set this field to one plus the previous value of this
6 field (if any).
- 7 • If the mobile station has included the ENC_SEQ_H field in the *Registration*
8 *Message*, then the mobile station shall set EXT_ENC_SEQ_S to $265 \times \text{ENC_SEQ_H}$.
- 9 • If the a message received from the base station requires a response, the mobile
10 station shall send a response to the message in this substate.

11 If the mobile station receives confirmation of delivery of the *Registration Message*, the
12 mobile station shall update its registration variables as specified in 2.6.5.5.3.1.

13 If the mobile station is directed by the user to originate a call, the mobile station may
14 process the origination request as follows:

- 15 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
16 access attempt in progress.
- 17 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
18 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
19 user that the PACA call has been canceled.
- 20 • The mobile station shall enter the *Mobile Station Origination Attempt Substate* with
21 an origination indication.

22 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
23 user directs the mobile station to cancel a PACA call.

24 If the mobile station receives a mobile-station-addressed page, the mobile station may
25 determine if there is a page match (see 2.6.2.3). If a match is declared, the mobile station
26 shall perform the following:

- 27 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
28 access attempt in progress.
- 29 • The mobile station shall enter the *Page Response Substate*.

30 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
31 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
32 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
33 the message has been sent and acknowledged.

34 If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a
35 message being transmitted was not terminated as a result of processing the Layer 2 fields of
36 the received message, the mobile station shall ignore the received message.

37 The following directed messages and orders can be received. If any field value of the
38 message or order is outside its permissible range, the mobile station may send a *Mobile*
39 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 1 1. *Authentication Challenge Message*: If the registration access was initiated due to a
2 user direction to power down, the mobile station shall ignore the message;
3 otherwise, the mobile station shall respond to the message as specified in
4 2.3.12.1.4, regardless of the value of AUTH_S.
- 5 2. *Base Station Challenge Confirmation Order*: If the registration access was initiated
6 due to a user direction to power down, the mobile station shall ignore the message;
7 otherwise, the mobile station shall respond to the message as specified in
8 2.3.12.1.5.

9 **3. Base Station Reject Order:**

- 10 • If ORDQ_R = '00000001', the mobile station shall send a *Security Mode Request*
11 *Message with the ENC SIG H field included in it. If the mobile receives two *Base**
12 *Station Reject Orders without successfully decrypting any encrypted messages*
13 *from the base station between the orders, the mobile station shall set*
14 *REG_ENCRYPT RESYNC to YES and the mobile station shall go to the *System**
15 *Determination Substate with an encryption failure indication.*

16 **34. Data Burst Message**

17 **45. Feature Notification Message**

18 **56. Local Control Order**

19 **67. Lock Until Power-Cycled Order**: The mobile station shall disable its transmitter and
20 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
21 permanent memory (LCKRSN_{S-p} equals the least significant four bits of ORDQ_R).
22 The mobile station should notify the user of the locked condition. The mobile
23 station shall enter the *System Determination Substate* of the *Mobile Station*
24 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
25 *Access State* again until after the next mobile station power-up or until it has
26 received an *Unlock Order*. This requirement shall take precedence over any other
27 mobile station requirement specifying entry to the *System Access State*.

28 **78. Maintenance Required Order**: The mobile station shall record the reason for the
29 *Maintenance Required Order* in the mobile station's semi-permanent memory
30 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_R). The mobile station
31 shall remain in the unlocked condition. The mobile station should notify the user of
32 the maintenance required condition.

33 **89. PACA Message**: If P_REV_IN_USE_S is less than or equal to four and the mobile
34 station does not support PACA capability, the mobile station shall send a *Mobile*
35 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
36 capability that is not supported by the mobile station); otherwise, the mobile station
37 shall process the message as follows:

38 If PACA_S is equal to disabled, the mobile station shall send a *Mobile Station Reject*
39 *Order* with the ORDQ field set to '00000010' (message not accepted in this state).

40 If PACA_S is equal to enabled, the mobile station shall perform the following:

- 1 • If the purpose of the message is to respond to an *Origination Message*
2 (PURPOSE_r is equal to '0000'), the mobile station shall send a *Mobile Station*
3 *Reject Order* with the ORDQ field set to '00000010' (message not accepted in this
4 state).
- 5 • If the purpose of the message is to provide the queue position of the PACA call
6 (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA state timer
7 to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of
8 PACA_TIMEOUT_S, should indicate to the user that the PACA call is still queued,
9 and should indicate to the user the current queue position (Q_POS_r) of the call.
- 10 • If the purpose of the message is to instruct the mobile station to re-originate the
11 PACA call (PURPOSE_r is equal to '0010'), Layer 3 shall send an L2-
12 Supervision.Request primitive to Layer 2 to abort any access attempt in
13 progress, shall set the PACA state timer to the duration shown in Table
14 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_S, and shall enter
15 the *Mobile Station Origination Attempt Substate* with a PACA response indication.
- 16 • If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal to
17 '0011'), the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0',
18 shall disable the PACA state timer, and should indicate to the user that the
19 PACA call has been canceled.

20 910. *Registration Accepted Order:*

- 21 • If ORDQ_r = '00000101', the mobile station shall set ROAM_INDI_S = ROAM_INDI_r
22 and should display the roaming condition.
- 23 • If ORDQ_r = '00000111', the mobile station shall perform the following
 - 24 - The mobile station shall set ROAM_INDI_S ~~=to~~ ROAM_INDI_r and should
25 display the roaming condition.
 - 26 - The mobile station shall set C SIG_ENCRYPT_MODE_S ~~=to~~
27 C SIG_ENCRYPT_MODE_r.
- 28 - If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile
29 station shall use the session key generated at the most recent registration for
30 encryption of signaling and user information. The mobile station shall store
31 the session key in KEY_S[KEY_SEQ_NEW_S_p]. The mobile station shall store
32 KEY_SIZE_r in KEY_SIZE_S. The mobile station shall increment the variable
33 KEY_SEQ_NEW_S_p by one (modulo 16). If ENC KEY SIZE_r is included, the
34 mobile station shall set ENC KEY SIZE_S to ENC KEY SIZE_r.
- 35 - If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall
36 use KEY_S[KEY_SEQ_r] as the session key.
- 37 - If C SIG ENCRYPT MODE_r is not equal to '000', the mobile station shall set
38 ENC KEY_S to the most recently generated CMEAKEY in the mobile station,
39 associated with the AUTHR of the Registration Message, and
40 EXT ENCRYPT SEQ[0] and EXT ENCRYPT SEQ[1] to 256 × ENC SEQ H
41 (the ENC SEQ H field in the Registration Message).

- 1 • The mobile station shall then enter the *Mobile Station Idle State*.

2 **4.011.** *Registration Rejected Order:* This order indicates that normal service is not available
 3 on this system. The mobile station shall disable the full-TMSI timer. If the received
 4 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
 5 all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System*
 6 *Determination Substate* of the *Mobile Station Initialization State* with a registration
 7 rejected indication (see 2.6.1.1).

8 **4.012.** *Release Order:* If NDSS_ORIG_S is equal to enabled, the mobile station shall set
 9 NDSS_ORIG_S to disabled, and should indicate to the user that the call origination
 10 has been canceled. The mobile station shall enter the *Mobile Station Idle State* or the
 11 *System Determination Substate* of the *Mobile Station Initialization State* with a release
 12 indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle State*, and
 13 if PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 14 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 15 user that the PACA call has been canceled.

16 **4.013.** *Retry Order:* The mobile station shall process the message as follows:

- 17 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
 18 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
 19 or '011'.
- 20 • If RETRY_TYPE_r is equal to '001', the mobile station shall perform the following:
 - 21 – If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
 22 RETRY_DELAY_S[RETRY_TYPE_r] to 0.
 - 23 – If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
 24 RETRY_DELAY_S[RETRY_TYPE_r] as follows:
 - 25 + If the most significant bit of the RETRY_DELAY_r is '0', set
 26 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
 27 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_S to 60000ms.
 - 28 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
 29 significant bits of RETRY_DELAY_r.
 - 30 + The mobile station shall store the next system time 80 ms boundary +
 31 RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as
 32 RETRY_DELAY_S[RETRY_TYPE_r].

33 **4.014.** *Security Mode Command Message:* The mobile station shall process the message as
 34 follows:

- 35 • The mobile station shall set C_SIG_ENCRYPT_MODE_S to
 36 C_SIG_ENCRYPT_MODE_r.

- If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_{s-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s. The mobile station shall then increment the variable KEY_SEQ_NEW_{s-p} by one (modulo 16). If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.

1415. Service Redirection Message: The mobile station shall process the message as follows:

- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).
- If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the redirection record received in the message as REDIRECT_REC_s and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).

1516. SSD Update Message: If the registration access was initiated due to a user direction to power down, the mobile station shall ignore the message. Otherwise, the mobile station shall respond to the message as specified in 2.3.12.1.5.

1617. Status Request Message: The mobile station shall disable the *System Access State* timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three, the mobile station shall respond with a *Status Response Message*. If P_REV_IN_USE_s is greater than three, the mobile station shall respond with an *Extended Status Response Message*. If the message does not specify any qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile station shall include the requested information records in the response. If the message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the mobile station shall only include the requested information records for the specified band class (BAND_CLASS_r) in the response. If the message specifies a band class and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile station shall only include the requested information records for the specified band class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response.

If the message specifies a band class or a band class and an operating mode which are not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a capability that is not supported by the mobile station). If the response to this message exceeds the allowable length, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).

4718. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r;
- The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to TMSI_CODE_r.

The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within T_{56m} seconds.

4819. *User Zone Reject Message*

4920. *Any other message*: If the mobile station receives any other message specified in Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all other messages.

20. Base Station Reject Order:

- ~~If ORDQ_r = '00000001', the mobile station shall send a *Security Mode Request Message* with the ENC_SIG_H field included in it. If the mobile receives two *Base Station Reject Orders* without successfully decrypting any encrypted messages from the base station between the orders, the mobile station shall set REG_ENCRYPT_RESYNC to YES and the mobile station shall go to the *System Determination Substate* with an encryption failure indication.~~

2.6.3.7 Mobile Station Message Transmission Substate

In this substate, the mobile station sends a *Data Burst Message* or a *Device Information Message*. If the base station responds with an authentication request, the mobile station responds in this substate.

Support of this substate is optional.

If a message received from the base station requires a Layer 2 acknowledgment and does not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is outstanding (see 2.1.1.2.2.1 of [4]).

If a message received from the base station requires a Layer 2 acknowledgment and also a Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see 2.1.1.2.2.1 of [4]).

When transmitting a response to a message received from the base station, Layer 3 shall indicate to Layer 2 that the type of the message is a response (see 2.1.1.2.2.1 of [4]).

When transmitting an autonomous message (i.e., a message that is not sent as a response to a message received from the base station) other than the *Data Burst Message*, Layer 3 shall indicate to Layer 2 that the message is a request other than a registration request or a message transmission request (see 2.1.1.2.2.1 of [4]).

When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2 that the type of the message is a request that is a message transmission (see 2.1.1.2.2.1 of [4]).

Upon entering the *Mobile Station Message Transmission Substate*, the mobile station shall transmit the message as follows:

- The mobile station shall exit the *Mobile Station Message Transmission Substate*, shall enter either the *Mobile Station Idle State* or the *System Determination Substate* with an ACCT blocked indication, and should indicate to the user that the message transmission has terminated if all of the following conditions are true:

- P_REV_IN_USE_S is greater than six,
- ACCT is enabled for the service option number associated with the data burst message, due to either of the following two conditions:
 - + The service option number associated with the data burst message is equal to an ACCT SO entry in ACCT SO LIST, or
 - + The service option group number of the service option associated with the data burst message is equal to an ACCT SO GRP entry in ACCT SO GRP LIST.

- If the mobile station entered this substate with a message transmission indication, the mobile station shall transmit the *Data Burst Message* to the base station.
- If the mobile station entered this substate with a hook status indication, the mobile station shall set the autonomous message timer equal to AUTO_MSG_INTERVAL_S and shall start the timer. The mobile station shall transmit the *Device Information Message* to the base station, with the RECORD_TYPE field of the message set to 00100000 and the Hook Indicator field set to the current hook status.

While in this substate, the mobile station shall monitor the Paging Channel or the Forward Common Control Channel. If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel (see [2.6.2.1.1.4](#) [2.6.3.1.8](#)), the mobile station shall perform the following:

- If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- The mobile station shall declare an access attempt failure and update its registration variables as specified in 2.6.5.5.3.2.
- The mobile station shall disable its transmitter and enter the *Mobile Station Idle State*.

If the mobile station receives confirmation of any message sent by the mobile station in this substate, it shall send a response in this substate if required and shall then enter the *Mobile Station Idle State*.

If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the user directs the mobile station to cancel a PACA call.

If the mobile station receives a mobile-station-addressed page, the mobile station may determine whether there is a page match (see 2.6.2.3). If a match is declared, the mobile station shall perform the following:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall enter the *Page Response Substate*.
- If the mobile station entered this substate with a message transmission indication, the mobile station may store the *Data Burst Message* for later transmission.

If the mobile station is to exit the *System Access State* as a result of processing Layer 3 fields of a message requiring an acknowledgment, the mobile station shall exit the *System Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.

If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a message being transmitted was not terminated as a result of processing the Layer 2 fields of the received message, the mobile station shall ignore the received message.

The following directed messages and orders can be received. If any field value of the message or order is outside its permissible range, the mobile station may send a *Mobile Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

1. *Authentication Challenge Message*: The mobile station shall respond to the message as specified in 2.3.12.1.4, regardless of the value of AUTH_S .
2. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the message as specified in 2.3.12.1.5.
3. *Base Station Reject Order*:

- 1 • If $\text{ORDQ}_r = '00000001'$, the mobile station shall send a *Security Mode Request*
 2 *Message* with the ENC SIG H field included in it. If the mobile receives two *Base*
 3 *Station Reject Orders* without successfully decrypting any encrypted messages
 4 from the base station between the orders, the mobile station shall set
 5 $\text{REG_ENCRYPT_RESYNC}$ to YES and the mobile station shall go to the *System*
 6 *Determination Substate* with an encryption failure indication.
- 7 34. *Data Burst Message*
- 8 45. *Local Control Order*
- 9 56. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
 10 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
 11 permanent memory (LCKRSN_{S-p} equals the least significant four bits of ORDQ_r).
 12 The mobile station should notify the user of the locked condition. The mobile
 13 station shall enter the *System Determination Substate* of the *Mobile Station*
 14 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
 15 *Access State* again until after the next mobile station power-up or until it has
 16 received an *Unlock Order*. This requirement shall take precedence over any other
 17 mobile station requirement specifying entry to the *System Access State*.
- 18 67. *Maintenance Required Order*: The mobile station shall record the reason for the
 19 *Maintenance Required Order* in the mobile station's semi-permanent memory
 20 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). The mobile station
 21 shall remain in the unlocked condition. The mobile station should notify the user of
 22 the maintenance required condition.
- 23 78. *PACA Message*: If P_REV_IN_USE_S is less than or equal to four and the mobile
 24 station does not support PACA capability, the mobile station shall send a *Mobile*
 25 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
 26 capability that is not supported by the mobile station); otherwise, the mobile station
 27 shall process the message as follows:
 28 If PACAS_S is equal to disabled, the mobile station shall send a *Mobile Station Reject*
 29 *Order* with the ORDQ field set to '00000010' (message not accepted in this state).
 30 If PACAS_S is equal to enabled, the mobile station shall perform the following:
 31 • If the purpose of the message is to respond to an *Origination Message*
 32 (PURPOSE_r is equal to '0000'), the mobile station shall send a *Mobile Station*
 33 *Reject Order* with the ORDQ field set to '00000010' (message not accepted in this
 34 state).
 35 • If the purpose of the message is to provide the queue position of the PACA call
 36 (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA state timer
 37 to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of
 38 PACA_TIMEOUT_S , should indicate to the user that the PACA call is still queued,
 39 and should indicate to the user the current queue position (Q_{POS}_r) of the call.

- If the purpose of the message is to instruct the mobile station to re-originate the PACA call (PURPOSE_r is equal to '0010'), Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress, shall set the PACA state timer to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s, and shall enter the *Mobile Station Origination Attempt Substate* with a PACA response indication.
- If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal to '0011'), the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.

89. Registration Accepted Order:

- If ORDQ_r = '00000101', the mobile station shall set ROAM_INDI_S = ROAM_INDI_r and should display the roaming condition.
- If ORDQ_r = '00000111', the mobile station shall perform the following
 - The mobile station shall set ROAM_INDI_S ~~=to~~ ROAM_INDI_r and should display the roaming condition.
 - The mobile station shall set C_SIG_ENCRYPT_MODE_S ~~=to~~ C_SIG_ENCRYPT_MODE_r.
 - ~~If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_S[KEY_SEQ_NEW_{S-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_S. The mobile station shall increment the variable KEY_SEQ_NEW_{S-p} by one (modulo 16). If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_S to ENC_KEY_SIZE_r.~~
 - ~~If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_S[KEY_SEQ_r] as the session key.~~
 - ~~If C SIG ENCRYPT MODE_r is not equal to '000', the mobile station shall set ENC_KEY_S to the most recently generated CMEAKEY in the mobile station associated with the AUTHR of the *Registration Message*, and EXT ENCRYPT SEQ[0] and EXT ENCRYPT SEQ[1] to 256 × ENC SEQ H (the ENC SEQ H field in the *Registration Message*).~~

90. Registration Rejected Order: This order indicates that normal service is not available on this system. The mobile station shall disable the full-TMSI timer. If the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).

911. Retry Order: The mobile station shall process the message as follows:

- 1 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
2 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
3 or '011'.
4 • If RETRY_TYPE_r is equal to '001', the mobile station shall perform the following:
5 – If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
6 RETRY_DELAY_S[RETRY_TYPE_r] to 0.
7 – If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
8 RETRY_DELAY_S[RETRY_TYPE_r] as follows:
9 + If the most significant bit of the RETRY_DELAY_r is '0', set
10 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
11 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_S to 60000ms.
12 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
13 significant bits of RETRY_DELAY_r.
14 + The mobile station shall store the next system time 80 ms boundary +
15 RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as
16 RETRY_DELAY_S[RETRY_TYPE_r].

17 **1112.** *Security Mode Command Message:* The mobile station shall process the message as
18 follows:

- 19 • The mobile station shall set C_SIG_ENCRYPT_MODE_S to
20 C_SIG_ENCRYPT_MODE_r.
- 21 • If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile
22 station shall use the session key generated at the most recent registration for
23 encryption of signaling and user information. The mobile station shall store the
24 session key in KEY_S[KEY_SEQ_NEW_{S-p}]. The mobile station shall store
25 KEY_SIZE_r in KEY_SIZE_S. The mobile station shall then increment the variable
26 KEY_SEQ_NEW_{S-p} by one (modulo 16). If ENC_KEY_SIZE_r is included, the
27 mobile station shall set ENC_KEY_SIZE_S to ENC_KEY_SIZE_r.
- 28 • If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use
29 KEY_S[KEY_SEQ_r] as the session key.

30 **1213.** *Service Redirection Message:* The mobile station shall process the message as
31 follows:

- 32 • If the mobile station is directed to an unsupported operation mode or band class,
33 the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ
34 equal to '00000110' (message requires a capability that is not supported by the
35 mobile station).
- 36 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
37 TMSI_CODE_{S-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 38 • The mobile station shall set RETURN_IF_FAIL_S = RETURN_IF_FAIL_r.

- 1 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
 2 *System Determination Substate* of the *Mobile Station Initialization State* with an
 3 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
 4 redirection record received in the message as REDIRECT_REC_s and shall enter
 5 the *System Determination Substate* of the *Mobile Station Initialization State* with a
 6 redirection indication (see 2.6.1.1).

7 **4314.** *SSD Update Message:* The mobile station shall respond to the message as specified
 8 in 2.3.12.1.5.

9 **4415.** *Status Request Message:* The mobile station shall disable the *System Access State*
 10 timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three,
 11 the mobile station shall respond with a *Status Response Message*. If
 12 P_REV_IN_USE_s is greater than three, the mobile station shall respond with an
 13 *Extended Status Response Message*. If the message does not specify any
 14 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
 15 station shall include the requested information records in the response. If the
 16 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 17 mobile station shall only include the requested information records for the specified
 18 band class (BAND_CLASS_r) in the response. If the message specifies a band class
 19 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
 20 station shall only include the requested information records for the specified band
 21 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response.

22 If the message specifies a band class or a band class and an operating mode which
 23 is not supported by the mobile station, the mobile station shall send a *Mobile Station*
 24 *Reject Order* with ORDQ set to '00000110' (message requires a capability that is not
 25 supported by the mobile station). If the response to this message exceeds the
 26 allowable length, the mobile station shall send a *Mobile Station Reject Order* with
 27 ORDQ set to '00001000' (response message would exceed the allowable length). If
 28 the message specifies an information record which is not supported by the mobile
 29 station for the specified band class and operating mode, the mobile station shall
 30 send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record
 31 is not supported for the specified band class and operating mode).

32 **4516.** *TMSI Assignment Message:* The mobile station shall store the TMSI zone and code
 33 as follows:

- 34 • The mobile station shall store the length of the TMSI zone field by setting
 35 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
 36 • The mobile station shall store the assigning TMSI zone number by setting the
 37 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 38 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
 39 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 40 TMSI_CODE_r.

41 The mobile station shall set the TMSI expiration time by setting
 42 TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the

1 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*
 2 *Completion Message* within T_{56m} seconds.

3 **1617. Any other message:** If the mobile station receives any other message specified in
 4 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
 5 other messages.

6 **17. Base Station Reject Order:**

- 7 • ~~If ORDO_{VF} = '00000001', the mobile station shall send a *Security Mode Request*~~
 8 ~~Message with the ENC_SIG_H field included in it. If the mobile receives two *Base*~~
 9 ~~*Station Reject Orders* without successfully decrypting any encrypted messages~~
 10 ~~from the base station between the orders, the mobile station shall set~~
 11 ~~REG_ENCRYPT_RESYNC to YES and the mobile station shall go to the *System*~~
 12 ~~*Determination Substate* with an encryption failure indication.~~

13 2.6.3.8 PACA Cancel Substate

14 In this substate, the mobile station sends a *PACA Cancel Message*. If the base station
 15 responds with an authentication request, the mobile station responds in this substate.

16 Upon entering the *PACA Cancel Substate*, the mobile station shall transmit the *PACA Cancel*
 17 *Message*.

18 If a message received from the base station requires a Layer 2 acknowledgment and does
 19 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
 20 outstanding (see 2.1.1.2.2.1 of [4]).

21 If a message received from the base station requires a Layer 2 acknowledgment and also a
 22 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see
 23 2.1.1.2.2.1 of [4]).

24 When transmitting a response to a message received from the base station, Layer 3 shall
 25 indicate to Layer 2 that the type of the message is a response (see 2.1.1.2.2.1 of [4]).

26 When transmitting an autonomous message (i.e., a message that is not sent as a response
 27 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
 28 of the message is a request other than a registration request or a message transmission
 29 request (see 2.1.1.2.2.1 of [4]).

30 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
 31 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
 32 the Forward Common Control Channel (see [2.6.2.1.1.4 2.6.3.1.8](#)), it shall declare an access
 33 attempt failure and update its registration variables as specified in 2.6.5.5.3.2, disable its
 34 transmitter and enter the *Mobile Station Idle State*. If the mobile station receives
 35 confirmation of any message sent by the mobile station in this substate, it shall send a
 36 response in this substate if required and shall then enter the *Mobile Station Idle State*.

37 If the mobile station receives a mobile-station-addressed page, the mobile station may
 38 determine if there is a page match (see 2.6.2.3). If a match is declared, Layer 3 shall send
 39 an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress and
 40 shall enter the *Page Response Substate*.

1 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
 2 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
 3 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
 4 the message has been sent and acknowledged.

5 If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a
 6 message being transmitted was not terminated as a result of processing the Layer 2 fields of
 7 the received message, the mobile station shall ignore the received message.

8 The following directed messages and orders can be received. If any field value of the
 9 message or order is outside its permissible range, the mobile station may send a *Mobile*
 10 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

11 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 12 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.

13 2. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 14 message as specified in 2.3.12.1.5.

15 3. *Base Station Reject Order*:

- 16 • If ORDQ_r = '00000001', the mobile station shall send a *Security Mode Request*
 17 *Message* with the ENC SIG H field included in it. If the mobile receives two *Base*
 18 *Station Reject Orders* without successfully decrypting any encrypted messages
 19 from the base station between the orders, the mobile station shall set
 20 REG ENCRYPT RESYNC to YES and the mobile station shall go to the *System*
 21 *Determination Substate* with an encryption failure indication.

22 34. *Data Burst Message*

23 45. *Local Control Order*

24 56. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
 25 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
 26 permanent memory (LCKRSN_Ps-p equals the least significant four bits of ORDQ_r).

27 The mobile station should notify the user of the locked condition. The mobile
 28 station shall enter the *System Determination Substate* of the *Mobile Station*
 29 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
 30 *Access State* again until after the next mobile station power-up or until it has
 31 received an *Unlock Order*. This requirement shall take precedence over any other
 32 mobile station requirement specifying entry to the *System Access State*.

33 67. *Maintenance Required Order*: The mobile station shall record the reason for the
 34 *Maintenance Required Order* in the mobile station's semi-permanent memory
 35 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). The mobile station
 36 shall remain in the unlocked condition. The mobile station should notify the user of
 37 the maintenance required condition.

38 78. *PACA Message*: The mobile station shall send a *Mobile Station Reject Order* with the
 39 ORDQ field set to '00000010' (message not accepted in this state).

40 89. *Registration Accepted Order*:

- 1 • If $\text{ORDQ}_r = '00000101'$, the mobile station shall set $\text{ROAM_INDI}_s \rightarrow \text{to} \text{ROAM_INDI}_r$ and should display the roaming condition.
- 2
- 3 • If $\text{ORDQ}_r = '00000111'$, the mobile station shall perform the following
- 4 - The mobile station shall set $\text{ROAM_INDI}_s \rightarrow \text{to} \text{ROAM_INDI}_r$ and should
- 5 display the roaming condition.
- 6 - The mobile station shall set $\text{C_SIG_ENCRYPT_MODE}_s \rightarrow \text{to} \text{C_SIG_ENCRYPT_MODE}_r$.
- 7
- 8 - ~~If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile~~
- 9 ~~station shall use the session key generated at the most recent registration for~~
- 10 ~~encryption of signaling and user information. The mobile station shall store~~
- 11 ~~the session key in $\text{KEY}_s[\text{KEY_SEQ_NEW}_{s,p}]$. The mobile station shall store~~
- 12 ~~KEY_SIZE_r in KEY_SIZE_s . The mobile station shall increment the variable~~
- 13 ~~$\text{KEY_SEQ_NEW}_{s,p}$ by one (modulo 16). If ENC KEY SIZE_r is included, the~~
- 14 ~~mobile station shall set ENC KEY SIZE_s to ENC KEY SIZE_r .~~
- 15 - ~~If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall~~
- 16 ~~use $\text{KEY}_s[\text{KEY_SEQ}_r]$ as the session key.~~
- 17 - ~~If $\text{C SIG ENCRYPT MODE}_r$ is not equal to '000', the mobile station shall set~~
- 18 ~~ENC KEY_s to the most recently generated CMEAKEY in the mobile station~~
- 19 ~~associated with the AUTHR of the *Registration Message*, and~~
- 20 ~~$\text{EXT ENCRYPT SEQ}[0]$ and $\text{EXT ENCRYPT SEQ}[1]$ to $256 \times \text{ENC SEQ H}$~~
- 21 ~~(the ENC SEQ H field in the *Registration Message*).~~

22 910. *Registration Rejected Order*: This order indicates that normal service is not available
 23 on this system. The mobile station shall disable the full-TMSI timer. If the received
 24 order specifies to delete the TMSI ($\text{ORDQ} = '00000100'$), the mobile station shall set
 25 all the bits of the $\text{TMSI_CODE}_{s,p}$ to '1'. The mobile station shall enter the *System*
 26 *Determination Substate* of the *Mobile Station Initialization State* with a registration
 27 rejected indication (see 2.6.1.1).

28 1011. *Retry Order*: The mobile station shall process the message as follows:

- 29 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
- 30 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ to 0, where RETRY_TYPE is equal to '001', '010',
 31 or '011'.
- 32 • If RETRY_TYPE_r is equal to '001', the mobile station shall perform the following:
- 33 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
- 34 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}_r]$ to 0.
- 35 - If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
- 36 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}_r]$ as follows:
- 37 + If the most significant bit of the RETRY_DELAY_r is '0', set
- 38 $\text{RETRY_DELAY_UNIT}_s$ to 1000ms. If the most significant bit of the
- 39 RETRY_DELAY_r is '1', set $\text{RETRY_DELAY_UNIT}_s$ to 60000ms.

- + The mobile station shall set RETRY_DELAY_VALUE_s to the seven least significant bits of RETRY_DELAY_r.
- + The mobile station shall store the next system time 80 ms boundary + RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as RETRY_DELAY_s[RETRY_TYPE_r].

4.12. Security Mode Command Message: The mobile station shall process the message as follows:

- The mobile station shall set C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_s[KEY_SEQ_NEW_{s-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_s. The mobile station shall then increment the variable KEY_SEQ_NEW_{s-p} by one (modulo 16). If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_s[KEY_SEQ_r] as the session key.

4.213. Service Redirection Message: The mobile station shall process the message as follows:

- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).
- If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the redirection record received in the message as REDIRECT_REC_s and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).

4.314. SSD Update Message: The mobile station shall respond to the message as specified in 2.3.12.1.5.

4.415. Status Request Message: The mobile station shall disable the *System Access State* timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three, the mobile station shall respond with a *Status Response Message*. If P_REV_IN_USE_s is greater than three, the mobile station shall respond with an *Extended Status Response Message*. If the message does not specify any qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile

1 station shall include the requested information records in the response. If the
 2 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 3 mobile station shall only include the requested information records for the specified
 4 band class (BAND_CLASS_r) in the response. If the message specifies a band class
 5 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
 6 station shall only include the requested information records for the specified band
 7 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the *Status Response*
 8 *Message*.

9 If the message specifies a band class or a band class and an operating mode which
 10 is not supported by the mobile station, the mobile station shall send a *Mobile Station*
 11 *Reject Order* with ORDQ set to '00000110' (message requires a capability that is not
 12 supported by the mobile station). If the response to this message exceeds the
 13 allowable length, the mobile station shall send a *Mobile Station Reject Order* with
 14 ORDQ set to '00001000' (response message would exceed the allowable length). If
 15 the message specifies an information record which is not supported by the mobile
 16 station for the specified band class and operating mode, the mobile station shall
 17 send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record
 18 is not supported for the specified band class and operating mode).

19 **1516. TMSI Assignment Message:** The mobile station shall store the TMSI zone and code
 20 as follows:

- 21 • The mobile station shall store the length of the TMSI zone field by setting
 22 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 23 • The mobile station shall store the assigning TMSI zone number by setting the
 24 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 25 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 26 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 27 TMSI_CODE_r.

28 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 29 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 30 mobile station shall then respond with a *TMSI Assignment Completion Message*
 31 within T_{56m} seconds.

32 **1617. Any other message:** If the mobile station receives any other message specified in
 33 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
 34 other messages.

35 **17. Base Station Reject Order:**

- 36 • ~~If ORDQ_r = '00000001', the mobile station shall send a Security Mode Request
 37 Message with the ENC_SIC_H field included in it. If the mobile receives two Base
 38 Station Reject Orders without successfully decrypting any encrypted messages
 39 from the base station between the orders, the mobile station shall set
 40 REG_ENCRYPT_RESYNC to YES and the mobile station shall go to the System
 41 Determination Substate with an encryption failure indication.~~

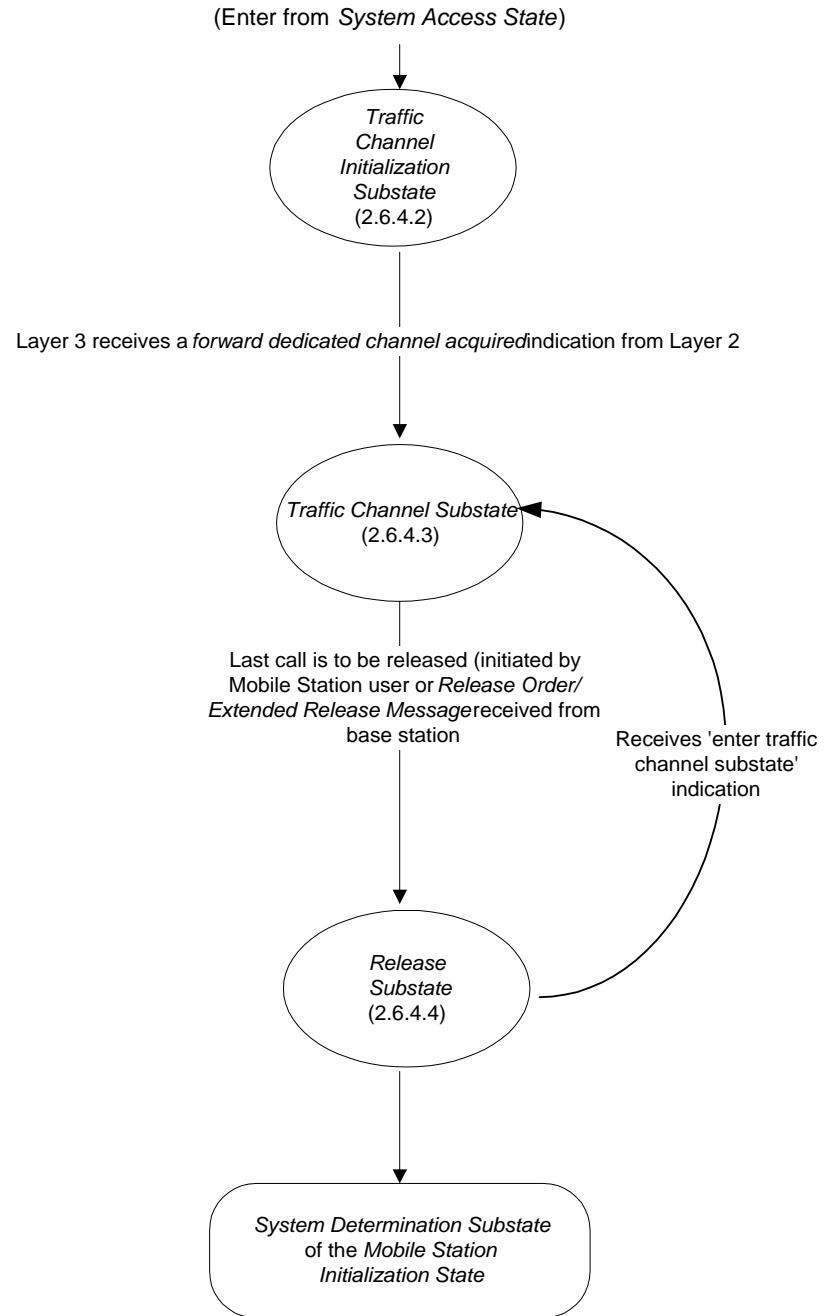

1 2.6.4 Mobile Station Control on the Traffic Channel State

2 In this state, the mobile station communicates with the base station using the Forward and
3 Reverse Traffic Channels.

4 As illustrated in Figure 2.6.4-1, the *Mobile Station Control on the Traffic Channel State*
5 consists of the following substates:

- 6 • *Traffic Channel Initialization Substate* - In this substate, the mobile station verifies
7 that it can receive the Forward Traffic Channel and begins transmitting on the
8 Reverse Traffic Channel.
- 9 • *Traffic Channel Substate* - In this substate, the mobile station exchanges Traffic
10 Channel frames with the base station in accordance with the current service
11 configuration. The mobile station may perform the gating operation of Reverse Pilot
12 Channel. While in this substate, one or more Call Control instances can be
13 activated (see 2.6.10).
- 14 • *Release Substate* - In this substate, the mobile station disconnects the calls and the
15 physical channels.

16

**Figure 2.6.4-1. Mobile Station Control on the Traffic Channel State**

1 2.6.4.1 Special Functions and Actions

2 The mobile station performs special functions and actions in one or more of the substates of
 3 the *Mobile Station Control on the Traffic Channel State*.

4 2.6.4.1.1 Forward Traffic Channel Power Control

5 The mobile station uses FPC_MODE_NO_SCH_S as FPC_MODE_S except during the forward
 6 Supplemental Channel assignment interval. During the forward Supplemental Channel
 7 assignment interval, the mobile station uses FPC_MODE_SCH_S as FPC_MODE_S.

8 To support Forward Traffic Channel power control, the mobile station reports frame error
 9 rate statistics to the base station. If the base station enables periodic reporting, the mobile
 10 station reports frame error rate statistics at specified intervals. If the base station enables
 11 threshold reporting, the mobile station reports frame error rate statistics when the frame
 12 error rate reaches a specified threshold.⁹

13 The mobile station shall maintain the following frame counters:

- 14 • A counter (TOT_FRAMES_S) for the total number of frames received on the Forward
 15 Fundamental Channel.
- 16 • A counter (BAD_FRAMES_S) for the number of bad frames detected on the Forward
 17 Fundamental Channel.
- 18 • A counter (DCCH_TOT_FRAMES_S) for the total number of frames received on the
 19 Forward Dedicated Control Channel, when the Dedicated Control Channel is
 20 assigned.
- 21 • A counter (DCCH_BAD_FRAMES_S) for the total number of bad frames received on
 22 the Forward Dedicated Control Channel, when the Dedicated Control Channel is
 23 assigned.

24 The mobile station shall maintain the following counters for each Supplemental Channel
 25 assigned, if FOR_SCH_FER_REP_S is equal to '1':

- 26 • A counter (SCH_TOT_FRAMES_S) for the number of frames received on the assigned
 27 Supplemental Channel.
- 28 • A counter (SCH_BAD_FRAMES_S) for the number of bad frames received on the
 29 assigned Supplemental Channel.

30 The mobile station shall increment the counter by 1 at every 20 ms interval if a 20ms frame
 31 or at least one 5ms frame is received from the Forward Fundamental Channel or Dedicated
 32 Control Channel:

⁹ Periodic reporting and threshold reporting may be independently enabled or disabled by the base station.

- If the received frame is from the Fundamental Channel, the mobile station shall perform the following:
 - Increment TOT_FRAMESS by 1.
 - If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile station shall increment BAD_FRAMESS by 1.
 - If the received frame is from the Forward Dedicated Control Channel, the mobile station shall perform the following:
 - Increment DCCH_TOT_FRAMESS by 1.
 - If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile station shall increment DCCH_BAD_FRAMESS by 1.
 - If either
 - PWR_THRESH_ENABLES is equal to '1' and if one of the following conditions is true:
 - + The Fundamental Channel carries the Power Control Subchannel [FPC_PRI_CHANs = '0'], and BAD_FRAMESS is equal to PWR_REP_THRESHs or
 - + The Dedicated Control Channel carries the Power Control Subchannel [FPC_PRI_CHANs = '1'], and DCCH_BAD_FRAMESS is equal to PWR_REP_THRESHs.
 - or
 - PWR_PERIOD_ENABLES is equal to '1' and if one of the following conditions is true:
 - + The Fundamental Channel carries the Power Control Subchannel [FPC_PRI_CHANs = '0'], and TOT_FRAMESS is equal to $\lfloor(2(PWR_REP_FRAMESS/2) \times 5)\rfloor$, or
 - + The Dedicated Control Channel carries the Power Control Subchannel [FPC_PRI_CHANs = '1'], and DCCH_TOT_FRAMESS is equal to $\lfloor(2(PWR_REP_FRAMESS/2) \times 5)\rfloor$,
- then the mobile station shall send a *Power Measurement Report Message* to the base station. The mobile station should send the *Power Measurement Report Message* in unassured mode. After sending a *Power Measurement Report Message*, the mobile station shall set TOT_FRAMESS, BAD_FRAMESS to zero, and if the Dedicated Control Channel is assigned, shall set DCCH_TOT_FRAMESS and DCCH_BAD_FRAMESS to zero. The mobile station shall not increment the counters for a period of $PWR_REP_DELAYs \times 4$ frames following the first transmission of the message.
- If FPC_PRI_CHANs is equal to '0' and TOT_FRAMESS is equal to $\lfloor(2(PWR_REP_FRAMESS/2) \times 5)\rfloor$, the mobile station shall perform the following:
 - Set TOT_FRAMESS and BAD_FRAMESS to zero.

- 1 – Set DCCH_TOT_FRAMESS and DCCH_BAD_FRAMESS to zero, if the Dedicated
2 Control Channel is assigned.
- 3 • If FPC_PRI_CHAN_S is equal to '1' and DCCH_TOT_FRAMESS is equal to
4 $\lfloor(2(\text{PWR_REP_FRAMESS}/2) \times 5)\rfloor$, the mobile station shall set
5 TOT_FRAMESS, BAD_FRAMESS, DCCH_TOT_FRAMESS, and DCCH_BAD_FRAMESS
6 to zero.
- 7 For each received frame from an assigned Supplemental Channel, the mobile station shall
8 perform the following, if FOR_SCH_FER_REPS is equal to '1':
- 9 • Increment SCH_TOT_FRAMESS by 1.
10 • If the received frame is bad, increment SCH_BAD_FRAMESS by 1.

11 At the end of a burst on each assigned Supplemental Channel, if FOR_SCH_FER_REPS is
12 equal to '1', the mobile station shall report the total number of frames received on this
13 Supplemental Channel (SCH_TOT_FRAMESS) and the bad frames detected
14 (SCH_BAD_FRAMESS) with the fields SCH_PWR_MEAS_FRAMESS and
15 SCH_ERRORS_DETECTED in the *Power Measurement Report Message* respectively. After
16 sending the *Power Measurement Report Message* for the Supplemental Channel, the mobile
17 station shall set SCH_TOTAL_FRAMESS and SCH_BAD_FRAMESS of the reported SCH to
18 zero.

19 If both Forward Fundamental Channel and the Forward Dedicated Control Channel are
20 assigned to the mobile station, the mobile station shall perform the following:

- 21 • The mobile station shall set FPC_DELTA_SETPT_S to (FPC_FCH_CURR_SETPT_S –
22 FPC_DCCH_CURR_SETPT_S).
23 • For each received frame, if |FPC_FCH_CURR_SETPT_S – FPC_DCCH_CURR_SETPT_S
24 – FPC_DELTA_SETPT_S| is equal to or greater than its assigned threshold
25 FPC_SETPT_THRESH_S, the mobile station shall send the *Outer Loop Report Message*
26 requiring acknowledgment to the base station, and the mobile station shall then set
27 FPC_DELTA_SETPT_S to (FPC_FCH_CURR_SETPT_S – FPC_DCCH_CURR_SETPT_S).

28 For each of the supplemental channels assigned to the mobile station and FPC_MODE_S is
29 set to '000', the mobile station shall perform the following:

- 30 • The mobile station shall set FPC_DELTA_SCH_SETPT_S to
31 (FPC_FCH_CURR_SETPT_S – FPC_SCH_CURR_SETPT_S) if FPC_PRI_CHAN_S is equal to
32 '0'.
33 • The mobile station shall set FPC_DELTA_SCH_SETPT_S to
34 (FPC_DCCH_CURR_SETPT_S – FPC_SCH_CURR_SETPT_S) if FPC_PRI_CHAN_S is equal
35 to '1'.

- 1 • For each received frame, if $FPC_PRI_CHAN_S$ is equal to '0' and
 2 $|FPC_FCH_CURR_SETPT_S - FPC_SCH_CURR_SETPT_S -$
 3 $FPC_DELTA_SCH_SETPT_S|$ is equal to or greater than its assigned threshold
 4 $FPC_SETPT_THRESH_SCH_S$, the mobile station shall send the *Outer Loop Report*
 5 *Message* in assured mode, and the mobile station shall then set
 6 $FPC_DELTA_SCH_SETPT_S$ to $(FPC_FCH_CURR_SETPT_S - FPC_SCH_CURR_SETPT_S)$.
- 7 • For each received frame, if $FPC_PRI_CHAN_S$ is equal to '1' and
 8 $|FPC_DCCH_CURR_SETPT_S - FPC_SCH_CURR_SETPT_S -$
 9 $FPC_DELTA_SCH_SETPT_S|$ is equal to or greater than its assigned threshold
 10 $FPC_SETPT_THRESH_SCH_S$, the mobile station shall send the *Outer Loop Report*
 11 *Message* in assured mode, and the mobile station shall then set
 12 $FPC_DELTA_SCH_SETPT_S$ to $(FPC_DCCH_CURR_SETPT_S -$
 13 $FPC_SCH_CURR_SETPT_S)$.

14 If the Supplemental channels are assigned to the mobile station and FPC_MODE_S is set to
 15 '001', '010', '101', or '110', for each additional Forward Supplemental Channel other than
 16 the Forward Supplemental Channel specified by $FPC_SEC_CHAN_S$, the mobile station shall
 17 perform the following:

- 18 • The mobile station shall set $FPC_DELTA_SCH_SETPT_S$ to
 19 $(FPC_SCH_CURR_SETPT_S[FPC_SEC_CHAN_S] - FPC_SCH_CURR_SETPT_S)$ for the
 20 Supplemental Channel.
- 21 • For each received frame, if $|FPC_SCH_CURR_SETPT_S[FPC_SEC_CHAN_S] -$
 22 $FPC_SCH_CURR_SETPT_S - FPC_DELTA_SCH_SETPT_S|$ is equal to or greater than
 23 its assigned threshold $FPC_SETPT_THRESH_SCH_S$, the mobile station shall send the
 24 *Outer Loop Report Message* in assured mode, and the mobile station shall then set
 25 $FPC_DELTA_SCH_SETPT_S$ to $(FPC_SCH_CURR_SETPT_S[FPC_SEC_CHAN_S] -$
 26 $FPC_SCH_CURR_SETPT_S)$.

27 2.6.4.1.1.1 Forward Traffic Channel Power Control Initialization

28 To initialize Forward Traffic Channel power control, the mobile station shall set
 29 TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$, and $DCCH_BAD_FRAMES_S$ to zero.
 30 The mobile station shall initialize the frame counters $SCH_TOT_FRAMES_S$ and
 31 $SCH_BAD_FRAMES_S$ for each assigned Supplemental Channel to zero. The mobile station
 32 shall initialize $FOR_SCH_FER_REP_S$ to zero.

33 2.6.4.1.1.2 Processing the Power Control Parameters Message

34 The mobile station shall store the following parameters from the *Power Control Parameters*
 35 *Message*:

- 36 • Power control reporting threshold ($PWR_REP_THRESH_S = PWR_REP_THRESH_r$)
- 37 • Power control reporting frame count ($PWR_REP_FRAMES_S = PWR_REP_FRAMES_r$)
- 38 • Threshold report mode indicator
 39 $(PWR_THRESH_ENABLE_S = PWR_THRESH_ENABLE_r)$

- 1 • Periodic report mode indicator
(PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_r)
- 2 • Power report delay (PWR REP DELAY_S = PWR REP DELAY_r)

3 The mobile station shall set TOT_FRAMESS and BAD_FRAMESS to zero if FCH is assigned.
 4 The mobile station shall set DCCH TOT FRAMESS and DCCH BAD FRAMESS to zero if
 5 DCCH is assigned.

6

7 2.6.4.1.1.3 Processing the Power Control Message

8 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 9 '00000110' (message requires a capability that is not supported by the mobile station) if any
 10 of the following conditions are detected:

- 11 • If the mobile station does not support any Radio Configuration greater than 2 and
 12 FPC_MODE_r is not supported by the mobile station.
- 13 • If the mobile station does not support Supplemental Channel and FPC_MODE_r is set
 14 to the '001', '010', '101', or '110'.
- 15 • If PWR_CNTL_STEP_r corresponds to a power control step size (see 2.1.2.3.2 of [2]) is
 16 not supported by the mobile station.

17 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 18 '00000111' (message cannot be handled by the current mobile station configuration) if any
 19 of the following conditions are detected:

- 20 • FPC_PRI_CHAN_r is set to '1' and only the Fundamental Channel is assigned.
- 21 • FPC_PRI_CHAN_r is set to '0' and only the Dedicated Control Channel is assigned.

22 If none of the above conditions are true, the mobile station shall process the message as
 23 follows at the action time (see 2.6.4.1.5) specified in the message:

- 24 • The mobile station shall store the power control step size (PWR_CNTL_STEP_S =
 25 PWR_CNTL_STEP_r).
- 26 • If FPC_INCL_r is equal to '1', the mobile station shall perform the following:
 - 27 – The mobile station shall set FPC_MODE_NO_SCH_S = FPC_MODE_r.
 - 28 – The mobile station shall set FPC_MODE_S = FPC_MODE_NO_SCH_S if there is no
 29 forward Supplemental Channel burst in progress (see 2.6.6.2.5.1.1).
 - 30 – The mobile station shall set FPC_PRI_CHAN_S to FPC_PRI_CHAN_r
 - 31 – If FPC_OLPC_FCH_INCL is equal to '1', the mobile station shall:
 - 32 + Set FPC_FCH_FER_S to FPC_FCH_FER_r.
 - 33 + If FPC_FCH_MIN_SETPT_r is not equal to '11111111', set
 34 FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_r; otherwise, set
 35 FPC_FCH_MIN_SETPT_S to FPC_FCH_CURR_SETPT_S.

- 1 + If FPC_FCH_MAX_SETPT_r is not equal to '11111111', set
 2 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r; otherwise, set
 3 FPC_FCH_MAX_SETPT_s to FPC_FCH_CURR_SETPT_s.
- 4 - If FPC_OLPC_DCCH_INCL is equal to '1', the mobile station shall:
 5 + Set FPC_DCCH_FER_s to FPC_DCCH_FER_r.
 6 + If FPC_DCCH_MIN_SETPT_r is not equal to '11111111', set
 7 FPC_DCCH_MIN_SETPT_s to FPC_DCCH_MIN_SETPT_r; otherwise, set
 8 FPC_DCCH_MIN_SETPT_s to FPC_DCCH_CURR_SETPT_s.
 9 + If FPC_DCCH_MAX_SETPT_r is not equal to '11111111', set
 10 FPC_DCCH_MAX_SETPT_s to FPC_DCCH_MAX_SETPT_r; otherwise, set
 11 FPC_DCCH_MAX_SETPT_s to FPC_DCCH_CURR_SETPT_s.
 12 - If FPC_INCL is equal to '1' and FPC_MODE is equal to '001', '010', '101', or '110',
 13 the mobile station shall:
 14 + Set FPC_SEC_CHAN_s to FPC_SEC_CHAN_r.
 15 - If NUM_SUP_r is not equal to '00', for each Supplemental Channel included in the
 16 message, the mobile station shall:
 17 + Set SCH_ID_s to SCH_ID_r.
 18 + Set FPC_SCH_FER_s[SCH_ID_s] to FPC_SCH_FER_r.
 19 + If FPC_SCH_MIN_SETPT_r is not equal to '11111111', set
 20 FPC_SCH_MIN_SETPT_s[SCH_ID_s] to FPC_SCH_MIN_SETPT_r; otherwise, set
 21 FPC_SCH_MIN_SETPT_s[SCH_ID_s] to FPC_SCH_CURR_SETPT_s.
 22 + If FPC_SCH_MAX_SETPT_r is not equal to '11111111', set
 23 FPC_SCH_MAX_SETPT_s[SCH_ID_s] to FPC_SCH_MAX_SETPT_r; otherwise, set
 24 FPC_SCH_MAX_SETPT_s[SCH_ID_s] to FPC_SCH_CURR_SETPT_s.
 25 - If FPC_THRESH_INCL is equal to '1', the mobile station shall set
 26 FPC_SETPT_THRESH_s to FPC_SETPT_THRESH_r.
 27 - If FPC_THRESH_SCH_INCL is equal to '1', the mobile station shall set
 28 FPC_SETPT_THRESH_SCH_s to FPC_SETPT_THRESH_SCH_r
 29 • If RPC_INCL_r is equal to '1' and the mobile station supports any Radio Configuration
 30 greater than 2, the mobile station shall perform the following:
 31 - If RPC_ADJ_REC_TYPE is equal to '0000', the mobile station shall update the
 32 Reverse Channel Adjustment Gain Table (see 2.1.2.3.3.2 of [2]) containing an
 33 offset relative to the Reverse Pilot Channel power for each reverse link code
 34 channel received in this message.
 35 - If RPC_ADJ_REC_TYPE is equal to '0001' or '0010', the mobile station shall
 36 update the Reverse Link Attribute Adjustment Gain Table (see 2.1.2.3.3.2 of [2])
 37 containing an offset relative to the Reverse Pilot Channel power for each
 38 transmission rate, frame length, coding type received in this message.

1 2.6.4.1.2 Service Configuration and Negotiation

2 During Traffic Channel operation, the mobile station and base station communicate
 3 through the exchange of Forward and Reverse Traffic Channel frames. The mobile station
 4 and base station use a common set of attributes for building and interpreting Traffic
 5 Channel frames. This set of attributes, referred to as a service configuration, consists of
 6 both negotiable and non-negotiable parameters.

7 The set of negotiable service configuration parameters consists of the following:

8 1. *Forward and Reverse Multiplex Options*: These control the way in which the
 9 information bits of the Forward and Reverse Traffic Channel frames, respectively,
 10 are divided into various types of traffic, such as signaling traffic, primary traffic and
 11 secondary traffic. A multiplex option together with a radio configuration specifies
 12 the frame structures and transmission rates (see [3]). The multiplex options which
 13 support Supplemental Code Channel transmission and Supplemental Channel
 14 transmission on the Forward and Reverse Traffic Channels are included in [3].
 15 Multiplex Options 3 through 16 also indicate the capability for supporting
 16 Supplemental Code Channel transmission on the Forward and Reverse Traffic
 17 Channels. Invocation of Supplemental Code Channel operation on the Forward or
 18 Reverse Traffic Channels occurs by the *Supplemental Channel Request Message*, the
 19 *Supplemental Channel Assignment Message*, and the *General Handoff Direction
 20 Message*. Invocation of Supplemental Channel operation on the Forward or Reverse
 21 Traffic Channels occurs by the *Supplemental Channel Request Mini Message*, the
 22 *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental
 23 Channel Assignment Mini Message*, *Universal Handoff Direction Message*, and the
 24 *Reverse Supplemental Channel Assignment Mini Message*. The multiplex option
 25 used for the Forward Traffic Channel can be the same as that used for the Reverse
 26 Traffic Channel, or it can be different.

27 2. *Forward and Reverse Traffic Channel Configurations*: These include the Radio
 28 Configurations and other necessary attributes for the Forward and Reverse Traffic
 29 Channels. The Traffic Channel Configuration used can be different for the Forward
 30 and Reverse Traffic Channels or it can be the same.

31 3. *Forward and Reverse Traffic Channel Transmission Rates*: These are the transmission
 32 rates actually used for the Forward and Reverse Traffic Channels respectively. The
 33 transmission rates for the Forward Traffic Channel can include all of the
 34 transmission rates supported by the radio configuration associated with the
 35 Forward Traffic Channel multiplex option, or a subset of the supported rates.
 36 Similarly, the transmission rates used for the Reverse Traffic Channel can include
 37 all rates supported by the radio configuration associated with the Reverse Traffic
 38 Channel multiplex option, or a subset of the supported rates. The transmission
 39 rates used for the Forward Traffic Channel can be the same as those used for the
 40 Reverse Traffic Channel, or they can be different.

41 4. *Service Option Connections*: These are the services in use on the Traffic Channel.
 42 There can be multiple service option connections. It is also possible that there is no
 43 service option connection, in which case the mobile station uses the Reverse Traffic

1 Channel as follows:

- 2 • Sends null traffic on the Reverse Fundamental Channel, if the Fundamental
3 Channel is present.
- 4 • Sends signaling traffic on the Reverse Traffic Channel where r-dsch is mapped
5 to.

6 Associated with each service option connection are a service option, a Forward
7 Traffic Channel traffic type, a Reverse Traffic Channel traffic type, and a service
8 option connection reference. The associated service option formally defines the way
9 in which traffic bits are processed by the mobile station and base station. The
10 associated Forward and Reverse Traffic Channel traffic types specify the types of
11 traffic used to support the service option. A service option can require the use of a
12 particular type of traffic, such as primary or secondary, or it can accept more than
13 one traffic type. A service option can be one-way, in which case it can be supported
14 on the Forward Traffic Channel only or the Reverse Traffic Channel only.

15 Alternatively, a service option can be two-way, in which case it can be supported on
16 the Forward and Reverse Traffic Channels simultaneously. Connected service
17 options can also invoke operation on Supplemental Code Channels in either one or
18 both of the Forward and Reverse Traffic Channels by negotiating a multiplex option
19 that supports operation on Supplemental Code Channels (see [3] for Multiplex
20 options applicable to Supplemental Code Channels), and by using the appropriate
21 Supplemental Code Channel related messages (i.e., the *Supplemental Channel*
22 *Request Message*, the *Supplemental Channel Assignment Message*, and the *General*
23 *Handoff Direction Message*). After Supplemental Code Channels have been assigned
24 by the base station, the connected service option can transmit primary and/or
25 secondary traffic on Supplemental Code Channels. Connected service options can
26 also invoke operation on Supplemental Channels in either one or both of the
27 Forward and Reverse Traffic Channels by negotiating a multiplex option that
28 supports operation on Supplemental Channels (see [3] for Multiplex Options
29 applicable to Supplemental Channel) and by using the appropriate Supplemental
30 Channel related messages (i.e., the *Supplemental Channel Request Mini Message*, the
31 *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental*
32 *Channel Assignment Mini Message*, the *Reverse Supplemental Channel Assignment*
33 *Mini Message*, and the *Universal Handoff Direction Message*). After Supplemental
34 Channels have been assigned by the base station, the connected service option can
35 transmit primary and/or secondary traffic on Supplemental Channels. The
36 associated service option connection reference provides a means for uniquely
37 identifying the service option connection. The reference serves to resolve ambiguity
38 when there are multiple service option connections in use.

39 The non-negotiable service configuration parameters are sent from the base station to the
40 mobile stations only, and consists of the following:

- 41 1. *Reverse Pilot Gating Rate*: This controls the way in which the reverse pilot is gated
42 on the Reverse Pilot Channel. The base station specifies the reverse pilot gating rate
43 to be used in the *Service Connect Message*, the *General Handoff Direction Message*,
44 and the *Universal Handoff Direction Message*.

- 1 2. *Forward and Reverse Power Control Parameters:* These consist of forward power
 2 control operation mode, outer loop power control parameters (e.g. target frame error
 3 rate, minimum E_b/N_t setpoint, and maximum E_b/N_t setpoint) for the Forward
 4 Fundamental Channel and Forward Dedicated Control Channel, and Power Control
 5 Subchannel indicator which indicates where the mobile station is to perform the
 6 primary inner loop estimation and the base station is to multiplex the Power Control
 7 Subchannel.
- 8 3. *Logical to Physical Mapping:* This is a table of logical to physical mapping entries,
 9 consisting of service reference identifier, logical resource, physical resource, forward
 10 flag, reverse flag, and priority.

11 The mobile station can request a default service configuration associated with a service
 12 option at call origination, and can request new service configurations during Traffic
 13 Channel operation. A requested service configuration can differ greatly from its predecessor
 14 or can be very similar. For example, the mobile station can request a service configuration
 15 in which all of the service option connections are different from those of the existing
 16 configuration; or the mobile station can request a service configuration in which the
 17 existing service option connections are maintained with only minor changes, such as a
 18 different set of transmission rates or a different mapping of service option connections to
 19 Forward and Reverse Traffic Channel traffic types.

20 If the mobile station requests a service configuration that is acceptable to the base station,
 21 they both begin using the new service configuration. If the mobile station requests a
 22 service configuration that is not acceptable to the base station, the base station can reject
 23 the requested service configuration or propose an alternative service configuration. If the
 24 base station proposes an alternative service configuration, the mobile station can accept or
 25 reject the base station's proposed service configuration, or propose yet another service
 26 configuration. This process, called service negotiation, ends when the mobile station and
 27 the base station find a mutually acceptable service configuration, or when either the mobile
 28 station or the base station rejects a service configuration proposed by the other.

29 It is also possible for the base station to request a default service configuration associated
 30 with a service option when paging the mobile station and to request new service
 31 configurations during Traffic Channel operation. The service negotiation proceeds as
 32 described above, but with the roles of the mobile station and base station reversed.

33 For CDMA mode operation in Band Class 0, the mobile station and base station can also
 34 use an alternative method for negotiating a service configuration known as service option
 35 negotiation. Service option negotiation is similar to service negotiation, but offers less
 36 flexibility for specifying the attributes of the service configuration. During service option
 37 negotiation, the base station or the mobile station specifies only which service option is to
 38 be used. There is no facility for explicitly specifying the multiplex options, traffic types or
 39 transmission rates to be used on the Forward and Reverse Traffic Channels in conjunction
 40 with the service option. Instead, implicit service configuration attributes are assumed. In
 41 particular, the Forward and Reverse multiplex options and transmission rates are assumed
 42 to be the default multiplex options and transmission rates associated with the requested
 43 service option, and the traffic type for both the Forward and Reverse Traffic Channels is

1 assumed to be primary traffic; furthermore, a service configuration established using
 2 service option negotiation is restricted to having only a single service option connection.

3 At mobile station origination and termination, the type of negotiation to use, either service
 4 negotiation or service option negotiation, is indicated in the *Channel Assignment Message*.
 5 Service negotiation is always used after the mobile station receives an *Extended Channel*
 6 *Assignment Message*. If a CDMA-to-CDMA hard handoff occurs during the call, the type of
 7 negotiation to use following the handoff is indicated in the *Extended Handoff Direction*
 8 *Message*, the *General Handoff Direction Message*, or the *Universal Handoff Direction*
 9 *Message*.

10 For CDMA mode operation in band classes other than Band Class 0, only service
 11 negotiation is to be used.

12 The following messages are used to support service negotiation:

- 13 1. *Service Request Message*: The mobile station can use this message to propose a
 14 service configuration, or to accept or reject a service configuration proposed in a
 15 *Service Response Message*. The base station can use this message to propose a
 16 service configuration, or to reject a service configuration proposed in a *Service*
 17 *Response Message*.
- 18 2. *Service Response Message*: The mobile station can use this message to accept or
 19 reject a service configuration proposed in a *Service Request Message*, or to propose
 20 an alternative service configuration. The base station can use this message to reject
 21 a service configuration proposed in a *Service Request Message*, or to propose an
 22 alternative service configuration.
- 23 3. *Service Connect Message*: The base station can use this message to accept a service
 24 configuration proposed in a *Service Request Message* or *Service Response Message*,
 25 and to instruct the mobile station to begin using the service configuration.
- 26 4. *Service Connect Completion Message*: The mobile station can use this message to
 27 acknowledge the transition to a new service configuration.
- 28 5. *Service Option Control Message*: The mobile station and base station can use this
 29 message to invoke service-option-specific functions.
- 30 6. *Extended Channel Assignment Message*: The base station can use this message to
 31 accept or reject the initial service configuration proposed by the mobile station in an
 32 *Origination Message* or a *Page Response Message*.

33 The following messages are used to support service option negotiation:

- 34 1. *Service Option Request Order*: The mobile station and base station can use this
 35 message either to request a service option or to suggest an alternative service
 36 option.
- 37 2. *Service Option Response Order*: The mobile station and base station can use this
 38 message to accept or to reject a service option request.
- 39 3. *Service Option Control Order*: The mobile station and base station can use this
 40 message to invoke service option specific functions.

1 The following messages are used to support both service negotiation and service option
2 negotiation:

- 3 1. *Origination Message*: The mobile station can use this message to propose an initial
4 service configuration.
- 5 2. *Channel Assignment Message*: The base station can use this message to accept or to
6 reject the initial service configuration proposed by the mobile station in an
7 *Origination Message* or a *Page Response Message* and to indicate which type of
8 negotiation, either service negotiation or service option negotiation, is to be used
9 during the call.
- 10 3. *Extended Handoff Direction Message*: The base station can use this message to indicate
11 which type of negotiation, either service negotiation or service option negotiation,
12 is to be used following a CDMA-to-CDMA hard handoff.
- 13 4. *General Handoff Direction Message*: The base station can use this message to indicate
14 which type of negotiation, either service negotiation or service option negotiation, is
15 to be used following a CDMA-to-CDMA hard handoff. The base station can use this
16 message to accept a service configuration proposed in a *Service Request Message* or
17 *Service Response Message*. The base station can also use this message to instruct
18 the mobile station to begin using the service configuration.
- 19 5. *General Page Message* or *Universal Page Message*: The base station can use a mobile-
20 station-addressed page in a *General Page Message* or in a *Universal Page Message*
21 to propose an initial service configuration.
- 22 6. *Page Response Message*: The mobile station can use this message to accept or to
23 reject the initial service configuration proposed by the base station in a mobile-
24 station-addressed page, or to propose an alternative initial service configuration.
- 25 7. *Status Request Message*: The base station can use this message to request service
26 capability information from the mobile station.
- 27 8. *Status Response Message*: The mobile station can use this message to return the
28 service capability information requested by the base station in a *Status Request*
29 *Message*.
- 30 9. *Extended Status Response Message*: The mobile station can use this message to
31 return the service capability information requested by the base station in a *Status*
32 *Request Message*.
- 33 10. *Universal Handoff Direction Message*: The base station can use this message to
34 indicate which type of negotiation, either service negotiation or service option
35 negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base
36 station can use this message to accept a service configuration proposed in a *Service*
37 *Request Message* or *Service Response Message*. The base station can also use this
38 message to instruct the mobile station to begin using the service configuration.

1 2.6.4.1.2.1 Use of Variables

2 2.6.4.1.2.1.1 Maintaining the Service Request Sequence Number

3 The mobile station shall maintain a service request sequence number variable,
 4 SERV_REQ_NUM_S for use with service negotiation. Upon entering the *Mobile Station*
 5 *Control on the Traffic Channel State*, the mobile station shall set SERV_REQ_NUM_S to 0.
 6 Each time the mobile station sends a new *Service Request Message*, it shall set the
 7 SERV_REQ_SEQ field of the message to the current value of SERV_REQ_NUM_S, and shall
 8 then set SERV_REQ_NUM_S equal to (SERV_REQ_NUM_S + 1) modulo 8.

9 2.6.4.1.2.1.2 Maintaining the Service Negotiation Indicator Variable

10 The mobile station shall maintain a service negotiation indicator variable, SERV_NEG_S, to
 11 indicate which type of negotiation to use, either service negotiation or service option
 12 negotiation. The mobile station shall set SERV_NEG_S to enabled whenever service
 13 negotiation is to be used, and shall set SERV_NEG_S to disabled whenever service option
 14 negotiation is to be used. The precise rules for setting SERV_NEG_S are specified in 2.6.4.2
 15 and 2.6.6.2.5.1.

16 For CDMA operation in band classes other than Band Class 0, the mobile station shall set
 17 SERV_NEG_S to enabled.

18 2.6.4.1.2.1.3 Maintaining the Service Option Request Number

19 The mobile station shall maintain a service option request number variable, SO_REQ_S, for
 20 use with service option negotiation. The mobile station shall set SO_REQ_S to a special
 21 value, NULL, if the mobile station does not have an outstanding service option request. If
 22 the mobile station has an outstanding service option request, the mobile station shall set
 23 SO_REQ_S to the number of the service option associated with the outstanding request.

24 2.6.4.1.2.2 Service Subfunctions

25 As illustrated in Figure 2.6.4.1.2.2-1, the mobile station supports service configuration and
 26 negotiation by performing the following set of service subfunctions:

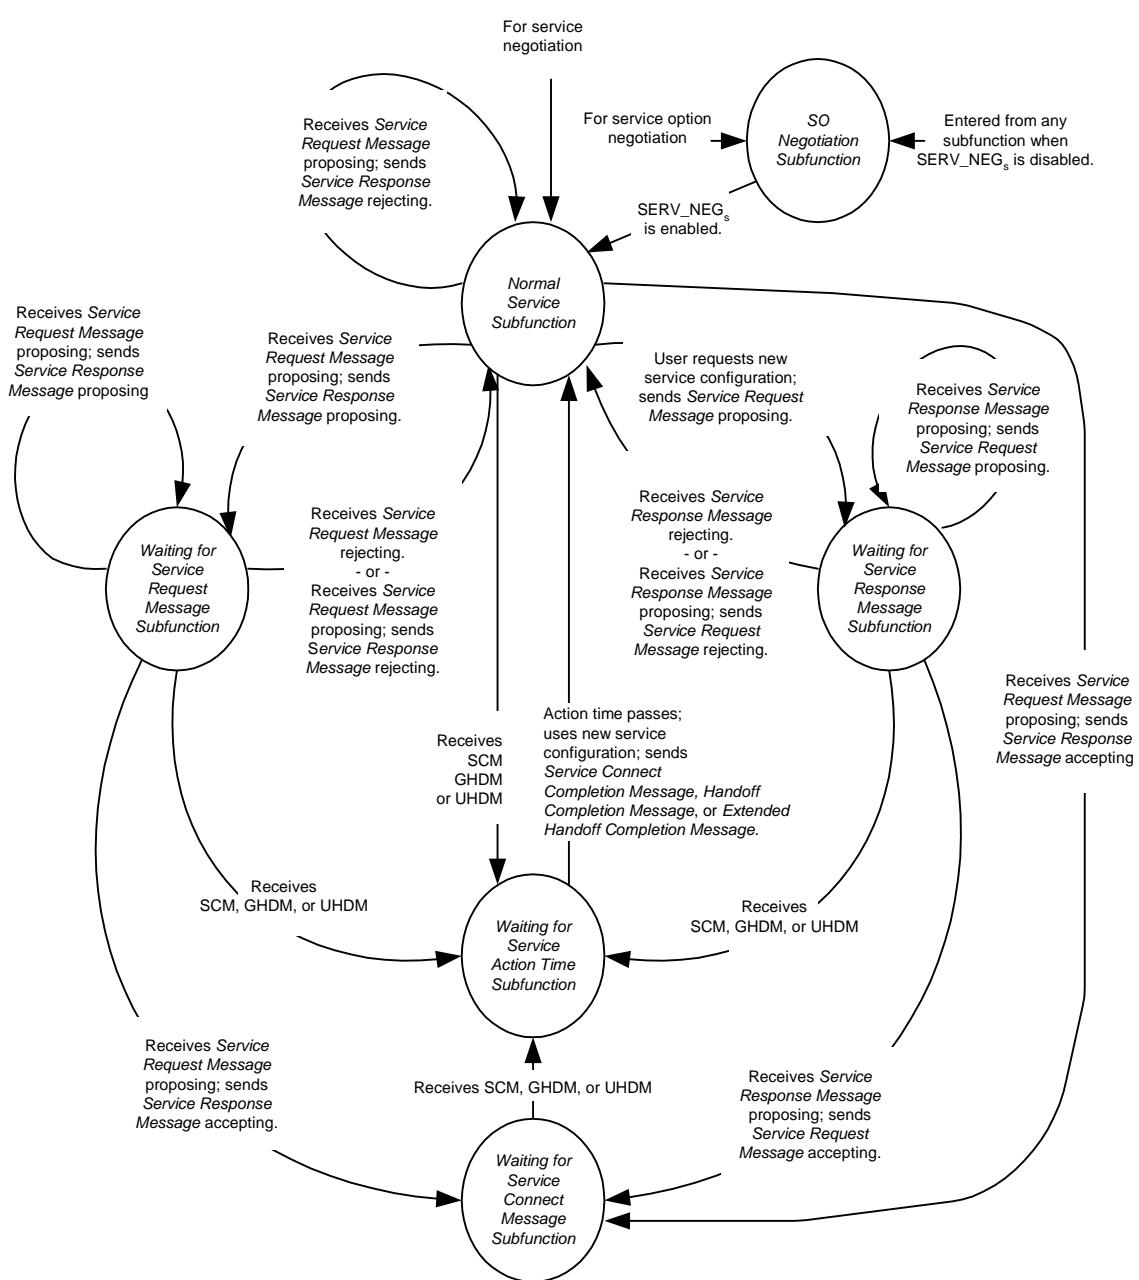

- 27 • *Normal Service Subfunction* - While this subfunction is active, the mobile station
 28 processes service configuration requests from the user and from the base station.
- 29 • *Waiting for Service Request Message Subfunction* - While this subfunction is active,
 30 the mobile station waits to receive a *Service Request Message*.
- 31 • *Waiting for Service Response Message Subfunction* - While this subfunction is active,
 32 the mobile station waits to receive a *Service Response Message*.
- 33 • *Waiting for Service Connect Message Subfunction* - While this subfunction is active,
 34 the mobile station waits to receive a *Service Connect Message*, a *General Handoff*
 35 *Direction Message*, or a *Universal Handoff Direction Message* containing a service
 36 configuration record.

- 1 • *Waiting for Service Action Time Subfunction* - While this subfunction is active, the
2 mobile station waits for the action time associated with a new service configuration
3 and then sends a *Service Connect Completion Message*, a *Handoff Completion*
4 *Message*, or an *Extended Handoff Completion Message*.
- 5 • *SO Negotiation Subfunction* - While this subfunction is active, the mobile station
6 supports service option negotiation with the base station. This subfunction is only
7 used while operating in Band Class 0.

8 The *SO Negotiation Subfunction* supports service option negotiation. All of the other service
9 subfunctions support service negotiation.

10 At any given time during Traffic Channel operation, only one of the service subfunctions is
11 active. For example, when the mobile station first enters the *Traffic Channel Initialization*
12 *Substate* of the *Mobile Station Control on the Traffic Channel State*, the *Normal Service*
13 *Subfunction*, the *Waiting for Service Connect Message Subfunction* or the *SO Negotiation*
14 *Subfunction* is active. Each of the other service subfunctions may become active in
15 response to various events which occur during the Traffic Channel substates. Typically, the
16 mobile station processes events pertaining to service configuration and negotiation in
17 accordance with the requirements for the active service subfunction, however, some Traffic
18 Channel substates do not allow for the processing of certain events pertaining to service
19 configuration and negotiation, or specify requirements for processing such events which
20 supersede the requirements of the active service subfunction.

21

**Notes:**

- SCM stands for Service Connect Message.
- GHDM stands for General Handoff Direction Message.
- UHDM stands for Universal Handoff Direction Message.
- Processing for special cases, such as timeouts and errors, is not shown in this diagram.

Figure 2.6.4.1.2.2-1. Mobile Station Service Subfunctions

1 2.6.4.1.2.2.1 Normal Service Subfunction

2 While this subfunction is active, the mobile station processes service configuration requests
 3 from the user and from the base station.

4 While the *Normal Service Subfunction* is active, the mobile station shall perform the
 5 following:

- 6 • The mobile station shall process Forward and Reverse Traffic Channel frames in
 7 accordance with the current service configuration. The mobile station shall discard
 8 any Forward Traffic Channel frame which has a format that is not supported by the
 9 mobile station. The mobile station may discard any type of Forward Traffic Channel
 10 traffic that is not signaling traffic and is not part of the current service
 11 configuration.
- 12 • To initiate service negotiation for a new service configuration, the mobile station
 13 shall send a *Service Request Message* to propose the new service configuration. The
 14 mobile station shall activate the *Waiting for Service Response Message Subfunction*.
- 15 • For any service option connection that is part of the current service configuration,
 16 the mobile station may send a *Service Option Control Message* to invoke a service
 17 option specific function in accordance with the requirements for the associated
 18 service option.
- 19 • If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station
 20 shall activate the *SO Negotiation Subfunction*.
- 21 • If the mobile station receives one of the following service negotiation messages, the
 22 mobile station shall process the message according to the specified requirements:
 - 23 1. *Service Connect Message*: The mobile station shall perform the following:
 - 24 • If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform the
 25 following: If the mobile station accepts the service configuration specified in
 26 the message, the mobile station shall activate the Waiting for Service Action
 27 Time Subfunction; otherwise, the mobile station shall send a Mobile Station
 28 Reject Order (ORDQ = '00000111') within T_{56m} seconds.
 - 29 • If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform the
 30 following: If the mobile station accepts the service configuration currently
 31 stored at the mobile station, the mobile station shall activate the Waiting for
 32 Service Action Time Subfunction; otherwise, the mobile station shall send a
 33 Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.
 - 34 • If USE OLD SERV CONFIG_r equals '10', the mobile station shall perform the
 35 following: If the mobile station accepts the service configuration resulting
 36 from updating the stored service configuration with the service configuration
 37 received in this message, the mobile station shall activate the Waiting for
 38 Service Action Time Subfunction; otherwise, the mobile station shall send a
 39 Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.

- 1 2. *Service Option Control Message*: If the service option connection specified by the
 2 message is part of the current service configuration, and the service option
 3 specified by the message is the same as the service option associated with the
 4 service option connection, the mobile station shall interpret the action time of
 5 the message as specified in 2.6.4.1.5, and shall process the message in
 6 accordance with the requirements for the service option; otherwise, the mobile
 7 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
 8 T_{56m} seconds.
- 9 3. *Service Request Message*: The mobile station shall process the message as
 10 follows:
- 11 - If the purpose of the message is to reject a proposed service configuration,
 12 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 13 '00000010') within T_{56m} seconds.
- 14 - If the purpose of the message is to propose a service configuration, the
 15 mobile station shall process the message as follows:
- 16 + If the mobile station accepts the proposed service configuration, the
 17 mobile station shall send a *Service Response Message* to accept the
 18 proposed service configuration within T_{59m} seconds. The mobile station
 19 shall activate the *Waiting for Service Connect Message Subfunction*.
- 20 + If the mobile station does not accept the proposed service configuration
 21 and does not have an alternative service configuration to propose, the mobile
 22 station shall send a *Service Response Message* to reject the
 23 proposed service configuration within T_{59m} seconds.
- 24 + If the mobile station does not accept the proposed service configuration
 25 and has an alternative service configuration to propose, the mobile
 26 station shall send a *Service Response Message* to propose the alternative
 27 service configuration within T_{59m} seconds. The mobile station shall
 28 activate the *Waiting for Service Request Message Subfunction*.

29 **4.3. Service Response Message**: The mobile station shall send a *Mobile Station*
 30 *Reject Order* (ORDQ = '00000010') within T_{56m} seconds.

31 **5.4. General Handoff Direction Message**: If the SCR_INCLUDED field is included
 32 in this message and is set to '1':

33 If the mobile station has not rejected this message, the mobile station shall
 34 activate the *Waiting for Service Action Time Subfunction*.

35 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
 36 this message and is set to '1':

37 If the mobile station has not rejected this message, the mobile station shall
 38 activate the *Waiting for Service Action Time Subfunction*.

- 39 • If the mobile station receives one of the following service option negotiation
 40 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 41 '00000010') within T_{56m} seconds:

- 1 1. *Service Option Request Order*
- 2 2. *Service Option Response Order*
- 3 3. *Service Option Control Order*

4 2.6.4.1.2.2.2 Waiting for Service Request Message Subfunction

5 While this subfunction is active, the mobile station waits to receive a *Service Request*
6 *Message*.

7 Upon activation of the *Waiting for Service Request Message Subfunction*, the mobile station
8 shall set the subfunction timer for T_{68m} seconds.

9 While the *Waiting for Service Request Message Subfunction* is active, the mobile station shall
10 perform the following:

- 11 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
12 *Subfunction*.
- 13 • The mobile station shall process Forward and Reverse Traffic Channel frames in
14 accordance with the current service configuration. The mobile station shall discard
15 any Forward Traffic Channel frame which has a format that is not supported by the
16 mobile station. The mobile station may discard any type of Forward Traffic Channel
17 traffic that is not signaling traffic and is not part of the current service
18 configuration.
- 19 • The mobile station shall not initiate service negotiation for a new service
20 configuration.
- 21 • For any service option connection that is part of the current service configuration,
22 the mobile station may send a *Service Option Control Message* to invoke a service
23 option specific function in accordance with the requirements for the associated
24 service option.
- 25 • If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station
26 shall activate the *SO Negotiation Subfunction*.
- 27 • If the mobile station receives one of the following service negotiation messages, the
28 mobile station shall process the message according to the specified requirements:
 - 29 1. *Service Connect Message*: The mobile station shall perform the following:
 - 30 • If USE_OLD_SERV_CONFIG_R equals 'Q0', the mobile station shall perform
31 the following: If the mobile station accepts the service configuration
32 specified in the message, the mobile station shall activate the *Waiting for*
33 *Service Action Time Subfunction*; otherwise, the mobile station shall send
34 a *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds
35 and shall activate the *Normal Service Subfunction*.
 - 36 • If USE_OLD_SERV_CONFIG_R equals 'Q1', the mobile station shall perform
37 the following: If the mobile station accepts the service configuration
38 currently stored at the mobile station, the mobile station shall activate
39 the *Waiting for Service Action Time Subfunction*; otherwise, the mobile

station shall send a Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.

- If USE OLD SERV CONFIG_r equals '10', the mobile station shall perform the following: If the mobile station accepts the service configuration resulting from updating the stored service configuration with the service configuration received in this message, the mobile station shall activate the Waiting for Service Action Time Subfunction; otherwise, the mobile station shall send a Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.

2. *Service Option Control Message:* If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the mobile station shall interpret the action time of the message as specified in 2.6.4.1.5, and shall process the message in accordance with the requirements for the service option; otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds.
3. *Service Request Message:* The mobile station shall process the message as follows:
 - If the purpose of the message is to reject a proposed service configuration, the mobile station shall activate the *Normal Service Subfunction*.
 - If the purpose of the message is to propose a service configuration, the mobile station shall process the message as follows:
 - + If the mobile station accepts the proposed service configuration, the mobile station shall send a *Service Response Message* to accept the proposed service configuration within T_{59m} seconds. The mobile station shall activate the *Waiting for Service Connect Message Subfunction*.
 - + If the mobile station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the mobile station shall send a *Service Response Message* to reject the proposed service configuration within T_{59m} seconds. The mobile station shall activate the *Normal Service Subfunction*.
 - + If the mobile station does not accept the proposed service configuration and has an alternative service configuration to propose, the mobile station shall send a *Service Response Message* to propose the alternative service configuration within T_{59m} seconds. The mobile station shall reset the subfunction timer for T_{68m} seconds.
4. *Service Response Message:* The mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within T_{56m} seconds.
5. *General Handoff Direction Message:* If the SCR_INCLUDED field is included in this message and is set to '1':

If the mobile station has not rejected this message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall activate the *Normal Service Subfunction*.

6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in this message and is set to '1':

If the mobile station has not rejected this message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall activate the *Normal Service Subfunction*.

- If the mobile station receives one of the following service option negotiation messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within T56m seconds:
 1. *Service Option Request Order*
 2. *Service Option Response Order*
 3. *Service Option Control Order*

2.6.4.1.2.2.3 Waiting for Service Response Message Subfunction

While this subfunction is active, the mobile station waits to receive a *Service Response Message*.

Upon activation of the *Waiting for Service Response Message Subfunction*, the mobile station shall set the subfunction timer for T68m seconds.

While the *Waiting for Service Response Message Subfunction* is active, the mobile station shall perform the following:

- If the subfunction timer expires, the mobile station shall activate the *Normal Service Subfunction*.
- The mobile station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The mobile station shall discard any Forward Traffic Channel frame which has a format that is not supported by the mobile station. The mobile station may discard any type of Forward Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.
- The mobile station shall not initiate service negotiation for a new service configuration.
- For any service option connection that is part of the current service configuration, the mobile station may send a *Service Option Control Message* to invoke a service option specific function in accordance with the requirements for the associated service option.
- If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station shall activate the *SO Negotiation Subfunction*.

- 1 • If the mobile station receives one of the following service negotiation messages, the
2 mobile station shall process the message according to the specified requirements:
- 3 1. *Service Connect Message*: The mobile station shall perform the following:
 - 4 • If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform the
5 following: If the mobile station accepts the service configuration specified in
6 the message, the mobile station shall activate the *Waiting for Service Action*
7 *Time Subfunction*; otherwise, the mobile station shall send a *Mobile Station*
8 *Reject Order* (ORDQ = '00000111') within T_{56m} seconds and shall activate
9 the *Normal Service Subfunction*.
 - 10 • If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform the
11 following: If the mobile station accepts the service configuration currently
12 stored at the mobile station, the mobile station shall activate the *Waiting for*
13 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
14 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds.
 - 15 • If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall perform the
16 following: If the mobile station accepts the service configuration resulting
17 from updating the stored service configuration with the service configuration
18 received in this message, the mobile station shall activate the Waiting for
19 Service Action Time Subfunction; otherwise, the mobile station shall send a
20 Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.
- 21 2. *Service Option Control Message*: If the service option connection specified by the
22 message is part of the current service configuration, and the service option
23 specified by the message is the same as the service option associated with the
24 service option connection, the mobile station shall interpret the action time of
25 the message as specified in 2.6.4.1.5, and shall process the message in
26 accordance with the requirements for the service option; otherwise, the mobile
27 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
28 T_{56m} seconds.
- 29 3. *Service Request Message*: The mobile station shall process the message as
30 follows:
 - 31 – If the purpose of the message is to reject a proposed service configuration,
32 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
33 '00000010') within T_{56m} seconds.
 - 34 – If the purpose of the message is to propose a service configuration, the
35 mobile station shall discontinue processing the service configuration
36 requested by the user and shall process the message as follows:
 - 37 + If the mobile station accepts the proposed service configuration, the
38 mobile station shall send a *Service Response Message* to accept the
39 proposed service configuration within T_{59m} seconds. The mobile station
40 shall activate the *Waiting for Service Connect Message Subfunction*.

1 + If the mobile station does not accept the proposed service configuration
 2 and does not have an alternative service configuration to propose, the
 3 mobile station shall send a *Service Response Message* to reject the
 4 proposed service configuration within T_{59m} seconds. The mobile station
 5 shall activate the *Normal Service Subfunction*.

6 + If the mobile station does not accept the proposed service configuration
 7 and has an alternative service configuration to propose, the mobile
 8 station shall send a *Service Response Message* to propose the alternative
 9 service configuration within T_{59m} seconds. The mobile station shall
 10 activate the *Waiting for Service Request Message Subfunction*.

11 4. *Service Response Message*: The mobile station shall process the message as
 12 follows:

- 13 – If the service request sequence number (SERV_REQ_SEQ_r) from the message
 14 does not match the sequence number of the *Service Request Message* for
 15 which the mobile station is expecting a response, the mobile station shall not
 16 process the other HLayer 3 fields of the message.
- 17 – If the purpose of the message is to reject the service configuration proposed
 18 in the corresponding *Service Request Message*, the mobile station shall
 19 activate the *Normal Service Subfunction*. The mobile station may indicate to
 20 the user that the requested service configuration has been rejected.
- 21 – If the purpose of the message is to propose a service configuration, the
 22 mobile station shall process the message as follows:
 - 23 + If the mobile station accepts the proposed service configuration, the
 24 mobile station shall send a *Service Request Message* to accept the
 25 proposed service configuration within T_{59m} seconds. The mobile station
 26 shall activate the *Waiting for Service Connect Message Subfunction*.
 - 27 + If the mobile station does not accept the proposed service configuration
 28 and does not have an alternative service configuration to propose, the mobile
 29 station shall send a *Service Request Message* to reject the
 30 proposed service configuration within T_{59m} seconds. The mobile station
 31 shall activate the *Normal Service Subfunction*.
 - 32 + If the mobile station does not accept the proposed service configuration
 33 and has an alternative service configuration to propose, the mobile
 34 station shall send a *Service Request Message* to propose the alternative
 35 service configuration within T_{59m} seconds. The mobile station shall
 36 reset the subfunction timer for T_{68m} seconds.

37 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
 38 this message and is set to '1':

39 If the mobile station has not rejected this message, the mobile station shall
 40 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
 41 station shall activate the *Normal Service Subfunction*.

1 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
 2 this message and is set to '1':

3 If the mobile station has not rejected this message, the mobile station shall
 4 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
 5 station shall activate the *Normal Service Subfunction*.

6 • If the mobile station receives one of the following service option negotiation
 7 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 8 '00000010') within T_{56m} seconds:

- 9 1. *Service Option Request Order*
 10 2. *Service Option Response Order*
 11 3. *Service Option Control Order*

12 2.6.4.1.2.2.4 Waiting for Service Connect Message Subfunction

13 While this subfunction is active, the mobile station waits to receive a *Service Connect*
 14 *Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*
 15 containing a service configuration record.

16 Upon activation of the *Waiting for Service Connect Message Subfunction*, the mobile station
 17 shall set the subfunction timer for T_{65m} seconds.

18 While the *Waiting for Service Connect Message Subfunction* is active, the mobile station shall
 19 perform the following:

- 20 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
 21 *Subfunction*.
 - 22 • The mobile station shall process Forward and Reverse Traffic Channel frames in
 23 accordance with the current service configuration. The mobile station shall discard
 24 any Forward Traffic Channel frame which has a format that is not supported by the
 25 mobile station. The mobile station may discard any type of Forward Traffic Channel
 26 traffic that is not signaling traffic and is not part of the current service
 27 configuration.
 - 28 • The mobile station shall not initiate service negotiation for a new service
 29 configuration.
 - 30 • For any service option connection that is part of the current service configuration,
 31 the mobile station may send a *Service Option Control Message* to invoke a service
 32 option specific function in accordance with the requirements for the associated
 33 service option.
 - 34 • If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station
 35 shall activate the *SO Negotiation Subfunction*.
 - 36 • If the mobile station receives one of the following service negotiation messages, the
 37 mobile station shall process the message according to the specified requirements:
- 38 1. *Service Connect Message*: The mobile station shall perform the following:

- 1 • If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform the
2 following: If the mobile station accepts the service configuration specified in
3 the message, the mobile station shall activate the *Waiting for Service Action*
4 *Time Subfunction*; otherwise, the mobile station shall send a *Mobile Station*
5 *Reject Order* (ORDQ = '00000111') within T_{56m} seconds and shall activate
6 the *Normal Service Subfunction*.
 - 7 • If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform the
8 following: If the mobile station accepts the service configuration currently
9 stored at the mobile station, the mobile station shall activate the Waiting for
10 Service Action Time Subfunction; otherwise, the mobile station shall send a
11 Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.
 - 12 • If USE OLD SERV CONFIG_r equals '10', the mobile station shall perform the
13 following: If the mobile station accepts the service configuration resulting
14 from updating the stored service configuration with the service configuration
15 received in this message, the mobile station shall activate the Waiting for
16 Service Action Time Subfunction; otherwise, the mobile station shall send a
17 Mobile Station Reject Order (ORDQ = '00000111') within T_{56m} seconds.
- 18 2. *Service Option Control Message*: If the service option connection specified by the
19 message is part of the current service configuration, and the service option
20 specified by the message is the same as the service option associated with the
21 service option connection, the mobile station shall interpret the action time of
22 the message as specified in 2.6.4.1.5, and shall process the message in
23 accordance with the requirements for the service option; otherwise, the mobile
24 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
25 T_{56m} seconds.
- 26 3. *Service Request Message*: The mobile station shall process the message as
27 follows:
- 28 – If the purpose of the message is to reject a proposed service configuration,
29 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
30 '00000010') within T_{56m} seconds.
 - 31 – If the purpose of the message is to propose a service configuration, the
32 mobile station shall process the message as follows:
 - 33 + If the mobile station accepts the proposed service configuration, the
34 mobile station shall send a *Service Response Message* to accept the
35 proposed service configuration within T_{59m} seconds. The mobile station
36 shall reset the subfunction timer for T_{65m} seconds.
 - 37 + If the mobile station does not accept the proposed service configuration
38 and does not have an alternative service configuration to propose, the
39 mobile station shall send a *Service Response Message* to reject the
40 proposed service configuration within T_{59m} seconds. The mobile station
41 shall activate the *Normal Service Subfunction*.

- 1 + If the mobile station does not accept the proposed service configuration
 2 and has an alternative service configuration to propose, the mobile
 3 station shall send a *Service Response Message* to propose the alternative
 4 service configuration within T_{59m} seconds. The mobile station shall
 5 activate the *Waiting for Service Request Message Subfunction*.
- 6 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
 7 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 8 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
 9 this message and is set to '1':
 10 If the mobile station has not rejected this message, the mobile station shall
 11 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
 12 station shall activate the *Normal Service Subfunction*.
- 13 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
 14 this message and is set to '1':
 15 If the mobile station has not rejected this message, the mobile station shall
 16 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
 17 station shall activate the *Normal Service Subfunction*.
- 18 • If the mobile station receives one of the following service option negotiation
 19 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 20 '00000010') within T_{56m} seconds:
 21 1. *Service Option Request Order*
 22 2. *Service Option Response Order*
 23 3. *Service Option Control Order*
- 24 2.6.4.1.2.2.5 Waiting for Service Action Time Subfunction
 25 While this subfunction is active, the mobile station waits for the action time associated with
 26 a new service configuration. If the action time was specified by a *Service Connect Message*,
 27 the mobile station shall send the *Service Connect Completion Message* at the action time.
 28 While the *Wait for Service Action Time Subfunction* is active, the mobile station shall perform
 29 the following:
 30 • Prior to the action time associated with the *Service Connect Message*, *General*
 31 *Handoff Direction Message* (containing a service configuration record), or *Universal*
 32 *Handoff Direction Message* (containing a service configuration record), the mobile
 33 station shall process Forward and Reverse Traffic Channel frames in accordance
 34 with the current service configuration. The mobile station shall discard any
 35 Forward Traffic Channel frame which has a format that is not supported by the
 36 mobile station. The mobile station may discard any type of Forward Traffic Channel
 37 traffic that is not signaling traffic and is not part of the current service
 38 configuration.

- 1 • At the action time associated with the *Service Connect Message*, *General Handoff*
 2 *Direction Message* (containing a service configuration record) or *Universal Handoff*
 3 *Direction Message* (containing a service configuration record), the mobile station
 4 shall perform the following¹⁰:
 - 5 – If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_r equals '01',
 6 the mobile station shall perform the following:
 - 7 + The Call Control instance identified by NULL shall also be identified by the
 8 connection reference assigned to the first service option connection in the
 9 stored Service Configuration information record.
 - 10 + For each service option connection (with corresponding connection reference
 11 CON_REF_i) in the stored service configuration record, if any, except for the
 12 first one, Layer 3 shall instantiate a Call Control instance (as specified in
 13 2.6.10) with a 'restore indication'. The mobile station shall identify each of
 14 these Call Control instances by the corresponding CON_REF_i.
 - 15 + The mobile station shall begin to use the service configuration which was
 16 stored by the mobile station when it left the *Mobile Station Control on the*
 17 *Traffic Channel State* as the current service configuration and shall begin to
 18 process Forward and Reverse Traffic Channel frames accordingly. The mobile
 19 station shall send a *Service Connect Completion Message* within T_{56m}
 20 seconds after the action time. The mobile station shall exit this subfunction
 21 and activate the *Normal Service Subfunction*.
 - 22 + The mobile station shall store the synchronization identifier corresponding to
 23 the stored service configuration as SYNC_ID_S.
 - 24 – If this is a *Service Connect Message* with USE OLD SERV CONFIG_r equals '10',
 25 the mobile station shall perform the following:
 - 26 + The mobile station shall update the stored service configuration with the
 27 received service configuration as follows:
 - 28 o The mobile station shall process the received Service Configuration
 29 Record as specified in 2.6.4.1.12.

¹⁰ Note that these procedures that take place at the action time may not occur for this message if a GHDM/UHDM with SCR INCLUDED equal to '1' is received before the action time of this message. In this case, these procedures take place for the new message. One exception is that the call assignments from this message take effect at the action time of this message regardless of the call assignments from the new message.

- 1 o The mobile station shall process the received Non-negotiable Service
 2 Configuration Record as specified in 2.6.4.1.13.
- 3 + The mobile station shall begin to use the updated service configuration as
 4 the current service configuration and shall begin to process Forward and
 5 Reverse Traffic Channel frames accordingly. The mobile station shall send a
 6 Service Connect Completion Message within T_{56m} seconds after the action
 7 time. The mobile station shall exit this subfunction and activate the Normal
 8 Service Subfunction
- 9 + The mobile station shall store (if included) the synchronization identifier
 10 received from the base station corresponding to this updated service
 11 configuration (SYNC ID_S = SYNC ID_R).
- 12 – Otherwise, the mobile station shall perform the following:
- 13 + Prior to this message, if a Service Connect Message, General Handoff
 14 Direction Message (with service configuration), or Universal Handoff Direction
 15 Message (with service configuration) was not successfully received or
 16 accepted by the mobile station since entering the Traffic Channel Substate,
 17 the mobile station shall perform the following:
- 18 o The mobile station shall delete the stored service configuration (if any).
- 19 o The mobile station shall set the service configuration parameters (i.e.
 20 those signaled via the Service Configuration information record and the
 21 Non-Negotiable Service Configuration information record) to their default
 22 values as specified in 2.6.4.2.
- 23 + The mobile station shall process the received Service Configuration Record as
 24 specified in 2.6.4.1.12, shall process the received Non-negotiable Service
 25 Configuration Record as specified in 2.6.4.1.13 (if included), and shall begin
 26 to use the service configuration specified by the *Service Connect Message*,
 27 *General Handoff Direction Message* or *Universal Handoff Direction Message*
 28 containing a service configuration record as the current service configuration
 29 and shall begin to process Forward and Reverse Traffic Channel frames
 30 accordingly. If the action time was specified by a *Service Connect Message*,
 31 the mobile station shall send a *Service Connect Completion Message* within
 32 T_{56m} seconds after the action time. The mobile station shall exit this
 33 subfunction and activate the *Normal Service Subfunction*.
- 34 + The mobile station shall store (if included) the synchronization identifier
 35 received from the base station corresponding to this service configuration
 36 (SYNC ID_S = SYNC ID_R).

- + If P_REV_IN_USE_S is greater than six, the Non-Negotiable Service Configuration information record is not included in this message, and the value of SR_ID corresponding to the logical resource of '0000' in the LOGICAL_TO_PHYSICAL_MAPPING_TABLE is NULL, the mobile station shall set this SR_ID field to the value specified in the Service Configuration information record.
- + If CC_INFO_INCL_r equals '1', then for each of the NUM_CALLS_ASSIGN_r occurrences of the call control parameters included in the message, the mobile station shall perform the following:
 - o If RESPONSE_IND_r equals '1', and TAG_r matches any of the TAG values contained in the list TAG_OUTSTANDING_LIST, the HLayer 3 shall instantiate a Call Control instance (as specified in 2.6.10). The mobile station shall identify this Call Control instance by CON_REF_r. The mobile station shall disable the enhanced origination timer associated with this call origination and remove the TAG value specified by TAG_r from the list TAG_OUTSTANDING_LIST.
 - o If RESPONSE_IND_r equals '0', the mobile station shall store the bypass indicator (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_r) and the HLayer 3 shall instantiate a Call Control instance (as specified in 2.6.10). The mobile station shall identify this Call Control instance by CON_REF_r.
- The mobile station shall not initiate service negotiation for a new service configuration.
- For any service option connection that is part of the current or pending service configuration, the mobile station may send a *Service Option Control Message* to invoke a service option specific function in accordance with the requirements for the associated service option.
- If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station shall activate the *SO Negotiation Subfunction*.
- If the mobile station receives one of the following service negotiation messages, the mobile station shall process the message according to the specified requirements:
 1. *Service Connect Message*: The mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within T56m seconds.
 2. *Service Option Control Message*: If the service option connection specified by the message is part of the current or pending service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the mobile station shall interpret the action time of the message as specified in 2.6.4.1.5, and shall process the message in accordance with the requirements for the service option; otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T56m seconds.

1 3. *Service Request Message*: The mobile station shall send a *Mobile Station Reject*
 2 *Order* (ORDQ = '00000010') within T_{56m} seconds.

3 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
 4 *Order* (ORDQ = '00000010') within T_{56m} seconds.

5 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
 6 this message and is set to '1':

7 If the mobile station has not rejected this message, the mobile station shall
 8 remain in this subfunction until the action time specified in the message, and
 9 shall perform the following:

10 o The mobile station shall not perform the above procedures for the previous
 11 message. But the call assignments from the previous message (if any) shall
 12 take effect at the action time of the previous message.

13 o The mobile station shall perform the above procedures for this message (that
 14 is, begin to use the service configuration specified by the *General Handoff*
 15 *Direction Message*) at the action time of this message.

16 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
 17 this message and is set to '1':

18 If the mobile station has not rejected this message, the mobile station shall
 19 remain in this subfunction until the action time specified in the message, and
 20 shall perform the following:

21 o The mobile station shall not perform the above procedures for the previous
 22 message. But the call assignments from the previous message (if any) shall
 23 take effect at the action time of the previous message.

24 o The mobile station shall perform the above procedures for this message (that
 25 begin to use the service configuration and call assignments (if any) specified
 26 by the *Universal Handoff Direction Message* at the action time of this
 27 *message.*

- 28 • If the mobile station receives one of the following service option negotiation
 29 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 30 '00000010') within T_{56m} seconds:

- 31 1. *Service Option Request Order*
 32 2. *Service Option Response Order*
 33 3. *Service Option Control Order*

34 2.6.4.1.2.2.6 SO Negotiation Subfunction

35 The *SO Negotiation Subfunction* is only supported for mobile stations operating in Band
 36 Class 0.

37 Service option negotiation is not supported for P_REV_IN_USE_S greater than six.

1 Upon activation of the *SO Negotiation Subfunction*, the mobile station shall delete from the
2 current service configuration any service option connection which does not use primary
3 traffic on both the Forward and Reverse Traffic Channels and the Layer 3 shall terminate
4 the corresponding Call Control instances. The Call Control instance corresponding to the
5 service option connection which uses primary traffic, if any, shall be identified by NULL.

6 While the *SO Negotiation Subfunction* is active, the mobile station shall perform the
7 following:

- 8 • If the current service configuration includes a service option connection, the mobile
9 station shall process the received primary traffic bits in accordance with the
10 requirements for the service option associated with the service option connection;
11 otherwise, the mobile station shall discard the received primary traffic bits.
- 12 • If the current service configuration includes a service option connection, the mobile
13 station shall transmit primary traffic bits in accordance with the requirements for
14 the service option associated with the service option connection; otherwise, the
15 mobile station shall transmit null traffic on the Reverse Fundamental Channel, if
16 the Fundamental Channel is present or transmit power control bits on the Reverse
17 Pilot Channel, if only the Dedicated Control Channel is present.
- 18 • If the current service configuration includes a service option connection, the mobile
19 station may send a *Service Option Control Order* to invoke a service option specific
20 function in accordance with the requirements for the service option associated with
21 the service option connection.
- 22 • To initiate service option negotiation, the mobile station shall set SO_REQ_S to the
23 number of the requested service option and shall send a *Service Option Request
Order* containing the requested service option number.
- 25 • If SERV_NEG_S changes from disabled to enabled (see 2.6.6.2.5.1), the mobile station
26 shall set SO_REQ_S to NULL and shall activate the *Normal Service Subfunction*.
- 27 • If the mobile station receives a *Service Option Request Order*, it shall process the
28 order as follows:

- If the mobile station accepts the requested service option, the mobile station shall set SO_REQ_S to NULL and shall send a *Service Option Response Order* accepting the requested service option within T_{58m} seconds. The mobile station shall interpret the message action time of the *Service Option Request Order* in accordance with the requirements for the requested service option and the mobile station shall begin using the service configuration implied by the requested service option in accordance with those requirements. The implied service configuration shall include the default Forward and Reverse multiplex options and radio configurations associated with the requested service option, and shall include one service option connection for which the service option connection reference is 1, the service option is the requested service option, and the Forward and Reverse Traffic Channel types are both primary traffic. If a Call Control instance currently exists, the Layer 3 shall use this Call Control instance for a new service option connection; otherwise, The- the HLayer 3 shall instantiate a Call Control instance (as specified in 2.6.10) and; this Call Control instance shall be identified by both a connection reference with a value of 1 and a default identifier with a value of NULL.
- If the mobile station does not accept the requested service option and has an alternative service option to request, the mobile station shall set SO_REQ_S to the alternative service option number and shall send a *Service Option Request Order* requesting the alternative service option within T_{58m} seconds.
- If the mobile station does not accept the requested service option and does not have an alternative service option to request, the mobile station shall set SO_REQ_S to NULL and shall send a *Service Option Response Order* to reject the request within T_{58m} seconds. The mobile station shall continue to use the current service configuration.
- If the mobile station receives a *Service Option Response Order*, it shall process the order as follows:
 - If the service option number specified in the order is equal to SO_REQ_S, the mobile station shall set SO_REQ_S to NULL. The mobile station shall interpret the message action time of the *Service Option Response Order* in accordance with the requirements for the specified service option, and the mobile station shall begin using the service configuration implied by the specified service option in accordance with those requirements. The implied service configuration shall include the default Forward and Reverse multiplex options and radio configurations associated with the specified service option, and shall include one service option connection for which the service option connection reference is 1, the service option is the specified service option, and the Forward and Reverse Traffic Channel types are both primary traffic. If a Call Control instance currently exists, the Layer 3 shall use this Call Control instance for a new service option connection; otherwise, The- the HLayer 3 shall instantiate a Call Control instance (as specified in 2.6.10) and; this Call Control instance shall be identified by both a connection reference with a value of 1 and a default identifier with a value of NULL.

- If the order indicates a service option rejection, the mobile station shall set SO_REQ_S to NULL. The mobile station shall continue to use the current service configuration.
- If the order does not indicate a service option rejection and the service option specified in the order is not equal to SO_REQ_S, the mobile station shall set SO_REQ_S to NULL and shall send a *Mobile Station Reject Order* (ORDQ = '00000100') within T_{58m} seconds. The mobile station shall continue to use the current service configuration.
- If the mobile station receives a *Service Option Control Order*, it shall process the order as follows:
 - If the current service configuration includes a service option connection, the mobile station shall interpret the message action time of the *Service Option Control Order* in accordance with the requirements for the service option associated with the service option connection and the mobile station shall process the *Service Option Control Order* in accordance with those requirements;
 - otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000001') within T_{56m} seconds.
- If the mobile station receives one of the following service negotiation messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within T_{56m} seconds:
 1. *Service Connect Message*
 2. *Service Option Control Message*
 3. *Service Request Message*
 4. *Service Response Message*

2.6.4.1.3 Ordering of Messages

The Layer 2 protocol does not guarantee delivery of messages in any order. If the mobile station requires that the base station receive a set of messages in a certain order, the mobile station shall send each message in assured mode requiring confirmation of delivery and shall wait for the confirmation of delivery of each message before transmitting the next message in the set.

2.6.4.1.4 Processing the In-Traffic System Parameters Message

The mobile station shall store the following parameters from the *In-Traffic System Parameters Message*:

- System identification (SID_S = SID_r)
- Network identification (NID_S = NID_r)
- Search window size for the Active Set and the Candidate Set (SRCH_WIN_A_S = SRCH_WIN_A_r)
- Search window size for the Neighbor Set (SRCH_WIN_N_S = SRCH_WIN_N_r)

- 1 • Search window size for the Remaining Set ($\text{SRCH_WIN}_S = \text{SRCH_WIN}_R$)
- 2 • Pilot detection threshold ($T_{\text{ADD}}_S = T_{\text{ADD}}_R$)
- 3 • Pilot drop threshold ($T_{\text{DROP}}_S = T_{\text{DROP}}_R$)
- 4 • Active Set versus Candidate Set comparison threshold ($T_{\text{COMP}}_S = T_{\text{COMP}}_R$)
- 5 • Drop timer value ($T_{\text{TDROP}}_S = T_{\text{TDROP}}_R$)
- 6 • Maximum age for retention of Neighbor Set members
($\text{NGBR_MAX_AGE}_S = \text{NGBR_MAX_AGE}_R$)
- 7 • Protocol revision level ($P_{\text{REV}}_S = P_{\text{REV}}_R$), and protocol revision level currently in
use ($P_{\text{REV_IN_USE}}_S = \min(P_{\text{REV}}_S, \text{MOB_P_REV}_p$ of the current band class))
- 8 • Slope of the handoff add/drop criterion ($\text{SOFT_SLOPE}_S = \text{SOFT_SLOPE}_R$)
- 9 • Intercept of the handoff add criterion ($\text{ADD_INTERCEPT}_S = \text{ADD_INTERCEPT}_R$)
- 10 • Intercept of the handoff drop criterion ($\text{DROP_INTERCEPT}_S = \text{DROP_INTERCEPT}_R$)
- 11 • If included, Reverse Supplemental Code Channel or Reverse Supplemental Channel
neighbor pilot strength measurement transmission threshold offset threshold
($T_{\text{MULCHAN}}_S = T_{\text{MULCHAN}}_R$)
- 12 • If included, Reverse Supplemental Code Channel beginning of transmission
preamble length ($\text{BEGIN_PREAMBLE}_S = \text{BEGIN_PREAMBLE}_R$)
- 13 • If included, Reverse Supplemental Code Channel discontinuous transmission
resumption preamble length ($\text{RESUME_PREAMBLE}_S = \text{RESUME_PREAMBLE}_R$)
- 14 • If included, Slotted Timer ($T_{\text{SLOTTED}}_S = T_{\text{SLOTTED}}_R$)
- 15 • If the mobile station supports packet data service options, the mobile station shall
store the packet data services zone identifier ($\text{PACKET_ZONE_ID}_S = \text{PACKET_ZONE_ID}_R$).
- 16 • If ENC_SUPPORTED_R is equal to '1', the mobile station shall store:
- 17 – Signaling encryption supported indicator ($\text{SIG_ENCRYPT_SUP}_S = \text{SIG_ENCRYPT_SUP}_R$)
- 18 – User information encryption supported indicator ($\text{UI_ENCRYPT_SUP}_S = \text{UI_ENCRYPT_SUP}_R$)
- 19 • Concurrent services supported indicator ($\text{CS_SUPPORTED}_S = \text{CS_SUPPORTED}_R$).

30 The mobile station shall determine its roaming status (see 2.6.5.3). The mobile station
31 should indicate to the user whether the mobile station is roaming.

32 2.6.4.1.5 Message Action Times

33 A Forward Traffic Channel message without a USE_TIME field or with a USE_TIME field set
34 to '0' has an implicit action time. A message that has its USE_TIME field set to '1' has an
35 explicit action time that is specified in the ACTION_TIME field of the message.

36 A message with an explicit action time is called a pending message.

Unless otherwise specified, a message having an implicit action time shall take effect no later than the first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end of the frame containing the last bit of the message. A message with an explicit action time, except for a *Power Up Function Message*, shall take effect when System Time (in 80 ms units) modulo 64 becomes equal to the message's ACTION_TIME field. A *Power Up Function Message* shall take effect ACTION_TIME_FRAME frames after the time when System Time (in 80 ms units) modulo 64 becomes equal to the message's ACTION_TIME field. The difference in time between ACTION_TIME and the end of the frame containing the last bit of the message shall be at least 80 ms.

The mobile station shall support two pending messages at any given time, not including pending *Service Option Control Orders* or *Service Option Control Messages*. The number of pending *Service Option Control Orders* or *Service Option Control Messages* that the mobile station is required to support is specific to the service option (see the relevant service option description). In addition, the mobile station shall support one pending *Power Up Function Message*.

2.6.4.1.6 Long Code Transition Request Processing

The mobile station performs these procedures upon receiving a *Long Code Transition Request Order*.

If the *Long Code Transition Request Order* requests a transition to the private long code, and the mobile station is able to generate the private long code (see 2.3.12.3), and the mobile station accepts the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000011') within T_{56m} seconds. The mobile station shall use the private long code on both the Forward Traffic Channel and the Reverse Traffic Channel. The mobile station shall begin using the private long code at the explicit action time (see 2.6.4.1.5) specified in the message. At the action time of the message, the mobile station should indicate to the user that the voice privacy mode is active. If the *Long Code Transition Request Order* requests a private long code transition, and the mobile station is not able to generate the private long code or the mobile station does not accept the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000010') within T_{56m} seconds.

If the *Long Code Transition Request Order* requests a transition to the public long code and the mobile station accepts the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000010') within T_{56m} seconds. The mobile station shall use the public long code on both the Forward Traffic Channel and the Reverse Traffic Channel. The mobile station shall begin using the public long code at the explicit action time (see 2.6.4.1.5) specified in the message. At the action time of the message, the mobile station should indicate to the user that the voice privacy mode is inactive. If the *Long Code Transition Request Order* requests a public long code transition, and the mobile station does not accept the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000011') within T_{56m} seconds.

1 2.6.4.1.7 Power Up Function (PUF)

2 Figure 2.6.4.1.7-1 illustrates the general structure of a PUF attempt. A PUF pulse is the
3 interval during which the mobile station transmits at the specified power level while
4 executing the Power Up Function.

5 A PUF probe is one or more consecutive Traffic Channel frames. A PUF probe consists of
6 three parts: PUF setup, PUF pulse, and PUF recovery. PUF_SETUP_SIZE is the duration of
7 the PUF setup part, in power control groups. PUF_PULSE_SIZE is the duration of the PUF
8 pulse, in power control groups. The PUF recovery period occupies the remainder of the last
9 frame of the PUF probe.

10 A PUF attempt is a sequence of PUF probes sent by the mobile station in response to a
11 *Power Up Function Message*. A PUF attempt begins at an offset frame boundary within 80
12 ms of the ACTION_TIME specified in the *Power Up Function Message*. A PUF attempt can be
13 terminated in one of four ways:

- 14 • The mobile station receives a *Power Up Function Completion Message*.
- 15 • The mobile station has transmitted the maximum number of PUF probes specified in
16 the *Power Up Function Message*.
- 17 • The mobile station has transmitted the maximum number of probes allowed at its
18 maximum output power.
- 19 • The mobile station receives a new *Power Up Function Message*.

20

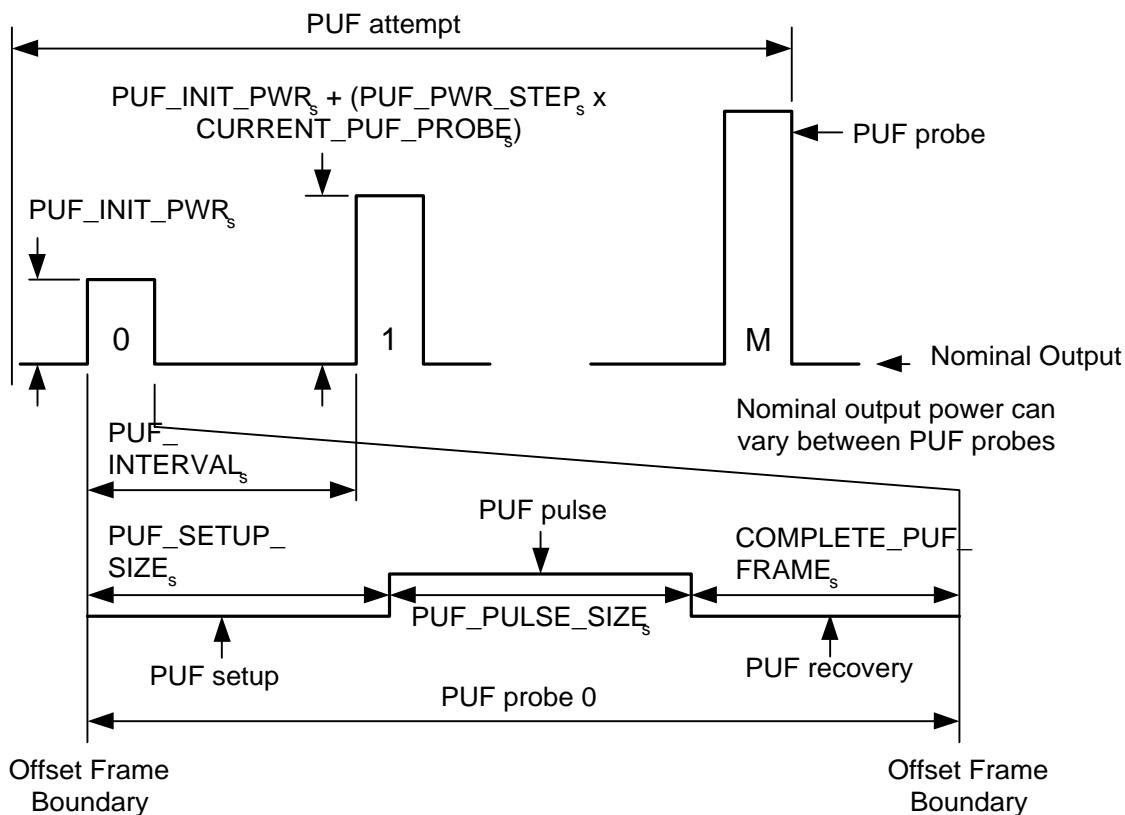

Figure 2.6.4.1.7-1. Structure of PUF Attempt

2.6.4.1.7.1 Processing the Power Up Function Message

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (message requires a capability that is not supported by the mobile station) if any of the following conditions are detected:

- PUF_FREQ_INCL_r is set to '1' and PUF_BAND_CLASS_r is not supported by the mobile station.
- PUF_FREQ_INCL_r is set to '1' and the mobile station is unable to re-tune to the PUF Target Frequency during $(\text{PUF_SETUP_SIZE}_r + 1)$ power control groups.
- MOB_P_REV_p is not equal to five and the mobile station does not support the Power Up Function.

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001100' (invalid Frequency Assignment), if the Frequency Assignment specified in the message is the same as the Serving Frequency (PUF_FREQ_INCL_r is equal to '1', PUF_BAND_CLASS_r is equal to CDMABAND_S and PUF_CDMA_FREQ_r is equal to CDMACH_S).

If the mobile station is processing a PUF probe, the mobile station shall wait for the PUF probe to complete. It shall then terminate the current PUF attempt. The mobile station shall store the following parameters:

- Maximum number of PUF probes transmitted at full power level ($\text{MAX_PWR_PUF}_S = \text{MAX_PWR_PUF}_r + 1$)
- Total number of PUF probes ($\text{TOTAL_PUF_PROBES}_S = \text{TOTAL_PUF_PROBES}_r + 1$)
- PUF interval ($\text{PUF_INTERVAL}_S = \text{PUF_INTERVAL}_r$)
- Number of PUF setup power control groups ($\text{PUF_SETUP_SIZE}_S = \text{PUF_SETUP_SIZE}_r + 1$)
- Number of PUF pulse power control groups ($\text{PUF_PULSE_SIZE}_S = \text{PUF_PULSE_SIZE}_r + 1$)
- Power increase of initial PUF pulse ($\text{PUF_INIT_PWR}_S = \text{PUF_INIT_PWR}_r$)
- Power increase for each successive PUF pulse ($\text{PUF_PWR_STEP}_S = \text{PUF_PWR_STEP}_r$)
- Frequency included indicator ($\text{PUF_FREQ_INCL}_S = \text{PUF_FREQ_INCL}_r$)

If PUF_FREQ_INCL_S equals '1', the mobile station shall store the following:

- PUF probe Target Frequency CDMA Channel number ($\text{PUF_TF_CDMACH}_S = \text{PUF_CDMA_FREQ}_r$)
- PUF probe Target Frequency CDMA band class ($\text{PUF_TF_CDMABAND}_S = \text{PUF_BAND_CLASS}_r$)

The mobile station shall set $\text{CURRENT_PUF_PROBE}_S$ equal to 0.

The mobile station shall then begin the PUF attempt at the time specified in 2.6.4.1.7.2.

2.6.4.1.7.2 Power Up Function Procedures

The mobile station shall process the initial PUF probe beginning at the start of the frame which starts $\text{ACTION_TIME_FRAME}_r \times 20 \text{ ms} + \text{FRAME_OFFSET}_S \times 1.25 \text{ ms}$ after the System Time specified by ACTION_TIME_r . The mobile station shall process additional PUF probes beginning at intervals of PUF_INTERVAL_S frames from the beginning of the initial PUF probe.

The mobile station shall transmit the PUF probes as described in 2.6.4.1.7.2.1 and 2.6.4.1.7.2.2.

2.6.4.1.7.2.1 PUF Probe On Serving Frequency

The mobile station shall process each PUF probe as follows:

- The mobile station shall use closed loop power control procedures as specified in 2.1.2.3.2 of [2].
- The mobile station shall use the gated output procedures specified in 2.1.2.2.4 and 2.1.3.1.10.3 of [2].

- 1 • The mobile station shall control its mean output power as specified in 2.1.2.3.1 of
2 [2].
- 3 • The mobile station shall monitor its output power during the PUF pulse, and should
4 monitor its output power at least once during each power control group of the PUF
5 pulse. If the mobile station detects that the transmit power level specified in [2] is
6 equal to or greater than the maximum power output of the mobile station at any
7 time during a PUF pulse, the mobile station shall decrement MAX_PWR_PUF_S by one
8 for that PUF pulse.
- 9 • The mobile station shall transmit the traffic channel preamble for the duration of
10 the PUF probe on the Reverse Fundamental **Code**-Channel.

11 After the processing of each PUF probe, the mobile station shall increment
12 CURRENT_PUF_PROBE_S by 1. If MAX_PWR_PUF_S is equal to 0, the mobile station shall
13 terminate the PUF attempt. If CURRENT_PUF_PROBE_S equal to TOTAL_PUF_PROBE_S, the
14 mobile station shall terminate the PUF attempt.

15 2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency

16 The mobile station shall process each PUF probe as follows:

- 17 • The mobile station shall use closed loop power control procedures as specified in
18 2.1.2.3.2 of [2].
- 19 • The mobile station shall use the gated output procedures specified in 2.1.3.1.10.3 of
20 [2].
- 21 • The mobile station shall control its mean output power as specified in 2.1.2.3.1 of
22 [2].
- 23 • The mobile station shall store the following Serving Frequency parameters from its
24 current configuration:
 - 25 – CDMA Band Class (PUF_SF_CDMABAND_S = CDMABAND_S)
 - 26 – Frequency assignment (PUF_SF_CDMACH_S = CDMACH_S)
- 27 • The mobile station shall monitor its output power during the PUF pulse, and should
28 monitor its output power at least once during each power control group of PUF
29 pulse. If the mobile station detects that the transmit power level specified in
30 2.1.2.3.1 of [2] is equal to or greater than the maximum power output of the mobile
31 station at any time during a PUF pulse, the mobile station shall decrement the
32 MAX_PWR_PUF_S by one for that PUF pulse.
- 33 • At the beginning of the PUF probe, the mobile station shall disable its transmitter,
34 stop processing the Forward Supplemental Code Channel (if any), or the Forward
35 Supplemental Channel (if any), disable all corrections to the mobile station time
36 reference (see 2.1.5 of [2]), tune to the CDMA channel specified by
37 PUF_TF_CDMACH_S, and PUF_TF_CDMABAND_S and re-enable its transmitter.
- 38 • The mobile station shall transmit the traffic channel preamble on the Reverse
39 Fundamental **Code**-Channel during the PUF pulse at PUF_TX_PWR_S.

- 1 • The mobile station should disable its transmitter immediately after the end of the
2 PUF pulse, and shall disable its transmitter before the end of the first power control
3 group after the PUF pulse. It shall then tune to its assigned CDMA channel as given
4 by CDMACH_S and CDMABAND_S.
- 5 • If the interval between the time that the mobile station tunes to the PUF Target
6 Frequency and the time that it re-tunes to the Serving Frequency is equal to or
7 greater than ($N_{2m} \times 0.02$) seconds, the mobile station shall wait to receive a period
8 of ($N_{3m} \times 20$) ms with sufficient signal quality (e.g. good frames) on the physical
9 channel corresponding to FPC_PRI_CHAN_S.
- 10 • The mobile station shall then re-enable its transmitter and re-enable any
11 adjustments to the mobile station time reference.
- 12 • If the Forward Supplemental Code Channel assignment has not expired while the
13 mobile station has tuned to the PUF Target Frequency, then the mobile station shall
14 resume processing the Forward Supplemental Code Channels after re-tuning to the
15 Serving Frequency.
- 16 • If the Forward Supplemental Channel assignment has not expired while the mobile
17 station has tuned to the PUF Target Frequency, then the mobile station shall
18 resume processing the Forward Supplemental Channels after re-tuning to the
19 Serving Frequency.
- 20 • If the Reverse Supplemental Code Channel assignment has not expired while the mobile
21 station has tuned to the PUF Target Frequency, then the mobile station may
22 resume transmitting the Reverse Supplemental Code Channels after re-tuning to the
23 Serving Frequency.
- 24 • If the Reverse Supplemental Channel assignment has not expired while the mobile
25 station has tuned to the PUF Target Frequency, then the mobile station may resume
26 transmitting the Reverse Supplemental Code Channels after re-tuning to the Serving
27 Frequency.

28 After the processing of each PUF probe, the mobile station shall increment
29 CURRENT_PUF_PROBE_S by one. If MAX_PWR_PUF_S is equal to 0, the mobile station shall
30 terminate the PUF attempt. If CURRENT_PUF_PROBE_S is equal to TOTAL_PUF_PROBE_S,
31 the mobile station shall terminate the PUF attempt.

32 2.6.4.1.7.3 Processing the Power Up Function Completion Message

33 The mobile station shall terminate any PUF attempt no later than the completion of the
34 current probe in progress and shall discard any pending *Power Up Function Message*. If
35 LOC_IND_R is equal to '1', the mobile station may store the following parameters:

- 36 • Mobile Station Latitude (MS_LAT_S = MS_LAT_R)
- 37 • Mobile Station Longitude (MS_LONG_S = MS_LONG_R)
- 38 • Time stamp (MS_LOC_TSTAMP_S = MS_LOC_TSTAMP_R)

1 2.6.4.1.8 Forward Traffic Channel Supervision

2 When in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall
 3 continuously monitor the Forward Channel, except:

- 4 • During a PUF probe in which it transmits on a PUF target frequency (see 2.6.4.1.7),
- 5 • During a search of pilots on a CDMA Candidate Frequency (see 2.6.6.2.8.3),
- 6 • During a search of analog frequencies (see 2.6.6.2.10).

7 The mobile station shall monitor the physical channel corresponding to FPC_PRI_CHAN_S.

8 If the mobile station receives a period of ($N_{2m} \times 20$) ms with insufficient signal quality (e.g.
 9 bad frames) on the physical channel corresponding to FPC_PRI_CHAN_S, it shall disable its
 10 transmitter. Thereafter, if the mobile station receives a period of ($N_{3m} \times 20$) ms with
 11 sufficient signal quality (e.g. good frames) on the physical channel corresponding to
 12 FPC_PRI_CHAN_S, then the mobile station should re-enable its transmitter.

13 The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be
 14 enabled when the mobile station first enables its transmitter when in the *Traffic Channel*
 15 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade
 16 timer shall be reset for T_{5m} seconds whenever the mobile station receives a period of (N_{3m}
 17 $\times 20$) ms with sufficient signal quality (e.g. good frames) on the physical channel
 18 corresponding to FPC_PRI_CHAN_S. The mobile station shall disable the fade timer when it
 19 tunes to a PUF target frequency, and shall re-enable the fade timer at the end of the PUF
 20 probe. If the timer expires, the mobile station shall disable its transmitter and declare a
 21 loss of the Forward Traffic Channel.

22 The mobile station also enables, disables, and resets the fade timer when it performs a hard
 23 handoff or a periodic search, as described in 2.6.6.2.8 and 2.6.6.2.10.

24 2.6.4.1.9 Processing the Extended Release Message and the Extended Release Mini Message

- 25 • Upon receiving the *Extended Release Message* or the *Extended Release Mini*
 26 *Message*, the mobile station shall process the message as follows:
 - 27 – If the mobile station determines that the configuration specified by CH_IND_r is
 28 not valid, the mobile station shall send a *Mobile Station Reject Order* with the
 29 ORDQ field set to '00000111' (message can not be handled by the current mobile
 30 station configuration) and the mobile station shall not perform the remaining
 31 procedures in this section.
 - 32 – If the physical channels indicated by the two least significant bits of CH_IND_r
 33 includes all the physical channels (FCH, DCCH, or both) currently being
 34 processed by the mobile station, the ILayer 3 shall send a "release indication" to
 35 all Call Control instances and shall perform the following:
 - 36 + Enter the *Release Substate* with a base station extended release indication if
 37 the message is the *Extended Release Message*.
 - 38 + Enter the *Release Substate* with a base station extended release mini
 39 message indication if the message is the *Extended Release Mini Message*.

- 1 – Otherwise, the mobile station shall perform the following:
- 2 + If the received message is the *Extended Release Message*, the mobile station
 3 shall send an *Extended Release Response Message* to the base station. If the
 4 received message is the *Extended Release Mini Message*, the mobile station
 5 shall send an *Extended Release Response Mini Message* to the base station.
- 6 + The mobile station shall update CH_IND_S as follows: If the least significant
 7 bit of CH_IND_r equals ‘1’, the mobile station shall set CH_IND_S = ‘10’.
 8 otherwise ~~If the second most least~~ significant bit of CH_IND_r equals ‘01’,
 9 the mobile station shall set CH_IND_S = ‘01’.
- 10 + If CH_IND_r is equal to ‘001’ or ‘101’, the mobile station shall set
 11 FPC_PRI_CHAN_S to ‘1’ at the action time of the message.
- 12 + If CH_IND_r is equal to ‘010’, the mobile station shall set FPC_PRI_CHAN_S to
 13 ‘0’ at the action time of the message.
- 14 + If the least significant bit of CH_IND_r equals ‘1’, then the mobile station shall
 15 stop transmitting on R-FCH and stop processing F-FCH at the action time
 16 specified by the message.
- 17 + If the second most significant bit of CH_IND_r equals ‘1’, then the mobile
 18 station shall stop transmitting on R-DCCH and stop processing F-DCCH at
 19 the action time specified by the message.
- 20 + If GATING_RATE_INCL_r equals ‘1’, the mobile station shall set
 21 PILOT_GATING_RATE_S = PILOT_GATING_RATE_r at the action time of the
 22 message.
- 23 + If the most significant bit of CH_IND_r equals ‘1’, the mobile station shall set
 24 PILOT_GATING_USE_RATE to ‘1’. The mobile station shall start the reverse
 25 pilot gating at PILOT_GATING_RATE_S at the action time of the message.
 26 Furthermore, if the least significant bit of CH_IND_r equals ‘1’ (that is, the
 27 Fundamental Channel is being released), the mobile station shall store the
 28 configuration used for the Fundamental Channel. The mobile station shall
 29 cancel the forward and reverse supplemental channel assignment, if any.

30 2.6.4.1.10 Processing the Resource Allocation Message and Resource Allocation Mini
 31 Message

32 The mobile station shall process the *Resource Allocation Message* and the *Resource
 33 Allocation Mini Message* as follows:

- 34 • The mobile station shall set FPC_PRI_CHAN_S = FPC_PRI_CHAN_r at the action time of
 35 the message.

- If the Fundamental Channel was previously established prior to transitioning to the *Control Hold Mode*, the mobile station shall start processing F-FCH and start transmitting on R-FCH at the action time of the message. The mobile station shall establish the Fundamental Channel with the same configuration as previously used, and shall set CH_IND_s to '11'.
- The mobile station shall set PILOT_GATING_USE_RATE to '0' and shall start the continuous reverse pilot at the action time of the message.

2.6.4.1.11 Reserved

2.6.4.1.12 Processing the Service Configuration Record

The mobile station shall update the Service Configuration information record currently in use as follows:

- The mobile station shall store the forward Fundamental Channel and Dedicated Control Channel multiplex option [FOR_MUX_OPTION_s = FOR_MUX_OPTION_r].
- The mobile station shall store the reverse Fundamental Channel and Dedicated Control Channel multiplex option [REV_MUX_OPTION_s = REV_MUX_OPTION_r].
- The mobile station shall store the set of number of bits per frame of the forward Fundamental Channel and Dedicated Control Channel traffic-channel [FOR_NUM_BITS_s = FOR_NUM_BITS_r].
- The mobile station shall store the set of number of bits per frame of the reverse Fundamental Channel and Dedicated Control Channel traffic-channel [REV_NUM_BITS_s = REV_NUM_BITS_r].
- If a service option connection has been omitted from the service option connection records, the Layer 3 shall terminate the call control instance (currently existing or pending instantiation) identified by the connection reference corresponding to the omitted service option connection.
- If this is the first Service Configuration Record received from the base station in a *Service Connect Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message* and accepted by the mobile station since entering the *Traffic Channel substate*, the mobile station shall also identify the Call Control instance currently identified by NULL by the connection reference assigned to the first service option connection, CON_REF_r; otherwise, the mobile station shall identify the Call Control instance corresponding to the first service option connection listed in this Service Configuration information record by the NULL identifier.
- The mobile station shall delete all instances of current service option connection records. For each of the NUM_CON_REC_r occurrences of the service option connection record (SO_CON_REC[i]), the mobile station shall perform the following:
 - The mobile station shall store the service option connection reference (SO_CON_REC_s[i].CON_REF = CON_REF_r).

- 1 – The mobile station shall store the service option
2 (SO_CON_REC_S[i].SERVICE_OPTION = SERVICE_OPTION_r).
- 3 – The mobile station shall store the forward traffic channel traffic type
4 (SO_CON_REC_S[i].FOR_TRAFFIC = FOR_TRAFFIC_r).
- 5 – The mobile station shall store the reverse traffic channel traffic type
6 (SO_CON_REC_S[i].REV_TRAFFIC = REV_TRAFFIC_r).
- 7 – The mobile station shall store the encryption mode indicator for user information
8 privacy (SO_CON_REC_S[i].UI_ENCRYPT_MODE = UI_ENCRYPT_MODE_r).
- 9 – The mobile station shall store the service reference identifier
10 (SO_CON_REC_S[i].SR_ID = SR_ID_r).
- 11 – If RLP_INFO_INCL_r equals ‘1’, the mobile station shall store the Radio Link
12 Protocol block of bits (SO_CON_REC_S[i].RLP_BLOB = RLP_BLOB_r).
- 13 – If QOS_PARMS_INCL_r equals ‘1’, the mobile station shall store the QoS
14 parameters block (SO_CON_REC_S[i].QOS_PARMS = QOS_PARMS_r).
- 15 • If FCH_CC_INCL_r equals ‘1’, the mobile station shall do the following:
 - 16 – The mobile station shall store the indicator for 5ms frames on Fundamental
17 Channel as follows: if FCH_FRAME_SIZE_r equals ‘1’, the mobile station shall set
18 FCH_5MS_FRAMES_S = ‘1’; otherwise, it is set to ‘0’.
 - 19 – The mobile station shall store the Forward Fundamental Channel Radio
20 Configuration (FOR_FCH_RC_S = FOR_FCH_RC_r).
 - 21 – The mobile station shall store the Reverse Fundamental Channel Radio
22 Configuration (REV_FCH_RC_S = REV_FCH_RC_r).
- 23 • If DCCH_CC_INCL_r equals ‘1’, the mobile station shall do the following:
 - 24 – The mobile station shall store the indicator for 5ms frames on Dedicated Control
25 Channel as follows: If DCCH_FRAME_SIZE_r equals ‘10’ or ‘11’, the mobile station
26 shall set DCCH_5MS_FRAMES_S = ‘1’; otherwise, it is set to ‘0’.
 - 27 – The mobile station shall store the Forward Dedicated Control Channel Radio
28 Configuration (FOR_DCCH_RC_S = FOR_DCCH_RC_r).
 - 29 – The mobile station shall store the Reverse Dedicated Control Channel Radio
30 Configuration (REV_DCCH_RC_S = REV_DCCH_RC_r).
- 31 • If FOR_SCH_CC_INCL_r equals ‘1’, the mobile station shall store the NUM_FOR_SCH_r
32 occurrences of the Forward Supplemental Channel channel configuration records as
33 follows:
 - 34 – The mobile station shall store the Forward Supplemental Channel Identification
35 (FOR_SCH_ID[FOR_SCH_ID_r]_S = FOR_SCH_ID_r).

- The mobile station shall store the Forward Supplemental Channel Multiplex Option ($\text{FOR_SCH_MUX}[\text{FOR_SCH_ID}_r]_s = \text{FOR_SCH_MUX}_r$).
 - The mobile station shall store the Forward Supplemental Channel Radio Configuration ($\text{FOR_SCH_RC}[\text{FOR_SCH_ID}_r]_s = \text{SCH_RC}_r$).
 - The mobile station shall store the Forward Supplemental Channel Coding Type ($\text{FOR_SCH_CODING}[\text{FOR_SCH_ID}_r]_s = \text{CODING}_r$).
 - If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the mobile station shall set $\text{FOR_SCH_FRAME_LENGTH}_s[\text{FOR_SCH_ID}_r]$ to '00' (i.e., 20 ms frame length).
 - If FRAME_40_USED_r is equal to '1', the mobile station shall set $\text{FOR_SCH_FRAME_LENGTH}_s[\text{FOR_SCH_ID}_r]$ to '01' (i.e., 40 ms frame length).
 - If FRAME_80_USED_r is equal to '1', the mobile station shall set $\text{FOR_SCH_FRAME_LENGTH}_s[\text{FOR_SCH_ID}_r]$ to '10' (i.e., 80 ms frame length).
 - $\text{F_MAX_RATE_IDX}_s[\text{FOR_SCH_ID}_r] = \text{MAX_RATE}_r$.
- If REV_SCH_CC_INCL_r equals '1', the mobile station shall store the NUM_REV_SCH_r occurrences of the Reverse Supplemental Channel channel configuration records as follows:
 - The mobile station shall store the Reverse Supplemental Channel Identification ($\text{REV_SCH_ID}[\text{REV_SCH_ID}_r]_s = \text{REV_SCH_ID}_r$).
 - The mobile station shall store the Reverse Supplemental Channel Multiplex Option ($\text{REV_SCH_MUX}[\text{REV_SCH_ID}_r]_s = \text{REV_SCH_MUX}_r$).
 - The mobile station shall store the Reverse Supplemental Channel Radio Configuration ($\text{REV_SCH_RC}[\text{REV_SCH_ID}_r]_s = \text{SCH_RC}_r$).
 - The mobile station shall store the Reverse Supplemental Channel Coding Type ($\text{REV_SCH_CODING}[\text{REV_SCH_ID}_r]_s = \text{CODING}_r$).
 - If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the mobile station shall set $\text{REV_SCH_FRAME_LENGTH}_s[\text{REV_SCH_ID}_r]$ to '00' (i.e., 20 ms frame length).
 - If FRAME_40_USED_r is equal to '1', the mobile station shall set $\text{REV_SCH_FRAME_LENGTH}_s[\text{REV_SCH_ID}_r]$ to '01' (i.e., 40 ms frame length).
 - If FRAME_80_USED_r is equal to '1', the mobile station shall set $\text{REV_SCH_FRAME_LENGTH}_s[\text{REV_SCH_ID}_r]$ to '10' (i.e., 80 ms frame length).
 - $\text{R_MAX_RATE_IDX}_s[\text{REV_SCH_ID}_r] = \text{MAX_RATE}_r$.

34 2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record

35 The mobile station shall update the Non-Negotiable Service Configuration information
 36 record currently in use as follows:

- If FPC_INCL_r equals '1', the mobile station shall do the following:

- The mobile station shall store the Power Control Subchannel indicator ($FPC_PRI_CHAN_s = FPC_PRI_CHAN_r$).
- The mobile station shall store the forward power control operation mode ($FPC_MODE_NO_SCH_s = FPC_MODE_r$).
- The mobile station shall set $FPC_MODE_s = FPC_MODE_NO_SCH_s$ if there is no forward Supplemental Channel assignment in progress (see 2.6.6.2.5.1.1).
- If $FPC_OLPC_FCH_INCL_r$ equals ‘1’, the mobile station shall do the following:
 - + The mobile station shall store the Fundamental Channel target Frame Error Rate ($FPC_FCH_FER_s = FPC_FCH_FER_r$).
 - + The mobile station shall store the minimum Fundamental Channel Outer Loop E_b/N_t setpoint ($FPC_FCH_MIN_SETPT_s = FPC_FCH_MIN_SETPT_r$).
 - + The mobile station shall store the maximum Fundamental Channel Outer Loop E_b/N_t setpoint ($FPC_FCH_MAX_SETPT_s = FPC_FCH_MAX_SETPT_r$).
- If $FPC_OLPC_DCCH_INCL_r$ equals ‘1’, the mobile station shall do the following:
 - + The mobile station shall store the Dedicated Control Channel target Frame Error Rate ($FPC_DCCH_FER_s = FPC_DCCH_FER_r$).
 - + The mobile station shall store the minimum Dedicated Control Channel Outer Loop E_b/N_t setpoint ($FPC_DCCH_MIN_SETPT_s = FPC_DCCH_MIN_SETPT_r$).
 - + The mobile station shall store the maximum Dedicated Control Channel Outer Loop E_b/N_t setpoint ($FPC_DCCH_MAX_SETPT_s = FPC_DCCH_MAX_SETPT_r$).
- If $GATING_RATE_INCL_r$ equals ‘1’, the mobile station shall store the Reverse Pilot Channel gating rate ($PILOT_GATING_RATE_s = PILOT_GATING_RATE_r$).
- If $FOR_SCH_INCL_r$ equals ‘1’, the mobile station shall store the $NUM_FOR_SCH_r$ occurrences of the Forward Supplemental Channel information as follows:
 - The mobile station shall store the Forward Supplemental Channel Multiframe Offset ($FOR_SCH_FRAME_OFFSET[FOR_SCH_ID_r]_s = FOR_SCH_FRAME_OFFSET_r$).
- If $REV_SCH_CC_INCL_r$ equals ‘1’, the mobile station shall store the $NUM_REV_SCH_r$ occurrences of the Reverse Supplemental Channel information as follows:
 - The mobile station shall store the Reverse Supplemental Channel Multiframe Offset ($REV_SCH_FRAME_OFFSET[REV_SCH_ID_r]_s = REV_SCH_FRAME_OFFSET_r$).
- The mobile station shall determine the Logical-to-Physical Mapping to be used as follows:

- If LPM_IND_r equals '00' and P_REV_IN_USE_s is greater than six, the mobile station shall reset the Logical-to-Physical Mapping to their default values as specified in Table 2.6.4.2-1 but with the following modification for requirement 1 stated in Table 2.6.4.2-1:
 - + The mobile station shall set the SR_ID field to the value specified in the Service Configuration information record.
- If LPM_IND_r equals '00' and P_REV_IN_USE_s is equal to or less than six, the mobile station shall reset the Logical-to-Physical Mapping to their default values as follows:
 - + Default number of Logical-to-Physical Mapping entries (NUM_LPM_ENTRIES_s = '0100').
 - + Default Table(0) Logical-to-Physical Mapping service reference identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].SR_ID_s = '000').
 - + Default Table(0) Logical-to-Physical Mapping logical resource identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].LOGICAL_RESOURCE_s = '0001').
 - + Default Table(0) Logical-to-Physical Mapping physical resource identifier:
 - o If CH_IND_s is equal to '01' or '11', the mobile station shall set LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to '0000'.
 - o If CH_IND_s is equal to '10', the mobile station shall set LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to '0001'.
 - + Default Table(0) Logical-to-Physical Mapping forward mapping indicator (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].FORWARD_FLAG_s = '1').
 - + Default Table(0) Logical-to-Physical Mapping reverse mapping indicator (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].REVERSE_FLAG_s = '1').
 - + Default Table(0) Logical-to-Physical Mapping priority (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PRIORITY_s = '0000').
 - + Default Table(1) Logical-to-Physical Mapping service reference identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].SR_ID_s = '001').
 - + Default Table(1) Logical-to-Physical Mapping logical resource identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].LOGICAL_RESOURCE_s = '0000').
 - + Default Table(1) Logical-to-Physical Mapping physical resource identifier:
 - o If CH_IND_s is equal to '01' or '11', the mobile station shall set LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to '0000'.

- 1 o If CH_IND_S is equal to '10', the mobile station shall set
 2 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE
 3 s to '0001'.
- 4 + Default Table(1) Logical-to-Physical Mapping forward mapping indicator
 5 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].FORWARD_FLAG_S = '1').
- 6 + Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
 7 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].REVERSE_FLAG_S = '1').
- 8 + Default Table(1) Logical-to-Physical Mapping priority
 9 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PRIORITY_S = '0000').
- 10 + Default Table(2) Logical-to-Physical Mapping service reference identifier
 11 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].SR_ID_S = '001').
- 12 + Default Table(2) Logical-to-Physical Mapping logical resource identifier
 13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].LOGICAL_RESOURCE_S =
 14 '0000').
- 15 + Default Table(2) Logical-to-Physical Mapping physical resource identifier
 16 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_S to
 17 '0010').
- 18 + Default Table(2) Logical-to-Physical Mapping forward mapping indicator
 19 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].FORWARD_FLAG_S = '1').
- 20 + Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
 21 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].REVERSE_FLAG_S = '1').
- 22 + Default Table(2) Logical-to-Physical Mapping priority
 23 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PRIORITY_S = '0000').
- 24 + Default Table(3) Logical-to-Physical Mapping service reference identifier
 25 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].SR_ID_S = '001').
- 26 + Default Table(3) Logical-to-Physical Mapping logical resource identifier
 27 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].LOGICAL_RESOURCE_S =
 28 '0000').
- 29 + Default Table(3) Logical-to-Physical Mapping physical resource identifier
 30 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PHYSICAL_RESOURCE_S to
 31 '0011').
- 32 + Default Table(3) Logical-to-Physical Mapping forward mapping indicator
 33 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].FORWARD_FLAG_S = '1').
- 34 + Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
 35 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].REVERSE_FLAG_S = '1').
- 36 + Default Table(3) Logical-to-Physical Mapping priority
 37 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PRIORITY_S = '0000').

- If LPM_IND_r equals '01', the mobile station shall use the Logical-to-Physical Mapping included in this Non-Negotiable Service Configuration Record. The mobile station shall do the following: The mobile station shall delete the Logical-to-Physical Mapping currently in use. The mobile station shall store the number of Logical-to-Physical Mapping entries (NUM_LPM_ENTRIES_s = NUM_LPM_ENTRIES_r). For each ith record of the NUM_LPM_ENTRIES_r Logical-to-Physical Mapping records included in the received Non-Negotiable Service Configuration Record:
 - + The mobile station shall store the Logical-to-Physical Mapping service reference identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].SR_ID_s = SR_ID_r).
 - + The mobile station shall store the Logical-to-Physical Mapping logical resource identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].LOGICAL_RESOURCE_s = LOGICAL_RESOURCE_r).
 - + The mobile station shall store the Logical-to-Physical Mapping Physical Channel (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PHYSICAL_RESOURCE_s = PHYSICAL_RESOURCE_r).
 - + The mobile station shall store the Logical-to-Physical Mapping forward mapping indicator (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FORWARD_FLAG_s = FORWARD_FLAG_r).
 - + The mobile station shall store the Logical-to-Physical Mapping reverse mapping indicator (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REVERSE_FLAG_s = REVERSE_FLAG_r).
 - + The mobile station shall store the Logical-to-Physical Mapping priority (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PRIORITY_s = PRIORITY_r).
- If LPM_IND_r equals '10', the mobile station shall use the Logical-to-Physical Mapping currently in use.
- For each of the NUM_REC_r occurrences of the service-specific records included in the Non-negotiable Service Configuration Record, the mobile station shall perform the following:
 - The mobile station shall store the Short Data Burst service option number omitted indicator (SDB_SO OMIT_s [SR_ID_r] = SDB_SO OMIT_r).
 - The mobile station shall store the following:
 - USE_FLEX_NUM_BITS_s = USE_FLEX_NUM_BITS_r
 - USE_VAR_RATE_s = USE_VAR_RATE_r

- 1 - If USE_VAR_RATE_r is equal to '1', then the mobile station shall store the
 2 following:
 3 + R_INC_RATE_ALLOWED_s = R_INC_RATE_ALLOWED_r
 4 + F_INC_RATE_ALLOWED_s = F_INC_RATE_ALLOWED_r
- 5 • If NUM_BITS_TABLES_INCL_r is included and is equal to '1', the mobile station shall
 6 store NUM_BITS_TABLES_COUNT+1 instances of the Flexible Rate Table
 7 (NUM_RECS triplets of (NUM_BITS_IDX, NUM_BITS, CRC_LEN_IDX) corresponding
 8 to each NUM_BITS_TABLE_ID) as follows:
 9 - For each of the NUM_RECS occurrences of the three field record consisting of
 10 NUM_BITS_IDX, NUM_BITS, and CRC_LEN_IDX the mobile station shall store
 11 the following
 12 + NUM_BITS_s[NUM_BITS_TABLE_ID_r][NUM_BITS_IDX_r] = NUM_BITS_r;
 13 + CRC_LEN_IDX_s[NUM_BITS_TABLE_ID_r][NUM_BITS_IDX_r] = CRC_LEN_IDX_r;
- 14 **Otherwise, the mobile station shall use the previously stored values for the*
 15 *NUM_BITS_s and CRC_LEN_IDX_s.*
- 16 • If USE_OLD_FLEX_MAPPING_r is included and equal to '0', the mobile station shall
 17 store the following:
 18 - FFCH_NBIT_TABLE_ID_s = FFCH_NBIT_TABLE_ID_r.
 19 - RFCH_NBIT_TABLE_ID_s = RFCH_NBIT_TABLE_ID_r.
 20 - FSCH_NBIT_TABLE_ID_s[1] = FSCH0_NBIT_TABLE_ID_r.
 21 - FSCH_NBIT_TABLE_ID_s[2] = FSCH1_NBIT_TABLE_ID_r.
 22 - RSCH_NBIT_TABLE_ID_s[1] = RSCH0_NBIT_TABLE_ID_r.
 23 - RSCH_NBIT_TABLE_ID_s[2] = RSCH1_NBIT_TABLE_ID_r.
 24 - FDCCH_NBIT_TABLE_ID_s = FDCCH_NBIT_TABLE_ID_r.
 25 - If FDCCH_NBIT_TABLE_ID_s is not equal to '0000', then the mobile station shall
 26 store FDCCH_NBITS_IDX_s = FDCCH_NBITS_IDX_r.
 27 - RDCCH_NBIT_TABLE_ID_s = RDCCH_NBIT_TABLE_ID_r.
 28 - If RDCCH_NBIT_TABLE_ID_s is not equal to '0000', then the mobile station shall
 29 store RDCCH_NBITS_IDX_s = RDCCH_NBITS_IDX_r.
- 30 • Otherwise, the mobile station shall use the previously stored values for the above ~~six~~
 31 variables.
 32 • If USE_FLEX_NUM_BITS_r is equal to '0', the mobile station shall store the following:
 33 - FFCH_NBIT_TABLE_ID_s = '0000'.
 34 - RFCH_NBIT_TABLE_ID_s = '0000'.
 35 - FSCH_NBIT_TABLE_ID_s[1] = '0000'.

- 1 - FSCH_NBIT_TABLE_ID_S[2] = '0000'.
 2 - RSCH_NBIT_TABLE_ID_S[1] = '0000'.
 3 - RSCH_NBIT_TABLE_ID_S[2] = '0000'.
 4 - FDCCH_NBIT_TABLE_ID_S = '0000'.
 5 - FDCCH_NBITS_IDX_S = '0000'.
 6 - RDCCH_NBIT_TABLE_ID_S = '0000'.
 7 - FDCCH_NBITS_IDX_S = '0000'.
 8 • If VAR_TABLES_INCL_r is included and is equal to '1', the mobile station shall store
 9 VAR_RATE_TABLES_COUNT+1 instances of the Variable Rate Mask Table
 10 (NUM_RECS pairs of (NUM_BITS_IDX, MASK) corresponding to each
 11 VAR_RATE_TABLE_ID) as follows:
 12 - For each of the NUM_RECS + 1 occurrences of the two-field record consisting of
 13 NUM_BITS_IDX and MASK the mobile station shall store the following:
 14 + MASK_S[VAR_RATE_TABLE_ID_r][NUM_BITS_IDX_r] = MASK_r;
 15 - If FSCH_VAR_TABLE_ID_S[1] is not equal to '000', then the mobile station shall
 16 store the following:
 17 + For row=1, ..., 15
 18 o For i=1, ..., row,
 19 ◊ If the *i*th bit position in MASK_S[FSCH_VAR_TABLE_ID_S[1]][row] is equal
 20 to '1', then the mobile station shall set
 21 VAR_FSCH_RATE_OFFSET_S[1][row][i] to i,
 22 ◊ otherwise, the mobile shall set VAR_FSCH_RATE_OFFSET_S[1][row][i]
 23 to '0'.
 24 - If FSCH_VAR_TABLE_ID_S[2] is not equal to '000', then the mobile station shall
 25 store the following:
 26 + For row=1, ..., 15
 27 o For i=1, ..., row,
 28 ◊ If the *i*th bit position in MASK_S[FSCH_VAR_TABLE_ID_S[2]][row] is equal
 29 to '1', then the mobile station shall set
 30 VAR_FSCH_RATE_OFFSET_S[2][row][i] to i,
 31 ◊ otherwise, the mobile shall set VAR_FSCH_RATE_OFFSET_S[2][row][i]
 32 to '0'.
 33 - If RSCH_VAR_TABLE_ID_S[1] is not equal to '000', then the mobile station shall
 34 store the following:
 35 + For row=1, ..., 15

- 1 o For i=1, ..., row,
 - 2 ◇ If the i^{th} bit position in MASK_s[RSCH_VAR_TABLE_ID_s[1]][row] is
 3 equal to '1', then the mobile station shall set
 4 VAR_RSCH_RATE_OFFSET_s[1][row][i] to i,
 - 5 ◇ otherwise, the mobile shall set VAR_RSCH_RATE_OFFSET_s[1][row][i]
 6 to '0'.
- 7 - If RSCH_VAR_TABLE_ID_s[2] is not equal to '000', then the mobile station shall
 8 store the following:
 - 9 + For row=1, ..., 15
 - 10 o For i=1, ..., row,
 - 11 ◇ If the i^{th} bit position in MASK_s[RSCH_VAR_TABLE_ID_s[2]][row] is
 12 equal to '1', then the mobile station shall set
 13 VAR_RSCH_RATE_OFFSET_s[2][row][i] to i,
 - 14 ◇ otherwise, the mobile shall set VAR_RSCH_RATE_OFFSET_s[2][row][i]
 15 to '0'.
 - 16 □ Else (if USE_OLD_VAR_TABLE_r is included and equal to '1'), use the previously
 17 stored values for VAR_RSCH_RATE_OFFSET_s and VAR_FSCH_RATE_OFFSET_s.
 - 18 • If USE_OLD_VAR_MAPPING_r is included and equal to '0', the mobile station shall
 19 store the following:
 - 20 - FSCH_VAR_TABLE_ID_s[1] = FSCH0_VAR_TABLE_ID_r.
 - 21 - FSCH_VAR_TABLE_ID_s[2] = FSCH1_VAR_TABLE_ID_r.
 - 22 - RSCH_VAR_TABLE_ID_s[1] = RSCH0_VAR_TABLE_ID_r.
 - 23 - RSCH_VAR_TABLE_ID_s[2] = RSCH1_VAR_TABLE_ID_r.
 - 24 • Otherwise, use the previously stored values for the above four variables.
 - 25 • If USE_VAR_RATE_r is equal to '0', the mobile station shall store the following:
 - 26 - FSCH_VAR_TABLE_ID_s[1] = '000'.
 - 27 - FSCH_VAR_TABLE_ID_s[2] = '000'.
 - 28 - RSCH_VAR_TABLE_ID_s[1] = '000'.
 - 29 - RSCH_VAR_TABLE_ID_s[2] = '000'.
 - 30 • If LTU_TABLES_INCL_r is included and is equal to '1', then the mobile station shall
 31 store NUM_LTU_TABLES + 1 instances of the LTU Table which determines the
 32 number of LTUs per frame for convolutionally encoded supplemental channels for
 33 each number of bits per frame. Each LTU Table is identified by its LTU_TABLE_ID.
 - 34 - For each of the NUM_ROWS + 1 rows of the LTU Size Table, the mobile station
 35 shall store the following:

- 1 + LTU_TAB_S[LTU_TABLE_ID_r][NBITS_IDX_r] = LTU_LENNUM_LTUS_r
 2 *Else (if USE_OLD_LTU_TABLE is included and equal to '1'), the mobile station shall
 3 use the previously stored values for the LTU_TAB_S.
- 4 • If USE_OLD_LTU_MAPPING_r is included and is equal to '0', then the mobile station
 5 shall store the following:
 - 6 - FSCH_LTU_TAB_IDS[1] = FSCH0_LTU_TAB_ID_r
 - 7 - FSCH_LTU_TAB_IDS[2] = FSCH1_LTU_TAB_ID_r
 - 8 - RSCH_LTU_TAB_IDS[1] = RSCH0_LTU_TAB_ID_r
 - 9 - RSCH_LTU_TAB_IDS[2] = RSCH1_LTU_TAB_ID_r
 - 10 • Else (if USE_OLD_LTU_MAPPING_r is included and is equal to '1'), the mobile station
 11 shall use the previously stored values for the above four variables.
 - 12 • If LTU_INFO_INCL_r is equal to '0', then the mobile station shall store the following:
 - 13 - FSCH_LTU_TAB_IDS[1] = '000'
 - 14 - FSCH_LTU_TAB_IDS[2] = '000'
 - 15 - RSCH_LTU_TAB_IDS[1] = '000'
 - 16 - RSCH_LTU_TAB_IDS[2] = '000'
 - 17 • If PARTITION_TABLES_INCL_r is included and is equal to '1', then the mobile station
 18 shall store NUM_PARTITION_TABLES + 1 instances of the Partition Table which
 19 determines the number of bits allocated to each service per FCH or DCCH frame as
 20 follows. Each Partition Table is identified by its PARTITION_TABLE_ID.
 - 21 - For each of the NUM_ROWS+1 rows of the Partition Table, the mobile station
 22 shall store the following:
 - 23 + PART_TAB_S[PARTITION_TABLE_ID_r][CATEGORY_r].MUX_HEADER_LEN =
 24 MUX_HEADER_LEN_r
 - 25 + PART_TAB_S[PARTITION_TABLE_ID_r][CATEGORY_r].MUX_HEADER =
 26 MUX_HEADER_r
 - 27 + PART_TAB_S[PARTITION_TABLE_ID_r][CATEGORY_r].NUM_PARTITIONS =
 28 NUM_PARTITIONS_r
 - 29 + For i=1, ..., NUM_PARTITIONS+1; the mobile station shall store the following:
 - 30 o PART_TAB_S[PARTITION_TABLE_ID_r][CATEGORY_r].PARTITION_SR_ID[i] =
 31 SR_ID_r
 - 32 o PART_TAB_S[PARTITION_TABLE_ID_r][CATEGORY_r].PARTITION_NBITS[i] =
 33 SRV_NUM_BITS_r
 - 34 • Else (if PARTITION_TABLES_INCL_r is included and is equal to '0'), the mobile station
 35 shall use the previously stored values for the PART_TAB_S.

- 1 • If USE_OLD_PART_MAPPING_r is included and is equal to '0', then the mobile station
2 shall store the following:
 - 3 - FFCH_PART_TAB_ID_s = FFCH_PART_TAB_ID_r
 - 4 - RFCH_PART_TAB_ID_s = RFCH_PART_TAB_ID_r
 - 5 - FDCCH_PART_TAB_ID_s = FDCCH_PART_TAB_ID_r
 - 6 - RDCCH_PART_TAB_ID_s = RDCCH_PART_TAB_ID_r
- 7 *Else (if USE_OLD_PART_MAPPING_r is included and equal to '1'), the mobile station
8 shall use the previously stored values for the above four variables.
- 9 • If USE_FLEX_NUM_BITS_s is equal to '0', then the mobile station shall store the
10 following:
 - 11 - FFCH_PART_TAB_ID_s = '000'
 - 12 - RFCH_PART_TAB_ID_s = '000'
 - 13 - FDCCH_PART_TAB_ID_s = '000'
 - 14 - RDCCH_PART_TAB_ID_s = '000'

15 2.6.4.1.14 Processing the Security Mode Command Message

16 The mobile station shall process the received *Security Mode Command Message* as follows:

- 17 • The mobile station shall set D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 18 *For each of the NUM_RECS_r instances of the two field record consisting of
19 CON_REF and UI_ENCRYPT_MODE, the mobile station shall set
20 UI_ENCRYPT_MODE_s[CON_REF_r] to UI_ENCRYPT_MODE_r.
- 21 • If D_SIG_ENCRYPT_MODE_r is not equal to '000', the mobile station shall perform
22 the following:
 - 23 - Set ENCRYPT_MODE_s to '11'
 - 24 - Set ENC_KEY_s to the most recently generated CMEAKEY in the mobile station
25 associated with the AUTHR of the *Origination Message* or *Page Response*
26 *Message*
 - 27 - Set EXT_ENCRYPT_SEQ[0] and EXT_ENCRYPT_SEQ[1] to $256 \times \text{ENC SEQ H}$ if
28 either of the following conditions is true:
 - 29 + The ENC SEQ H field is included in the last *Origination Message* or *Page*
30 *Response Message* and EXT_ENCRYPT_SEQ[0] and EXT_ENCRYPT_SEQ[1]
31 have not been initialized by the last *Channel Assignment Message*, *Extended*
32 *Channel Assignment Message*, or an earlier f-dsch *Security Mode Command*
33 *Message* (see 2.3.12.4.1.3).
 - 34 + This message is a response to a *Security Mode Request Message* (see
35 2.3.12.4.1.3) that includes an ENC SEQ H field.

- For each of the service option connections specified by the CON_REF field included in this message, the mobile station shall set the user information encryption mode in the corresponding service option connection record (SO_CON_REC_S[i]) to UI_ENCRYPT_MODE_r (i.e., set SO_CON_REC_S[i].UI_ENCRYPT_MODE to UI_ENCRYPT_MODE_r where SO_CON_REC_S[i].CON_REF = CON_REF_r).
- For each of the service option connections specified by the CON_REF field included in this message, at the action time of the message the mobile station shall start encrypting user information (e.g., voice and data) using the encryption algorithm specified by SO_CON_REC_S[i].UI_ENCRYPT_MODE where SO_CON_REC_S[i].CON_REF = CON_REF_r. (see Table 3.7.4.5-1).
- If USE_NEW_KEY_r is not included, or is included and is set to '1', the mobile station shall use the session key generated at the most recent registration for encryption of signaling and user information. The mobile station shall store the session key in KEY_S[KEY_SEQ_NEW_{S-p}]. The mobile station shall store KEY_SIZE_r in KEY_SIZE_S. The mobile station shall then increment the variable KEY_SEQ_NEW_{S-p} by one (modulo 16). If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_S to ENC_KEY_SIZE_r.
□ If USE_NEW_KEY_r is included and is set to '0', then the mobile station shall use KEY_S[KEY_SEQ_r] as the session key.
- If C_SIG_ENCRYPT_MODE is included, the mobile station shall set C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_r.

2.6.4.2 Traffic Channel Initialization Substate

In this substate, the mobile station verifies that it can receive the Forward Traffic Channel and begins transmitting on the Reverse Traffic Channel.

Upon entering the *Traffic Channel Initialization Substate*, the mobile station shall perform the following:

- The mobile station shall perform registration initialization as specified in 2.6.5.5.4.1.
- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to reset the acknowledgment procedures as specified in 2.2.1.1 and 2.2.2.1 of [4].
- The mobile station shall initialize Forward Traffic Channel power control as specified in 2.6.4.1.1.1.
- The mobile station shall initialize the list TAG_OUTSTANDING_LIST to be empty.
- If P_REV_IN_USE_S is less than seven, the mobile station shall set CS_SUPPORTED_S to '0'.
- The mobile station shall set the following variables to their initial default values given below:

- 1 – If the mobile station has included the SYNC_ID field in the *Origination Message*
 2 or *Page Response Message*, the mobile station shall not reset any of the service
 3 configuration parameters (i.e. those signaled via the Service Configuration
 4 information record and the Non-Negotiable Service Configuration information
 5 record) to their default values.
- 6 – Default power control step size
 7 (PWR_CNTL_STEPS = '000')
- 8 – Default Reverse Supplemental Channel power offset adjustment relative to
 9 Reverse Pilot Channel power
 10 + RLGAIN_SCH_PILOT_S [0]= '000000'
 11 + RLGAIN_SCH_PILOT_S [1]= '000000'
- 12 – Default Reverse Discontinuous Transmission Duration on Reverse Supplemental
 13 Code Channel (REV_DTX_DURATION_S = '0000')
- 14 – Default Reverse Discontinuous Transmission Duration on Reverse Supplemental
 15 Channel (REV_SCH_DTX_DURATION_S = '0000')
- 16 – Default channel on which the mobile station is to perform the primary inner loop
 17 estimation and the base station is to multiplex the Power Control Subchannel:
 18 + If CH_IND_S is equal to '01', the mobile station shall set FPC_PRI_CHAN_S to
 19 '0'.
 20 + If CH_IND_S is equal to '10', the mobile station shall set FPC_PRI_CHAN_S to
 21 '1'.
- 22 – Default forward power control operation mode used except during the forward
 23 Supplemental Channel interval
 24 (FPC_MODE_NO_SCH_S = '000')
- 25 – Default forward power control operation mode used during the forward
 26 Supplemental Channel interval
 27 (FPC_MODE_SCH_S = '000')
- 28 – Default forward power control operation mode
 29 (FPC_MODE_S = '000')
- 30 – Slotted timer (T_SLOTTED_S = T_{74m})
- 31 – Default Reverse Pilot Channel gating (PILOT_GATING_USE_RATE='0')
- 32 – Default begin preamble for Reverse Supplemental Code Channels
 33 (BEGIN_PREAMBLE_S = '000')
- 34 – Default resume preamble for Reverse Supplemental Code Channels
 35 (RESUME_PREAMBLE_S = '000')
- 36 – Default start time for Reverse Supplemental Code Channel assignment
 37 (REV_START_TIME_S = NULL)
- 38 – Default retry delays:

- ```

1 + RETRY_DELAYS[010] = 0
2 + RETRY_DELAYS[011] = 0
3 - Default neighbor pilot strength measurement threshold reporting-offset
4 (T_MULCHANS = '000')
5 - Default start time for forward Supplemental Code Channel Assignment
6 (FOR_START_TIMES = NULL)
7 - Default number of Reverse Supplemental Code Channels
8 (NUM_REV_CODEDSS = '000')
9 - Default reverse use T_ADD abort indicator
10 (USE_T_ADD_ABORTS = '0')
11 - Default Supplemental Channel Request Message sequence number
12 (SCRM_SEQ_NUMS = NULL)
13 - Default indicator to ignore reverse Supplemental Code Channel assignment
14 Supplemental Channel Assignment Message
15 (IGNORE_SCAMS = '0')
16 - Default indicator to ignore reverse Supplemental Channel assignment Extended
17 Supplemental Channel Assignment Message
18 (IGNORE_ESCAMS = '0')
19 Default maximum wait time on the CDMA Candidate Frequency
20 (CF_WAIT_TIMES = '1111')
21 - Default search period for the candidate search
22 (SEARCH_PERIODS = '1111')
23 - Default search window size for the Candidate Frequency Search Set
24 (CF_SRCH_WIN_NS = SRCH_WIN_NS)
25 - Default search window size for the Remaining Set on the CDMA Candidate
26 Frequency (CF_SRCH_WIN_RS = SRCH_WIN_RS)
27 - Default pilot PN sequence offset increment for the CDMA Candidate Frequency
28 (CF_PILOT_INCS = PILOT_INCS)
29 - Default Candidate Frequency search priorities included indicator
30 (CF_SEARCH_PRIORITY_INCLS = '0')
31 - Default Candidate Frequency search window size included indicator
32 (CF_SRCH_WIN_NGHBR_INCLS = '0')
33 - Default Candidate Frequency search window offset included indicator
34 (CF_SRCH_OFFSET_INCLS = '0')
35 - Default periodic search indicator
36 (PERIODIC_SEARCHS = '0')
37 - Default return-if-handoff-fail indicator
38 (RETURN_IF_HANDOFF_FAILS = '0')

```

- Default total pilot  $E_c/I_o$  threshold  
(MIN\_TOTAL\_PILOT\_EC\_IO<sub>S</sub> = '00000')
- Default total pilot  $E_c$  threshold  
(SF\_TOTAL\_EC\_THRESH<sub>S</sub> = '11111')
- Default total pilot  $E_c/I_o$  threshold  
(SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> = '11111')
- Default received power difference threshold  
(DIFF\_RX\_PWR\_THRESH<sub>S</sub> = '00000')
- Default maximum wait time on the CDMA Target Frequency  
(TF\_WAIT\_TIME<sub>S</sub> = '1111')
- Default Candidate Frequency Search Set  
(Candidate Frequency Search Set is empty)
- Default Analog Frequency Search Set  
(Analog Frequency Search Set is empty)
- Default Candidate Frequency CDMA band  
(CF\_CDMABAND<sub>S</sub> = NULL)
- Default Candidate Frequency CDMA channel  
(CF\_CDMACH<sub>S</sub> = NULL)
- Default indicator for 5ms frames on Fundamental Channel  
(FCH\_5MS\_FRAMES<sub>S</sub> = '0')
- Default indicator for 5ms frames on Dedicated Control Channel  
(DCCH\_5MS\_FRAMES<sub>S</sub> = '0')
- Default start time unit for Supplemental Channel  
(START\_TIME\_UNIT<sub>S</sub> = '000')
- Default Forward Supplemental Channel FER report indicator  
(FOR\_SCH\_FER\_REP<sub>S</sub> = '0')
- Default Forward Supplemental Channel Configuration parameters:
  - + Set the Forward Supplemental Channel frame length FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[0] to NULL.
  - + Set the Forward Supplemental Channel Multiplex Option FOR\_SCH\_MUX<sub>S</sub>[0] to NULL.
  - + Set the Forward Supplemental Channel Radio Configuration FOR\_SCH\_RC<sub>S</sub>[0] to NULL.
  - + Set the Forward Supplemental Channel Coding Type FOR\_SCH\_CODING<sub>S</sub>[0] to NULL.
  - + Set QOF\_ID<sub>S</sub>[0][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer values of i from 0 to 15.

- 1        + Set FOR\_SCH\_CC\_INDEX<sub>S</sub> [0][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer  
2        values of i from 0 to 15.
- 3        + Set the Forward Supplemental Channel frame length  
4        FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[1] to NULL.
- 5        + Set the Forward Supplemental Channel Multiplex Option FOR\_SCH\_MUX<sub>S</sub>[1]  
6        to NULL.
- 7        + Set the Forward Supplemental Channel Radio Configuration  
8        FOR\_SCH\_RC<sub>S</sub>[1] to NULL.
- 9        + Set the Forward Supplemental Channel Coding Type FOR\_SCH\_CODING<sub>S</sub>[1]  
10      to NULL.
- 11      + Set QOF\_ID<sub>S</sub>[1][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer values of i from 0 to  
12      15.
- 13      + Set FOR\_SCH\_CC\_INDEX<sub>S</sub> [1][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer  
14      values of i from 0 to 15.
- 15      - Call Origination Transaction Identifier  
16      (TAG<sub>S</sub> = '0000').
- 17      - Default Reverse Supplemental Channel Configuration parameters:
  - 18        + REV\_WALSH\_ID<sub>S</sub>[0][0000] = 1
  - 19        + REV\_WALSH\_ID<sub>S</sub>[0][0001] = 1
  - 20        + REV\_WALSH\_ID<sub>S</sub>[0][0010] = 1
  - 21        + REV\_WALSH\_ID<sub>S</sub>[0][0011] = 1
  - 22        + REV\_WALSH\_ID<sub>S</sub>[0][0100] = 0
  - 23        + REV\_WALSH\_ID<sub>S</sub>[0][0101] = 0
  - 24        + REV\_WALSH\_ID<sub>S</sub>[0][0110] = 0
  - 25        + REV\_WALSH\_ID<sub>S</sub>[1][0000] = 1
  - 26        + REV\_WALSH\_ID<sub>S</sub>[1][0001] = 1
  - 27        + REV\_WALSH\_ID<sub>S</sub>[1][0010] = 1
  - 28        + REV\_WALSH\_ID<sub>S</sub>[1][0011] = 0
  - 29        + REV\_WALSH\_ID<sub>S</sub>[1][0100] = 0
  - 30        + REV\_WALSH\_ID<sub>S</sub>[1][0101] = 0
  - 31        + REV\_WALSH\_ID<sub>S</sub>[1][0110] = 0
  - 32        + Set the Reverse Supplemental Channel frame length  
33        REV\_SCH\_FRAME\_LENGTH<sub>S</sub>[0] to NULL.
  - 34        + Set the Reverse Supplemental Channel Multiplex Option REV\_SCH\_MUX<sub>S</sub>[0]  
35        to NULL.

- 1        + Set the Reverse Supplemental Channel Radio Configuration  
 2        REV\_SCH\_RC<sub>S</sub>[0] to NULL.
- 3        + Set the Reverse Supplemental Channel Coding Type REV\_SCH\_CODING<sub>S</sub>[0]  
 4        to NULL.
- 5        + Set the Reverse Supplemental Channel frame length  
 6        REV\_SCH\_FRAME\_LENGTH<sub>S</sub>[1] to NULL.
- 7        + Set the Reverse Supplemental Channel Multiplex Option REV\_SCH\_MUX<sub>S</sub>[1]  
 8        to NULL.
- 9        + Set the Reverse Supplemental Channel Radio Configuration  
 10      REV\_SCH\_RC<sub>S</sub>[1] to NULL.
- 11      + Set the Reverse Supplemental Channel Coding Type REV\_SCH\_CODING<sub>S</sub>[1]  
 12      to NULL.
- 13
- 14      • If P\_REV\_IN\_USE<sub>S</sub> is greater than six, the mobile station shall initialize the logical to  
 15      physical mapping table (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE) according to  
 16      the requirements in Table 2.6.4.2-1:

17  

18      **Table 2.6.4.2-1. Default Logical to Physical Mapping Table**

| <b>SR_ID</b>                              | <b>LOGICAL_RESOURCE</b> | <b>PHYSICAL_RESOURCE</b>                  | <b>FORWARD_FLAG</b> | <b>REVERSE_FLAG</b> | <b>PRIORITY</b> |
|-------------------------------------------|-------------------------|-------------------------------------------|---------------------|---------------------|-----------------|
| 000                                       | 0001                    | (shall be set according to requirement 2) | 1                   | 1                   | 0000            |
| (shall be set according to requirement 1) | 0000                    | (shall be set according to requirement 3) | 1                   | 1                   | 0000            |

19      Where requirement 1 is as follows:

- 20      + The SR\_ID field shall be set to NULL.

21      Requirement 2 is as follows:

- 22      + If CH\_IND<sub>S</sub> is equal to '01', the PHYSICAL\_RESOURCE field shall be set to  
 23      '0000'.
- 24      + If CH\_IND<sub>S</sub> is equal to '10', the PHYSICAL\_RESOURCE field shall be set to  
 25      '0001'.

- 1        + If CH\_IND<sub>S</sub> is equal to '11', there shall be two entries in the default LPM table  
 2              where the PHYSICAL\_RESOURCE field shall be set to '0000' and '0001'  
 3              respectively.

4     Requirement 3 is as follows:

- 5        + If CH\_IND<sub>S</sub> is equal to '01':  
 6              o If the Radio Configuration in use is less than three, the  
 7                   PHYSICAL\_RESOURCE field shall be set to '0000'; otherwise, there shall  
 8                   be three entries in the default LPM table where the  
 9                   PHYSICAL\_RESOURCE field shall be set to '0000', '0010', and '0011'  
 10                  respectively.
- 11        + If CH\_IND<sub>S</sub> is equal to '10':  
 12              o There shall be three entries in the default LPM table where the  
 13                   PHYSICAL\_RESOURCE field shall be set to '0001', '0010', and '0011'  
 14                  respectively.
- 15        + If CH\_IND<sub>S</sub> is equal to '11':  
 16              o There shall be four entries in the default LPM table where the  
 17                   PHYSICAL\_RESOURCE field shall be set to '0000', '0001', '0010', and  
 18                  '0011' respectively.
- 19        • If P\_REV\_IN\_USE<sub>S</sub> is equal to or less than six, the mobile station shall initialize the  
 20           logical to physical mapping table (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE) as  
 21           follows:
  - 22              – Default number of Logical-to-Physical Mapping entries  
 23                   (NUM\_LPM\_ENTRIES<sub>S</sub> = '0100')
  - 24              – Default Table(0) Logical-to-Physical Mapping service reference identifier  
 25                   (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].SR\_ID<sub>S</sub> = '000')
  - 26              – Default Table(0) Logical-to-Physical Mapping logical resource identifier  
 27                   (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].LOGICAL\_RESOURCE<sub>S</sub> = '0001')
  - 28              – Default Table(0) Logical-to-Physical Mapping physical resource identifier:  
 29                  + If CH\_IND<sub>S</sub> is equal to '01' or '11', the mobile station shall set  
 30                      LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PHYSICAL\_RESOURCE<sub>S</sub> to  
 31                      '0000'.  
 32                  + If CH\_IND<sub>S</sub> is equal to '10', the mobile station shall set  
 33                      LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PHYSICAL\_RESOURCE<sub>S</sub> to  
 34                      '0001'.  
 35              – Default Table(0) Logical-to-Physical Mapping forward mapping indicator  
 36                   (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].FORWARD\_FLAG<sub>S</sub> = '1')  
 37              – Default Table(0) Logical-to-Physical Mapping reverse mapping indicator  
 38                   (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].REVERSE\_FLAG<sub>S</sub> = '1')

- 1    – Default Table(0) Logical-to-Physical Mapping priority  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PRIORITY<sub>S</sub> = '0000')
- 2
- 3    – Default Table(1) Logical-to-Physical Mapping service reference identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].SR\_ID<sub>S</sub> = '001')
- 4
- 5    – Default Table(1) Logical-to-Physical Mapping logical resource identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].LOGICAL\_RESOURCE<sub>S</sub> = '0000')
- 6
- 7    – Default Table(1) Logical-to-Physical Mapping physical resource identifier:
  - 8     + If CH\_IND<sub>S</sub> is equal to '01' or '11', the mobile station shall set  
LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PHYSICAL\_RESOURCE<sub>S</sub> to  
'0000'.
  - 9     + If CH\_IND<sub>S</sub> is equal to '10', the mobile station shall set  
LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PHYSICAL\_RESOURCE<sub>S</sub> to  
'0001'.
- 10
- 11
- 12
- 13
- 14    – Default Table(1) Logical-to-Physical Mapping forward mapping indicator  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].FORWARD\_FLAG<sub>S</sub> = '1')
- 15
- 16    – Default Table(1) Logical-to-Physical Mapping reverse mapping indicator  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].REVERSE\_FLAG<sub>S</sub> = '1')
- 17
- 18    – Default Table(1) Logical-to-Physical Mapping priority  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PRIORITY<sub>S</sub> = '0000')
- 19
- 20    – Default Table(2) Logical-to-Physical Mapping service reference identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].SR\_ID<sub>S</sub> = '001')
- 21
- 22    – Default Table(2) Logical-to-Physical Mapping logical resource identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].LOGICAL\_RESOURCE<sub>S</sub> = '0000')
- 23
- 24    – Default Table(2) Logical-to-Physical Mapping physical resource identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PHYSICAL\_RESOURCE<sub>S</sub> to  
'0010').
- 25
- 26    – Default Table(2) Logical-to-Physical Mapping forward mapping indicator  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].FORWARD\_FLAG<sub>S</sub> = '1')
- 27
- 28    – Default Table(2) Logical-to-Physical Mapping reverse mapping indicator  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].REVERSE\_FLAG<sub>S</sub> = '1')
- 29
- 30    – Default Table(2) Logical-to-Physical Mapping priority  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PRIORITY<sub>S</sub> = '0000')
- 31
- 32    – Default Table(3) Logical-to-Physical Mapping service reference identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].SR\_ID<sub>S</sub> = '001')
- 33
- 34    – Default Table(3) Logical-to-Physical Mapping logical resource identifier  
(LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].LOGICAL\_RESOURCE<sub>S</sub> = '0000')
- 35
- 36

- Default Table(3) Logical-to-Physical Mapping physical resource identifier (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PHYSICAL\_RESOURCE<sub>S</sub> to '0011').
- Default Table(3) Logical-to-Physical Mapping forward mapping indicator (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].FORWARD\_FLAG<sub>S</sub> = '1')
- Default Table(3) Logical-to-Physical Mapping reverse mapping indicator (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].REVERSE\_FLAG<sub>S</sub> = '1')
- Default Table(3) Logical-to-Physical Mapping priority (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].PRIORITY<sub>S</sub> = '0000')
- The mobile station shall disable the T<sub>MS\_Slotted</sub> timer, and set SLOTTED<sub>S</sub> to YES.
- If the ASSIGN\_MODE<sub>r</sub> field from the *Channel Assignment Message* equals '000', the mobile station shall set SERV\_NEG<sub>S</sub> to disabled.
- If the ASSIGN\_MODE<sub>r</sub> field from the *Channel Assignment Message* equals '100', the mobile station shall set SERV\_NEG<sub>S</sub> to enabled.
- The mobile station shall determine the service configuration as follows:
  - If SERV\_NEG<sub>S</sub> equals disabled, the initial service configuration shall include Multiplex Option 1 and Radio Configuration 1 for both the Forward and Reverse Traffic Channels, and shall include no service option connections.
  - If SERV\_NEG<sub>S</sub> equals enabled, and if GRANTED\_MODE<sub>S</sub> equals '00', the initial service configuration shall include the multiplex option and radio configuration for the Forward and Reverse Traffic Channels as specified by DEFAULT\_CONFIG<sub>S</sub>, and shall include no service option connections.
  - If SERV\_NEG<sub>S</sub> equals enabled and GRANTED\_MODE<sub>S</sub> equals '01' or '10', ~~the initial service configuration shall include the default Forward and Reverse Traffic Channel multiplex options and transmission rates corresponding to the service option requested by the mobile station in the Origination Message, in the case of a mobile station originated call, or the Page Response Message, in the case of a mobile station terminated that are derived from the radio configurations corresponding to the Table 3.7.2.3.2.21-7 call, and shall include no service option connections.~~
  - + If the mobile station enters the *Traffic Channel Initialization Substate* because of receiving the *Channel Assignment Message*, the initial service configuration shall include the default Forward and Reverse Traffic Channel multiplex options and transmission rates corresponding to the service option requested by the mobile station in the *Origination Message*, in the case of a mobile station originated call, or the *Page Response Message*, in the case of a mobile station terminated, and shall include no service option connections.

1       + If the mobile station enters the *Traffic Channel Initialization Substate* because  
 2       of receiving the *Extended Channel Assignment Message*, the initial service  
 3       configuration shall include the default Forward and Reverse Traffic Channel  
 4       multiplex options that are derived from the radio configurations  
 5       corresponding to the Table 3.7.2.3.2.21-7, and shall include no service  
 6       option connections.

- 7       – If SERV\_NEG<sub>s</sub> equals disabled, the mobile station shall perform the following:
- 8           + If the call is mobile station originated and the *Origination Message* requests a  
 9           special service option, the mobile station shall set SO\_REQ<sub>s</sub> to the special  
 10          service option number.
- 11          + If the call is mobile station originated and the *Origination Message* does not  
 12          request a special service option, the mobile station shall set SO\_REQ<sub>s</sub> to 1  
 13          (the default service option number).
- 14          + If the call is mobile station terminated, the mobile station shall set SO\_REQ<sub>s</sub>  
 15          to the service option number requested in the *Page Response Message*.

16       While in the *Traffic Channel Initialization Substate*, the mobile station shall perform the  
 17       following:

- 18       • The mobile station shall monitor Forward Traffic Channels associated with one or  
 19          more pilots in the Active Set.
- 20       • The mobile station shall perform pilot strength measurements as specified in  
 21          2.6.6.2.2, but shall not send *Pilot Strength Measurement Messages* or *Extended Pilot*  
 22          *Strength Measurement Messages*.
- 23       • The mobile station shall perform registration timer maintenance as specified in  
 24          2.6.5.5.4.2.
- 25       • If the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to ‘1’ and if System Time (in 80 ms  
 26          units) exceeds TMSI\_EXP\_TIME<sub>s-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
 27          TMSI\_CODE<sub>s-p</sub> to ‘1’ within T<sub>66m</sub> seconds.
- 28       • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits  
 29          of TMSI\_CODE<sub>s-p</sub> to ‘1’. The mobile station shall update the registration variables  
 30          as described in 2.6.5.5.2.5.

31       If the mobile station does not support the assigned CDMA Channel (see 2.1.1 and 3.1.1 of  
 32          [2]) or all of the assigned Forward Traffic code channels (see 2.1.3.1.9 of [2]), the mobile  
 33          station shall enter the *System Determination Substate* of the *Mobile Station Initialization*  
 34          State with an error indication (see 2.6.1.1).

35       If the mobile station supports the assigned CDMA Channel and the assigned Forward  
 36          Traffic code channels, the mobile station shall perform the following:

- 37       • The mobile station shall tune to the assigned CDMA Channel.
- 38       • The mobile station shall set its code channel for the assigned Forward Traffic code  
 39          channel.

- The mobile station shall set its Forward and Reverse Traffic Channel frame offsets to the assigned frame offset as determined by FRAME\_OFFSET<sub>s</sub>.
- The mobile station shall set its Forward and Reverse Traffic Channel long code masks to the public long code mask (see 2.1.3.1.12 of [2]).

If the mobile station does not receive a period of ( $N_{5m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> within T<sub>50m</sub> seconds after entering this substate, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

If the mobile station receives a period of ( $N_{5m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> within T<sub>50m</sub> seconds after entering this substate, the mobile station shall perform the following additional functions while it remains in the *Traffic Channel Initialization Substate*:

- The mobile station shall perform Forward Traffic Channel supervision as specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- The mobile station shall adjust its transmit power as specified in 2.1.2.3 of [2].
- The mobile station shall transmit the Traffic Channel preamble as specified in 2.1.3.6.2.3 and 2.1.3.7.2.3 of [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2 (see 2.2.2.1.2 of [4]).
- The mobile station shall process Forward Traffic Channel signaling traffic and shall discard other types of Forward Traffic Channel traffic.
- If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an acknowledgment failure, the mobile station shall disable its transmitter and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

The mobile station should provide diversity combining of the Forward Traffic Channels associated with pilots in the Active Set if the mobile station receives multiple pilots in the *Extended Channel Assignment Message*.

If Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see 2.2.2.1.2 of [4]) within T<sub>51m</sub> seconds after the first occurrence of receiving a period of ( $N_{5m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>, the mobile station shall disable its transmitter and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

If Layer 3 receives a *forward dedicated channel acquired* indication from Layer 2 within T<sub>51m</sub> seconds after the first occurrence of receiving a period of ( $N_{5m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>, the mobile station shall perform the following:

- 1     • If CH\_IND<sub>S</sub> is equal to ‘01’ or ‘11’, the mobile station shall begin transmitting on the  
2       Reverse Fundamental Channel.
- 3     • If CH\_IND<sub>S</sub> is equal to ‘10’ or ‘11’, the mobile station shall begin transmitting on the  
4       Reverse Dedicated Control Channel when the mobile station has user data or  
5       signaling traffic to send on the Reverse Dedicated Control Channel.
- 6     • If SERV\_NEG<sub>S</sub> equals disabled, the mobile station shall activate the *SO Negotiation  
7       Subfunction*.
- 8     • If SERV\_NEG<sub>S</sub> equals enabled and the GRANTED\_MODE<sub>S</sub> is ‘00’ or ‘01’, the mobile  
9       station shall activate the *Normal Service Subfunction*.
- 10    • If SERV\_NEG<sub>S</sub> equals enabled and the GRANTED\_MODE<sub>S</sub> is ‘10’, the mobile station  
11      shall activate the *Waiting for Service Connect Message Subfunction*.
- 12    • The HLayer 3 shall instantiate a Call Control instance (as specified in 2.6.10). The  
13      HLayer 3 shall assign a default identifier of NULL to this Call Control instance.
- 14    • The HLayer 3 shall enter the *Traffic Channel Substate*.

#### 15    2.6.4.3 Traffic Channel Substate

16    In this substate, the mobile station may exchange Traffic Channel frames with the base  
17      station in accordance with the current service configuration. The mobile station may  
18      perform the gating operation of Reverse Pilot Channel.

19    The mobile station can be in the *Active Mode* or *Control Hold Mode* while in this substate.

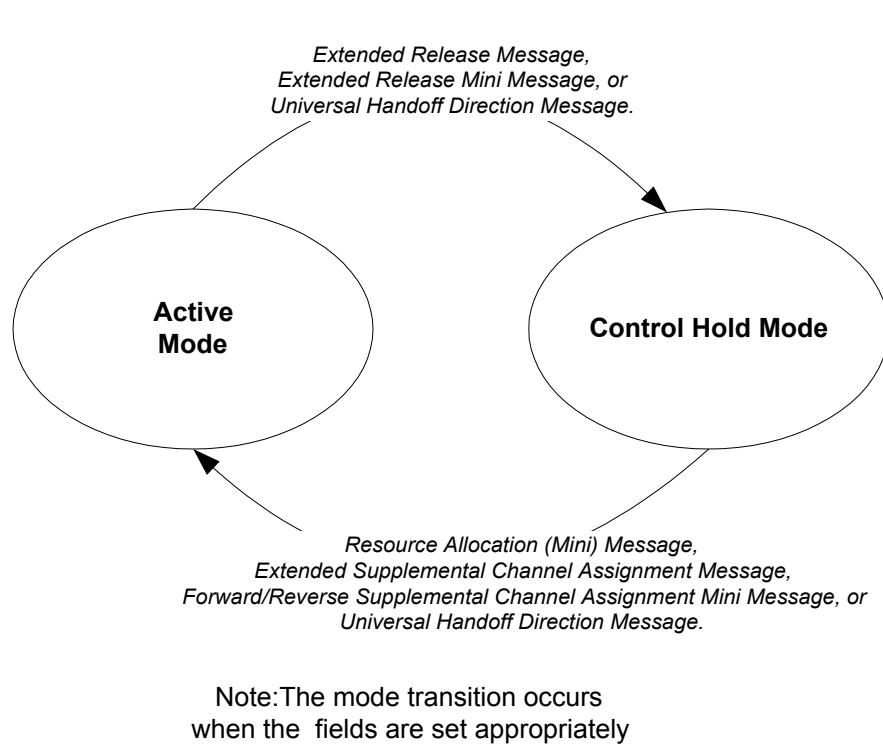

20    The following are the attributes when the mobile station is in the *Active Mode of Traffic  
21      Channel Substate*:

- 22     • PILOT\_GATING\_USE\_RATE is set to ‘0’ (i.e., the reverse pilot (r-pich) is not gated).
- 23     • Flow of data traffic is permitted by the Multiplex Sublayer.

24    The following are the attributes when the mobile station is in the *Control Hold Mode of  
25      Traffic Channel Substate*:

- 26     • PILOT\_GATING\_USE\_RATE is set to ‘1’.
- 27     • The reverse pilot (r-pich) may be gated (if PILOT\_GATING\_RATE<sub>S</sub> is not equal to ‘00’).
- 28     • Flow of data traffic is blocked by the Multiplex Sublayer.

29    Figure 2.6.4.3-1 shows the valid transitions between the modes of a *Traffic Channel  
30      Substate* and the over-the-air Upper Layer Signaling Messages that trigger transitions  
31      between these modes.

**Figure 2.6.4.3-1. Mobile Station Modes**

Upon entering the *Traffic Channel Substate*, the mobile station shall perform the following:

- If SERV\_NEG<sub>S</sub> equals enabled, the call is mobile station originated, and GRANTED\_MODE<sub>S</sub> is equal to '00' or '01', the mobile station should initiate service negotiation to request a service configuration in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

While in the *Traffic Channel Substate*, the mobile station shall perform the following:

- The mobile station shall perform Forward Traffic Channel supervision as specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall terminate all Call Control instances, and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- The mobile station may send a *Pilot Strength Measurement Mini Message* to report pilot strength order change information, periodic pilot strength information, or threshold based pilot strength information, as specified in the *Mobile Assisted Burst Operation Parameters Message* (see 2.6.6.2.5.2).
- The mobile station shall adjust its transmit power as specified in 2.1.2.3 of [2].
- The mobile station shall perform Forward Traffic Channel power control as specified in 2.6.4.1.1.

- 1     • The mobile station shall perform handoff processing as specified in 2.6.6.
- 2     • The mobile station shall process Forward and Reverse Traffic Channel frames in  
3       accordance with requirements for the active service subfunction (see 2.6.4.1.2.2).
- 4     • The mobile station shall perform registration timer maintenance as specified in  
5       2.6.5.5.4.2.
- 6     • If the mobile station is directed to send a *Data Burst Message*, the mobile station  
7       shall send a *Data Burst Message*. If PILOT\_GATING\_USE\_RATE is set to '1', the  
8       mobile station may request to transition to the *Active Mode*  
9       (PILOT\_GATING\_USE\_RATE set to '0') prior to sending the *Data Burst Message*.
- 10    • If the mobile station has user data to send and PILOT\_GATING\_USE\_RATE is equal  
11       to '1', then the mobile station may send a *Resource Request Message*, *Resource*  
12       *Request Mini Message*, *Supplemental Channel Request Message*, or *Supplemental*  
13       *Channel Request Mini Message* to request for continuous reverse pilot transmission  
14       and user traffic transmission. ~~The mobile station shall not send a Resource Request~~  
15       ~~Message or a Resource Request Mini Message if RETRY\_DELAY<sub>s[010]</sub> is not equal to~~  
16       ~~0; the mobile station shall not send a Supplemental Channel Request Message or a~~  
17       ~~Supplemental Channel Request Mini Message if RETRY\_DELAY<sub>s[011]</sub> is not equal to~~  
18       ~~0.~~
- 19    • If the mobile station is directed by the user to request a new service configuration,  
20       the mobile station shall initiate service negotiation or service option negotiation in  
21       accordance with the requirements for the active service subfunction (see  
22       2.6.4.1.2.2).
- 23    • The mobile station may send a *Service Option Control Message* or *Service Option*  
24       *Control Order* to invoke a service option specific function in accordance with the  
25       requirements for the active service subfunction (see 2.6.4.1.2.2).
- 26    • If the mobile station is directed by the user to request a private long code transition  
27       and has the long code mask (see 2.3.12.3), the mobile station shall send a *Long*  
28       *Code Transition Request Order* (ORDQ = '00000001') in assured mode.
- 29    • If the mobile station is directed by the user to request a public long code transition,  
30       the mobile station shall send a *Long Code Transition Request Order* (ORDQ =  
31       '00000000') in assured mode.
- 32    • If the mobile station is directed by the user to operate in analog mode, allowing  
33       operation in either wide or narrow analog mode, the mobile station shall send the  
34       *Request Analog Service Order* in assured mode.
- 35    • If the mobile station is directed by the user to operate in wide analog mode, the  
36       mobile station shall send the *Request Wide Analog Service Order* in assured mode.
- 37    • If the mobile station is directed by the user to operate in narrow analog mode, the  
38       mobile station shall send the *Request Narrow Analog Service Order* in assured mode.
- 39    • If the mobile station is directed by the user to originate a call, the mobile station  
40       shall perform the following:

- If this is an emergency call origination, the mobile station shall perform the following:
  - + If it can be indicated to the base station within an existing Call Control instance, the mobile station shall send an indication to this Call Control instance that the user has originated an emergency call.
  - + Otherwise, the mobile station shall perform the following:
    - o The mobile station shall increment the stored value of TAG<sub>S</sub> to the next unused integer value.
    - o The mobile station shall add TAG<sub>S</sub> to the list TAG\_OUTSTANDING\_LIST.
    - o The mobile station shall send an *Enhanced Origination Message* to the base station, with the TAG field of the message set to TAG<sub>S</sub>.
    - o Upon sending the *Enhanced Origination Message* and prior to receiving a Layer 3 response from the base station, if the mobile station is directed by the user to cancel this call, the mobile station shall perform the following:
      - ◊ The mobile station shall send a *Call Cancel Message* to the base station, with the TAG field of the message set to the TAG value in the *Enhanced Origination Message* sent to originate this call.
      - ◊ The mobile station shall remove the TAG field corresponding to this call from the list TAG\_OUTSTANDING\_LIST.
  - Otherwise, the mobile station shall perform the following:
    - + If this is a packet data call origination, the mobile station shall first determine the following conditions:
      - o If RETRY\_DELAY<sub>S</sub>[001] is set to *infinity*, the mobile station shall not send the *Enhanced Origination Message* to the base station.
      - o If RETRY\_DELAY<sub>S</sub>[001] is not 0 or *infinity*, the mobile station shall not send the *Enhanced Origination Message* until after the system time stored in RETRY\_DELAY<sub>S</sub>[001].
    - + If the above conditions do not prohibit the mobile station from sending an *Enhanced Origination Message* at this time, the mobile station shall perform the following:
      - o The mobile station shall increment the stored value of TAG<sub>S</sub> to the next unused integer value.
      - o The mobile station shall add TAG<sub>S</sub> to the list TAG\_OUTSTANDING\_LIST.
      - o The mobile station shall set an enhanced origination timer to a value of T<sub>42m</sub> seconds.

- 1        o The mobile station shall send an *Enhanced Origination Message* to the  
2                  base station, with the TAG field of the message set to TAGs.
- 3        + Upon sending the *Enhanced Origination Message* and prior to receiving a  
4                  Hlayer 3 response from the base station, if the mobile station is directed by  
5                  the user to cancel this call, the mobile station shall perform the following:
- 6                  o The mobile station shall send a *Call Cancel Message* to the base station,  
7                          with the TAG field of the message set to the TAG value in the *Enhanced*  
8                          *Origination Message* sent to originate this call.
- 9                  o The mobile station shall disable the enhanced origination timer and shall  
10                          remove the TAG field corresponding to this call from the list  
11                          TAG\_OUTSTANDING\_LIST.
- 12                  + If the enhanced origination timer expires, mobile station shall remove the  
13                          TAG field corresponding to this call from TAG\_OUTSTANDING\_LIST.
- 14        • If the Hlayer 3 receives a “call release request” from a Call Control instance, Hlayer 3  
15                  shall perform the following:
- 16                  - If there are no other active or pending calls, the Hlayer 3 shall enter the *Release*  
17                          *Substate* with a mobile station release indication (see 2.6.4.4).
- 18                  - Otherwise, the mobile station shall send a *Service Request Message*, *Resource*  
19                          *Release Request Message*, or a *Resource Release Request Mini Message* to the  
20                          base station requesting to release this service option connection. If the mobile  
21                          station sends a *Resource Release Request Message* or a *Resource Release*  
22                          *Request Mini Message*, it shall set the PURGE\_SERVICE field to ‘0’.
- 23        • If the Hlayer 3 receives a “call inactive indication” from a Call Control instance,  
24                  Hlayer 3 shall perform the following:
- 25                  - If there are no other active or pending calls, the Hlayer 3 shall enter the *Release*  
26                          *Substate* with a service inactive indication (see 2.6.4.4).
- 27                  - Otherwise, the mobile station shall send a *Service Request Message*, *Resource*  
28                          *Release Request Message*, or a *Resource Release Request Mini Message*. If the  
29                          mobile station sends a *Resource Release Request Message* or a *Resource Release*  
30                          *Request Mini Message*, it shall set the PURGE\_SERVICE field to ‘1’.
- 31        • If the mobile station is directed by the user to power down, the layerLayer 3 shall  
32                          send a “release indication” to all Call Control instances, and shall enter the *Release*  
33                          *Substate* with a power-down indication (see 2.6.4.4).
- 34        • If Layer 3 receives a L2-Condition.\_Notification primitive from Layer 2 indicating an  
35                          acknowledgment failure, the layer 3 shall terminate all Call Control instances, and  
36                          the mobile station shall disable its transmitter and shall enter the *System*  
37                          *Determination Substate* of the *Mobile Station Initialization State* with a system lost  
38                          indication (see 2.6.1.1).

- The mobile station shall perform the following:
  - The mobile station may send the *Resource Request Message* or *Resource Request Mini Message* in accordance with requirements for the currently connected service option whenever  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  is equal to 0, where,  $\text{RETRY\_TYPE}$  is equal to '010'.
  - The mobile station shall not send the *Resource Request Message* or *Resource Request Mini Message* whenever  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  is set to *infinity*, where,  $\text{RETRY\_TYPE}$  is equal to '010'.
  - If  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  is not 0 or *infinity*, the mobile station shall not send the *Resource Request Message* or *Resource Request Mini Message* until after the system time stored in  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$ , where,  $\text{RETRY\_TYPE}$  is equal to '010'.
  - The mobile station may send the *Supplemental Channel Request Message* or *Supplemental Channel Request Mini Message* whenever  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  is set to '0', where,  $\text{RETRY\_TYPE}$  is equal to '011'.
  - The mobile station shall not send the *Supplemental Channel Request Message* or *Supplemental Channel Request Mini Message* whenever  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  is set to *infinity*, where,  $\text{RETRY\_TYPE}$  is equal to '011'.
  - If  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  is not 0 or *infinity*, the mobile station shall not send the *Supplemental Channel Request Message* or *Supplemental Channel Request Mini Message* until after the system time stored in  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$ , where,  $\text{RETRY\_TYPE}$  is equal to '011'.
  - At the system time stored in  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$ , the mobile station shall reset  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}]$  to '0<sup>2</sup>', where  $\text{RETRY\_TYPE}$  is equal to '001', '010' or '011'.
- The mobile station may send a *Resource Release Request Message* or a *Resource Release Request Mini Message* to request for reverse pilot gating operation to be performed or to request a service option connection to be disconnected.
- The mobile station may enter the *Release Substate* with a service inactive indication (see 2.6.4.4) if the service corresponding to the packet data service option instance is inactive at the mobile station.
- If [layer-3Layer 3](#) receives a "substate timer expired indication" from a Call Control instance, the [layer-3Layer 3](#) shall perform the following:
  - If there are no other active or pending calls, the [layer-3Layer 3](#) shall terminate this Call Control instance; and the mobile station shall disable its transmitter and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
  - Otherwise, the mobile station shall send a *Service Request Message*, *Resource Release Request Message*, or a *Resource Release Request Mini Message*.

- 1     • If there are no active or pending calls, the layer 3Layer 3 shall enter the *Release*  
2        *Substate* with a mobile station release indication.
- 3     • If layer 3Layer 3 receives a ‘message rejected indication’ from a Call Control  
4        instance, mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the  
5        applicable reason code as determined from Table 2.7.3-1) within T<sub>56m</sub> seconds as  
6        follows:  
7        - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the mobile station shall  
8            include the CON\_REF\_INCL field with this message and shall perform the  
9            following: if the corresponding Call Control instance is identified by NULL, the  
10           mobile station shall either set the CON\_REF\_INCL field of the message to ‘0’ or  
11           set the CON\_REF\_INCL field to ‘1’ and set the CON\_REF field to the connection  
12           reference of the service option connection corresponding to this Call Control  
13           instance; otherwise, the mobile station shall set the CON\_REF\_INCL field of the  
14           message to ‘1’ and the CON\_REF field of the message to the connection reference  
15           of the service option connection corresponding to this Call Control instance.
- 16     • If Layer 3 is requested by the upper layers to query base station identification  
17        number, SID, and NID related information for one or more pilots, and  
18        PILOT\_INFO\_REQ\_SUPPORTED<sub>S</sub> equals ‘1’, mobile station shall send a Base Station  
19        Status Request Message with a “Pilot Information” record type to the base station.
- 20     • If the mobile station receives a message which is included in the following list and  
21        every message field value is within its permissible range, the mobile station shall  
22        process the message as described below and in accordance with the message’s  
23        action time (see 2.6.4.1.5).
  - 24        1. *Alert With Information Message:* If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the layer  
25           3Layer 3 shall deliver this message to the Call Control instance; otherwise, the  
26           layer 3Layer 3 shall deliver this message to the Call Control instance identified  
27           by NULL.
  - 28        2. *Analog Handoff Direction Message:* If the analog mode directed by the base  
29           station is supported by the mobile station, the mobile station shall process the  
30           message as specified in 2.6.6.2.9, and shall perform the following at the action  
31           time of the message:
    - 32           - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the mobile station shall  
33              perform the following: if CON\_REF\_INCL<sub>r</sub> equals ‘0’, the layer 3Layer 3 shall  
34              terminate all Call Control instances (if there are any) except the one  
35              identified by NULL; otherwise, the layer 3Layer 3 shall terminate all Call  
36              Control instances (if there are any) except the one identified by CON\_REF<sub>r</sub>.
    - 37           - The mobile station shall perform the following (see [6] for handoff to a wide  
38              analog channel and [22] for handoff to an 800 MHz narrow analog channel):
      - 39              + If this Call Control instance is in the *Waiting for Order Substate*, the  
40                mobile station shall enter the Waiting for Order Task.

- + If this Call Control instance is in the *Waiting for Mobile Station Answer Substate*, the mobile station shall enter the Waiting for Answer Task.
- + If this Call Control instance is in the *Conversation Substate*, the mobile station shall enter the Conversation Task.
- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).

3. *Audit Order*

4. *Authentication Challenge Message*: The ~~layer 3~~Layer 3 shall send a “reset waiting for order substate timer indication” to all Call Control instances. The mobile station shall process the message and shall respond as specified in 2.3.12.1.4 within T<sub>32m</sub> seconds, regardless of the value of AUTH<sub>S</sub>.

5. *Base Station Challenge Confirmation Order*: The ~~layer 3~~Layer 3 shall send a “reset waiting for order substate timer indication” to all Call Control instances. The mobile station shall process the message and shall respond with an *SSD Update Confirmation Order* or *SSD Update Rejection Order* as specified in 2.3.12.1.5 within T<sub>32m</sub> seconds.

6. *Base Station Status Response Message*: The Layer 3 shall deliver the information contained in this message to the Upper Layer entity that requested for this information.

6.7. Call Assignment Message: The mobile station shall process this message as follows:

- If RESPONSE\_IND<sub>r</sub> equals ‘1’ and TAG<sub>r</sub> matches any of the TAG values contained in the list TAG\_OUTSTANDING\_LIST, the mobile station shall perform the following:
  - + If ACCEPT\_IND<sub>r</sub> equals ‘0’, the mobile station shall disable the enhanced origination timer and shall remove the TAG value specified by TAG<sub>r</sub> from the list TAG\_OUTSTANDING\_LIST.
  - + If ACCEPT\_IND<sub>r</sub> equals ‘1’, the mobile station shall perform the following:
    - o If there already exists or currently pending instantiation a Call Control instance identified by CON\_REF<sub>r</sub>, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00010010’ (a call control instance is already present with the specified identifier), with the CON\_REF field of the order set to CON\_REF<sub>r</sub>.

- 1           o Otherwise, [layer 3](#)[Layer 3](#) shall instantiate a Call Control instance (as  
 2            specified in 2.6.10) at the action time of the message. The mobile  
 3            station shall identify this Call Control instance by CON\_REF<sub>r</sub>. If a  
 4            service option connection corresponding to this call has not been  
 5            established, the mobile station should wait for the base station to  
 6            initiate service negotiation to establish the service option connection.
- 7           o The mobile station shall disable the enhanced origination timer and  
 8            shall remove the TAG value specified by TAG<sub>r</sub> from the list  
 9            TAG\_OUTSTANDING\_LIST.
- 10          – If RESPONSE\_IND<sub>r</sub> equals ‘1’ and TAG<sub>r</sub> does not match any of the TAG  
 11            values contained in the list TAG\_OUTSTANDING\_LIST, the mobile station  
 12            shall send a *Mobile Station Reject Order* with ORDQ field set to ‘00010011’  
 13            (TAG received does not match TAG stored), with the TAG field of the order set  
 14            to TAG<sub>r</sub>, and the CON\_REF field of the order set to CON\_REF<sub>r</sub>.
- 15          – If RESPONSE\_IND<sub>r</sub> equals ‘0’, the mobile station shall perform the following:
- 16            + If there already exists [or currently pending instantiation](#) a Call Control  
 17            instance identified by CON\_REF<sub>r</sub>, the mobile station shall send a *Mobile*  
 18            *Station Reject Order* with ORDQ field set to ‘00010010’ (a call control  
 19            instance is already present with the specified identifier), with the  
 20            CON\_REF field of the order set to CON\_REF<sub>r</sub>.
- 21            + Otherwise, if the mobile station does not accept this call assignment, the  
 22            mobile station shall send a *Mobile Station Reject Order* with ORDQ field  
 23            set to ‘00010000’ (call assignment not accepted), with the CON\_REF field  
 24            of the order set to CON\_REF<sub>r</sub>.
- 25            + Otherwise, at the action time of the message, the mobile station shall  
 26            store the bypass indicator (BYPASS\_ALERT\_ANSWER<sub>s</sub> =  
 27            BYPASS\_ALERT\_ANSWER<sub>r</sub>) and the [layer 3](#)[Layer 3](#) shall instantiate a  
 28            Call Control instance (as specified in 2.6.10). The mobile station shall  
 29            identify this Call Control instance by CON\_REF<sub>r</sub>. If a service option  
 30            connection corresponding to this call has not been established, the  
 31            mobile station should wait for the base station to initiate service  
 32            negotiation to establish the service option connection.

33          [7.8.](#) *Candidate Frequency Search Control Message*: The mobile station shall process  
 34            the message as specified in 2.6.6.2.5.1.

35          [8.9.](#) *Candidate Frequency Search Request Message*: The mobile station shall process  
 36            the message as specified in 2.6.6.2.5.1.

37          [9.10.](#) *Continuous DTMF Tone Order*: Support of this order by the mobile station is  
 38            optional. If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the [layer 3](#)[Layer 3](#) shall deliver  
 39            this message to the Call Control instance; otherwise, the [layer 3](#)[Layer 3](#) shall

1      | perform the following: if CON\_REF\_INCL<sub>r</sub> equals '0', the ~~layer 3~~Layer 3 shall  
 2      | deliver this message to the Call Control instance identified by NULL; otherwise,  
 3      | the ~~layer 3~~Layer 3 shall deliver this message to the Call Control instance  
 4      | identified by CON\_REF<sub>r</sub>.

5      | [10.11. Data Burst Message](#)

6      | [11.12. Extended Alert With Information Message](#): The mobile station shall perform  
 7      | the following: If CON\_REF\_INCL<sub>r</sub> equals '0', the ~~layer 3~~Layer 3 shall deliver this  
 8      | message to the Call Control instance identified by NULL; otherwise, the ~~layer~~  
 9      | ~~3~~Layer 3 shall deliver this message to the Call Control instance identified by  
 10     | CON\_REF<sub>r</sub>.

11     | [12.13. Extended Flash With Information Message](#): The mobile station shall perform  
 12     | the following: If CON\_REF\_INCL<sub>r</sub> equals '0', the ~~layer 3~~Layer 3 shall deliver this  
 13     | message to the Call Control instance identified by NULL; otherwise, the ~~layer~~  
 14     | ~~3~~Layer 3 shall deliver this message to the Call Control instance identified by  
 15     | CON\_REF<sub>r</sub>.

16     | [13.14. Extended Handoff Direction Message](#): The ~~layer 3~~Layer 3 shall send a "reset  
 17     | waiting for order substate timer indication" to all Call Control instances. The  
 18     | mobile station shall process the message as specified in 2.6.6.2.5.1.

19     | [14.15. Extended Neighbor List Update Message](#): The mobile station shall process the  
 20     | message as specified in 2.6.6.2.5.1.

21     | [15.16. Extended Release Message](#): The mobile station shall process the message as  
 22     | specified in 2.6.4.1.9.

23     | [16.17. Extended Release Mini Message](#): The mobile station shall process the  
 24     | message as specified in 2.6.4.1.9.

25     | [17.18. Forward Supplemental Channel Assignment Mini Message](#): The mobile station  
 26     | shall process the message as specified in 2.6.6.2.5.1.

27     | [18.19. Flash With Information Message](#): If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the  
 28     | ~~layer 3~~Layer 3 shall deliver this message to the Call Control instance; otherwise,  
 29     | the ~~layer 3~~Layer 3 shall deliver this message to the Call Control instance  
 30     | identified by NULL.

31     | [19.20. Extended Supplemental Channel Assignment Message](#): The mobile station  
 32     | shall process the message as specified in 2.6.6.2.5.1.

33     | [20.21. General Handoff Direction Message](#): The ~~layer 3~~Layer 3 shall send a "reset  
 34     | waiting for order substate timer indication" to all Call Control instances. The  
 35     | mobile station shall process the message as specified in 2.6.6.2.5.1.

36     | [21.22. In-Traffic System Parameters Message](#): The mobile station shall process the  
 37     | message as specified in 2.6.4.1.4.

38     | [22.23. Local Control Order](#)

39     | [23.24. Lock Until Power-Cycled Order](#): The mobile station shall disable its  
 40     | transmitter and record the reason for the *Lock Until Power-Cycled Order* in the

mobile station's semi-permanent memory ( $LCKRSN_{S-p}$  equals the least-significant four bits of  $ORDQ_r$ ). The mobile station should notify the user of the locked condition. The ~~layer 3~~Layer 3 shall terminate all Call Control instances, and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System Access State* again until after the next mobile station power-up or until it has received an *Unlock Order*. This requirement shall take precedence over any other mobile station requirement specifying entry to the *System Access State*.

~~24.25.~~ *Long Code Transition Request Order*: The mobile station shall process the message as specified in 2.6.4.1.6.

~~25.26.~~ *Maintenance Order*: If  $P_{REV\_IN\_USE_s}$  is less than seven, the ~~layer 3~~Layer 3 shall deliver this message to the Call Control instance; otherwise, the ~~layer 3~~Layer 3 shall perform the following: if  $CON\_REF\_INCL_r$  equals '0', the ~~layer 3~~Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the ~~layer 3~~Layer 3 shall deliver this message to the Call Control instance identified by  $CON\_REF_r$ .

~~26.27.~~ *Maintenance Required Order*: The mobile station shall record the reason for the *Maintenance Required Order* in the mobile station's semi-permanent memory ( $MAINTRSN_{S-p}$  equals the least-significant four bits of  $ORDQ_r$ ). The mobile station shall remain in the unlocked condition. The mobile station should notify the user of the maintenance required condition.

~~27.28.~~ *Message Encryption Mode Order*: The mobile station shall process the message as specified in 2.3.12.2.

~~28.29.~~ *Mobile Station Registered Message*: The mobile station shall process the message as specified in 2.6.5.5.4.3.

~~29.30.~~ *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall process the message as specified in 2.6.6.2.5.1.

~~30.31.~~ *Neighbor List Update Message*: The mobile station shall process the message as specified in 2.6.6.2.5.1.

~~31.32.~~ *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop Report Message* in assured mode to the base station.

~~32.33.~~ *Parameter Update Order*: The ~~layer 3~~Layer 3 shall send a "reset waiting for order substate timer indication" to all Call Control instances. The mobile station shall increment  $COUNT_{S-p}$  (see 2.3.12.1.3). The mobile station shall send a *Parameter Update Confirmation Order* within  $T_{56m}$  seconds. The mobile station shall set the  $ORDQ$  field of the *Parameter Update Confirmation Order* to the same value as the  $ORDQ$  field of the *Parameter Update Order*.

~~33.34.~~ *Periodic Pilot Measurement Request Order*: The mobile station shall process the order as specified in 2.6.6.2.5.1.

~~34.35.~~ *Pilot Measurement Request Order*: The mobile station shall process the order

1 as specified in 2.6.6.2.5.1.

2     [35.36.](#) *Power Control Message*: The mobile station shall process the message as  
3        specified in 2.6.4.1.1.3.

4     [36.37.](#) *Power Control Parameters Message*: The mobile station shall process the  
5        message as specified in 2.6.4.1.1.2.

6     [37.38.](#) *Power Up Function Message*: The mobile station shall process the message as  
7        specified in 2.6.4.1.7.1.

8     [38.39.](#) *Power Up Function Completion Message*: The mobile station shall process the  
9        message as specified in 2.6.4.1.7.3.

10    [39.40.](#) *Release Order*: The layer 3Layer 3 shall send a “release indication” to all Call  
11       Control instances, and shall enter the *Release Substate* with a base station  
12       release indication (see 2.6.4.4).

13    [40.41.](#) *Resource Allocation Message*: The mobile station shall process the message  
14       as specified in 2.6.4.1.10.

15    [41.42.](#) *Resource Allocation Mini Message*: The mobile station shall process the  
16       message as specified in 2.6.4.1.10.

17    [42.43.](#) *Retrieve Parameters Message*: The mobile station shall send, within T<sub>56m</sub>  
18       seconds, a *Parameters Response Message*.

19    [43.44.](#) *Retry Order*: The mobile station shall process the order as follows:

- 20      • If RETRY\_TYPE<sub>r</sub> is equal to ‘000’, the mobile station shall set  
21           RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE] to 50, where RETRY\_TYPE is equal to ‘001’,  
22           ‘010’, or ‘011’.
- 23      • If RETRY\_TYPE<sub>r</sub> is equal to ‘001’, then the mobile station shall perform the  
24           following:
  - 25           – If RETRY\_DELAY<sub>r</sub> is equal to ‘00000000’, then the mobile station shall  
26              set RETRY\_DELAY<sub>s</sub> [RETRY\_TYPE<sub>r</sub>] to 0.
  - 27           – If RETRY\_DELAY<sub>r</sub> is not equal to ‘00000000’ the mobile station shall set  
28              RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE<sub>r</sub>] as follows:
    - 29               + If the most significant bit of the RETRY\_DELAY<sub>r</sub> is 0, set  
30                  RETRY\_DELAY\_UNIT<sub>s</sub> to 1000ms. If the most significant bit of the  
31                  RETRY\_DELAY<sub>r</sub> is ‘1’, set RETRY\_DELAY\_UNIT<sub>s</sub> to 60000ms.
    - 32               + The mobile station shall set RETRY\_DELAY\_VALUE<sub>s</sub> to the seven  
33                  least significant bits of RETRY\_DELAY<sub>r</sub>.
    - 34               + The mobile station shall store the next system time 80 ms boundary +  
35                  RETRY\_DELAY\_VALUE<sub>s</sub> × RETRY\_DELAY\_UNIT<sub>s</sub> ms as  
36                  RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE<sub>r</sub>].
  - 37           • If RETRY\_TYPE<sub>r</sub> is equal to ‘010’ or ‘011’, the mobile station shall perform  
38              the following:

- 1    - If  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r]$  is '00000000', then the mobile station  
2    shall set  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}_r]$  to '0'.
- 3    - If  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r]$  is '11111111', then the mobile station  
4    shall set  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}_r]$  to *infinity*.
- 5    - If  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r]$  is not equal to '00000000' or  
6    '11111111', the mobile station shall store the next system time 80 ms  
7    boundary +  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r] \times 320$  ms as  
8     $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}_r]$ .

9    **44.45. Reverse Supplemental Channel Assignment Mini Message:** The mobile station  
10   shall process the message as specified in 2.6.6.2.5.1.

11   **45.46. Security Mode Command Message:** The mobile station shall process the  
12   message as specified in 2.6.4.1.14.

13   **46.47. Send Burst DTMF Message:** Support of this order by the mobile station is  
14   optional. If  $P_{REV\_IN\_USE}s$  is less than seven, the layer 3 shall deliver  
15   this message to the Call Control instance; otherwise, the layer 3 shall  
16   perform the following: if  $CON_{REF\_INCL}r$  equals '0', the layer 3 shall  
17   deliver this message to the Call Control instance identified by NULL; otherwise,  
18   the layer 3 shall deliver this message to the Call Control instance  
19   identified by  $CON_{REF}r$ .

20   **47.48. Service Connect Message:** The mobile station shall process the message in  
21   accordance with the requirements for the active service subfunction (see  
22   2.6.4.1.2.2)-if the message is not rejected due to the following conditions:

- 23    - If the CC INFO INCL field is included in this message and is set to '1', the  
24       mobile station shall perform the following for each of the  
25       NUM CALLS ASSIGN call assignments included in this message:
  - 26        + If there already exists or currently pending instantiation a Call Control  
27           instance identified by CON REF<sub>r</sub>, the mobile station shall send a Mobile  
28           Station Reject Order with ORDQ field set to '00010010' (a call control  
29           instance is already present with the specified identifier), with the  
30           CON REF field of the order set to CON REF<sub>r</sub>.
  - 31        + If RESPONSE IND<sub>r</sub> equals '1' and TAG<sub>r</sub> does not match any of the TAG  
32           values contained in the list TAG OUTSTANDING LIST, the mobile station  
33           shall send a Mobile Station Reject Order with ORDQ field set to  
34           '00010011' (TAG received does not match TAG stored), with the TAG field  
35           of the order set to TAG<sub>r</sub>, and the CON REF field of the order set to  
36           CON REF<sub>r</sub>.
  - 37        + If the mobile station does not accept this call assignment, the mobile  
38           station shall send a Mobile Station Reject Order with ORDQ field set to  
39           '00010000' (call assignment not accepted), with the CON REF field of the  
40           order set to CON REF<sub>r</sub>.

1            **48.49.** *Service Option Control Message:* The mobile station shall process the  
 2            message in accordance with the requirements for the active service subfunction  
 3            (see 2.6.4.1.2.2).

4            **49.50.** *Service Option Control Order:* The mobile station shall process the message  
 5            in accordance with the requirements for the active service subfunction (see  
 6            2.6.4.1.2.2).

7            **50.51.** *Service Option Request Order:* The mobile station shall process the message  
 8            in accordance with the requirements for the active service subfunction (see  
 9            2.6.4.1.2.2).

10          **51.52.** *Service Option Response Order:* The mobile station shall process the message  
 11         in accordance with the requirements for the active service subfunction (see  
 12         2.6.4.1.2.2).

13          **52.53.** *Service Redirection Message:* The mobile station shall process the message  
 14         as follows:

15         If RECORD\_TYPE<sub>r</sub> is equal to '00000000', the mobile station shall do the  
 16         following:

- 17            – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
- 18            – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits of  
 19            TMSI\_CODE<sub>s-p</sub> to '1'.
- 20            – The mobile station shall disable the full-TMSI timer.
- 21            – The layer 3 shall send a "release indication" to all Call Control  
 22            instances, and shall enter the Release Substate with an NDSS off  
 23            indication (see 2.6.4.4).

24         If RECORD\_TYPE<sub>r</sub> is not equal to '00000000', REDIRECT\_TYPE<sub>r</sub> is '1', and the  
 25         mobile station supports the band class and operating mode specified in the  
 26         message, the mobile station shall do the following:

- 27            – The mobile station shall store the redirection record received in the  
 28            message as REDIRECT\_REC<sub>s</sub>.
- 29            – The mobile station shall enable NDSS\_ORIG<sub>s</sub> and shall record the dialed  
 30            digits (if any) corresponding to the last MS originated call.
- 31            – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
- 32            – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits of  
 33            TMSI\_CODE<sub>s-p</sub> to '1'.
- 34            – The mobile station shall disable the full-TMSI timer.
- 35            – The layer 3 shall send a "release indication" to all Call Control  
 36            instances, and shall enter the *Release Substate* with a redirection indication (see  
 37            2.6.4.4). Otherwise, the mobile station shall discard the message and send a  
 38            *Mobile Station Reject Order* (ORDQ set to the applicable reason code as  
 39            determined from Table 2.7.3-1) within T<sub>56m</sub> seconds.

1           **53.54.** *Service Request Message:* The mobile station shall process the message in  
 2           accordance with the requirements for the active service subfunction (see  
 3           2.6.4.1.2.2).

4           **54.55.** *Service Response Message:* The mobile station shall process the message in  
 5           accordance with the requirements for the active service subfunction (see  
 6           2.6.4.1.2.2).

7           **55.56.** *Set Parameters Message:* If the mobile station can set all of the parameters  
 8           specified by the PARAMETER\_ID fields in the message, the mobile station shall  
 9           set them; otherwise, the mobile station shall send, within T<sub>56m</sub> seconds, a  
 10          *Mobile Station Reject Order.*

11          **56.57.** *SSD Update Message:* The ~~layer 3~~**Layer 3** shall send a “reset waiting for order  
 12          substate timer indication” to all Call Control instances. The mobile station shall  
 13          process the message and respond with a *Base Station Challenge Order* as  
 14          specified in 2.3.12.1.5 within T<sub>32m</sub> seconds.

15          **57.58.** *Status Request Message:* The mobile station shall send, within T<sub>56m</sub>  
 16          seconds, a *Status Response Message*. If the message does not specify any  
 17          qualification information (QUAL\_INFO\_TYPE<sub>r</sub> is equal to ‘00000000’), the mobile  
 18          station shall include the requested information records in the *Status Response*  
 19          *Message*. If the message specifies a band class (QUAL\_INFO\_TYPE<sub>r</sub> is equal to  
 20          ‘00000001’), the mobile station shall only include the requested information  
 21          records for the specified band class (BAND\_CLASS<sub>r</sub>) in the *Status Response*  
 22          *Message*. If the message specifies a band class and an operating mode  
 23          (QUAL\_INFO\_TYPE<sub>r</sub> is equal to ‘00000010’), the mobile station shall only  
 24          include the requested information records for the specified band class  
 25          (BAND\_CLASS<sub>r</sub>) and operating mode (OP\_MODE<sub>r</sub>) in the *Status Response*  
 26          *Message*.

27          If the message specifies a band class or a band class and an operating mode  
 28          which is not supported by the mobile station, the mobile station shall send a  
 29          *Mobile Station Reject Order* with ORDQ set to ‘00000110’ (message requires a  
 30          capability that is not supported by the mobile station).

31          If the response to this message exceeds the allowable length, the mobile station  
 32          shall send a *Mobile Station Reject Order* with ORDQ set to ‘00001000’ (response  
 33          message would exceed the allowable length).

34          If the message specifies an information record which is not supported by the  
 35          mobile station for the specified band class and operating mode, the mobile  
 36          station shall send a *Mobile Station Reject Order* with ORDQ set to ‘00001001’  
 37          (information record is not supported for the specified band class and operating  
 38          mode).

39          **58.59.** *Status Request Order:* If CDMABAND<sub>s</sub> is equal to ‘00000’, the mobile station  
 40          shall send a *Status Message* within T<sub>56m</sub> seconds. The mobile station shall  
 41          respond with information corresponding to the current band class and  
 42          operating mode.

1            **59-60.** *Supplemental Channel Assignment Message:* The mobile station shall process  
 2            the message as specified in 2.6.6.2.5.1.

3            **60-61.** *TMSI Assignment Message:* The mobile station shall store the TMSI zone and  
 4            code as follows:

- 5            • The mobile station shall store the length of the TMSI zone field by setting  
               ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>,
- 6            • The mobile station shall store the assigning TMSI zone number by setting  
               the ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of  
               ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- 7            • The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to  
               TMSI\_CODE<sub>r</sub>.

8            The mobile station shall set the TMSI expiration time by setting  
 9            TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIMER<sub>r</sub>. The mobile station shall disable  
 10          the full-TMSI timer. The mobile station shall then respond with a *TMSI*  
 11          *Assignment Completion Message* within T56m seconds.

12           **61-62.** *Universal Handoff Direction Message:* The layer 3Layer 3 shall send a “reset  
 13          waiting for order substate timer indication” to all Call Control instances. The  
 14          mobile station shall process the message as specified in 2.6.6.2.5.1.

15           **62-63.** *User Zone Reject Message:* The mobile station shall process this message as  
 16          specified in 2.6.9.2.2.

17           **63-64.** *User Zone Update Message:* The mobile station shall process this message as  
 18          specified in 2.6.9.2.2.

- 19            • If the mobile station receives a message that is not included in the above list, cannot  
               be processed, or requires a capability which is not supported, the mobile station  
               shall discard the message and send a *Mobile Station Reject Order* (ORDQ set to the  
               applicable reason code as determined from Table 2.7.3-1) within T56m seconds. If  
               the mobile station receives a Call Control message (see 2.6.10) which is directed to a  
               Call Control instance that does not exists, the mobile station shall send a *Mobile*  
               *Station Reject Order* with ORDQ field set to ‘00010001’ (no call control instance  
               present with the specified identifier) to the base station within T56m seconds.
- 20            • If the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to ‘1’, and if System Time (in 80 ms  
               units) exceeds TMSI\_EXP\_TIME<sub>s-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
               TMSI\_CODE<sub>s-p</sub> to ‘1’ within T66m seconds.
- 21            • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits  
               of TMSI\_CODE<sub>s-p</sub> to ‘1’. The mobile station shall update the registration variables  
               as described in 2.6.5.5.2.5.

#### 37            2.6.4.4 Release Substate

38            In this substate, the mobile station confirms the disconnect of all calls and physical  
 39          channels.

1 Upon entering the *Release Substate*, the mobile station shall perform the following:

- 2 • The mobile station shall set the substate timer for T55m seconds.
- 3 • If the mobile station enters the *Release Substate* with a power-down indication, the  
4 mobile station shall send a *Release Order* (ORDQ = '00000001'), and shall perform  
5 power-down registration procedures (see 2.6.5.5.4.4). The layer 3Layer 3 shall  
6 terminate all Call Control instances.
- 7 • If the mobile station enters the *Release Substate* with a mobile station release  
8 indication, the mobile station shall send a *Release Order* (ORDQ = '00000000'), and  
9 set RETURN\_CAUSE<sub>s</sub> to '0000'. The mobile station may store the current service  
10 configuration (that is, parameters conveyed by both the Service Configuration  
11 information record and the Non-negotiable Service Configuration information  
12 record); if the mobile station stores the current service configuration, then the  
13 mobile station shall store the SYNC ID<sub>s</sub> corresponding to the current service  
14 configuration.
- 15 • If the mobile station enters the *Release Substate* with a service inactive indication,  
16 the mobile station shall send a *Release Order* (ORDQ = '00000010'), and set  
17 RETURN\_CAUSE<sub>s</sub> to '0000'.
- 18 • If the mobile station enters the *Release Substate* with a base station release  
19 indication, the mobile station shall send a *Release Order* (ORDQ = '00000000'). The  
20 layer 3Layer 3 shall terminate all Call Control instances. The mobile station may  
21 store the current service configuration (that is, parameters conveyed by both the  
22 Service Configuration information record and the Non-negotiable Service  
23 Configuration information record); if the mobile station stores the current service  
24 configuration, then the mobile station shall store the SYNC ID<sub>s</sub> corresponding to the  
25 current service configuration. The mobile station shall disable its transmitter, set  
26 RETURN\_CAUSE<sub>s</sub> to '0000', and shall enter the *System Determination Substate* of  
27 the *Mobile Station Initialization State* with a release indication (see 2.6.1.1).
- 28 • If the mobile station entered the *Release Substate* with a base station extended  
29 release indication, the mobile station shall perform the following:
  - 30 – The mobile station may store the current service configuration (that is,  
31 parameters conveyed by both the Service Configuration information record and  
32 the Non-negotiable Service Configuration information record); if the mobile  
33 station stores the current service configuration, then the mobile station shall  
34 store the SYNC ID<sub>s</sub> corresponding to the current service configuration.
  - 35 – The mobile station shall send an *Extended Release Response Message* to the  
36 base station.
  - 37 – The layer 3Layer 3 shall terminate all Call Control instances.
  - 38 – The mobile station shall disable its transmitter, set RETURN\_CAUSE<sub>s</sub> to '0000',  
39 and shall enter the *System Determination Substate* of the *Mobile Station*  
40 *Initialization State* with a release indication (see 2.6.1.1).

- 1     • If the mobile station entered the *Release Substate* with a base station extended  
 2       release with mini message indication, then the mobile station shall perform the  
 3       following:

4           The mobile station may store the current service configuration (that is,  
 5           parameters conveyed by both the Service Configuration information record and  
 6           the Non-negotiable Service Configuration information record); if the mobile  
 7           station stores the current service configuration, then the mobile station shall  
 8           store the SYNC\_IDs.

- 9     – The mobile station shall send an *Extended Release Response Mini Message* to the  
 10      base station.
- 11     – The layer-3Layer 3 shall terminate all Call Control instances.
- 12     – The mobile station shall disable its transmitter, set RETURN\_CAUSE<sub>s</sub> to '0000',  
 13       and shall enter the *System Determination Substate* of the *Mobile Station*  
 14       *Initialization State* with a release indication (see 2.6.1.1).
- 15     • If the mobile station enters the *Release Substate* with a redirection indication, the  
 16       mobile station shall send a *Release Order* (ORDQ = '00000000') and shall enter the  
 17       *System Determination Substate* of the *Mobile Station Initialization State* with a  
 18       redirection indication (see 2.6.1.1). The layer-3Layer 3 shall terminate all Call  
 19       Control instances.
- 20     • If the mobile station enters the *Release Substate* with an NDSS off indication, the  
 21       mobile station shall send a *Release Order* (ORDQ = '00000000'), and shall enter the  
 22       *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS  
 23       off indication (see 2.6.1.1). The layer-3Layer 3 shall terminate all Call Control  
 24       instances.

25     While in the *Release Substate*, the mobile station shall perform the following:

- 26     • If the substate timer expires, the layer-3Layer 3 shall terminate all Call Control  
 27       instances, and the mobile station shall disable its transmitter and shall enter the  
 28       *System Determination Substate* of the *Mobile Station Initialization State* with a release  
 29       indication (see 2.6.1.1).
- 30     • The mobile station shall perform Forward Traffic Channel supervision as specified in  
 31       2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the layer-3Layer 3  
 32       shall terminate all Call Control instances, and shall enter the *System Determination*  
 33       *Substate* of the *Mobile Station Initialization State* with a release indication (see  
 34       2.6.1.1).
- 35     • The mobile station shall adjust its transmit power as specified in 2.1.2.3 of [2].
- 36     • The mobile station shall perform Forward Traffic Channel power control as specified  
 37       in 2.6.4.1.1.
- 38     • The mobile station shall perform handoff processing as specified in 2.6.6.

- 1     • If the Fundamental Channel is present, the mobile station shall transmit null traffic,  
2       except when transmitting signaling traffic, on the Reverse Fundamental Channel.
- 3     • The mobile station shall process Forward Traffic Channel signaling traffic and shall  
4       discard other types of Forward Traffic Channel traffic.
- 5     • The mobile station shall perform registration timer maintenance as specified in  
6       2.6.5.5.4.2.
- 7     • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an  
8       acknowledgment failure, the layer 3Layer 3 shall terminate all Call Control  
9       instances, and the mobile station shall disable its transmitter and enter the *System*  
10      *Determination Substate* of the *Mobile Station Initialization State* with a release  
11      indication (see 2.6.1.1).
- 12    • If the layer 3Layer 3 receives an “enter traffic channel substate indication” from a  
13      Call Control instance, the layer 3Layer 3 shall enter the *Traffic Channel substate*.
- 14    • If layer 3Layer 3 receives a ‘message rejected indication’ from a Call Control  
15      instance, mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the  
16      applicable reason code as determined from Table 2.7.3-1) within T<sub>56m</sub> seconds as  
17      follows:
  - 18       - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
19           include the CON\_REF\_INCL field with this message and shall perform the  
20           following: if the corresponding Call Control instance is identified by NULL, the  
21           mobile station shall either set the CON\_REF\_INCL field of the message to ‘0’ or  
22           set the CON\_REF\_INCL field to ‘1’ and set the CON\_REF field to the connection  
23           reference of the service option connection corresponding to this Call Control  
24           instance; otherwise, the mobile station shall set the CON\_REF\_INCL field of the  
25           message to ‘1’ and the CON\_REF field of the message to the connection reference  
26           of the service option connection corresponding to this Call Control instance.
- 27    • If the mobile station receives a message which is included in the following list, and if  
28      every message field value is within its permissible range, the mobile station shall  
29      process the message as described below and in accordance with the message’s  
30      action time (see 2.6.4.1.5):
  - 31       1. *Alert With Information Message*: If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the layer  
32          Layer 3 shall deliver this message to the Call Control instance; otherwise, the  
33          layer 3Layer 3 shall deliver this message to the Call Control instance identified  
34          by NULL.
  - 35       2. *Candidate Frequency Search Control Message*: The mobile station shall process  
36          the message as specified in 2.6.6.2.5.1.
  - 37       3. *Candidate Frequency Search Request Message*: The mobile station shall process  
38          the message as specified in 2.6.6.2.5.1.
  - 39       4. *Data Burst Message*
  - 40       5. *Extended Alert With Information Message*: The mobile station shall perform the

1           following: If CON\_REF\_INCL<sub>r</sub> equals '0', the ~~layer 3~~<sub>Layer 3</sub> shall deliver this  
 2           message to the Call Control instance identified by NULL; otherwise, the ~~layer~~  
 3           ~~3~~<sub>Layer 3</sub> shall deliver this message to the Call Control instance identified by  
 4           CON\_REF<sub>r</sub>.

- 5         6. *Extended Handoff Direction Message*: The mobile station shall process the  
 6           message as specified in 2.6.6.2.5.1.
- 7         7. *Extended Neighbor List Update Message*: The mobile station shall process the  
 8           message as specified in 2.6.6.2.6.3.
- 9         8. *Extended Supplemental Channel Assignment Message*: The mobile station shall  
 10          process the message as specified in 2.6.6.2.5.1.
- 11         9. *General Handoff Direction Message*: The mobile station shall process the  
 12          message as specified in 2.6.6.2.5.1.
- 13         10. *In-Traffic System Parameters Message*: The mobile station shall process the  
 14          message as specified in 2.6.4.1.4.
- 15         11. *Local Control Order*
- 16         12. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall  
 17          process the message as specified in 2.6.6.2.5.1.
- 18         13. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter  
 19          and record the reason for the *Lock Until Power-Cycled Order* in the mobile  
 20          station's semi-permanent memory (LCKRSN<sub>s-p</sub> equals the least-significant  
 21          four bits of ORDQ<sub>r</sub>). The mobile station should notify the user of the locked  
 22          condition. The ~~layer 3~~<sub>Layer 3</sub> shall terminate all Call Control instances. The  
 23          ~~layer 3~~<sub>Layer 3</sub> shall enter the *System Determination Substate* of the *Mobile*  
 24          *Station Initialization State* with a lock indication (see 2.6.1.1), and shall not enter  
 25          the *System Access State* again until after the next mobile station power-up or  
 26          until it has received an *Unlock Order*. This requirement shall take precedence  
 27          over any other mobile station requirement specifying entry to the *System Access*  
 28          *State*.
- 29         14. *Maintenance Required Order*: The mobile station shall record the reason for the  
 30          *Maintenance Required Order* in the mobile station's semi-permanent memory  
 31          (MAINTRSN<sub>s-p</sub> equals the least-significant four bits of ORDQ<sub>r</sub>). The mobile  
 32          station shall remain in the unlocked condition. The mobile station should  
 33          notify the user of the maintenance required condition.
- 34         15. *Mobile Station Registered Message*: The mobile station shall process the  
 35          message as specified in 2.6.5.5.4.3.
- 36         16. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall  
 37          process the message as specified in 2.6.6.2.5.1.
- 38         17. 16. *Neighbor List Update Message*: The mobile station shall process the message  
 39          as specified in 2.6.6.2.6.3.
- 40         18. 17. *Outer Loop Report Request Order*: The mobile station shall send the *Outer*

1           *Loop Report Message* in assured mode to the base station.

2       [19.18.](#) *Power Control Message*: The mobile station shall process the message as  
3           specified in 2.6.4.1.1.3.

4       [20.19.](#) *Power Control Parameters Message*: The mobile station shall process the  
5           message as specified in 2.6.4.1.1.2.

6       [21.20.](#) *Power Up Function Message*: The mobile station shall process the message as  
7           specified in 2.6.4.1.7.1.

8       [22.21.](#) *Power Up Function Completion Message*: The mobile station shall process the  
9           message as specified in 2.6.4.1.7.3.

10      [23.22.](#) *Release Order*: The mobile station shall disable its transmitter. The ~~layer~~  
11           ~~3Layer 3~~ shall terminate all Call Control instances. If the mobile station enters  
12           the *Release Substate* with a power-down indication, the mobile station may  
13           power down; otherwise, the mobile station shall enter the *System Determination*  
14           *Substate* of the *Mobile Station Initialization State* with a release indication (see  
15           2.6.1.1).

16      [24.23.](#) *Retrieve Parameters Message*: The mobile station shall send, within T<sub>56m</sub>  
17           seconds, a *Parameters Response Message*.

18      [25.24.](#) *Retry Order*: The mobile station shall process the order as follows:

- 19           • If RETRY\_TYPE<sub>r</sub> is equal to '000', the mobile station shall set  
20            RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE] to '~~0~~<sup>0</sup>', where RETRY\_TYPE is equal to '001',  
21            '010', or '011'.
- 22           • If RETRY\_TYPE<sub>r</sub> is equal to '001', then the mobile station shall perform the  
23            following:
  - 24              – If RETRY\_DELAY<sub>r</sub> is equal to '00000000', then the mobile station shall  
25                set RETRY\_DELAY<sub>s</sub> [RETRY\_TYPE<sub>r</sub>] to 0.
  - 26              – If RETRY\_DELAY<sub>r</sub> is not equal to '00000000' the mobile station shall set  
27                RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE<sub>r</sub>] as follows:
    - 28                + If the most significant bit of the RETRY\_DELAY<sub>r</sub> is 0, set  
29                  RETRY\_DELAY\_UNIT<sub>s</sub> to 1000ms. If the most significant bit of the  
30                  RETRY\_DELAY<sub>r</sub> is '1', set RETRY\_DELAY\_UNIT<sub>s</sub> to 60000ms.
    - 31                + The mobile station shall set RETRY\_DELAY\_VALUE<sub>s</sub> to the seven  
32                least significant bits of RETRY\_DELAY<sub>r</sub>.
    - 33                + The mobile station shall store the next system time 80 ms boundary +  
34                RETRY\_DELAY\_VALUE<sub>s</sub> × RETRY\_DELAY\_UNIT<sub>s</sub> ms as  
35                RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE<sub>r</sub>].

36      [26.25.](#) *Service Option Control Message*: The mobile station shall process the  
37           message in accordance with the requirements for the active service subfunction  
38           (see 2.6.4.1.2.2).

39      [27.26.](#) *Service Option Control Order*: The mobile station shall process the message

1           in accordance with the requirements for the active service subfunction (see  
 2           2.6.4.1.2.2).

3           | **28.27.** *Service Redirection Message:* The mobile station shall disable its transmitter.  
 4           | If the mobile station enters the *Release Substate* with a power-down indication,  
 5           | the mobile station may power down (if powering down, the **layer 3****Layer 3** shall  
 6           | terminate all Call Control instances); otherwise, the mobile station shall process  
 7           | the message as follows:

- 8           • If RECORD\_TYPE<sub>r</sub> is '00000000', the mobile station shall do the following:
  - 9           – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
  - 10           – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits of  
 11           TMSI\_CODE<sub>s-p</sub> to '1'.
    - 12           – The mobile station shall disable the full-TMSI timer.
    - 13           – The **layer 3****Layer 3** shall terminate all Call Control instances, and shall  
 14           enter the *System Determination Substate of the Mobile Station Initialization  
 15           State* with an NDSS off indication (see 2.6.1.1).
  - 16           • If RECORD\_TYPE is not equal to '00000000', REDIRECT\_TYPE<sub>r</sub> is '1', and  
 17           the mobile station supports the band class and operating mode specified in  
 18           the message, the mobile station shall do the following:
    - 19           – The mobile station shall store the redirection record received in the  
 20           message as REDIRECT\_REC<sub>s</sub>.
    - 21           – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
    - 22           – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits of  
 23           TMSI\_CODE<sub>s-p</sub> to '1'.
      - 24           – The mobile station shall disable the full-TMSI timer.
      - 25           – The **layer 3****Layer 3** shall terminate all Call Control instances, and shall  
 26           enter the *System Determination Substate of the Mobile Station Initialization  
 27           State* with a redirection indication (see 2.6.1.1).
    - 28           • Otherwise, the mobile station shall discard the message and send a *Mobile  
 29           Station Reject Order* (ORDQ set to the applicable reason code as determined  
 30           from Table 2.7.3-1) within T<sub>56m</sub> seconds.

31           | **29.28.** *Status Request Message:* The mobile station shall send, within T<sub>56m</sub>  
 32           | seconds, a Status Response Message. If the message does not specify any  
 33           | qualification information (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000000'), the mobile  
 34           | station shall include the requested information records in the *Status Response  
 35           Message*. If the message specifies a band class (QUAL\_INFO\_TYPE<sub>r</sub> is equal to  
 36           | '00000001'), the mobile station shall only include the requested information  
 37           | records for the specified band class (BAND\_CLASS<sub>r</sub>) in the *Status Response  
 38           Message*. If the message specifies a band class and an operating mode  
 39           | (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000010'), the mobile station shall only  
 40           | include the requested information records for the specified band class

1 (BAND\_CLASS<sub>r</sub>) and operating mode (OP\_MODE<sub>r</sub>) in the *Status Response*  
 2 *Message*. If the message specifies a band class or a band class and an  
 3 operating mode which are not supported by the mobile station, the mobile  
 4 station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110'  
 5 (message requires a capability that is not supported by the mobile station). If  
 6 the response to this message exceeds the allowable length, the mobile station  
 7 shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response  
 8 message would exceed the allowable length). If the message specifies an  
 9 information record which is not supported by the mobile station for the  
 10 specified band class and operating mode, the mobile station shall send a *Mobile*  
 11 *Station Reject Order* with ORDQ set to '00001001' (information record is not  
 12 supported for the specified band class and operating mode).

13 **30.29. Status Request Order:** If CDMABAND<sub>s</sub> is equal to '00000', the mobile station  
 14 shall send, a *Status Message* within T<sub>56m</sub> seconds. The mobile station shall  
 15 respond with information corresponding to the current band class and  
 16 operating mode.

17 **31.30. Supplemental Channel Assignment Message:** The mobile station shall process  
 18 the message as specified in 2.6.6.2.5.1.

19 **32.31. TMSI Assignment Message:** The mobile station shall store the TMSI zone and  
 20 code as follows:

- 21 • The mobile station shall store the length of the TMSI zone field by setting  
     ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>;
- 22 • The mobile station shall store the assigning TMSI zone number by setting the  
     ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of  
     ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- 23 • The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to  
     TMSI\_CODE<sub>r</sub>.

24 The mobile station shall set the TMSI expiration time by setting  
 25 TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the  
 26 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*  
 27 *Completion Message* within T<sub>56m</sub> seconds.

28 **33.32. Universal Handoff Direction Message:** The mobile station shall process the  
 29 message as specified in 2.6.6.2.5.1.

30 **34.33. User Zone Reject Message:** The mobile station shall process this message as  
 31 specified in 2.6.9.2.2.

32 **35.34. User Zone Update Message:** The mobile station shall process this message as  
 33 specified in 2.6.9.2.2.

- If the mobile station receives a message that is not included in the above list or cannot be processed, the mobile station shall discard the message and send a *Mobile Station Reject Order* (ORDQ set to the applicable reason code as determined from Table 2.7.3-1) within T<sub>56m</sub> seconds. If the mobile station receives a Call Control message (see 2.6.10) which is directed to a Call Control instance that does not exist, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00010001' (no call control instance present with the specified identifier) to the base station within T<sub>56m</sub> seconds.
- If the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to '1', and if System Time (in 80 ms units) exceeds TMSI\_EXP\_TIME<sub>s-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of TMSI\_CODE<sub>s-p</sub> to '1' within T<sub>66m</sub> seconds.
- If the full-TMSI timer expires or has expired, the mobile station shall set all the bits of TMSI\_CODE<sub>s-p</sub> to '1'. The mobile station shall update the registration variables as described in 2.6.5.5.2.5.

## 2.6.5 Registration

### 2.6.5.1 Forms of Registration

Registration is the process by which the mobile station notifies the base station of its location, status, identification, slot cycle, and other characteristics. The mobile station informs the base station of its location and status so that the base station can efficiently page the mobile station when establishing a mobile station terminated call. For operation in the slotted mode, the mobile station supplies the SLOT\_CYCLE\_INDEX parameter so that the base station can determine which slots the mobile station is monitoring. The mobile station supplies the station class mark and the protocol revision number so that the base station knows the capabilities of the mobile station.

The CDMA system supports ten-eleven different forms of registration:

1. Power-up registration. The mobile station registers when it powers on, switches from using a different frequency block, switches from using a different band class, switches from using an alternative operating mode, or switches from using the analog system.
2. Power-down registration. The mobile station registers when it powers off if previously registered in the current serving system.
3. Timer-based registration. The mobile station registers when a timer expires.
4. Distance-based registration. The mobile station registers when the distance between the current base station and the base station in which it last registered exceeds a threshold.
5. Zone-based registration. The mobile station registers when it enters a new zone.
6. Parameter-change registration. The mobile station registers when certain of its stored parameters change or when it enters a new system.
7. Ordered registration. The mobile station registers when the base station requests it.

- 1       8. Implicit registration. When a mobile station successfully sends an *Origination*  
 2       *Message or Page Response Message*, the base station can infer the mobile station's  
 3       location. This is considered an implicit registration.
- 4       9. Traffic Channel registration. Whenever the base station has registration information  
 5       for a mobile station that has been assigned to a Traffic Channel, the base station  
 6       can notify the mobile station that it is registered.
- 7       10. User Zone Registration. The mobile station registers when it selects an active User  
 8       Zone (see 2.6.9.1.2).
- 9       11. Encryption re-sync required registration. The mobile station registers when  
 10      extended encryption is turned on and the mobile station determines that it can not  
 11      decrypt any messages from the base station (see 2.3.12.4.1.3).

12      The first five forms of registration, User Zone Registration, and Encryption re-sync required  
 13      registration, as a group, are called autonomous registration and are enabled by roaming  
 14      status (see 2.6.5.3). Parameter-change registration is independent of roaming status.  
 15      Ordered registration is initiated by the base station through an *Order Message*. Implicit  
 16      registration does not involve the exchange of any registration messages between the base  
 17      station and the mobile station. The base station can obtain registration information by  
 18      sending the *Status Request Message* to the mobile station on either the f-csch or the f-dsch.  
 19      The base station can obtain limited registration information by sending the *Status Request*  
 20      *Order* to the mobile station on the f-dsch. The mobile station can be notified that it is  
 21      registered through the *Mobile Station Registered Message*.

22      Any of the various forms of autonomous registration and parameter-change registration can  
 23      be enabled or disabled. The forms of registration that are enabled and the corresponding  
 24      registration parameters are communicated in the *System Parameters Message* on the Paging  
 25      Channel, or the *ANSI-41 System Parameters Message* on the Primary Broadcast Control  
 26      Channel.

27      In addition, the mobile station may enable or disable autonomous registration for each type  
 28      of roaming described in 2.6.5.3.

#### 29      2.6.5.1.1 Power-Up Registration

30      Power-up registration is performed when the mobile station is turned on. To prevent  
 31      multiple registrations when power is quickly turned on and off, the mobile station delays  
 32      T<sub>57m</sub> seconds before registering, after entering the *Mobile Station Idle State*.

33      The mobile station shall maintain a power-up/initialization timer. While the power-  
 34      up/initialization timer is active, the mobile station shall not make registration access  
 35      attempts.

36      Power-up registration is also performed when the mobile station changes to a different  
 37      operating mode, band class, serving system, or frequency block (see 2.6.5.5.1.1)

## 1    2.6.5.1.2 Power-Down Registration

2    Power-down registration is performed when the user directs the mobile station to power off.  
 3    If power-down registration is performed, the mobile station does not power off until after  
 4    completing the registration attempt.

5    The mobile station does not perform power-down registration if it has not previously  
 6    registered in the system that corresponds to the current SID<sub>S</sub> and NID<sub>S</sub> (see 2.6.5.5.2.4).

## 7    2.6.5.1.3 Timer-Based Registration

8    Timer-based registration causes the mobile station to register at regular intervals. Its use  
 9    also allows the system to automatically deregister mobile stations that did not perform a  
 10   successful power-down registration. Timer-based registration uses a Paging Channel or a  
 11   Forward Common Control Channel slot counter (equivalent to a timer with time increments  
 12   of 80 ms). Timer-based registration is performed when the counter reaches a maximum  
 13   value (REG\_COUNT\_MAX<sub>S</sub>) that is controlled by the base station via the REG\_PRD field of  
 14   the *System Parameters Message* or *ANSI-41 System Parameters Message*. The base station  
 15   disables timer-based registration by setting REG\_PRD to zero.

16   The mobile station shall maintain a timer-based registration counter (REG\_COUNT<sub>S</sub>). The  
 17   mobile station shall compute and store the timer expiration count (REG\_COUNT\_MAX<sub>S</sub>) as

$$18 \quad \text{REG\_COUNT\_MAX}_S = \lfloor 2^{\text{REG\_PRD}/4} \rfloor.$$

19   The mobile station shall maintain an indicator of timer-based registration timer enable  
 20   status (COUNTER\_ENABLED<sub>S</sub>).

21   The counter is reset when the mobile station powers on and when the mobile station  
 22   switches from different band classes, different serving systems, different frequency blocks,  
 23   and alternate operating modes. The counter is also reset after each successful registration.

24   Whenever the mobile station changes COUNTER\_ENABLED<sub>S</sub> from NO to YES, it shall set  
 25   REG\_COUNT<sub>S</sub> to a pseudorandom value between 0 and REG\_COUNT\_MAX<sub>S</sub> - 1, using the  
 26   pseudorandom number generator specified in 2.6.7.2.

27   If the mobile station is operating in the non-slotted mode, it shall increment the timer-  
 28   based registration counter once per 80 ms whenever COUNTER\_ENABLED<sub>S</sub> equals YES. If  
 29   the mobile station is operating in slotted mode, it may increment the timer-based  
 30   registration counter when it begins to monitor the Paging Channel (see 2.6.2.1.1.3) or the  
 31   Forward Common Control Channel. A mobile station operating in the slotted mode shall  
 32   increment the counter by the same amount that the counter would have been incremented  
 33   if the mobile station had been operating in the non-slotted mode.<sup>11</sup>

---

11 For example, if the mobile station uses a 2.56 second slot cycle, then it may increment the counter by 32 every time it becomes active.

1    2.6.5.1.4 Distance-Based Registration

2    Distance-based registration causes a mobile station to register when the distance between  
 3    the current base station and the base station in which it last registered exceeds a  
 4    threshold. The mobile station determines that it has moved a certain distance by  
 5    computing a distance measure based on the difference in latitude and longitude between  
 6    the current base station and the base station where the mobile station last registered. If  
 7    this distance measure exceeds the threshold value, the mobile station registers.

8    The mobile station stores the base station latitude (BASE\_LAT\_REG<sub>s-p</sub>), the base station  
 9    longitude (BASE\_LONG\_REG<sub>s-p</sub>) and the registration distance (REG\_DIST\_REG<sub>s-p</sub>), of the  
 10   base station to which the first access probe (for a *Registration Message*, *Origination*  
 11   *Message*, or *Page Response Message* sent on the r-csch) was transmitted after entering the  
 12   *System Access State*. The mobile station shall compute the current base station's distance  
 13   from the last registration point (DISTANCE) as:

$$14 \quad DISTANCE = \lfloor \frac{\sqrt{(\Delta lat)^2 + (\Delta long)^2}}{16} \rfloor,$$

15   where

$$16 \quad \Delta lat = BASE\_LAT_s - BASE\_LAT\_REG_{s-p}$$

17   and

$$18 \quad \Delta long = (BASE\_LONG_s - BASE\_LONG\_REG_{s-p}) \times \cos(\pi/180 \times BASE\_LAT\_REG_{s-p}/14400).$$

19   The mobile station shall compute DISTANCE with an error of no more than  $\pm 5\%$  of its true  
 20   value when  $|BASE\_LAT\_REG_{s-p}/14400|$  is less than 60 and with an error of no more than  
 21    $\pm 7\%$  of its true value when  $|BASE\_LAT\_REG_{s-p}/14400|$  is between 60 and 70.<sup>12</sup>

22   2.6.5.1.5 Zone-Based Registration

23   Registration zones are groups of base stations within a given system and network. A base  
 24   station's zone assignment is identified by the REG\_ZONE field of the *System Parameters*  
 25   *Message* or *ANSI-41 System Parameters Message*.

26   Zone-based registration causes a mobile station to register whenever it ~~moves into~~  
 27   ~~determines it is in~~ a new zone ([see 2.6.5.5.2.1](#)), not on its internally stored list of visited  
 28   registration zones. A zone is added to the list whenever a registration (including implicit  
 29   registration) occurs, and is deleted upon expiration of a timer. After a system access,  
 30   timers are enabled for every zone except one that was successfully registered by the access.

31   A mobile station can be registered in more than one zone. Zones are uniquely identified by  
 32   a zone number (REG\_ZONE) plus the SID and NID of the zone.

---

12 BASE\_LAT and BASE\_LONG are given in units of 1/4 seconds. BASE\_LAT/14400 and  
 BASE\_LONG/14400 are in units of degrees.

1 The mobile station shall store a list of the zones in which the mobile station has registered  
 2 (*ZONE\_LIST<sub>S</sub>*). Each entry in *ZONE\_LIST<sub>S</sub>* shall include the zone number (*REG\_ZONE*) and  
 3 the (*SID*, *NID*) pair for the zone. The mobile station shall be capable of storing at least *N9m*  
 4 entries in *ZONE\_LIST<sub>S</sub>*. A base station shall be considered to be in *ZONE\_LIST<sub>S</sub>* only if the  
 5 base station's *REG\_ZONE*, *SID* and *NID* are found in an entry in *ZONE\_LIST<sub>S</sub>*. The mobile  
 6 station provides storage for one entry of *ZONE\_LIST<sub>S</sub>* in semi-permanent memory,  
 7 *ZONE\_LIST<sub>S-p</sub>* (see 2.3.4).

8 The mobile station shall maintain a zone list entry timer for each entry in *ZONE\_LIST<sub>S</sub>*.  
 9 When an entry in *ZONE\_LIST<sub>S</sub>* is removed from the list, the corresponding zone list entry  
 10 timer shall be disabled. The timer duration shall be as determined from the stored value of  
 11 *ZONE\_TIMER<sub>S</sub>* using Table 3.7.2.3.2.1-1. The mobile station shall provide a means to  
 12 examine each timer's value while the timer is active, so that the age of list entries can be  
 13 compared.

14 If the mobile station supports Band Class 1, Band Class 2, Band Class 4, Band Class 5, ~~or~~  
 15 Band Class 7, or Band Class 10, the mobile station shall maintain an identifier of the  
 16 frequency block for each entry in *ZONE\_LIST<sub>S</sub>* (see 2.1.1.1 of [2]). When the mobile station  
 17 adds a zone to *ZONE\_LIST<sub>S</sub>*, the mobile station shall include the identifier for the frequency  
 18 block.<sup>13</sup>

19 If the mobile station supports multiple band classes, the mobile station shall maintain an  
 20 identifier of the band class for each entry in *ZONE\_LIST<sub>S</sub>* (see 2.1.1.1 of [2]). When the  
 21 mobile station adds a zone to *ZONE\_LIST<sub>S</sub>*, the mobile station shall include the identifier for  
 22 the band class.

23 The base station controls the maximum number of zones in which a mobile station may be  
 24 considered registered, by means of the *TOTAL\_ZONES* field of the *System Parameters*  
 25 *Message* or *ANSI-41 System Parameters Message*. When an entry is added to the zone list,  
 26 or if *TOTAL\_ZONES* is decreased, the mobile station removes entries from the zone list if  
 27 there are more entries than allowed by the setting of *TOTAL\_ZONES*.

28 Whenever *ZONE\_LIST<sub>S</sub>* contains more than *TOTAL\_ZONES<sub>S</sub>* entries, the mobile station shall  
 29 delete the excess entries according to the following rules:

- 30 • If *TOTAL\_ZONES<sub>S</sub>* is equal to zero, the mobile station shall delete all entries.
- 31 • If *TOTAL\_ZONES<sub>S</sub>* is not equal to zero, the mobile station shall delete those entries  
 32 having active zone list entry timers, starting with the oldest entry, as determined by  
 33 the timer values, and continuing in order of decreasing age until no more than  
 34 *TOTAL\_ZONES<sub>S</sub>* entries remain.

35 The mobile station shall store a list of the systems/networks in which the mobile station  
 36 has registered (*SID\_NID\_LIST<sub>S</sub>*). Each entry in *SID\_NID\_LIST<sub>S</sub>* shall include the (*SID*, *NID*)  
 37 pair for the system/network. The mobile station shall be capable of storing *N10m* entries in

13 The mobile station need not maintain a separate identifier for Band Class 0, as the least significant bit of the *SID* identifies the serving system.

1 SID\_NID\_LIST<sub>s</sub>. A base station shall be considered to be in the SID\_NID\_LIST<sub>s</sub> only if the  
 2 base station's SID and NID are found in an entry in SID\_NID\_LIST<sub>s</sub>. The mobile station  
 3 shall provide storage for one entry of SID\_NID\_LIST<sub>s</sub> in semi-permanent memory  
 4 (SID\_NID\_LIST<sub>s-p</sub>).

5 If the mobile station supports Band Class 1, Band Class 2, Band Class 4, Band Class 5, ~~or~~  
 6 Band Class 7, or Band Class 10, the mobile station shall maintain an identifier of the  
 7 frequency block for each entry in SID\_NID\_LIST<sub>s</sub> (see 2.1.1.1 of [2]). When the mobile  
 8 station adds an entry to SID\_NID\_LIST<sub>s</sub>, the mobile station shall include the identifier for  
 9 the frequency block.

10 If the mobile station supports multiple band classes, the mobile station shall maintain an  
 11 identifier of the band class for each entry in SID\_NID\_LIST<sub>s</sub> (see 2.1.1.1 of [2]). When the  
 12 mobile station adds an entry to SID\_NID\_LIST<sub>s</sub>, the mobile station shall include the  
 13 identifier for the band class.

14 The mobile station shall maintain a SID/NID list entry timer for each entry in  
 15 SID\_NID\_LIST<sub>s</sub>. When an entry in SID\_NID\_LIST<sub>s</sub> is removed from the list, the  
 16 corresponding SID/NID list entry timer shall be disabled. The timer duration shall be as  
 17 determined from the stored value of ZONE\_TIMER<sub>s</sub> using Table 3.7.2.3.2.1-1. The mobile  
 18 station shall provide a means to examine each timer's value while the timer is active, so  
 19 that the age of list entries can be compared.

20 Whenever SID\_NID\_LIST<sub>s</sub> contains more than N<sub>10m</sub> entries, the mobile station shall delete  
 21 the excess entries according to the following rule:

- 22     • The mobile station shall delete those entries having active SID/NID list entry timers,  
 23       starting with the oldest entry, as determined by the timer values, and continuing in  
 24       order of decreasing age.

25 Whenever MULT\_SIDS<sub>s</sub> is equal to '0' and SID\_NID\_LIST contains entries with different  
 26 SIDs, the mobile station shall delete the excess entries according to the following rules:

- 27     • If the SID/NID entry timer for any entry is disabled, the mobile station shall delete  
 28       all entries not having the same SID as the entry whose timer is disabled;
- 29     • Otherwise, the mobile station shall delete all entries not having the same SID as the  
 30       newest entry in SID\_NID\_LIST, as determined by the timer values.

31 Whenever MULT\_NIDS<sub>s</sub> is equal to '0', and SID\_NID\_LIST contains more than one entry for  
 32 any SID, the mobile station shall delete the excess entries for each SID according to the  
 33 following rules:

- 34     • If the SID/NID entry timer for any entry is disabled, the mobile station shall delete  
 35       all entries for that SID except the entry whose timer is disabled;
- 36     • For all other SIDs, the mobile station shall delete all entries for each SID except the  
 37       newest entry, as determined by the timer values.

### 38     2.6.5.1.6 Parameter-Change Registration

39     Parameter-change registration is performed when a mobile station modifies any of the  
 40 following stored parameters:

- The preferred slot cycle index (SLOT\_CYCLE\_INDEX<sub>p</sub>)
- The station class mark (SCM<sub>p</sub>)
- The call termination enabled indicators (MOB\_TERM\_HOME<sub>p</sub>, MOB\_TERM\_FOR\_SID<sub>p</sub>, and MOB\_TERM\_FOR\_NID<sub>p</sub>)

Parameter-change registration is also performed when any of the following capabilities supported by the mobile station changes:

- The band classes
- The power classes
- The radio configurations
- The operating modes
- Transmit diversity (OTD or STS)
- Quick Paging Channel
- Spreading Rate 3 common channels support
- Encryption capability

Parameter-change registration is performed whenever there is no entry in the mobile station's SID\_NID\_LIST<sub>s</sub> that matches the base station's SID and NID.

Parameter-change registration is independent of the roaming status of the mobile station.<sup>14</sup>

Whenever a parameter changes, the mobile station shall delete all entries from SID\_NID\_LIST<sub>s</sub>.

#### 2.6.5.1.7 Ordered Registration

The base station can command the mobile station to register by sending a *Registration Request Order*. Ordered registration is performed in the *Mobile Station Order and Message Processing Operation* (2.6.2.4). Requirements are specified in 2.6.5.5.2.3.

#### 2.6.5.1.8 Implicit Registration

Whenever an *Origination Message* or *Page Response Message* is sent, the base station can infer the location of the mobile station. This is considered an implicit registration. Requirements are specified in 2.6.5.5.3.

#### 2.6.5.1.9 Traffic Channel Registration

While a mobile station is assigned a Traffic Channel, the mobile station is notified that it is registered through the *Mobile Station Registered Message*. Requirements are specified in 2.6.5.5.4.3.

<sup>14</sup> The indicator REG\_ENABLED does not govern parameter-change registration.

1    2.6.5.1.10 User Zone Registration

2    User Zone registration is performed when the mobile station selects an active User Zone  
3    (see 2.6.9.2.1).

4    [2.6.5.1.11 Encryption Re-sync Required Registration](#)

5    Encryption re-sync required registration is performed when the mobile station determines  
6    that it can not decrypt any message from the base station (see 2.3.12.4.1.3). This type of  
7    registration is needed for the mobile station to recover from any encryption out-of-sync  
8    scenario.

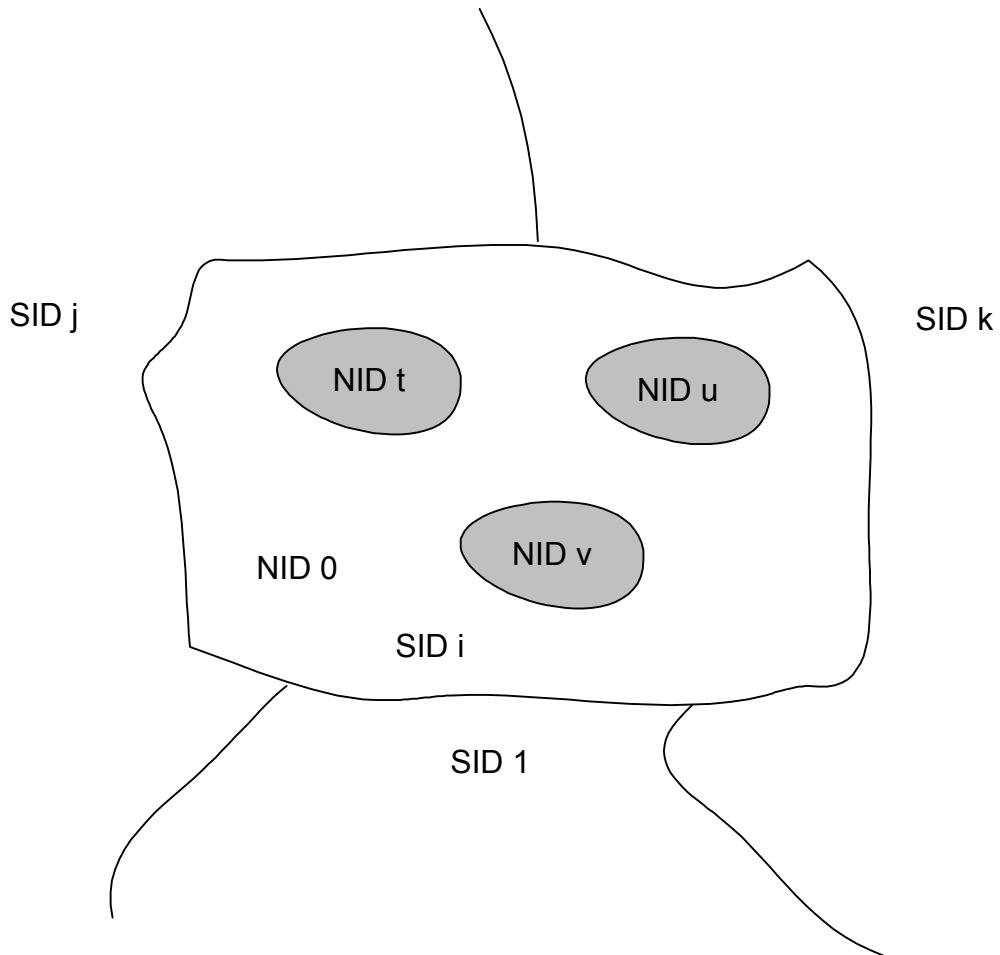

9    2.6.5.2 Systems and Networks

10   A base station is a member of a cellular or PCS system and a network. A network is a  
11   subset of a system.

12   Systems are labeled with an identification called the system identification or SID; networks  
13   within a system are given a network identification or NID. A network is uniquely identified  
14   by the pair (SID, NID). The SID number 0 is a reserved value. The NID number 0 is a  
15   reserved value indicating all base stations that are not included in a specific network. The  
16   NID number 65535 ( $2^{16}-1$ ) is a reserved value the mobile station may use for roaming  
17   status determination (see 2.6.5.3) to indicate that the mobile station considers the entire  
18   SID (regardless of NID) as home (non-roaming).

19   Figure 2.6.5.2-1 shows an example of systems and networks. SID i contains three  
20   networks labeled t, u, and v. A base station in system i that is not in one of these three  
21   networks is in NID 0.

22

**Figure 2.6.5.2-1. Systems and Networks Example**

### 2.6.5.3 Roaming

The mobile station has a list of one or more home (non-roaming) (SID, NID) pairs. A mobile station is roaming if the stored ( $SID_s$ ,  $NID_s$ ) pair (received in the *System Parameters Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary Broadcast Control Channel) does not match one of the mobile station's non-roaming (SID, NID) pairs. Two types of roaming are defined: A mobile station is a foreign NID roamer if the mobile station is roaming and there is some (SID, NID) pair in the mobile station's (SID, NID) list for which SID is equal to  $SID_s$ . A mobile station is a foreign SID roamer if there is no (SID, NID) pair in the mobile station's (SID, NID) list for which SID is equal to  $SID_s$ <sup>15</sup>.

<sup>15</sup> For example, suppose a mobile station has the following SID, NID list: (2, 3), (2, 0), (3, 1). If the base station (SID, NID) pair is (2, 3), then the mobile station is not roaming because the (SID, NID)

(footnote continued on next page)

1 The mobile station may use the special NID value 65535 to indicate that the mobile station  
 2 considers all NIDs within a SID to be non-roaming (i.e., that the mobile station is not  
 3 roaming when operating with any base station in that system).

4 The mobile station shall store three 1-bit parameters in its permanent memory (see 2.3.8).  
 5 These parameters are MOB\_TERM\_HOME<sub>p</sub>, MOB\_TERM\_FOR\_SID<sub>p</sub>, and MOB\_TERM-  
 6 \_FOR\_NID<sub>p</sub>. The mobile station shall set MOB\_TERM\_HOME<sub>p</sub> to '1' if the mobile station is  
 7 configured to receive mobile station terminated calls when using a home (SID, NID) pair;  
 8 otherwise, the mobile station shall set MOB\_TERM\_HOME<sub>p</sub> to '0'. The mobile station shall  
 9 set MOB\_TERM\_FOR\_SID<sub>p</sub> to '1' if the mobile station is configured to receive mobile station  
 10 terminated calls when it is a foreign SID roamer; otherwise MOB\_TERM\_FOR\_SID<sub>p</sub> shall be  
 11 set to '0'. The mobile station shall set MOB\_TERM\_FOR\_NID<sub>p</sub> to '1' if the mobile station is  
 12 configured to receive mobile station terminated calls when it is a foreign NID roamer;  
 13 otherwise the mobile station shall set MOB\_TERM\_FOR\_NID<sub>p</sub> to '0'.

14 The mobile station determines the registration status using these parameters and the  
 15 HOME\_REG, FOR\_NID\_REG, and FOR\_SID\_REG fields of the *System Parameters Message*  
 16 or *ANSI-41 System Parameters Message*.

17 The mobile station shall store a mobile station call termination enabled indicator,  
 18 MOB\_TERM<sub>s</sub>. The mobile station shall set MOB\_TERM<sub>s</sub> to YES if any of the following  
 19 conditions is met:

- 20 • The mobile station is not roaming, and MOB\_TERM\_HOME<sub>p</sub> is equal to '1'; or
- 21 • The mobile station is a foreign NID roamer and MOB\_TERM\_FOR\_NID<sub>p</sub> is equal to  
 22 '1'; or
- 23 • The mobile station is a foreign SID roamer and MOB\_TERM\_FOR\_SID<sub>p</sub> is equal to  
 24 '1'; otherwise the mobile station shall set MOB\_TERM<sub>s</sub> to NO.

25 The mobile station shall store a registration status indicator, REG\_ENABLED<sub>s</sub>. The mobile  
 26 station shall set the indicator REG\_ENABLED<sub>s</sub> to YES if any of the following conditions is  
 27 met for the mobile station:

- 28 • The mobile station is not roaming, and both HOME\_REG<sub>s</sub> and MOB\_TERM\_HOME<sub>p</sub>  
 29 are equal to '1'; or
- 30 • The mobile station is a foreign NID roamer and both FOR\_NID\_REG<sub>s</sub> and  
 31 MOB\_TERM\_FOR\_NID<sub>p</sub> are equal to '1'; or
- 32 • The mobile station is a foreign SID roamer and both FOR\_SID\_REG<sub>s</sub> and  
 33 MOB\_TERM\_FOR\_SID<sub>p</sub> are equal to '1'; otherwise the mobile station shall set  
 34 REG\_ENABLED<sub>s</sub> to NO.

---

pair is in the list. If the base station (SID, NID) pair is (2, 7), then the mobile station is a foreign NID roamer, because the SID 2 is in the list, but the (SID, NID) pair (2, 7) is not in the list. If the base station (SID, NID) pair is (4, 0), then the mobile station is a foreign SID roamer, because SID 4 is not in the list.

1 The mobile station performs autonomous registrations if REG\_ENABLED<sub>s</sub> is YES.

2 2.6.5.4 Registration Timers and Indicators

3 The mobile station shall provide the following registration timers:

- 4 • Power-up/initialization timer (see 2.6.5.1.1).
- 5 • Timer-based registration timer (see 2.6.5.1.3).
- 6 • Zone list entry timers (see 2.6.5.1.5).
- 7 • SID/NID list entry timers (see 2.6.5.1.5).

8 The mobile station shall provide a means of enabling and disabling each timer. When a  
9 timer is disabled, it shall not be considered expired. A timer that has been enabled is  
10 referred to as active.

11 2.6.5.5 Registration Procedures

12 2.6.5.5.1 Actions in the Mobile Station Initialization State

13 2.6.5.5.1.1 Power-Up or Change to a Different Operating Mode, Band Class, Serving  
14 System, or Frequency Block

15 Upon power-up, the mobile station shall perform the following actions:

- 16 • Delete all entries of ZONE\_LIST<sub>s</sub>.
- 17 • If ZONE\_LIST<sub>s-p</sub> contains an entry, copy the entry to ZONE\_LIST<sub>s</sub> and disable the  
18 corresponding entry timer.
- 19 • Delete all entries of SID\_NID\_LIST<sub>s</sub>.
- 20 • If SID\_NID\_LIST<sub>s-p</sub> contains an entry, copy the entry to SID\_NID\_LIST<sub>s</sub> and disable  
21 the corresponding entry timer.
- 22 • Set the registered flag (REGISTERED<sub>s</sub>) to NO.
- 23 • Set timer-based registration enable status (COUNTER\_ENABLED<sub>s</sub>) to NO.
- 24 • Set autonomous registration enable status (REG\_ENABLED<sub>s</sub>) to NO.
- 25 • Set RETURN\_CAUSE<sub>s</sub> to '0000'.
- 26 • Set ENC\_KEY<sub>s</sub> to NULL.
- 27 • Set D SIG ENCRYPT MODE<sub>s</sub> and C SIG ENCRYPT MODE<sub>s</sub> to '000'.

28 Upon switching from using CDMA in a different band class, from using CDMA in a different  
29 serving system in a band class that supports multiple serving systems (e.g., Band Class 0),  
30 from using CDMA in a different frequency block in a band class that supports frequency  
31 block allocations (e.g. Band Class 1, ~~Band Class 4~~), or from using the 800 MHz analog  
32 system, the mobile station shall perform the following actions:

- 33 • Set timer-based registration enable status (COUNTER\_ENABLED<sub>s</sub>) to NO.
- 34 • Set autonomous registration enable status (REG\_ENABLED<sub>s</sub>) to NO.

- 1     • Set RETURN\_CAUSE<sub>s</sub> to '0000'.
- 2     • Set the registered flag (REGISTERED<sub>s</sub>) to NO.
- 3     • Set ENC\_KEY<sub>s</sub> to NULL.

4     2.6.5.5.1.2 Timer Maintenance

5     While in the *Mobile Station Initialization State*, the mobile station shall update all active  
 6     registration timers (see 2.6.5.4). If any timer expires while in this state, the mobile station  
 7     shall preserve the expiration status so that further action can be taken in the *Mobile Station*  
 8     *Idle State*.

9     2.6.5.5.1.3 Entering the Mobile Station Idle State

10    Before entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the  
 11    mobile station shall perform the following action:

- 12    • If REGISTERED<sub>s</sub> is equal to NO, enable the power-up/initialization timer with an  
 13      expiration time of T57m seconds (see 2.6.5.1.1) only when the mobile station is  
 14      entering this state with a power-up indication.

15    2.6.5.5.2 Actions in the Mobile Station Idle State

16    Requirements in this section and its subsections apply only when the mobile station is in  
 17    the *Mobile Station Idle State*.

18    2.6.5.5.2.1 Idle Registration Procedures

19    These procedures are performed whenever the mobile station is in the *Mobile Station Idle*  
 20    *State* (see 2.6.2.1.3).

21    While in the *Mobile Station Idle State*, the mobile station shall update all active registration  
 22    timers (see 2.6.5.4).

23    If the power-up/initialization timer has expired or is disabled, the mobile station shall  
 24    perform the following actions in the order given. If any action necessitates a registration,  
 25    the mobile station shall enter the *Update Overhead Information Substate* of the *System*  
 26    *Access State* (see 2.6.3) with a registration indication.

- 27    1. The timer-based registration timer shall be enabled (COUNTER\_ENABLED<sub>s</sub> = YES)  
 28      and the timer count (REG\_COUNT<sub>s</sub>) shall be set to a pseudorandom number as  
 29      specified in 2.6.5.1.3, if the following conditions are met:
  - 30       a. COUNTER\_ENABLED<sub>s</sub> is equal to NO; and
  - 31       b. The stored configuration parameters are current (see 2.6.2.2); and
  - 32       c. REG\_ENABLED<sub>s</sub> is equal to YES; and
  - 33       d. REG\_PRD<sub>s</sub> is not equal to zero.
- 34    2. If any zone list entry timer (see 2.6.5.1.5) has expired, the mobile station shall delete  
 35      the corresponding entry from ZONE\_LIST<sub>s</sub>.

3. If any SID/NID list entry timer (see 2.6.5.1.5) has expired, the mobile station shall  
4. delete the corresponding entry from SID\_NID\_LIST<sub>S</sub>.
5. The mobile station shall perform power-up registration, as specified in 2.6.5.1.1, if  
6. all the following conditions are met:
  7. a. POWER\_UP\_REG<sub>S</sub> is equal to '1'; and
  8. b. The stored configuration parameters are current (see 2.6.2.2); and
  9. c. REGISTERED<sub>S</sub> is equal to NO, and
  10. d. REG\_ENABLED<sub>S</sub> is equal to YES.
11. The mobile station shall perform parameter-change registration (see 2.6.5.1.6) if all  
12. the following conditions are met:
  13. a. PARAMETER\_REG<sub>S</sub> is equal to '1'; and
  14. b. The stored configuration parameters are current (see 2.6.2.2); and
  15. c. There is no entry of SID\_NID\_LIST<sub>S</sub> whose SID and NID fields match the stored  
16. SID<sub>S</sub> and NID<sub>S</sub>.
17. The mobile station shall perform timer-based registration (see 2.6.5.1.3) if all the  
18. following conditions are met:
  19. a. COUNTER\_ENABLED<sub>S</sub> is equal to YES; and
  20. b. The stored configuration parameters are current (see 2.6.2.2); and
  21. c. REG\_ENABLED<sub>S</sub> is equal to YES; and
  22. d. REG\_COUNT<sub>S</sub> is greater than or equal to REG\_COUNT\_MAX<sub>S</sub>.
23. The mobile station shall perform distance-based registration (see 2.6.5.1.4) if all the  
24. following conditions are met:
  25. a. REG\_DIST<sub>S</sub> is not equal to zero; and
  26. b. The stored configuration parameters are current (see 2.6.2.2); and
  27. c. REG\_ENABLED<sub>S</sub> is equal to YES; and
  28. d. The current base station's distance from the base station in which the mobile  
29. station last registered (see 2.6.5.1.4) is greater than or equal to  
REG\_DIST\_REG<sub>S-p</sub>.
30. The mobile station shall perform zone-based registration (see 2.6.5.1.5) if all the  
31. following conditions are met:
  32. a. TOTAL\_ZONES<sub>S</sub> is not equal to zero; and
  33. b. The stored configuration parameters are current (see 2.6.2.2); and
  34. c. REG\_ENABLED<sub>S</sub> is equal to YES; and
  35. d. There is no entry of ZONE\_LIST<sub>S</sub> whose SID, NID and REG\_ZONE fields match  
the stored SID<sub>S</sub>, NID<sub>S</sub> and REG\_ZONE<sub>S</sub>.

1       9. The mobile station shall perform User Zone registration (see 2.6.2.5.1.10) if it selects  
 2       an active User Zone (see 2.6.9.1.2).

3       10. The mobile station shall perform encryption re-sync required registration (see  
 4       2.6.5.1.11) if all the following conditions are met:

- 5        a. REG\_ENCRYPT RESYNC is equal to YES; and  
 6        b. None of the above registrations have been performed since the last entering of  
 7        the Mobile Station Idle State.

8       2.6.5.5.2.2 Processing the Registration Fields of the System Parameters Message and ANSI-  
 9       41 System Parameters Message

10      When the mobile station processes the *System Parameters Message* or *ANSI-41 System  
 11     Parameters Message*, it shall perform the following actions:

- 12     1. If REG\_PRD<sub>s</sub> is equal to zero, the mobile station shall set COUNTER\_ENABLED<sub>s</sub> to  
 13       NO.
- 14     2. If REG\_PRD<sub>s</sub> is not equal to zero, the mobile station shall set REG\_COUNT\_MAX<sub>s</sub> as  
 15       specified in 2.6.5.1.3.
- 16     3. The mobile station shall update its roaming status and set REG\_ENABLED<sub>s</sub> as  
 17       specified in 2.6.5.3.
- 18     4. If ZONE\_LIST<sub>s</sub> contains more than TOTAL\_ZONES<sub>s</sub> entries, the mobile station shall  
 19       delete the excess entries according to the rules specified in 2.6.5.1.5.
- 20     5. If MULT\_SIDS<sub>s</sub> is equal to '0' and SID\_NID\_LIST contains entries with different  
 21       SIDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 22     6. If MULT\_NIDS<sub>s</sub> is equal to '0' and SID\_NID\_LIST contains more than one entry for  
 23       any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.

24       2.6.5.5.2.3 Ordered Registration

25      Ordered registration is performed after receiving a *Registration Request Order* while in the  
 26     *Mobile Station Order and Message Processing Operation* (see 2.6.2.4).

27      The mobile station shall enter the *Update Overhead Information Substate* of the *System  
 28     Access State* with a registration indication within T<sub>33m</sub> seconds after the *Registration  
 29     Request Order* is received.

30       2.6.5.5.2.4 Power Off

31      These procedures are performed when the mobile station is directed by the user to power  
 32       off.

33      The mobile station shall perform the following actions:

- 34       • If an entry of ZONE\_LIST<sub>s</sub> does not have an active timer, copy that entry to  
 35       ZONE\_LIST<sub>s-p</sub>; otherwise, delete any entry in ZONE\_LIST<sub>s-p</sub>.

- 1     • If an entry of SID\_NID\_LIST<sub>s</sub> does not have an active timer, copy that entry to  
 2       SID\_NID\_LIST<sub>s-p</sub>; otherwise, delete any entry in SID\_NID\_LIST<sub>s-p</sub>.

3     The mobile station shall perform power-down registration (see 2.6.5.1.2) by entering the  
 4       *System Access State* with a registration indication within T<sub>33m</sub> seconds after the user  
 5       directs the mobile station to power off, if all the following conditions are true:

- 6       • REG\_ENABLED<sub>s</sub> equals YES; and  
 7       • POWER\_DOWN\_REG<sub>s</sub> equals ‘1’; and  
 8       • There is an entry of SID\_NID\_LIST<sub>s</sub> for which the SID and NID fields are equal to  
 9         SID<sub>s</sub> and NID<sub>s</sub>; and  
 10      • The power-up/initialization timer (see 2.6.5.1.1) is disabled or has expired.

11     2.6.5.2.5 Full-TMSI Timer Expiration

12     When the mobile station sets all the bits of TMSI\_CODE<sub>s-p</sub> to ‘1’ upon expiration of the full-  
 13       TMSI timer (see 2.6.2), the mobile station shall delete all entries from SID\_NID\_LIST<sub>s</sub> and  
 14       ZONE\_LIST<sub>s</sub>.

15     2.6.5.3 Actions in the System Access State

16     Requirements in this section and its subsections apply only when the mobile station is in  
 17       the *System Access State*.

18     2.6.5.3.1 Successful Access, Registration, or Implicit Registration

19     These procedures shall be performed after the mobile station receives confirmation of  
 20       delivery of a *Registration Message*, *Origination Message*, or *Page Response Message* sent on  
 21       the r-csch (see 2.6.3.1.2).

- 22       • Disable the power-up/initialization timer (see 2.6.5.1.1).
- 23       • If the mobile station supports the 800 MHz analog mode, set the First-Idle ID status  
 24         to enabled (see [2.6.3.11\[6\]](#)).
- 25       • Set DIGITAL\_REG<sub>s-p</sub> to ‘00000001’.
- 26       • Set REG\_COUNT<sub>s</sub> to zero.
- 27       • Set REGISTERED<sub>s</sub> to YES.
- 28       • Delete all entries from ZONE\_LIST<sub>s</sub> belonging to a different band class (see 2.1.1.1 of  
 29         [2]) than CDMABAND<sub>s</sub>.
- 30       • If CDMABAND<sub>s</sub> = ‘00000’ or CDMABAND<sub>s</sub> = ‘00011’, delete all entries from  
 31         ZONE\_LIST<sub>s</sub> that have a SID from a different serving system than SERVSYS<sub>s</sub>.
- 32       • If CDMABAND<sub>s</sub> = ‘00001’, CDMABAND<sub>s</sub> = ‘00010’, CDMABAND<sub>s</sub> = ‘00100’,  
 33         CDMABAND<sub>s</sub> = ‘00101’, ~~or~~-CDMABAND<sub>s</sub> = ‘00111’, or CDMABAND<sub>s</sub> = ‘01010’, delete  
 34         all entries from ZONE\_LIST<sub>s</sub> belonging to a different frequency block (see 2.1.1.1 of  
 35         [2]) than the frequency block associated with SID<sub>s</sub>.

- 1     • Add REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub> to ZONE\_LIST<sub>S</sub> if not already in the list. If  
2         required, include the band class identifier and block identifier for the current band  
3         and frequency block as specified in 2.6.5.1.5.
- 4     • Disable the zone list entry timer for the entry of ZONE\_LIST<sub>S</sub> containing  
5         REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub>. For any other entry of ZONE\_LIST<sub>S</sub> whose entry timer  
6         is not active, enable the entry timer with the duration specified by ZONE\_TIMER<sub>S</sub>  
7         (see 2.6.5.1.5).
- 8     • If ZONE\_LIST<sub>S</sub> contains more than TOTAL\_ZONES<sub>S</sub> entries, delete the excess entries  
9         according to the rules specified in 2.6.5.1.5.
- 10    • Delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different band class (see  
11         2.1.1.1 of [2]) than CDMABAND<sub>S</sub>
- 12    • If CDMABAND<sub>S</sub> = '00000' or CDMABAND<sub>S</sub> = '00011', delete all entries from  
13         SID\_NID\_LIST<sub>S</sub> that have a SID from a different serving system than SERVSYS<sub>S</sub>.
- 14    • If CDMABAND<sub>S</sub> = '00001', CDMABAND<sub>S</sub> = '00010', CDMABAND<sub>S</sub> = '00100',  
15         CDMABAND<sub>S</sub> = '00101', ~~or~~ CDMABAND<sub>S</sub> = '00111', or CDMABAND<sub>S</sub> = '01010', delete  
16         all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different frequency block (see 2.1.1.1  
17         of [2]) than the frequency block associated with SID<sub>S</sub>.
- 18    • Add SID<sub>S</sub> and NID<sub>S</sub> to SID\_NID\_LIST<sub>S</sub> if not already in the list. If required, include  
19         the band class identifier and block identifier for the current band and frequency  
20         block as specified in 2.6.5.1.5.
- 21    • Disable the SID/NID list entry timer for the entry of SID\_NID\_LIST<sub>S</sub> containing SID<sub>S</sub>  
22         and NID<sub>S</sub>. For any other entry of SID\_NID\_LIST<sub>S</sub> whose entry timer is not active,  
23         enable the entry timer with the duration specified in 2.6.5.1.5.
- 24    • If SID\_NID\_LIST<sub>S</sub> contains more than N<sub>10m</sub> entries, delete the excess entries  
25         according to the rules specified in 2.6.5.1.5.
- 26    • If MULT\_SIDS<sub>S</sub> is equal to '0' and SID\_NID\_LIST contains entries with different  
27         IDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 28    • If MULT\_NIDS<sub>S</sub> is equal to '0' and SID\_NID\_LIST contains more than one entry for  
29         any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 30    • Set the stored location of last registration (BASE\_LAT\_REG<sub>S-p</sub> and BASE\_LONG-  
31         \_REG<sub>S-p</sub>) to the current base station's location (BASE\_LAT<sub>S</sub> and BASE\_LONG<sub>S</sub>). Set  
32         the stored registration distance (REG\_DIST\_REG<sub>S-p</sub>) to the current base station's  
33         registration distance (REG\_DIST<sub>S</sub>).
- 34    • Set REG\_ENCRYPT RESYNC to NO.

35 These procedures shall be performed after the mobile station receives confirmation of  
36 delivery of any other message:

- 37     • If the mobile station supports the 800 MHz analog mode, set the First-Idle ID status  
38         to enabled (see [2.6.3.11\[6\]](#)).
- 39     • Set DIGITAL\_REG<sub>S-p</sub> to '00000001'.

- Delete all entries from ZONE\_LIST<sub>S</sub> belonging to a different band class (see 2.1.1.1 of [2]) than CDMABAND<sub>S</sub>.
- If CDMABAND<sub>S</sub> = '00000' or CDMABAND<sub>S</sub> = '00011', delete from ZONE\_LIST<sub>S</sub> all entries from ZONE\_LIST<sub>S</sub> that have a SID from a different serving system than SERVSYSS<sub>S</sub>.
- If CDMABAND<sub>S</sub> = '00001', CDMABAND<sub>S</sub> = '00010', CDMABAND<sub>S</sub> = '00100', CDMABAND<sub>S</sub> = '00101', ~~or~~-CDMABAND<sub>S</sub> = '00111', or CDMABAND<sub>S</sub> = '01010', delete all entries from ZONE\_LIST<sub>S</sub> belonging to a different frequency block (see 2.1.1.1 of [2]) than the frequency block associated with SID<sub>S</sub>.
- For any entry of ZONE\_LIST<sub>S</sub> not matching REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub> and not having an active entry timer, enable the entry timer with the duration specified by ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).
- Delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different band class (see 2.1.1.1 of [2]) than CDMABAND<sub>S</sub>.
- If CDMABAND<sub>S</sub> = '00000' or CDMABAND<sub>S</sub> = '00011', delete from SID\_NID\_LIST<sub>S</sub> all entries from SID\_NID\_LIST<sub>S</sub> that have a SID from a different serving system than SERVSYSS<sub>S</sub>.
- If CDMABAND<sub>S</sub> = '00001', CDMABAND<sub>S</sub> = '00010', CDMABAND<sub>S</sub> = '00100', CDMABAND<sub>S</sub> = '00101', ~~or~~-CDMABAND<sub>S</sub> = '00111', or CDMABAND<sub>S</sub> = '01010', delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different frequency block (see 2.1.1.1 of [2]) than the frequency block associated with SID<sub>S</sub>.
- For any entry of SID\_NID\_LIST<sub>S</sub> not matching SID<sub>S</sub> and NID<sub>S</sub> and not having an active entry timer, enable the entry timer with the duration specified by ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).

#### 2.6.5.3.2 Unsuccessful Access

These procedures are performed when the mobile station declares an access attempt failure when in the *System Access State* (see 2.6.3).

The mobile station shall perform the following actions:

- If the mobile station supports the 800 MHz analog mode, set the First-Idle ID status to enabled (see [2.6.3.11\[6\]](#)).
- Set DIGITAL\_REG<sub>S-p</sub> to '00000001'.
- Delete all entries from ZONE\_LIST<sub>S</sub> belonging to a different band class (see 2.1.1.1 of [2]) than CDMABAND<sub>S</sub>.
- If CDMABAND<sub>S</sub> = '00000' or CDMABAND<sub>S</sub> = '00011', delete from ZONE\_LIST<sub>S</sub> all entries from ZONE\_LIST<sub>S</sub> that have a SID from a different serving system than SERVSYSS<sub>S</sub>.

- If  $\text{CDMABAND}_S = '00001'$ ,  $\text{CDMABAND}_S = '00010'$ ,  $\text{CDMABAND}_S = '00100'$ ,  $\text{CDMABAND}_S = '00101'$ , ~~or~~ $\text{CDMABAND}_S = '00111'$ , or  $\text{CDMABAND}_S = '01010'$ , delete all entries from  $\text{ZONE\_LIST}_S$  belonging to a different frequency block (see 2.1.1.1 of [2]) than the frequency block associated with  $\text{SID}_S$ .
- For any entry of  $\text{ZONE\_LIST}_S$  not matching  $\text{REG\_ZONE}_S$ ,  $\text{SID}_S$ , and  $\text{NID}_S$  and not having an active entry timer, enable the entry timer with the duration specified by  $\text{ZONE\_TIMER}_S$  (see 2.6.5.1.5).
- Delete all entries from  $\text{SID\_NID\_LIST}_S$  belonging to a different band class (see 2.1.1.1 of [2]) than  $\text{CDMABAND}_S$ .
- If  $\text{CDMABAND}_S = '00000'$  or  $\text{CDMABAND}_S = '00011'$ , delete from  $\text{SID\_NID\_LIST}_S$  all entries from  $\text{SID\_NID\_LIST}_S$  that have a SID from a different serving system than  $\text{SERVSYS}_S$ .
- If  $\text{CDMABAND}_S = '00001'$ ,  $\text{CDMABAND}_S = '00010'$ ,  $\text{CDMABAND}_S = '00100'$ ,  $\text{CDMABAND}_S = '00101'$ , ~~or~~ $\text{CDMABAND}_S = '00111'$ , or  $\text{CDMABAND}_S = '01010'$ , delete all entries from  $\text{SID\_NID\_LIST}_S$  belonging to a different frequency block (see 2.1.1.1 of [2]) than the frequency block associated with  $\text{SID}_S$ .
- For any entry of  $\text{SID\_NID\_LIST}_S$  not matching  $\text{SID}_S$  and  $\text{NID}_S$  and not having an active entry timer, enable the entry timer with the duration specified by  $\text{ZONE\_TIMER}_S$  (see 2.6.5.1.5).

#### 2.6.5.3.3 Power Off

These procedures are performed when the mobile station is directed by the user to power off.

The mobile station shall perform the following actions:

- If an entry of  $\text{ZONE\_LIST}_S$  does not have an active timer, copy that entry to  $\text{ZONE\_LIST}_{S-p}$ ; otherwise, delete any entry in  $\text{ZONE\_LIST}_{S-p}$ .
- If an entry of  $\text{SID\_NID\_LIST}_S$  does not have an active timer, copy that entry to  $\text{SID\_NID\_LIST}_{S-p}$ ; otherwise, delete any entry in  $\text{SID\_NID\_LIST}_{S-p}$ .

#### 2.6.5.4 Actions in the Mobile Station Control on the Traffic Channel State

Requirements in this section and its subsections apply only when the mobile station is in the *Mobile Station Control on the Traffic Channel State*.

##### 2.6.5.4.1 Traffic Channel Initialization

Upon entering the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*, the mobile station shall set  $\text{COUNTER\_ENABLED}_S$  to NO.

##### 2.6.5.4.2 Timer Maintenance

While in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall update all active registration timers.

1 If a zone list entry timer expires, the mobile station shall delete the corresponding entry  
 2 from ZONE\_LIST<sub>s</sub>. If a SID/NID list entry timer expires, the mobile station shall delete the  
 3 corresponding entry from SID\_NID\_LIST<sub>s</sub>.

4 2.6.5.5.4.3 Processing the Mobile Station Registered Message

5 The mobile station receives the *Mobile Station Registered Message* on the Forward Traffic  
 6 Channel when the mobile station is considered registered for the base station whose  
 7 location and other parameters are included in the message.

8 The mobile station shall store the following parameters:

- 9 • System identification ( $SID_s = SID_r$ )
- 10 • Network identification ( $NID_s = NID_r$ )
- 11 • Registration zone ( $REG\_ZONE_s = REG\_ZONE_r$ )
- 12 • Number of registration zones to be retained ( $TOTAL\_ZONES_s = TOTAL\_ZONES_r$ )
- 13 • Zone timer length ( $ZONE\_TIMER_s = ZONE\_TIMER_r$ )
- 14 • Multiple SID storage indicator ( $MULT\_SIDS_s = MULT\_SIDS_r$ )
- 15 • Multiple NID storage indicator ( $MULT\_NIDS_s = MULT\_NIDS_r$ )
- 16 • Base station latitude ( $BASE\_LAT_s = BASE\_LAT_r$ )
- 17 • Base station longitude ( $BASE\_LONG_s = BASE\_LONG_r$ )
- 18 • Registration distance ( $REG\_DIST_s = REG\_DIST_r$ )

19 The mobile station shall perform the following actions:

- 20 • If the mobile station supports the 800 MHz analog mode, set the First-Idle ID status  
     to enabled (see [6]).
- 21 • Set DIGITAL\_REG<sub>s-p</sub> to '00000001'.
- 22 • Add REG\_ZONE<sub>s</sub>, SID<sub>s</sub>, and NID<sub>s</sub> to ZONE\_LIST<sub>s</sub> if not already in the list. If  
     required, include the band class identifier and block identifier for the current band  
     and frequency block as specified in 2.6.5.1.5.
- 23 • Delete all entries from ZONE\_LIST<sub>s</sub> belonging to a different band class (see 2.1.1.1 of  
     [2]) than CDMABAND<sub>s</sub>.
- 24 • Disable the zone list entry timer for the entry of ZONE\_LIST<sub>s</sub> containing  
     REG\_ZONE<sub>s</sub>, SID<sub>s</sub>, and NID<sub>s</sub>. For any other entry of ZONE\_LIST<sub>s</sub> whose entry timer  
     is not active, enable the entry timer with the duration specified by ZONE\_TIMER<sub>s</sub>  
     (see 2.6.5.1.5).
- 25 • If ZONE\_LIST<sub>s</sub> contains more than TOTAL\_ZONES<sub>s</sub> entries, delete the excess entries  
     according to the rules specified in 2.6.5.1.5.
- 26 • Delete all entries from SID\_NID\_LIST<sub>s</sub> belonging to a different band class (see [2])  
     than CDMABAND<sub>s</sub>.

- 1     • Add SID<sub>s</sub> and NID<sub>s</sub> to SID\_NID\_LIST<sub>s</sub> if not already in the list. If required, include  
2       the band class identifier and block identifier for the current band and frequency  
3       block as specified in 2.6.5.1.5.
- 4     • Disable the SID/NID list entry timer for the entry of SID\_NID\_LIST<sub>s</sub> containing SID<sub>s</sub>,  
5       and NID<sub>s</sub>. For any other entry of SID\_NID\_LIST<sub>s</sub> whose entry timer is not active,  
6       enable the entry timer with the duration specified in 2.6.5.1.5.
- 7     • If SID\_NID\_LIST<sub>s</sub> contains more than N<sub>10m</sub> entries, delete the excess entries  
8       according to the rules specified in 2.6.5.1.5.
- 9     • If MULT\_SIDS<sub>s</sub> is equal to '0' and SID\_NID\_LIST contains entries with different  
10      IDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 11    • If MULT\_NIDS<sub>s</sub> is equal to '0' and SID\_NID\_LIST contains more than one entry for  
12      any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 13    • Set the stored location of last registration (BASE\_LAT\_REG<sub>s-p</sub> and BASE\_LONG-  
14      \_REG<sub>s-p</sub>) to the base station's location (BASE\_LAT<sub>s</sub> and BASE\_LONG<sub>s</sub>). Set the  
15      stored registration distance (REG\_DIST\_REG<sub>s-p</sub>) to the base station's registration  
16      distance (REG\_DIST<sub>s</sub>).
- 17    • Update its roaming status and set MOB\_TERM<sub>s</sub> as specified in 2.6.5.3. The mobile  
18      station should indicate to the user whether the mobile station is roaming.

#### 19    2.6.5.4.4 Power Off

20   These procedures are performed when the mobile station is directed by the user to power  
21   off.

22   The mobile station shall perform the following actions:

- 23    • If an entry of ZONE\_LIST<sub>s</sub> does not have an active timer, copy that entry to  
24      ZONE\_LIST<sub>s-p</sub>; otherwise, delete the entry in ZONE\_LIST<sub>s-p</sub> if ZONE\_LIST<sub>s-p</sub>  
25      contains an entry.
- 26    • If an entry of SID\_NID\_LIST<sub>s</sub> does not have an active timer, copy that entry to  
27      SID\_NID\_LIST<sub>s-p</sub>; otherwise, delete the entry in SID\_NID\_LIST<sub>s-p</sub> if SID\_NID\_LIST<sub>s-p</sub>  
28      contains an entry.

### 29   2.6.6 Handoff Procedures

30   This section presents an overview and mobile station requirements for handoffs occurring  
31   while the mobile station is in the *Mobile Station Control on the Traffic Channel State* (see  
32   2.6.4). Mobile station requirements for handoffs occurring while the mobile station is in the  
33   *Mobile Station Idle State* are specified in 2.6.2.1.4.

#### 34   2.6.6.1 Overview

##### 35   2.6.6.1.1 Types of Handoff

36   The mobile station supports the following three handoff procedures while in the *Mobile*  
37   *Station Control on the Traffic Channel State*:

- *Soft Handoff:* A handoff in which the mobile station commences communications with a new base station without interrupting communications with the old base station. Soft handoff can only be used between CDMA Channels having identical Frequency Assignments. Soft handoff provides diversity of Forward Traffic Channels and Reverse Traffic Channel paths on the boundaries between base stations.
- *CDMA-to-CDMA Hard Handoff:* A handoff in which the mobile station is transitioned between disjoint sets of base stations, different band classes, different Frequency Assignments, or different frame offsets.
- *CDMA-to-Analog Handoff:* A handoff in which the mobile station is directed from a CDMA traffic channel to an analog voice channel.

The mobile station shall support soft handoffs on the same Frequency Assignment (see 2.6.6.2.7). The mobile station shall support CDMA-to-CDMA hard handoffs between band classes on which it supports CDMA operation (see 2.6.6.2.8). The mobile station shall support CDMA-to-Analog handoffs from band classes on which it supports CDMA operation to band classes on which it supports analog operation (see 2.6.6.2.9).

#### 2.6.6.1.2 Pilot Sets

Within section 2.6.6 the term pilot refers to a Pilot Channel identified by a pilot sequence offset (see 3.1.3.2.1 of [2]), a Walsh function or a quasi-orthogonal function (see 3.1.3.2.2 of [2]), and a Frequency Assignment (see 2.1.1.1 of [2]). A pilot is associated with the Forward Traffic Channels in the same Forward CDMA Channel. All pilots in a pilot set have the same CDMA Frequency Assignment.

The mobile station searches for pilots on the current CDMA Frequency Assignment to detect the presence of CDMA Channels and to measure their strengths. When the mobile station detects a pilot of sufficient strength that is not associated with any of the Forward Traffic Channels assigned to it, it sends a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* to the base station. The base station can then assign a Forward Traffic Channel associated with that pilot to the mobile station and direct the mobile station to perform a handoff.

The pilot search parameters and the rules for *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* transmission are expressed in terms of the following sets of pilots:

- *Active Set:* The pilots associated with the Forward Traffic Channels assigned to the mobile station.
- *Candidate Set:* The pilots that are not currently in the Active Set but have been received by the mobile station with sufficient strength to indicate that the associated Forward Traffic Channels could be successfully demodulated.
- *Neighbor Set:* The pilots that are not currently in the Active Set or the Candidate Set and are likely candidates for handoff.

- *Remaining Set:* The set of all possible pilots in the current system on the current CDMA Frequency Assignment, excluding the pilots in the Neighbor Set, the Candidate Set, and the Active Set. This set of possible pilots consists of pilots whose pilot PN sequence offset indices are integer multiples of PILOT\_INC<sub>S</sub>.

The base station may direct the mobile station to search for pilots on a different CDMA frequency to detect the presence of CDMA Channels and to measure their strengths. The mobile station reports the results of the search to the base station using the *Candidate Frequency Search Report Message*. Depending upon the pilot strength measurements reported in the *Candidate Frequency Search Report Message*, the base station can direct the mobile station to perform an inter-frequency hard handoff.

The pilot search parameters are expressed in terms of the following sets of pilots on the CDMA Candidate Frequency:

- *Candidate Frequency Neighbor Set:* A list of pilots on the CDMA Candidate Frequency.
- *Candidate Frequency Search Set:* A subset of the Candidate Frequency Neighbor Set that the base station may direct the mobile station to search.

#### 2.6.6.2 Requirements

##### 2.6.6.2.1 Pilot Search

For the pilot sets defined in 2.6.6.1.2, the base station sets the search window (range of PN offsets) in which the mobile station is to search for usable multipath components (i.e., multipath components that the mobile station can use for demodulation of the associated Forward Traffic Channel) of the pilots in the set.

Search performance criteria are defined in [11].

This search shall be governed by the following:

- *Active Set and Candidate Set:* The search procedures for pilots in the Active Set and Candidate Set shall be identical. The search window size<sup>16</sup> for each pilot in the Active Set and Candidate Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH\_WIN\_A<sub>S</sub>. The mobile station should center the search window for each pilot of the Active Set and Candidate Set around the earliest arriving usable multipath component of the pilot. If the mobile station receives a value greater than or equal to 13 for SRCH\_WIN\_A<sub>R</sub>, it may store and use the value 13 in SRCH\_WIN\_A<sub>S</sub>.

---

<sup>16</sup> The table defines the entire search range. For example, SRCH\_WIN\_A<sub>S</sub> = 6 corresponds to a 28 PN chip search window or  $\pm 14$  PN chips around the search window center.

1

**Table 2.6.6.2.1-1. Searcher Window Sizes**

| <b>SRCH_WIN_A</b><br><b>SRCH_WIN_N</b><br><b>SRCH_WIN_NGHBR</b><br><b>SRCH_WIN_R</b><br><b>CF_SRCH_WIN_N</b> | <b>window_size</b><br>(PN chips) | <b>SRCH_WIN_A</b><br><b>SRCH_WIN_N</b><br><b>SRCH_WIN_NGHBR</b><br><b>SRCH_WIN_R</b><br><b>CF_SRCH_WIN_N</b> | <b>window_size</b><br>(PN chips) |
|--------------------------------------------------------------------------------------------------------------|----------------------------------|--------------------------------------------------------------------------------------------------------------|----------------------------------|
| 0                                                                                                            | 4                                | 8                                                                                                            | 60                               |
| 1                                                                                                            | 6                                | 9                                                                                                            | 80                               |
| 2                                                                                                            | 8                                | 10                                                                                                           | 100                              |
| 3                                                                                                            | 10                               | 11                                                                                                           | 130                              |
| 4                                                                                                            | 14                               | 12                                                                                                           | 160                              |
| 5                                                                                                            | 20                               | 13                                                                                                           | 226                              |
| 6                                                                                                            | 28                               | 14                                                                                                           | 320                              |
| 7                                                                                                            | 40                               | 15                                                                                                           | 452                              |

| 6                                                       | $-3 \times \text{window\_size} / 2$ |
| 7                                                       | Reserved                            |

4

- *Neighbor Set:* If SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> is equal to ‘1’, the search window size for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1, corresponding to SRCH\_WIN\_NGHBR<sub>S</sub> associated with the pilot being searched. If SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> is equal to ‘0’, the search window size for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH\_WIN\_N<sub>S</sub>. If SRCH\_OFFSET\_INCL<sub>S</sub> is equal to ‘1’, the search window offset for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-2, corresponding to SRCH\_OFFSET\_NGHBR<sub>S</sub> associated with the pilot being searched. If SRCH\_OFFSET\_INCL<sub>S</sub> is equal to ‘0’, the search window offset for each pilot in the Neighbor Set shall be zero PN chip. The mobile station should center the search window for each pilot in the Neighbor Set around the pilot’s PN sequence offset plus the corresponding search window offset, using timing defined by the mobile station’s time reference (see [2]). If SEARCH\_PRIORITY\_INCL<sub>S</sub> is equal to ‘1’, the mobile station should use SEARCH\_PRIORITY<sub>S</sub> for the corresponding pilot to schedule its neighbor search. If the mobile station supports hopping pilot beacons and the TIMING\_INCL field of the NGHBR\_REC for the corresponding pilot is equal to ‘1’, then the mobile station shall use the information included in the NGHBR\_TX\_OFFSET, NGHBR\_TX\_DURATION, and NGHBR\_TX\_PERIOD fields of the NGHBR\_REC for the corresponding pilot to schedule the time for searching the neighbor. If ADD\_PILOT\_REC\_INCL field of the NGHBR\_REC for the corresponding pilot is equal to ‘1’, the mobile station shall use the information included in the NGHBR\_PILOT\_REC field for searching the neighbor.
- *Remaining Set:* The search window size for each pilot in the Remaining Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH\_WIN\_R<sub>S</sub>. The mobile station should center the search window for each pilot in the Remaining Set around the pilot’s PN sequence offset, using timing defined by the mobile station’s time reference (see [2]). The mobile station should only search for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer multiples of PILOT\_INC<sub>S</sub>.

- *Candidate Frequency Search Set:* If CF\_SRCH\_WIN\_NGHBR<sub>N</sub>\_INCL<sub>S</sub> is equal to ‘1’, the search window size for each pilot in the Candidate Frequency Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-1, corresponding to SRCH\_WIN\_NGHBR<sub>S</sub> associated with the pilot being searched. If CF\_SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> is equal to ‘0’, the search window size for each pilot in the Candidate Frequency Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to CF\_SRCH\_WIN\_N<sub>S</sub>. If CF\_SRCH\_OFFSET\_INCL<sub>S</sub> is equal to ‘1’, the search window offset for each pilot in the Candidate Frequency Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-2, corresponding to SRCH\_OFFSET\_NGHBR<sub>S</sub> associated with the pilot being searched. If CF\_SRCH\_OFFSET\_INCL<sub>S</sub> is equal to ‘0’, the search window offset for each pilot in the Candidate Frequency Search Set shall be zero PN chips. The mobile station should center the search window for each pilot in the Candidate Frequency Search Set around the pilot’s PN sequence offset plus the corresponding search window offset using timing defined by the mobile station’s time reference (see [2]). If CF\_SEARCH\_PRIORITY\_INCL<sub>S</sub> is equal to ‘1’, the mobile station should use SEARCH\_PRIORITY<sub>S</sub> associated with each pilot to schedule a search of its Candidate Frequency Search Set.

## 2.6.6.2.2 Pilot Strength Measurements

The mobile station assists the base station in the handoff process and in the Reverse Supplemental Code Channel operation and in the Reverse Supplemental Channel operation by measuring and reporting the strengths of received pilots.

For an SR1 pilot, the mobile station should use the searcher element (see [2]) to compute the strength of a pilot (PS) by adding the ratios of received pilot energy per chip, E<sub>c</sub>, to total received spectral density (noise and signals), I<sub>o</sub>, of at most k usable multipath components, where k is the number of demodulating elements (see [2]) supported by the mobile station.

For an SR3 pilot, the pilot strength is given by

$$\frac{1}{3} \times \left( \left( \frac{E_c}{I_o} \right)_{\text{Primary}} + \frac{\left( \frac{E_c}{I_o} \right)_1}{\Delta_1} + \frac{\left( \frac{E_c}{I_o} \right)_2}{\Delta_2} \right)$$

where:

-  $\left( \frac{E_c}{I_o} \right)_{\text{Primary}}$  is the pilot Ec/Io measured on the Primary carrier (computed as specified above for SR1 pilots),

-  $\left( \frac{E_c}{I_o} \right)_1$  is the pilot Ec/Io measured on the pilot on the lower frequency of the two remaining SR3 frequencies (computed as specified above for SR1 pilots), and  $\Delta_1$  is

1 the pilot power level on the lower frequency of the two remaining SR3 frequencies  
 2 relative to that of the primary SR3 pilot, i.e.  $\Delta_1 = \frac{E_c}{I_o}^{(-SR3\_PILOT\_POWER1/10)}$ .

- 3 -  $\left( \frac{E_c}{I_o} \right)_2$  is the pilot Ec/Io measured on the pilot on the higher frequency of the two  
 4 remaining SR3 frequencies (computed as specified above for SR1 pilots), and  $\Delta_2$  is  
 5 the pilot power level on the higher frequency of the two remaining SR3 frequencies  
 6 relative to that of the primary SR3 pilot, i.e.  $\Delta_2 = \frac{E_c}{I_o}^{(-SR3\_PILOT\_POWER2/10)}$ .

7 2.6.6.2.3 Handoff Drop Timer

8 The mobile station shall maintain a handoff drop timer for each pilot in the Active Set and  
 9 Candidate Set.

10 If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three or SOFT\_SLOPE<sub>s</sub> is equal to '000000', the  
 11 mobile station shall perform the following:

- 12 • For the Candidate Set, the mobile station shall start the timer whenever the  
 13 strength of the corresponding pilot becomes less than T\_DROP<sub>s</sub>. The mobile station  
 14 shall reset and disable the timer if the strength of the corresponding pilot exceeds  
 15 T\_DROP<sub>s</sub>.
- 16 • For the Active Set, the mobile station shall start the timer whenever the strength of  
 17 the corresponding pilot becomes less than T\_DROP<sub>s</sub>. The mobile station shall start  
 18 the timer even if the timer has previously expired. The mobile station shall reset  
 19 and disable the timer if the strength of the corresponding pilot exceeds T\_DROP<sub>s</sub>.

20 If P\_REV\_IN\_USE<sub>s</sub> is greater than three and SOFT\_SLOPE<sub>s</sub> is not equal to '000000', the  
 21 mobile station shall perform the following:

- 22 • For the Candidate Set, the mobile station shall start the timer whenever the  
 23 strength of the corresponding pilot becomes less than T\_DROP<sub>s</sub>. The mobile station  
 24 shall reset and disable the timer if the strength of the corresponding pilot exceeds  
 25 T\_DROP<sub>s</sub>.
- 26 • For the Active Set, the mobile station shall sort the N<sub>A</sub> pilots in the Active Set in  
 27 order of increasing strengths, i.e., PS<sub>1</sub> < PS<sub>2</sub> < PS<sub>3</sub> < ... < PS<sub>N<sub>A</sub></sub> where the strength  
 28 PS is as defined in 2.6.6.2.2. The mobile station shall start the timer whenever the  
 29 strength PS<sub>i</sub> satisfies the following inequality:

$$30 \quad 10 \times \log_{10} PS_i < \max\left(\frac{SOFT\_SLOPE_s}{8} \times 10 \times \log_{10} \sum_{j>i} PS_j + \frac{DROP\_INTERCEPT_s}{2}, -\frac{T\_DROP_s}{2}\right)$$

$i = 1, 2, \dots, PS_{N_A-1}$

31  
 32 For the Active Set, the mobile station shall start the timer even if the timer has previously  
 33 expired. The mobile station shall reset and disable the timer whenever the above inequality  
 34 is not satisfied for the corresponding pilot.

If  $T_{TDROP_S}$  equals zero, the mobile station shall consider the timer expired within 100 ms of enabling it. Otherwise, the mobile station shall consider the timer expired within 10% of the timer expiration value shown in Table 2.6.6.2.3-1 corresponding to  $T_{TDROP_S}$ . If  $T_{TDROP_S}$  changes, the mobile station shall begin using the new value for all handoff drop timers within 100 ms.

**Table 2.6.6.2.3-1. Handoff Drop Timer Expiration Values**

| <b><math>T_{TDROP}</math></b> | <b>Timer<br/>Expiration<br/>(seconds)</b> | <b><math>T_{TDROP}</math></b> | <b>Timer<br/>Expiration<br/>(seconds)</b> |
|-------------------------------|-------------------------------------------|-------------------------------|-------------------------------------------|
| 0                             | 0.1                                       | 8                             | 27                                        |
| 1                             | 1                                         | 9                             | 39                                        |
| 2                             | 2                                         | 10                            | 55                                        |
| 3                             | 4                                         | 11                            | 79                                        |
| 4                             | 6                                         | 12                            | 112                                       |
| 5                             | 9                                         | 13                            | 159                                       |
| 6                             | 13                                        | 14                            | 225                                       |
| 7                             | 19                                        | 15                            | 319                                       |

The mobile station shall indicate the status of the handoff drop timer for all pilots in the Active Set and Candidate Set when transmitting a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message*.

#### 2.6.6.2.4 Pilot PN Phase

The mobile station shall measure the arrival time, PILOT\_ARRIVAL, for each pilot reported to the base station. The pilot arrival time shall be the time of occurrence, as measured at the mobile station antenna connector, of the earliest arriving usable multipath component of the pilot (for SR3 pilots, it is based on the earliest arriving usable multipath component from all three carriers). The arrival time shall be measured relative to the mobile station's time reference (see [2]) in units of PN chips. The mobile station shall compute the reported pilot PN phase, PILOT\_PN\_PHASE, as

$$\text{PILOT\_PN\_PHASE} = (\text{PILOT\_ARRIVAL} + (64 \times \text{PILOT\_PN})) \bmod 2^{15},$$

where PILOT\_PN is the PN sequence offset index of the pilot (see [2]).

#### 2.6.6.2.5 Handoff Messages

##### 2.6.6.2.5.1 Processing of Forward Traffic Channel Handoff Messages

If the mobile station receives any of the following messages, then the mobile station shall process the message as described.

- 1    1. *Pilot Measurement Request Order*: The mobile station shall send, within T<sub>56m</sub>  
 2    seconds, a *Pilot Strength Measurement Message* if P\_REV\_IN\_USE is less than seven  
 3    or a *Extended Pilot Strength Measurement Message* if P\_REV\_IN\_USE is equal to or  
 4    greater than seven.
- 5    2. *Analog Handoff Direction Message*: The mobile station shall process the message as  
 6    specified in 2.6.6.2.9.
- 7    3. *Neighbor List Update Message*: The mobile station shall process the message as  
 8    specified in 2.6.6.2.6.3 and set SEARCH\_PRIORITY\_INCL<sub>S</sub>,  
 9    SRCH\_WIN\_NGHBR\_INCL<sub>S</sub>, and SRCH\_OFFSET\_INCL<sub>S</sub> to '0', and set TIMING\_INCL  
 10   for each of the neighboring base stations in the *Neighbor List Update Message* to '0'.
- 11   4. *Extended Handoff Direction Message*: The mobile station shall process the message as  
 12   follows:

13     The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set  
 14   to '00000110' (capability not supported), if the mobile station does not support the  
 15   band class specified in the *Extended Handoff Direction Message*.

16     If the mobile station does not send a *Mobile Station Reject Order* in response to the  
 17   *Extended Handoff Direction Message*, the mobile station shall perform the following at  
 18   the action time of the message:

- 19     • The mobile station shall send a *Handoff Completion Message* or an *Extended  
 20   Handoff Completion Message* as specified in 2.6.6.2.5.2.
- 21     • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the  
 22   *Extended Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and  
 23   2.6.6.2.6.3).
- 24     • The mobile station shall delete all pilots that are not listed in the Active Set of the  
 25   Fundamental Channel from the Active Set of the Supplemental Channel for the  
 26   Forward Supplemental Channel Assignment (if any). If these deleted pilots include  
 27   all pilots in the Active Set of the Supplemental Channel, the mobile station shall  
 28   cancel the Forward Supplemental Channel Assignment.
- 29     • Discontinue use of all Forward Traffic Channels associated with pilots not listed in  
 30   the *Extended Handoff Direction Message*.
- 31     • The mobile station shall update the Code Channel List, CODE\_CHAN\_LIST<sub>S</sub>, as  
 32   specified in 2.6.8.
- 33     • If the mobile station is currently processing Forward Supplemental Code Channels,  
 34   then it shall continue processing the Forward Supplemental Code Channels using  
 35   the updated Code Channel List, CODE\_CHAN\_LIST<sub>S</sub>.
- 36     • The mobile station shall set IGNORE\_SCAM<sub>S</sub> and IGNORE\_ESCAM<sub>S</sub> to '0'.
- 37     • If HARD\_INCLUDED is equal to '1', perform the following actions:
  - 38       – If FRAME\_OFFSET<sub>r</sub> is not equal to FRAME\_OFFSET<sub>S</sub>, change the frame  
 39   offset on all of the code channels of the Forward Traffic Channel and of the  
 40   Reverse Traffic Channel.

- If RESET\_L2<sub>r</sub> is equal to ‘1’, Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset the acknowledgment procedures as specified in 2.2.1.1 and 2.2.2.1 of [4]. The acknowledgment procedures shall be reset immediately after the action time of the *Extended Handoff Direction Message*.
- If RESET\_FPC<sub>r</sub> is equal to ‘1’, initialize the Forward Traffic Channel power control counters as specified in 2.6.4.1.1.1.
- If SERV\_NEG\_TYPE<sub>r</sub> is equal to ‘1’, set SERV\_NEG<sub>s</sub> to enabled; otherwise set SERV\_NEG<sub>s</sub> to disabled.
- Use the long code mask specified by the PRIVATE\_LCM<sub>r</sub> (see 2.3.12.3) and indicate to the user the voice privacy mode status.
- Process the ENCRYPT\_MODE field as specified in 2.3.12.2.
- Store the following parameters from the current configuration:
  - Serving Frequency Assignment ( $SF_{CDMACH_s} = CDMACH_s$ )
  - Serving Frequency band class ( $SF_{BAND\_CLASS_s} = BAND\_CLASS_s$ )
  - Serving Frequency frame offset ( $SF_{FRAME\_OFFSET_s} = FRAME\_OFFSET_s$ )
- If HARD\_INCLUDED is not equal to ‘1’, set NUM\_PREAMBLE<sub>s</sub> = ‘000’.
- Store the following parameters from the *Extended Handoff Direction Message*:
  - *Extended Handoff Direction Message* sequence number ( $HDM_{SEQ_s} = HDM_{SEQ_r}$ )
  - If SEARCH\_INCLUDED is equal to ‘1’, then store the following:
    - + Search window size for the Active Set and Candidate Set ( $SRCH_{WIN\_A_s} = SRCH_{WIN\_A_r}$ )
    - + Pilot detection threshold ( $T_{ADD_s} = T_{ADD_r}$ )
    - + Pilot drop threshold ( $T_{DROP_s} = T_{DROP_r}$ )
    - + Active Set versus Candidate Set comparison threshold ( $T_{COMP_s} = T_{COMP_r}$ )
    - + Drop timer value ( $T_{TDROP_s} = T_{TDROP_r}$ )
  - If HARD\_INCLUDED is equal to ‘1’, then store the following:
    - + Frame offset ( $FRAME_{OFFSET_s} = FRAME_{OFFSET_r}$ )
    - + Nominal power setting of the target cell ( $NOM_{PWR_s} = NOM_{PWR_r}$ )
    - + Hard handoff traffic channel preamble count required before transmitting *Handoff Completion Message* or *Extended Handoff Completion Message* ( $NUM_{PREAMBLE_s} = NUM_{PREAMBLE_r}$ )
    - + CDMA band class ( $CDMABAND_s = BAND\_CLASS_r$ )
    - + Frequency assignment ( $CDMACH_s = CDMA\_FREQ_r$ )

- + Nominal power setting of the target cell (If  $CDMABAND_S = '00000'$  or  $CDMABAND_S = '00011'$ , then  $NOM\_PWR\_EXT_S = '0'$ ; otherwise,  $NOM\_PWR\_EXT_S = NOM\_PWR\_EXT_r$ )
- One occurrence of PILOT\_PN and PWR\_COMB\_IND for each included member of the Active Set.
- If ADD\_LENGTH is not equal to '000', then store the following:
  - + Protocol revision level ( $P\_REV_S = P\_REV_r$ )
  - + Protocol revision level currently in use ( $P\_REV\_IN\_USE_S =$  the minimum value of  $P\_REV_S$  and  $MOB\_P\_REV_p$  of the current band class)
- Disable return on failure ( $RETURN\_IF\_HANDOFF\_FAIL_S = '0'$ )
- Perform a soft or hard handoff depending on the following conditions:
  - If any of the following conditions is true, the mobile station shall perform a hard handoff:
    - + HARD\_INCLUDED is set to '1' and either  $BAND\_CLASS_r$  is not equal to  $SF\_CDMABAND_S$ ,  $CDMA\_FREQ_r$  is not equal to  $SF\_CDMACH_S$ , or  $FRAME\_OFFSET_r$  is not equal to  $SF\_FRAME\_OFFSET_S$ , or
    - + The set of pilots specified by the message is disjoint from the Active Set prior to the action time of the message.
  - If the mobile station performs a hard handoff, it shall do the following:
    - + If a Periodic Serving Frequency Pilot Report Procedure is in progress, abort the procedure (see 2.6.6.2.12).
    - + If a Candidate Frequency periodic search is in progress, abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4) and set  $PERIODIC\_SEARCH_S$  to '0'.
    - + The mobile station shall cancel the Forward Supplemental Channel assignment or the Reverse Supplemental Channel assignment (if any).
  - Perform the actions specified in 2.6.6.2.8.1. If the message specifies more than one pilot, the mobile station shall also perform the actions specified in 2.6.6.2.7.1 and 2.6.6.2.7.2.
  - Otherwise, the mobile station shall perform a soft handoff as specified in 2.6.6.2.7.

5. *Candidate Frequency Search Request Message:* The mobile station shall process the message as follows:

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the following condition is true:

- $SEARCH\_MODE_r$  is not equal to '0000', and the mobile station does not support the capability specified by  $SEARCH\_MODE_r$ .

If none of the above conditions is true, the mobile station shall perform the actions described in the remainder of this section to process the *Candidate Frequency Search Request Message*.

If SEARCH\_MODE<sub>r</sub> is equal to '0000', the mobile station shall process the *Candidate Frequency Search Request Message* as follows:

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001100' (invalid Frequency Assignment), if the Frequency Assignment specified in the message is the same as the Serving Frequency (BAND\_CLASS<sub>r</sub> is equal to CDMABAND<sub>s</sub> and CDMA\_FREQ<sub>r</sub> is equal to CDMACH<sub>s</sub>).
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001010' (search set not specified), if SEARCH\_TYPE<sub>r</sub> is equal to '01' or '11', and one of the following conditions is true:
  - PILOT\_UPDATE<sub>r</sub> is equal to '0' and the Candidate Frequency Search Set before the action time of the *Candidate Frequency Search Request Message* is empty, or
  - PILOT\_UPDATE<sub>r</sub> is equal to '1' and the message specifies an empty search set.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001101' (search period too short), if SEARCH\_TYPE<sub>r</sub> is equal to '11' and search\_period is less than (max (fwd\_time, rev\_time) + T71m) seconds, where search\_period, fwd\_time and rev\_time are defined below.

(In the following, if PILOT\_UPDATE<sub>r</sub> is equal to '1', rec\_search\_set is the set of pilots specified in the *Candidate Frequency Search Request Message* with the corresponding SEARCH\_SET field set to '1'; otherwise, rec\_search\_set is the Candidate Frequency Search Set before the action time of the *Candidate Frequency Search Request Message*.)

search\_period = time period corresponding to SEARCH\_PERIOD<sub>r</sub> shown in Table 2.6.6.2.8.3.2-1

fwd\_time = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Forward Traffic Channel processing in order to tune to the Candidate Frequency, to search rec\_search\_set, and to re-tune to the Serving Frequency; if the mobile station searches rec\_search\_set in multiple visits, fwd\_time is the total time for all visits to the Candidate Frequency in a search period (see 2.6.6.2.8.3.2)

1           `rev_time` = the mobile station's estimate of the total length of time, in  
 2           seconds, for which the mobile station will need to suspend its  
 3           current Reverse Traffic Channel processing in order to tune to the Candidate Frequency, to search `rec_search_set`, and to re-  
 4           tune to the Serving Frequency; if the mobile station searches  
 5           `rec_search_set` in multiple visits, `rev_time` is the total time for  
 6           all visits to the Candidate Frequency in a search period  
 7

- 8           • If the mobile station does not send a *Mobile Station Reject Order* in response to  
 9           the *Candidate Frequency Search Request Message*, it shall perform the following:
- 10           – The mobile station shall send a *Candidate Frequency Search Response*  
 11           *Message* in assured mode, within T56m seconds of receiving the *Candidate*  
 12           *Frequency Search Request Message*. The mobile station shall set the fields of  
 13           the *Candidate Frequency Search Response Message* as follows:
  - 14           + The mobile station shall set `TOTAL_OFF_TIME_FWD` and  
 15           `TOTAL_OFF_TIME_REV` to its estimate of the total number of frames or  
 16           power control groups for which it will need to suspend its current  
 17           Forward Traffic Channel processing and Reverse Traffic Channel  
 18           processing, respectively, in order to tune to the Candidate Frequency, to  
 19           search `rec_search_set`, and to re-tune to the Serving Frequency (see  
 20           2.6.6.2.8.3.2). If the mobile station searches `rec_search_set` in multiple  
 21           visits to the Candidate Frequency, the mobile station shall report the  
 22           total number of frames or power control groups in all visits in a search  
 23           period for which it will need to suspend its current Forward Traffic  
 24           Channel and the Reverse Traffic Channel processing.
  - 25           + The mobile station shall set `MAX_OFF_TIME_FWD` and  
 26           `MAX_OFF_TIME_REV` to its estimate of the maximum number of frames  
 27           or power control groups for which it will need to suspend its current  
 28           Forward Traffic Channel processing and Reverse Traffic Channel  
 29           processing, respectively, during any single visit to tune to the Candidate  
 30           Frequency, to search a subset of `rec_search_set`, and to re-tune to the  
 31           Serving Frequency.<sup>17</sup>

---

<sup>17</sup> If the mobile station searches the entire Candidate Frequency Search Set in a single visit to the Candidate Frequency, `TOTAL_OFF_TIME_FWD` will be equal to `MAX_OFF_TIME_FWD`, and `TOTAL_OFF_TIME_REV` will be equal to `MAX_OFF_TIME_REV`.

- + The mobile station shall set PCG\_OFF\_TIMES to '1' if TOTAL\_OFF\_TIME\_FWD, MAX\_OFF\_TIME\_FWD, TOTAL\_OFF\_TIME\_**REVFWD** and MAX\_OFF\_TIME\_**REVFWD** are expressed in units of power control groups. If these time estimates are expressed in units of frames, the mobile station shall set PCG\_OFF\_TIMES to '0'. The mobile station shall not use power control groups as the unit of delay-duration, if P\_REV\_IN\_USE<sub>s</sub> is less than six.
- + If ALIGN\_TIMING<sub>r</sub> is equal to '1', the mobile station shall set ALIGN\_TIMING\_USED to '1' to indicate if it will align its search as requested by the base station; otherwise, the mobile station shall set ALIGN\_TIMING\_USED to '0'. If ALIGN\_TIMING\_USED is set to '1', the mobile station shall set MAX\_NUM\_VISITS to the maximum number of visits per search period minus one.\_and,\_if MAX\_NUM\_VISITS is not equal to 0, the mobile station shall set INTER\_VISIT\_TIME, in units of frames or power control groups, to its estimate of the time between subsequent the beginning of consecutive visits to the Candidate Frequency within the same search period.
- When the message takes effect, the mobile station shall perform the following actions:
  - + If any periodic search is in progress, the mobile station shall abort it (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
  - + Store the following parameters from the *Candidate Frequency Search Request Message*:
    - o *Candidate Frequency Search Request Message* sequence number (CFSRM\_SEQ<sub>s</sub> = CFSRM\_SEQ<sub>r</sub>)
    - o Periodic search flag: If SEARCH\_TYPE<sub>r</sub> is equal to '11', the mobile station shall set PERIODIC\_SEARCH<sub>s</sub> to '1'; otherwise, the mobile station shall set PERIODIC\_SEARCH<sub>s</sub> to '0'.
    - o Search period on the Candidate Frequency (SEARCH\_PERIOD<sub>s</sub> = SEARCH\_PERIOD<sub>r</sub>)
    - o Candidate Frequency search mode (SEARCH\_MODE<sub>s</sub> = SEARCH\_MODE<sub>r</sub>)
    - o Band class for the Candidate Frequency (CF\_CDMABAND<sub>s</sub> = BAND\_CLASS<sub>r</sub>)
    - o CDMA Channel number for the CDMA Candidate Frequency (CF\_CDMACH<sub>s</sub> = CDMA\_FREQ<sub>r</sub>)
    - o Serving Frequency total pilot E<sub>c</sub> threshold (SF\_TOTAL\_EC\_THRESH<sub>s</sub> = SF\_TOTAL\_EC\_THRESH<sub>r</sub>)
    - o Serving Frequency total pilot E<sub>c</sub>/I<sub>o</sub> threshold (SF\_TOTAL\_EC\_IO\_THRESH<sub>s</sub> = SF\_TOTAL\_EC\_IO\_THRESH<sub>r</sub>)

- 1        o Received power difference threshold  
( $\text{DIFF\_RX\_PWR\_THRESH}_S = \text{DIFF\_RX\_PWR\_THRESH}_R$ )
- 2
- 3        o Candidate Frequency Total pilot  $E_C/I_0$  threshold  
( $\text{MIN\_TOTAL\_PILOT\_EC\_IO}_S = \text{MIN\_TOTAL\_PILOT\_EC\_IO}_R$ )
- 4
- 5        o Pilot detection threshold on the CDMA Candidate Frequency  
( $\text{CF\_T\_ADD}_S = \text{CF\_T\_ADD}_R$ )
- 6
- 7        o Maximum time on the CDMA Target Frequency that the mobile  
station may wait to receive a period of ( $N_{11m} \times 20$ ) ms with sufficient  
signal quality (e.g. good frames) on the physical channel  
corresponding to  $\text{FPC\_PRI\_CHAN}_S$   
( $\text{TF\_WAIT\_TIME}_S = \text{TF\_WAIT\_TIME}_R$ )
- 8
- 9
- 10
- 11
- 12        o Pilot PN sequence offset increment on the CDMA Candidate  
Frequency ( $\text{CF\_PILOT\_INC}_S = \text{CF\_PILOT\_INC}_R$ )
- 13
- 14        o Search window for pilots in the Neighbor Set on the CDMA Candidate  
Frequency ( $\text{CF\_SRCH\_WIN\_N}_S = \text{CF\_SRCH\_WIN\_N}_R$ )
- 15
- 16        o Search window for pilots in the Remaining Set on the CDMA Candidate  
Frequency ( $\text{CF\_SRCH\_WIN\_R}_S = \text{CF\_SRCH\_WIN\_R}_R$ )
- 17
- 18        o If PILOT\_UPDATE is equal to '1', the mobile station shall perform the  
following:
  - 20            ◊ Set  $\text{CF\_SEARCH\_PRIORITY\_INCL}_S$  and  
 $\text{CF\_SRCH\_WIN\_NGHBR\_INCL}_S$  to the values corresponding to  
 $\text{CF\_NGHBR\_SRCH\_MODE}$  shown in Table 2.6.6.2.5.1-1,
  - 21            ◊ Set  $\text{CF\_SRCH\_OFFSET\_INCL}_S$  to  $\text{CF\_SRCH\_OFFSET\_INCL}_R$ .
- 22
- 23
- 24        o If PILOT\_UPDATE is equal to '1', the mobile station shall replace the  
Candidate Frequency Neighbor Set with all neighbor pilots specified  
in the *Candidate Frequency Search Request Message*. Specifically, the  
mobile station shall store the following:
  - 28            ◊ Set the NGHBR\_PN [field of the Candidate Frequency Neighbor Set  
Pilot Record](#) to  $\text{NGHBR\_PN}_R$ .
  - 29
  - 30            ◊ Set the ADD\_PILOT\_REC\_INCL field [of the Candidate Frequency  
Neighbor Set Pilot Record](#) to  $\text{ADD\_PILOT\_REC\_INCL}_R$ . If  
 $\text{ADD\_PILOT\_REC\_INCL}_R$  is equal to '1', the mobile station shall  
store the following:
    - 34              – Set the NGHBR\_PILOT\_REC\_TYPE field of the Candidate  
Frequency Neighbor Set Pilot Record to  
 $\text{NGHBR\_PILOT\_REC\_TYPE}_R$ .
    - 35
    - 36

- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station shall set the TD\_POWER\_LEVEL and TD MODE fields of the Candidate Frequency Neighbor Set Pilot Record to TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>, respectively.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall
  - + Set the AUX\_PILOT\_QOF field of the Candidate Frequency Neighbor Set Pilot Record to QOF<sub>r</sub>.
  - + Set the AUX\_PILOT\_WALSH\_CODE field of the Candidate Frequency Neighbor Set Pilot Record to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
  - + Set the AUX\_PILOT\_TD\_QOF field of the Candidate Frequency Neighbor Set Pilot Record to QOF<sub>r</sub>.
  - + Set the AUX\_PILOT\_WALSH\_CODE field of the Candidate Frequency Neighbor Set Pilot Record to AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - + Set the AUX\_TD\_POWER\_LEVEL field of the Candidate Frequency Neighbor Set Pilot Record to AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
  - + Set the TD\_MODE field of the Candidate Frequency Neighbor Set Pilot Record to TD\_MODE<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
  - + Set the SR3\_PRIMARY\_PILOT field of Candidate Frequency Neighbor Set Pilot Record to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - + Set the SR3\_PILOT\_POWER1 field of Candidate Frequency Neighbor Set Pilot Record to SR3\_PILOT\_POWER1<sub>r</sub>.
  - + Set the SR3\_PILOT\_POWER2 field of Candidate Frequency Neighbor Set Pilot Record to SR3\_PILOT\_POWER2<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
  - + Set the SR3\_PRIMARY\_PILOT field of Candidate Frequency Neighbor Set Pilot Record to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - + Set the SR3\_PILOT\_POWER1 field of Candidate Frequency Neighbor Set Pilot Record to SR3\_PILOT\_POWER1<sub>r</sub>.

- + Set the SR3\_PILOT\_POWER2 field of Candidate Frequency Neighbor Set Pilot Record to SR3\_PILOT\_POWER2<sub>r</sub>.
- + Set the AUX\_PILOT\_QOF field of Candidate Frequency Neighbor Set Pilot Record to QOF<sub>r</sub>.
- + Set the AUX\_PILOT\_WALSH\_CODE field of Candidate Frequency Neighbor Set Pilot Record to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- + If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of Candidate Frequency Neighbor Set Pilot Record to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of Candidate Frequency Neighbor Set Pilot Record to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1 field of Candidate Frequency Neighbor Set Pilot Record to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of Candidate Frequency Neighbor Set Pilot Record to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- + If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of Candidate Frequency Neighbor Set Pilot Record to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of Candidate Frequency Neighbor Set Pilot Record to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF2 field of Candidate Frequency Neighbor Set Pilot Record to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of Candidate Frequency Neighbor Set Pilot Record to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- o If PILOT\_UPDATE is equal to '1' and CF\_SEARCH\_PRIORITY\_INCL<sub>s</sub> is equal to '1', the mobile station shall store the search priority (SEARCH\_PRIORITY<sub>s</sub> = SEARCH\_PRIORITY<sub>r</sub>) associated with each of the neighboring base stations contained in the Candidate Frequency Neighbor Set.
- o If PILOT\_UPDATE is equal to '1' and CF\_SRCH\_WIN\_NGHBR\_INCL<sub>s</sub> is equal to '1', the mobile station shall perform the following:
  - ◊ Store the neighbor pilot channel search window size (SRCH\_WIN\_NGHBR<sub>s</sub> = SRCH\_WIN\_NGHBR<sub>r</sub>) associated with each of the neighboring base stations contained in the Candidate Frequency Neighbor Set,

- 1               ◊ If CF\_SRCH\_OFFSET\_INCL<sub>r</sub> equals to ‘1’, store the neighbor pilot  
 2               channel search window offset (SRCH\_OFFSET\_NGHBR<sub>s</sub> =  
 3               SRCH\_OFFSET\_NGHBR<sub>r</sub>) associated with each of the neighboring  
 4               base stations contained in the Candidate Frequency Neighbor Set.
- 5               o If PILOT\_UPDATE is equal to ‘1’, the mobile station shall replace the  
 6               Candidate Frequency Search Set with all flagged pilots (those with the  
 7               corresponding SEARCH\_SET field set to ‘1’) specified in the *Candidate*  
 8               *Frequency Search Request Message*.
- 9               — o ~~Search\_offset\_time (If ALIGN\_TIMING<sub>r</sub> is equal to ‘1’,  
 10               SEARCH\_OFFSET<sub>s</sub> = SEARCH\_OFFSET<sub>r</sub>; otherwise,  
 11               SEARCH\_OFFSET<sub>s</sub> = ‘000000’)~~
- 12               + If ALIGN\_TIMING<sub>r</sub> is equal to ‘1’ and the mobile station will align its  
 13               search as requested by the base station, the mobile station shall set  
 14               ALIGN\_TIMING\_USED<sub>s</sub> to ‘1’ and SEARCH\_OFFSET<sub>s</sub> to  
 15               SEARCH\_OFFSET<sub>r</sub>; otherwise, the mobile station shall  
 16               set ALIGN\_TIMING\_USED<sub>s</sub> to ‘0’ and SEARCH\_OFFSET<sub>s</sub> to ‘000000’.
- 17               + If the mobile station sets the PCG\_OFF\_TIMES field of the *Candidate*  
 18               *Frequency Search Response Message* to ‘1’, it shall set  
 19               SEARCH\_TIME\_RESOLUTION<sub>s</sub> to 0.00125; otherwise, it shall set  
 20               SEARCH\_TIME\_RESOLUTION<sub>s</sub> to 0.02.
- 21               + If SEARCH\_TYPE<sub>r</sub> is equal to ‘01’, the mobile station shall perform a  
 22               single search of the Candidate Frequency Search Set, as described in  
 23               2.6.6.2.8.3.1. If SEARCH\_TYPE<sub>r</sub> is equal to ‘11’, the mobile station shall  
 24               perform the periodic search procedures, as described in 2.6.6.2.8.3.2.

**Table 2.6.6.2.5.1-1. Search Parameter Settings**

| NGHBR_SRCH_MODE    | SEARCH_PRIORITY_INCL    | SRCH_WIN_NGHBR_INCL    |
|--------------------|-------------------------|------------------------|
| CF_NGHBR_SRCH_MODE | CF_SEARCH_PRIORITY_INCL | CF_SRCH_WIN_NGHBR_INCL |
| 00                 | 0                       | 0                      |
| 01                 | 1                       | 0                      |
| 10                 | 0                       | 1                      |
| 11                 | 1                       | 1                      |

27  
 28               If SEARCH\_MODE<sub>r</sub> is equal to ‘0001’, and if the mobile station supports analog  
 29               searching, the mobile station shall process the *Candidate Frequency Search Request*  
 30               *Message* as follows:

- 1     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 2       set to ‘00001101’ (search period too short), if SEARCH\_TYPE<sub>r</sub> is equal to ‘11’ and  
 3       search\_period is less than (max (fwd\_time, rev\_time) + T71m) seconds where  
 4       search\_period, fwd\_time and rev\_time are defined below.

5           (In the following, *rec\_search\_set* is the set of analog frequencies specified in the  
 6           *Candidate Frequency Search Request Message*.)

7           *search\_period* = time period corresponding to SEARCH\_PERIOD<sub>r</sub> shown in  
 8           Table 2.6.6.2.8.3.2-1

9           *fwd\_time* = the mobile station’s estimate of the total length of time, in  
 10          seconds, for which the mobile station will need to suspend its  
   11          current Forward Traffic Channel processing in order to tune to  
   12          each analog frequency in *rec\_search\_set* and measure its  
   13          strength, and to re-tune to the Serving Frequency; if the mobile  
   14          station searches *rec\_search\_set* in multiple visits, *fwd\_time* is  
   15          the total time for all visits away from the Serving Frequency in a  
   16          search period (see 2.6.6.2.10.2)

17           *rev\_time* = the mobile station’s estimate of the total length of time, in  
 18          seconds, for which the mobile station will need to suspend its  
   19          current Reverse Traffic Channel processing in order to tune to  
   20          each analog frequency in *rec\_search\_set* and measure its  
   21          strength, and to re-tune to the Serving Frequency; if the mobile  
   22          station searches *rec\_search\_set* in multiple visits, *rev\_time* is the  
   23          total time for all visits away from the Serving Frequency in a  
   24          search period

- 25     • If the mobile station does not send a *Mobile Station Reject Order* in response to  
 26       the *Candidate Frequency Search Request Message*, it shall perform the following:
- 27       – The mobile station shall send a *Candidate Frequency Search Response*  
 28       *Message* in assured mode, within T56m seconds of receiving the *Candidate*  
 29       *Frequency Search Request Message*. The mobile station shall set the fields of  
 30       the *Candidate Frequency Search Response Message* as follows:
- 31        + The mobile station shall set TOTAL\_OFF\_TIME\_FWD and  
 32           TOTAL\_OFF\_TIME\_REV to its estimate of the total number of frames or  
 33           power control groups for which it will need to suspend its current  
 34           Forward Traffic Channel processing and Reverse Traffic Channel  
 35           processing, respectively, in order to tune to each analog frequency in  
 36           *rec\_search\_set*, to measure its strength, and to re-tune to the Serving  
 37           Frequency (see 2.6.6.2.8.3.2). If the mobile station searches  
 38           *rec\_search\_set* in multiple visits away from the Serving Frequency, the  
 39           mobile station shall report the total number of frames or power control  
 40           groups in all visits in a search period for which it will need to suspend its  
 41           current Forward Traffic Channel and the Reverse Traffic Channel  
 42           processing.

- + The mobile station shall set MAX\_OFF\_TIME\_FWD and MAX\_OFF\_TIME\_REV to its estimate of the maximum number of frames or power control groups for which it will need to suspend its current Forward Traffic Channel processing and Reverse Traffic Channel processing, respectively, during any single visit away from the Serving Frequency, to search a subset of *rec\_search\_set*, and to re-tune to the Serving Frequency.
- + The mobile station shall set PCG\_OFF\_TIMES to ‘1’ if TOTAL\_OFF\_TIME\_FWD, MAX\_OFF\_TIME\_FWD, TOTAL\_OFF\_TIME\_-REVFWD and MAX\_OFF\_TIME\_REVFWD are expressed in units of power control groups. If these time estimates are expressed in units of frames, the mobile station shall set PCG\_OFF\_TIMES to ‘0’. The mobile station shall not use power control groups as the unit of delay\_duration if P\_REV\_IN\_USE<sub>S</sub> is less than six.
- + If ALIGN\_TIMING<sub>r</sub> is equal to ‘1’, the mobile station shall set ALIGN\_TIMING\_USED to ‘1’ to indicate if it will align its search as requested by the base station; otherwise, the mobile station shall set ALIGN\_TIMING\_USED to ‘0’. If ALIGN\_TIMING\_USED is set to ‘1’, the mobile station shall set MAX\_NUM\_VISITS to the maximum number of visits per search period minus one.\_and,\_if MAX\_NUM\_VISITS is not equal to 0, the mobile station shall set INTER\_VISIT\_TIME, in units of frames or power control groups, to its estimate of the time between subsequent the beginning of consecutive visits away from the Serving Frequency within the same search period.
- When the message takes effect, the mobile station shall perform the following actions:
  - + If any periodic search is in progress, the mobile station shall abort it (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
  - + Store the following parameters from the *Candidate Frequency Search Request Message*:
    - o *Candidate Frequency Search Request Message* sequence number (CFSRM\_SEQ<sub>S</sub> = CFSRM\_SEQ<sub>r</sub>)
    - o Periodic search flag: If SEARCH\_TYPE<sub>r</sub> is equal to ‘11’, the mobile station shall set PERIODIC\_SEARCH<sub>S</sub> to ‘1’; otherwise, the mobile station shall set PERIODIC\_SEARCH<sub>S</sub> to ‘0’.
    - o Search period for the analog frequencies search (SEARCH\_PERIOD<sub>S</sub> = SEARCH\_PERIOD<sub>r</sub>)
    - o Candidate Frequency search mode (SEARCH\_MODE<sub>S</sub> = SEARCH\_MODE<sub>r</sub>)
    - o Band class for the analog frequencies (CF\_CDMABAND<sub>S</sub> = BAND\_CLASS<sub>r</sub>)

- 1        o Serving Frequency total pilot  $E_C$  threshold  
   2        ( $SF_{TOTAL\_EC\_THRESH_S} = SF_{TOTAL\_EC\_THRESH_R}$ )
- 3        o Serving Frequency total pilot  $E_C/I_0$  threshold  
   4        ( $SF_{TOTAL\_EC\_IO\_THRESH_S} = SF_{TOTAL\_EC\_IO\_THRESH_R}$ )
- 5        o Candidate Frequency Analog Search Set: The mobile station shall  
   6        replace the Candidate Frequency Analog Search Set with the analog  
   7        frequencies included in the *Candidate Frequency Search Request*  
   8        *Message*.
- 9        ~~o Search offset time (If  $ALIGN\_TIMING_R$  is equal to '1',  $SEARCH\_OFFSET_S = SEARCH\_OFFSET_R$ ; otherwise,  $SEARCH\_OFFSET_S = '000000'$ )~~
- 10      + If  $ALIGN\_TIMING_R$  is equal to '1' and the mobile station will align its  
   11     search as requested by the base station, the mobile station shall set  
   12      $ALIGN\_TIMING\_USED_S$  to '1' and  $SEARCH\_OFFSET_S$  to  
   13      $SEARCH\_OFFSET_R$ ; otherwise, the mobile station shall set  
   14      $ALIGN\_TIMING\_USED_S$  to '0' and  $SEARCH\_OFFSET_S$  to '000000'.
- 15      + If the mobile station sets the  $PCG\_OFF\_TIMES$  field of the *Candidate*  
   16     *Frequency Search Response Message* to '1', it shall set  
   17      $SEARCH\_TIME\_RESOLUTION_S$  to 0.00125; otherwise, it shall set  
   18      $SEARCH\_TIME\_RESOLUTION_S$  to 0.02.
- 19      + If  $SEARCH\_TYPE_R$  is equal to '01', the mobile station shall perform a  
   20     single search of the Candidate Frequency Analog Search Set as described  
   21     in 2.6.6.2.10.1. If  $SEARCH\_TYPE_R$  is equal to '11', the mobile station  
   22     shall perform the periodic search procedures described in 2.6.6.2.10.2.

24     6. *Candidate Frequency Search Control Message*: The mobile station shall process the  
 25     message as follows:

26     If  $SEARCH\_MODE_S$  is equal to '0000':

- 27        • The mobile station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field  
   28        set to '00001010' (search set not specified), if  $SEARCH\_TYPE_R$  is not equal to '00'  
   29        and the Candidate Frequency Search Set is empty.
- 30        • The mobile station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field  
   31        set to '00001011' (invalid search request), if  $SEARCH\_TYPE_R$  is not equal to '00'  
   32        and the Candidate Frequency is the same as the Serving Frequency  
   33        ( $CF_{CDMABAND_S}$  is equal to  $CDMABAND_S$  and  $CF_{CDMACH_S}$  is equal to  
   34         $CDMACH_S$ ).
- 35        • The mobile station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field  
   36        set to '00001101' (search period too short), if  $SEARCH\_TYPE_R$  is equal to '11' and  
   37         $search\_period$  is less than  $(max(fwd\_time, rev\_time) + T_{71m})$  seconds, where  
   38         $search\_period$  = time period corresponding to  $SEARCH\_PERIOD_R$  shown in  
   39        Table 2.6.6.2.8.3.2-1,

1                   *fwd\_time* = the mobile station's estimate of the total length of time, in  
 2                   seconds, for which the mobile station will need to suspend its  
 3                   current Forward Traffic Channel processing in order to tune to  
 4                   the Candidate Frequency, to search the Candidate Frequency  
 5                   Search Set and to re-tune to the Serving Frequency; if the  
 6                   mobile station searches the Candidate Frequency Search Set in  
 7                   multiple visits, *fwd\_time* is the total time for all visits to the  
 8                   Candidate Frequency in a search period (see 2.6.6.2.8.3.2),

9                   and

10                  *rev\_time* = the mobile station's estimate of the total length of time, in  
 11                  seconds, for which the mobile station will need to suspend its  
 12                  current Reverse Traffic Channel processing in order to tune to  
 13                  the Candidate Frequency, to search the Candidate Frequency  
 14                  Search Set and to re-tune to the Serving Frequency; if the  
 15                  mobile station searches the Candidate Frequency Search Set in  
 16                  multiple visits, *rev\_time* is the total time for all visits to the  
 17                  Candidate Frequency in a search period.

- 18                  • If the mobile station does not reject the *Candidate Frequency Search Control*  
 19                  *Message*, it shall perform the following actions when the message takes effect:
  - 20                   – If any periodic search is in progress, the mobile station shall abort it (see  
                     2.6.6.2.8.3.4 and 2.6.6.2.10.4).
  - 21                   – If ALIGN\_TIMING<sub>r</sub> is equal to '1' and the mobile station will align its search  
                     as requested by the base station, the mobile station shall set  
                     ALIGN\_TIMING\_USED<sub>s</sub> to '1'; otherwise, the mobile station shall set  
                     ALIGN\_TIMING\_USED<sub>s</sub> to '0' and SEARCH\_OFFSET<sub>s</sub> to '000000'.
  - 22                   – If SEARCH\_TYPE<sub>r</sub> is equal to '00', the mobile station shall set  
                     PERIODIC\_SEARCH<sub>s</sub> to '0'.
  - 23                   – If SEARCH\_TYPE<sub>r</sub> is equal to '01':
    - 24                      + The mobile station shall set PERIODIC\_SEARCH<sub>s</sub> to '0'.
    - 25                      + The mobile station shall perform a single search of the Candidate  
                         Frequency Search Set, as described in 2.6.6.2.8.3.1.
  - 26                   – If SEARCH\_TYPE<sub>r</sub> is equal to '11':
    - 27                      + The mobile station shall set PERIODIC\_SEARCH<sub>s</sub> to '1'.
    - 28                      + The mobile station shall perform the periodic search procedures for the  
                         Candidate Frequency Search Set, as described in 2.6.6.2.8.3.2.

36                  If SEARCH\_MODE<sub>s</sub> is equal to '0001':

- 37                  • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 38                  set to '00001010' (search set not specified), if SEARCH\_TYPE<sub>r</sub> is not equal to '00'  
 39                  and the Candidate Frequency Analog Search Set is empty.

- 1     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 2       set to ‘00001101’ (search period too short), if SEARCH\_TYPE<sub>r</sub> is equal to ‘11’ and  
 3       search\_period is less than (max (fwd\_time, rev\_time) + T71m) seconds, where  
 4           search\_period = time period corresponding to SEARCH\_PERIOD<sub>r</sub> shown in  
 5           Table 2.6.6.2.8.3.2-1,  
 6           fwd\_time = the mobile station’s estimate of the total length of time, in  
 7           seconds, for which the mobile station will need to suspend its  
 8           current Forward Traffic Channel processing in order to tune to  
 9           each analog frequency in the Candidate Frequency Analog  
 10          Search Set and measure its strength, and to re-tune to the  
 11          Serving Frequency; if the mobile station searches the Candidate  
 12          Frequency Analog Search Set in multiple visits, fwd\_time is the  
 13          total time for all visits away from the Serving Frequency in a  
 14          search period (see 2.6.6.2.10.2),

15       and

16           rev\_time = the mobile station’s estimate of the total length of time, in  
 17           seconds, for which the mobile station will need to suspend its  
 18           current Reverse Traffic Channel processing in order to tune to  
 19           each analog frequency in the Candidate Frequency Analog  
 20          Search Set and measure its strength, and to re-tune to the  
 21          Serving Frequency; if the mobile station searches the Candidate  
 22          Frequency Analog Search Set in multiple visits, fwd\_time is the  
 23          total time for all visits away from the Serving Frequency in a  
 24          search period (see 2.6.6.2.10.2).

- 25     • If the mobile station does not reject the *Candidate Frequency Search Control*  
 26       *Message*, it shall perform the following actions when the message takes effect:
  - 27         – If any periodic search is in progress, the mobile station shall abort it (see  
 28           2.6.6.2.8.3.4 and 2.6.6.2.10.4).
  - 29         – If ALIGN\_TIMING<sub>r</sub> is equal to ‘1’ and the mobile station will align its search  
 30           as requested by the base station, the mobile station shall set  
 31           ALIGN\_TIMING\_USED<sub>s</sub> to ‘1’; otherwise, the mobile station shall set  
 32           ALIGN\_TIMING\_USED<sub>s</sub> to ‘0’ and SEARCH\_OFFSET<sub>s</sub> to ‘000000’.
  - 33         – If SEARCH\_TYPE<sub>r</sub> is equal to ‘00’, the mobile station shall set  
 34           PERIODIC\_SEARCH<sub>s</sub> to ‘0’.
  - 35         – If SEARCH\_TYPE<sub>r</sub> is equal to ‘01’:
    - 36           + The mobile station shall set PERIODIC\_SEARCH<sub>s</sub> to ‘0’.
    - 37           + The mobile station shall perform a single search of the Candidate  
 38           Frequency Analog Search Set, as described in 2.6.6.2.10.1.
  - 39         – If SEARCH\_TYPE<sub>r</sub> is equal to ‘11’:
    - 40           + The mobile station shall set PERIODIC\_SEARCH<sub>s</sub> to ‘1’.

- 1       + The mobile station shall perform the periodic search procedures for the  
 2           Candidate Frequency Analog Search Set, as described in 2.6.6.2.10.2.

3     7. *Extended Neighbor List Update Message*: The mobile station shall update its  
 4           neighbor set as specified in 2.6.6.2.6.3 and perform the following:

- 5       • If NGHBR\_SRCH\_MODE<sub>r</sub> is equal to '01' or '11', the mobile station shall store  
 6           the search priority (SEARCH\_PRIORITY<sub>s</sub> = SEARCH\_PRIORITY<sub>r</sub>) associated with  
 7           each of the neighboring base stations contained in the *Extended Neighbor List*  
 8           *Update Message* which are in the mobile's neighbor set.
- 9       • If NGHBR\_SRCH\_MODE<sub>r</sub> is equal to '01' or '00', the mobile station shall set the  
 10           SRCH\_OFFSET\_INCL<sub>s</sub> field '0'.
- 11       • If NGHBR\_SRCH\_MODE<sub>r</sub> is equal to '10' or '11', the mobile station shall perform  
 12           the following:
  - 13           – Store the neighbor pilot channel search window size  
 14           (SRCH\_WIN\_NGHBR<sub>s</sub> = SRCH\_WIN\_NGHBR<sub>r</sub>) associated with each of the  
 15           neighboring base stations contained in the *Extended Neighbor List Updated*  
 16           *Message* which are in the mobile's neighbor set,
  - 17           – If SRCH\_OFFSET\_INCL<sub>r</sub> equals to '1', set the SRCH\_OFFSET\_NGHBR field of  
 18           NGHBR\_REC[i] to the i<sup>th</sup> occurrence of SRCH\_OFFSET\_NGHBR<sub>r</sub>,
  - 19           – Set SRCH\_OFFSET\_INCL<sub>s</sub> to SRCH\_OFFSET\_INCL<sub>r</sub>.
- 20       • The mobile station shall update the default search window size for its Neighbor  
 21           Set (SRCH\_WIN\_N<sub>s</sub> = SRCH\_WIN\_N<sub>r</sub>).
- 22       • The mobile station shall set SEARCH\_PRIORITY\_INCL<sub>s</sub> and  
 23           SRCH\_WIN\_NGHBR\_INCL<sub>s</sub> to the value specified in Table 2.6.6.2.5.1-1  
 24           corresponding to NGHBR\_SRCH\_MODE<sub>r</sub>.
- 25       • If USE\_TIMING is equal to '1', the mobile station shall store the timing included  
 26           flag (TIMING\_INCL) associated with each of the neighboring base stations  
 27           contained in the *Extended Neighbor List Update Message* which are in the mobile  
 28           station neighbor set; otherwise the mobile station shall set the timing included  
 29           flag (TIMING\_INCL) associated with each of the neighboring base stations to '0'.
- 30       • If USE\_TIMING is equal to '1' and TIMING\_INCL<sub>r</sub> is equal to '1', the mobile  
 31           station shall store the neighbor transmit time offset (NGHBR\_TX\_OFFSET =  
 32           NGHBR\_TX\_OFFSET<sub>r</sub>) associated with each of the neighboring base stations  
 33           contained in the *Extended Neighbor List Update Message* which are in the mobile  
 34           station neighbor set.
- 35       • If USE\_TIMING is equal to '1' and the TIMING\_INCL is equal to '1', then the  
 36           mobile station shall perform the following:

- If the GLOBAL\_TIMING\_INCL field is equal to '1', then the mobile station shall store the neighbor transmit time duration ( $\text{NGHBR\_TX\_DURATION} = \text{GLOBAL\_TX\_DURATION}_r$ ) and the neighbor transmit time duration ( $\text{NGHBR\_TX\_PERIOD} = \text{GLOBAL\_TX\_PERIOD}_r$ ) contained in the *Extended Neighbor List Update Message*.
- If the GLOBAL\_TIMING\_INCL field is equal to '0', then the mobile station shall store the neighbor transmit time duration ( $\text{NGHBR\_TX\_DURATION} = \text{NGHBR\_TX\_DURATION}_r$ ) and the neighbor transmit time duration ( $\text{NGHBR\_TX\_PERIOD} = \text{NGHBR\_TX\_PERIOD}_r$ ) associated with each of the neighboring base stations contained in the *Extended Neighbor List Update Message* which are in the mobile station neighbor set.
- For each of the neighboring base stations contained in the *General Neighbor List Message*, the mobile station shall set ADD\_PILOT\_REC\_INCL field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of ADD\_PILOT\_REC\_INCL<sub>r</sub>. If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals '1', for each pilot, the mobile station shall also perform the following:
  - Set the NGHBR\_PILOT\_REC\_TYPE field of NGHBR\_PILOT\_REC to NGHBR\_PILOT\_REC\_TYPE<sub>r</sub>.
  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '000'. The mobile station shall set the TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall:
    - + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>
    - + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>
  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
    - + Set the AUX\_PILOT\_TD\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
    - + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
    - + Set the AUX\_TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
    - + Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
    - + Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
    - + Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.

- 1        + Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to  
2              SR3\_PILOT\_POWER2<sub>r</sub>.
- 3        - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
  - 4              + Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to  
5                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - 6              + Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to  
7                   SR3\_PILOT\_POWER1<sub>r</sub>.
  - 8              + Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to  
9                   SR3\_PILOT\_POWER2<sub>r</sub>.
  - 10             + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
  - 11             + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
12                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
13                   WALSH\_LENGTH<sub>r</sub>.
  - 14             + If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of  
15                   NGHBR\_PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1  
16                   field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh  
17                   Code length specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the  
18                   AUX\_PILOT\_QOF1 field of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and set the  
19                   AUX\_PILOT\_WALSH\_CODE1 field of NGHBR\_PILOT\_REC to  
20                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
21                   WALSH\_LENGTH<sub>r</sub>.
  - 22             + If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of  
23                   NGHBR\_PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2  
24                   field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh  
25                   Code length specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the  
26                   AUX\_PILOT\_QOF2 field of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and set the  
27                   AUX\_PILOT\_WALSH\_CODE2 field of NGHBR\_PILOT\_REC to  
28                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
29                   WALSH\_LENGTH<sub>r</sub>.

30        8. *Supplemental Channel Assignment Message*: The mobile station shall process this  
31           message as follows:

32        The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set  
33           to the specified value if any of the following conditions is true, and shall not perform  
34           any other action described in this section for processing the *Supplemental Channel*  
35           *Assignment Message*:

- 36           • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
37                   set to '00000110' (capability not supported), if the number of forward or reverse  
38                   Supplemental Code Channels specified in the *Supplemental Channel Assignment*  
39                   *Message* is greater than the maximum number of Supplemental Code Channels  
40                   supported by the mobile station.

- 1     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
2       set to '00000011' (message structure not acceptable), if both  
3       USE\_REV\_HDM\_SEQ and EXPL\_REV\_START\_TIME or both  
4       USE\_FOR\_HDM\_SEQ and EXPL\_FOR\_START\_TIME specified in the  
5       *Supplemental Channel Assignment Message* are set to '1'.  
6  
7     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
8       set to '00000100' (message field not in valid range), if PILOT\_PN specified in the  
9       *Supplemental Channel Assignment Message* is not in the Active Set and this  
      message is not linked with a *General Handoff Direction Message*.

10   If none of the above conditions is true, the mobile station shall perform the  
11   following.

- 12    • The mobile station shall store the following parameters from the *Supplemental*  
13      *Channel Assignment Message*:
  - 14       – Use *General Handoff Direction Message* forward sequence number indicator  
15       (USE\_FOR\_HDM\_SEQ<sub>s</sub> = USE\_FOR\_HDM\_SEQ<sub>r</sub>)
  - 16       – If USE\_FOR\_HDM\_SEQ<sub>r</sub> is equal to '1', then the mobile station shall store  
17       the following:
    - 18           + The sequence number of the *General Handoff Direction Message* to which  
19            this messaged is linked for the Forward Supplemental Code Channel  
20            assignment (FOR\_LINKED\_HDM\_SEQ<sub>s</sub> = FOR\_LINKED\_HDM\_SEQ<sub>r</sub>)
    - 21           + The forward Supplemental Code Channel assignment order  
22           (SCAM\_FOR\_ORDER<sub>s</sub> = least significant bit of FOR\_SUP\_CONFIG<sub>r</sub>)
    - 23           + The forward duration assignment indicator  
24           (SCAM\_FOR\_DURATION\_MODE<sub>s</sub> = USE\_FOR\_DURATION<sub>r</sub>).  
25
    - 26       – Use *General Handoff Direction Message* reverse sequence number indicator  
27       (USE\_REV\_HDM\_SEQ<sub>s</sub> = USE\_REV\_HDM\_SEQ<sub>r</sub>)
    - 28       – If USE\_REV\_HDM\_SEQ<sub>r</sub> is equal to '1', then the mobile station shall store  
      the following:
      - 29           + The sequence number of the *General Handoff Direction Message* to which  
30            this messaged is linked for the Reverse Supplemental Code Channel  
31            assignment (REV\_LINKED\_HDM\_SEQ<sub>s</sub> = REV\_LINKED\_HDM\_SEQ<sub>r</sub>)
      - 32           + The reverse duration assignment indicator  
33           (SCAM\_REV\_DURATION\_MODE<sub>s</sub> = USE\_REV\_DURATION<sub>r</sub>).  
34
  - 35    • If USE\_RETRY\_DELAY<sub>r</sub> is '0', then the mobile station shall store 0 as  
36       RETRY\_DELAY<sub>s</sub>. The mobile station may send subsequent *Supplemental*  
37       *Channel Request Messages* whenever RETRY\_DELAY<sub>s</sub> is set to 0.  
38  
39    • If USE\_RETRY\_DELAY<sub>r</sub> is set to '1', the mobile station shall interpret the  
40       *Supplemental Channel Assignment Message* as an indication that the base  
      station has specified a *Supplemental Channel Request Message* retry delay in  
      RETRY\_DELAY<sub>r</sub> as follows:

- The mobile station shall store the next system time 80 ms boundary +  $\text{RETRY\_DELAY}_r \times 320$  ms as  $\text{RETRY\_DELAY}_s$ . The mobile station shall not send any subsequent *Supplemental Channel Request Message* until after the system time stored in  $\text{RETRY\_DELAY}_s$ . At the system time stored in  $\text{RETRY\_DELAY}_s$ , the mobile station shall reset  $\text{RETRY\_DELAY}_s$  to 0.
- If  $\text{RETRY\_DELAY}_r$  is ‘00000000’, then the mobile station shall store 0 as  $\text{RETRY\_DELAY}_s$ . The mobile station may send subsequent *Supplemental Channel Request Messages* whenever  $\text{RETRY\_DELAY}_s$  is set to 0.
- If  $\text{RETRY\_DELAY}_r$  is ‘11111111’, then the mobile station shall store *infinity* as  $\text{RETRY\_DELAY}_s$ , and the mobile station shall not send any further *Supplemental Channel Request Messages* until the mobile station receives a new *Supplemental Channel Assignment Message* with no retry delay or a non-infinite retry delay specified, or until the mobile station receives a *General Handoff Direction Message* with a *CLEAR\_RETRY\_DELAY* indication set.
- If  $\text{REV\_INCLUDED}_r$  is equal to ‘1’, then the mobile station shall process Reverse Supplemental Code Channel assignment information for the *Supplemental Channel Assignment Message*. This information shall be processed as follows:
  - The mobile station shall store  $\text{USE\_T\_ADD\_ABORT}_r$ , the Reverse Supplemental Code Channel assignment T\_ADD abort indicator, as  $\text{USE\_T\_ADD\_ABORT}_s$ .
  - The mobile station shall store  $\text{REV\_DTX\_DURATION}_r$ , Reverse Supplemental Channel Discontinuous Transmission Duration, as  $\text{REV\_DTX\_DURATION}_s$ .
  - If  $\text{REV\_PARMS\_INCLUDED}_r$  is equal to ‘1’, the mobile station shall store the following:
    - +  $\text{T\_MULCHAN}_s = \text{T\_MULCHAN}_r$
    - +  $\text{BEGIN\_PREAMBLE}_s = \text{BEGIN\_PREAMBLE}_r$
    - +  $\text{RESUME\_PREAMBLE}_s = \text{RESUME\_PREAMBLE}_r$
  - If  $\text{IGNORE\_SCAM}_s$  is equal to ‘1’ and  $\text{SCRM\_SEQ\_NUM}_r$  is not present or is present and is not equal to  $\text{SCRM\_SEQ\_NUM}_s$ , then the mobile station shall not process the remaining Reverse Supplemental Code Channel assignment information in this message.
  - If  $\text{IGNORE\_SCAM}_s$  is equal to ‘1’ and  $\text{SCRM\_SEQ\_NUM}_r$  is present and is equal to  $\text{SCRM\_SEQ\_NUM}_s$ , then the mobile station shall set  $\text{IGNORE\_SCAM}_s$  to ‘0’.
  - The mobile station shall set  $\text{REV\_START\_TIME}_s$  as follows:
    - + If  $\text{EXPL\_REV\_START\_TIME}_r$  is equal to ‘1’, the mobile station shall set the  $\text{REV\_START\_TIME}_s$  to  $\text{REV\_START\_TIME}_r$ .
    - + If  $\text{USE\_REV\_HDM\_SEQ}_r$  is equal to ‘1’ and  $\text{REV\_LINKED\_HDM\_SEQ}_r$  is not equal to  $\text{HDM\_SEQ}_s$ , the mobile station shall set the  $\text{REV\_START\_TIME}_s$  to NULL.

- + If USE\_REV\_HDM\_SEQ<sub>r</sub> is equal to ‘1’ and REV\_LINKED\_HDM\_SEQ<sub>r</sub> is equal to HDM\_SEQ<sub>s</sub>, then the mobile station shall set the REV\_START\_TIME<sub>s</sub> to the action time of the *General Handoff Direction Message* that is linked to the *Supplemental Channel Assignment Message*.
- + If EXPL\_REV\_START\_TIME<sub>r</sub> is equal to ‘0’ and USE\_REV\_HDM\_SEQ<sub>r</sub> is equal to ‘0’, the mobile station shall set the REV\_START\_TIME<sub>s</sub> to the next 80 ms boundary following the action time of the *Supplemental Channel Assignment Message*.
- The mobile station shall set NUM\_REV\_CODES<sub>s</sub> to NUM\_REV\_CODES<sub>r</sub>. If REV\_START\_TIME<sub>s</sub> is not equal to NULL, the mobile station shall perform the following actions:
  - + If NUM\_REV\_CODES<sub>r</sub> is equal to ‘000’, the mobile station shall stop transmitting the Reverse Supplemental Code Channels at the start time specified by REV\_START\_TIME<sub>s</sub>.
  - + If NUM\_REV\_CODES<sub>r</sub> is not equal to ‘000’, the mobile station shall set PILOT\_GATING\_USE\_RATE to ‘0’ at the action time of the message and the mobile station may start transmitting on NUM\_REV\_CODES<sub>s</sub> Reverse Supplemental Code Channels at the start time specified by REV\_START\_TIME<sub>s</sub> for a duration of time specified by the following rules:
    - o If USE\_REV\_DURATION<sub>r</sub> is equal to ‘1’, the mobile station shall set REV\_DURATION<sub>s</sub> to REV\_DURATION<sub>r</sub>. The mobile station may continue transmitting on the Reverse Supplemental Code Channels for a period of (REV\_DURATION<sub>s</sub> × 80) ms, or until it receives the action time of a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Reverse Supplemental assignment duration or start time.
    - o If USE\_REV\_DURATION<sub>r</sub> is equal to ‘0’, the mobile station may continue to transmit indefinitely on the Reverse Supplemental Code Channels, or until it receives the action time of a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Reverse Supplemental assignment duration or start time.
- If FORINCLUDED is equal to ‘1’, then the mobile station shall process Forward Supplemental Code Channel assignment information as follows:
  - The mobile station shall assign a value to FOR\_START\_TIME<sub>s</sub> according to the following rules:
    - + If EXPL\_FOR\_START\_TIME is equal to ‘1’, the mobile station shall set the FOR\_START\_TIME<sub>s</sub> to FOR\_START\_TIME<sub>r</sub>.
    - + If USE\_FOR\_HDM\_SEQ<sub>r</sub> is equal to ‘1’ and FOR\_LINKED\_HDM\_SEQ<sub>r</sub> is not equal to HDM\_SEQ<sub>s</sub>, the mobile station shall set the FOR\_START\_TIME<sub>s</sub> to NULL.

- + If USE\_FOR\_HDM\_SEQ<sub>r</sub> is equal to '1' and FOR\_LINKED\_HDM\_SEQ<sub>r</sub> is equal to HDM\_SEQ<sub>s</sub>, then the mobile station shall set the FOR\_START\_TIME<sub>s</sub> to the action time of the *General Handoff Direction Message* that is linked to the *Supplemental Channel Assignment Message*.
- + If EXPL\_FOR\_START\_TIME<sub>r</sub> is equal to '0' and USE\_FOR\_HDM\_SEQ<sub>r</sub> equals '0', the mobile station shall set the FOR\_START\_TIME<sub>s</sub> to the action time of the *Supplemental Channel Assignment Message*.
- If FOR\_SUP\_CONFIG<sub>r</sub> is equal to '00' and FOR\_START\_TIME<sub>s</sub> is not equal to NULL, the mobile station should stop processing the Forward Supplemental Code Channels at the time specified by FOR\_START\_TIME<sub>s</sub>.
- If FOR\_SUP\_CONFIG<sub>r</sub> is equal to '01' and FOR\_START\_TIME<sub>s</sub> is not equal to NULL, the mobile station shall set PILOT\_GATING\_USE\_RATE to '0' at the action time of the message and start processing the Forward Supplemental Code Channels in the CODE\_CHAN\_LIST<sub>s</sub> at FOR\_START\_TIME<sub>s</sub> for a period of time specified by the following rules:
  - + If USE\_FOR\_DURATION is equal to '1', the mobile station shall set FOR\_DURATION<sub>s</sub> to FOR\_DURATION<sub>r</sub>. The mobile station shall continue processing the Forward Supplemental Code Channels for a period of (FOR\_DURATION<sub>s</sub> × 80) ms, or until it receives the action time of a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental assignment duration or start time.
  - + If USE\_FOR\_DURATION<sub>r</sub> is equal to '0', the mobile station shall continue processing the Forward Supplemental Code Channels until it receives the action time of a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental assignment duration or start time.
- If FOR\_SUP\_CONFIG<sub>r</sub> is equal to '10', the mobile station shall perform the following:
  - + The mobile station shall update the CODE\_CHAN\_LIST<sub>s</sub> as specified in 2.6.8.
  - + If FOR\_START\_TIME<sub>s</sub> is not equal to NULL the mobile station should stop processing Forward Supplemental Code Channels at the time specified by FOR\_START\_TIME<sub>s</sub>.
- If FOR\_SUP\_CONFIG<sub>r</sub> is equal to '11', the mobile station shall perform the following:
  - + The mobile station shall update the CODE\_CHAN\_LIST<sub>s</sub> as specified in 2.6.8.

- + If FOR\_START\_TIME<sub>s</sub> is not equal to NULL, then the mobile station shall set PILOT\_GATING\_USE\_RATE to '0' at the action time of the message and start processing the Forward Supplemental Code Channels in the CODE\_CHAN\_LIST<sub>s</sub> at the time specified by FOR\_START\_TIME<sub>s</sub> for a period of time specified by the following rules:
  - o If USE\_FOR\_DURATION<sub>r</sub> is equal to '1', the mobile station shall set FOR\_DURATION<sub>s</sub> to FOR\_DURATION<sub>r</sub>. The mobile station shall continue processing the Forward Supplemental Code Channels for (FOR\_DURATION<sub>s</sub> × 80) ms, until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental assignment duration or start time.
  - o If USE\_FOR\_DURATION<sub>r</sub> is equal to '0', the mobile station shall continue processing the Forward Supplemental Code Channels until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental assignment duration or start time.

9. *General Handoff Direction Message*: The mobile station shall process the message as follows:

In addition to the requirements in this section, if the SCR\_INCLUDED field is included in this message and is set to '1' the mobile station shall also process this message in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to the specified value if any of the following conditions is true, and shall not perform any other action described in this section for processing the *General Handoff Direction Message*:

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the mobile station does not support the band class specified in the *General Handoff Direction Message*.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the number of forward or reverse Supplemental Code Channels specified in the *General Handoff Direction Message* is greater than the maximum number of Supplemental Code Channels supported by the mobile station.
- If the SCR\_INCLUDED field is included in this message and is set to '1', the mobile station shall do the following:
  - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message cannot be handled by the current mobile station configuration), if the mobile station does not support the service configuration specified in the *General Handoff Direction Message*.

- 1            - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
 2            '00000111') within T<sub>56m</sub> seconds, if the mobile station supports the service  
 3            configuration specified but does not accept the service configuration specified  
 4            in the *General Handoff Direction Message*.
- 5       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 6            set to '00000111' (message cannot be handled by the current mobile station  
 7            configuration), if the NNSCR\_INCLUDED field is included and set to '1' and the  
 8            SCR\_INCLUDED field is either not included or included but set to '0', and the  
 9            mobile station does not support the configuration specified in the non-negotiable  
 10          service configuration information record in the *General Handoff Direction  
                 Message*.
- 12       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 13            set to '00001010' (search set not specified), if the PERIODIC\_SEARCH field is  
 14            included in the *General Handoff Direction Message* and is set to '1', and the  
 15            Candidate Frequency Search Set is empty.
- 16       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 17            set to '00001101' (search period too short), if the PERIODIC\_SEARCH field is  
 18            included in the *General Handoff Direction Message* and is set to '1', and  
 19            *search\_period* is less than (max (*fwd\_time*, *rev\_time*) + T<sub>71m</sub> seconds), where  
 20            *search\_period* = time period corresponding to SEARCH\_PERIOD<sub>S</sub> shown in  
 21            Table 2.6.6.2.8.3.2-1,
- 22            *fwd\_time* = the mobile station's estimate of the total length of time, in seconds,  
 23            for which the mobile station will need to suspend its current  
 24            Forward Traffic Channel processing in order to tune to the CDMA  
 25            Candidate Frequency, to search the Candidate Frequency Search  
 26            Set, and to re-tune to the Serving Frequency; if the mobile station  
 27            searches the Candidate Frequency Search Set in multiple visits,  
 28            *fwd\_time* is the total time for all visits to the CDMA Candidate  
 29            Frequency in a search period (see 2.6.6.2.8.3.2),
- 30            and
- 31            *rev\_time* = the mobile station's estimate of the total length of time, in seconds,  
 32            for which the mobile station will need to suspend its current Reverse  
 33            Traffic Channel processing in order to tune to the CDMA Candidate  
 34            Frequency, to search the Candidate Frequency Search Set, and to  
 35            re-tune to the Serving Frequency; if the mobile station searches the  
 36            Candidate Frequency Search Set in multiple visits, *rev\_time* is the  
 37            total time for all visits to the CDMA Candidate Frequency in a search  
 38            period.
- 39            If none of the above conditions is true, the mobile station shall perform the actions  
 40            described in the remainder of this section to process the *General Handoff Direction  
                 Message* at the action time of the message.

1       If EXTRA\_PARMS is equal to '1', the mobile station shall store the return on failure  
 2       indicator from the *General Handoff Direction Message* (RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub>  
 3       = RETURN\_IF\_HANDOFF\_FAIL<sub>r</sub>); otherwise the mobile station shall set  
 4       RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> to '0'.

5       The mobile station shall set RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> to '0' (disable return on  
 6       failure) if any of the following conditions is true:

- 7       • If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to four and the mobile station does not  
       support hard handoff with return on failure, or
- 9       • At least one of the pilots specified by the message is also included in the Active  
 10      Set prior to the action time of the message, and one of the following conditions is  
 11      true:
  - 12       – EXTRA\_PARMS is equal to '0', or
  - 13       – EXTRA\_PARMS is equal to '1', the message specifies the same Frequency  
       Assignment as the Serving Frequency (BAND\_CLASS<sub>r</sub> is equal to  
       CDMABAND<sub>s</sub> and CDMA\_FREQ<sub>r</sub> is equal to CDMACH<sub>s</sub>), and  
       FRAME\_OFFSET<sub>r</sub> is equal to FRAME\_OFFSET<sub>s</sub>.

17      The mobile station shall store the following parameters from its current  
 18      configuration:

- 19       • CDMA band class (SF\_CDMABAND<sub>s</sub> = CDMABAND<sub>s</sub>)
- 20       • Frequency assignment (SF\_CDMACH<sub>s</sub> = CDMACH<sub>s</sub>)
- 21       • Frame Offset (SF\_FRAME\_OFFSET<sub>s</sub> = FRAME\_OFFSET<sub>s</sub>)

22      If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', the mobile station shall also store the  
 23      following parameters from its current configuration:

- 24       • Protocol revision level  
       (SF\_P\_REV<sub>s</sub> = P\_REV<sub>s</sub>)
- 26       • Protocol revision level in use on the Serving Frequency  
       (SF\_P\_REV\_IN\_USE<sub>s</sub> = P\_REV\_IN\_USE<sub>s</sub>)
- 28       • Search window size for the Active Set and Candidate Set  
       (SF\_SRCH\_WIN\_A<sub>s</sub> = SRCH\_WIN\_A<sub>s</sub>)
- 30       • Search window size for the Neighbor Set  
       (SF\_SRCH\_WIN\_N<sub>s</sub> = SRCH\_WIN\_N<sub>s</sub>)
- 32       • Search window size for the Remainder Set  
       (SF\_SRCH\_WIN\_R<sub>s</sub> = SRCH\_WIN\_R<sub>s</sub>)
- 34       • Pilot detection threshold  
       (SF\_T\_ADD<sub>s</sub> = T\_ADD<sub>s</sub>)
- 36       • Pilot drop threshold  
       (SF\_T\_DROP<sub>s</sub> = T\_DROP<sub>s</sub>)

- 1     • Active Set versus Candidate Set comparison threshold  
(SF\_T\_COMP<sub>S</sub> = T\_COMP<sub>S</sub>)
- 2
- 3     • Drop timer value  
(SF\_T\_TDROPS<sub>S</sub> = T\_TDROPS<sub>S</sub>)
- 4
- 5     • Soft slope for the dynamic add and drop thresholds  
(SF\_SOFT\_SLOPE<sub>S</sub> = SOFT\_SLOPE<sub>S</sub>)
- 6
- 7     • Intercept for the dynamic add threshold  
(SF\_ADD\_INTERCEPT<sub>S</sub> = ADD\_INTERCEPT<sub>S</sub>)
- 8
- 9     • Intercept for the dynamic drop threshold  
(SF\_DROP\_INTERCEPT<sub>S</sub> = DROP\_INTERCEPT<sub>S</sub>)
- 10
- 11    • Private long code mask indicator: If the mobile station is using the private long  
12    code mask on the Serving Frequency, it shall set SF\_PRIVATE\_LCM<sub>S</sub> to '1';  
13    otherwise, it shall set SF\_PRIVATE\_LCM<sub>S</sub> to '0'.

- 14    • Service negotiation type  
(SF\_SERV\_NEG<sub>S</sub> = SERV\_NEG<sub>S</sub>)
- 15

- 16    • Service configuration:  
17      Store the current service configuration (service configuration record and non-  
18      negotiable service configuration record) in SF\_SERVICE\_CONFIG<sub>S</sub>

- 19    • **Call Information:**

[Store the list of current calls \(Call Control instances, etc.\) in SF\\_CALLS<sub>S</sub>](#)

- 21    • Message encryption mode: If message encryption is on, the mobile station shall  
22      set SF\_ENCRYPT\_MODE<sub>S</sub> to '1'; otherwise, the mobile station shall set  
23      SF\_ENCRYPT\_MODE<sub>S</sub> to '0'.
- 24    • Extended nominal power setting of the current cell  
(SF\_NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>S</sub>)
- 25
- 26    • Nominal power setting of the current cell  
(SF\_NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>S</sub>)
- 27
- 28    • Power control step  
(SF\_PWR\_CNTL\_STEP<sub>S</sub> = PWR\_CNTL\_STEP<sub>S</sub>)
- 29
- 30    • Serving Frequency Active Set (SF Active Set = □For each pilot in the current  
31      Active Set: (PILOT\_PN, PWR\_COMB\_IND) □ )
- 32
- 33    • Serving Frequency Code Channel List  
(SF\_CODE\_CHAN\_LIST<sub>S</sub> = CODE\_CHAN\_LIST<sub>S</sub>)

34    When the message takes effect, the mobile station shall perform the following  
35    actions:

- 36    • The mobile station shall send a *Handoff Completion Message* or an *Extended  
37      Handoff Completion Message* as specified in 2.6.6.2.5.2.

- 1     • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the  
2       *General Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and  
3       2.6.6.2.6.3).
- 4     • The mobile station shall delete all pilots that are not listed in the Active Set of  
5       the Fundamental Channel from the Active Set of the Supplemental Channel for  
6       the Forward Supplemental Channel Assignment (if any). If these deleted pilots  
7       include all pilots in the Active Set of the Supplemental Channel, the mobile  
8       station shall cancel the Forward Supplemental Channel Assignment.
- 9     • Discontinue use of all Forward Traffic Channels associated with pilots not listed  
10      in the *General Handoff Direction Message*.
- 11    • If EXTRA\_PARMS is equal to '1', perform the following actions:
  - 12      – If FRAME\_OFFSET<sub>r</sub> is not equal to FRAME\_OFFSET<sub>s</sub>, change the frame  
13       offset on all of the code channels of the Forward Traffic Channel and of the  
14       Reverse Traffic Channel.
  - 15      – If RESET\_L2<sub>r</sub> is equal to '1', and RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '0',  
16       Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset the  
17       acknowledgment procedures, as specified in 2.2.1.1 and 2.2.2.1 of [4]. The  
18       mobile station shall reset the acknowledgment procedures immediately after  
19       the action time of the *General Handoff Direction Message*.
  - 20      – If RESET\_FPC<sub>r</sub> is equal to '1' and RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to  
21       '0', initialize the Forward Traffic Channel power control counters, as specified  
22       in 2.6.4.1.1.1.
  - 23      – If SERV\_NEG\_TYPE<sub>r</sub> is equal to '1', set SERV\_NEG<sub>s</sub> to enabled; otherwise set  
24       SERV\_NEG<sub>s</sub> to disabled.
  - 25      – Use the long code mask specified by the PRIVATE\_LCM<sub>r</sub> (see 2.3.12.3) and  
26       indicate to the user the voice privacy mode status.
  - 27      – Process the ENCRYPT\_MODE field, as specified in 2.3.12.2.
    - 28       – If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is included and is not set to '000', the mobile  
29           station shall set D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to D\_SIG\_ENCRYPT\_MODE<sub>r</sub> and  
30           set ENC\_KEY<sub>s</sub> to the most recently generated CMEAKEY in the mobile  
31           station.
    - 32       – If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is included, the mobile station shall perform the  
33           following:
      - 34           + If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is equal to '000', the mobile station shall set  
35              D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>s</sub>; otherwise, the  
36              mobile station shall set D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to  
37              D\_SIG\_ENCRYPT\_MODE<sub>r</sub> and set KEY<sub>s</sub> to the most recently generated  
38              CMEAKEY in the mobile station.
      - 39           – If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is included, the mobile station shall set  
40              D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to D\_SIG\_ENCRYPT\_MODE<sub>r</sub>.

- 1           – If ENC KEY SIZE<sub>r</sub> is included, the mobile station shall set ENC KEY SIZE<sub>s</sub>  
 2            to ENC KEY SIZE<sub>r</sub>.
- 3     • If EXTRA\_PARMS is equal to ‘0’, set the following variables to the values  
 4        indicated:
- 5        – Hard handoff traffic channel preamble count required before transmitting a  
 6          *Handoff Completion Message* or an *Extended Handoff Completion Message*  
 7          ( $\text{NUM\_PREAMBLE}_s = '000'$ )
- 8        – Complete search flag ( $\text{COMPLETE\_SEARCH}_s = '1'$ )
- 9        – CDMA band class for the Target Frequency  
 10        ( $\text{TF\_CDMABAND}_s = \text{SF\_CDMABAND}_s$ )
- 11        – Frequency assignment for the Target Frequency  
 12        ( $\text{TF\_CDMACH}_s = \text{SF\_CDMACH}_s$ )
- 13     • Store the following parameters from the *General Handoff Direction Message*:
- 14        – *General Handoff Direction Message* sequence number  
 15        ( $\text{HDM\_SEQ}_s = \text{HDM\_SEQ}_r$ )
- 16        – Forward power control subchannel relative gain ( $\text{FPC\_SUBCHAN\_GAIN}_s =$   
 17           $\text{FPC\_SUBCHAN\_GAIN}_r$ ).
- 18        – If the mobile station uses  $\text{FPC\_SUBCHAN\_GAIN}_s$ , the mobile station shall  
 19          perform the following:
- 20           + If  $\text{PC\_ACTION\_TIME}_r$  is received, the mobile station shall apply its usage  
 21            of the  $\text{FPC\_SUBCHAN\_GAIN}_s$  at the time specified by  $\text{PC\_ACTION\_TIME}_r$ .
- 22           + If  $\text{PC\_ACTION\_TIME}$  is not received and the explicit action time is  
 23            received, the mobile station shall apply its usage of the  
 24             $\text{FPC\_SUBCHAN\_GAIN}_s$  at the action time.
- 25           + If neither  $\text{PC\_ACTION\_TIME}_r$  nor explicit action time is received, the  
 26            mobile station shall apply its usage of the  $\text{FPC\_SUBCHAN\_GAIN}_s$  at the  
 27            first 80ms boundary occurring at least 80ms after the end of the frame  
 28            containing the last bit of the *General Handoff Direction Message* sent to  
 29            the mobile station.
- 30        – Reverse Eighth Gating Mode ( $\text{REV\_FCH\_GATING\_MODE}_s =$   
 31           $\text{REV\_FCH\_GATING\_MODE}_r$ ).
- 32        – Reverse Power Control Delay if  $\text{REV\_PWR\_CNTL\_DELAY\_INCL}_r$  is equal to ‘1’  
 33          ( $\text{REV\_PWR\_CNTL\_DELAY}_s = \text{REV\_PWR\_CNTL\_DELAY}_r$ ).
- 34        – If  $\text{SEARCH\_INCLUDED}$  is equal to ‘1’, store the following:
- 35           + Search window size for the Active Set and Candidate Set  
 36            ( $\text{SRCH\_WIN\_A}_s = \text{SRCH\_WIN\_A}_r$ )
- 37           + Pilot detection threshold  
 38            ( $\text{T\_ADD}_s = \text{T\_ADD}_r$ )

- 1       + Pilot drop threshold  
( $T_{DROP_S} = T_{DROP_R}$ )
- 2
- 3       + Active Set versus Candidate Set comparison threshold  
( $T_{COMP_S} = T_{COMP_R}$ )
- 4
- 5       + Drop timer value  
( $T_{TDROP_S} = T_{TDROP_R}$ )
- 6
- 7       + Soft slope for the dynamic add and drop thresholds  
( $SOFT\_SLOPE_S = SOFT\_SLOPE_R$ )
- 8
- 9       + Intercept for the dynamic add threshold  
( $ADD\_INTERCEPT_S = ADD\_INTERCEPT_R$ )
- 10
- 11      + Intercept for the dynamic drop threshold  
( $DROP\_INTERCEPT_S = DROP\_INTERCEPT_R$ )
- 12
- 13     - If EXTRA\_PARMS is equal to '1', store the following:
- 14       + Protocol revision level ( $P_{REV_S} = P_{REV_R}$ ), and protocol revision level  
currently in use ( $P_{REV\_IN\_USE_S} = \min(P_{REV_S}, MOB\_P\_REV_p$  of the  
current band class) )
- 15
- 16       + If the mobile station supports packet data service options, the packet  
data services zone identifier ( $PACKET\_ZONE\_ID_S = PACKET\_ZONE\_ID_R$ )
- 17
- 18       + Frame offset ( $FRAME\_OFFSET_S = FRAME\_OFFSET_R$ )
- 19
- 20       + Acknowledgment procedures reset indicator  
(If  $RETURN\_IF\_HANDOFF\_FAIL_S$  is equal to '1', set  $TF\_RESET\_L2_S$  to  
 $RESET\_L2_R$ )
- 21
- 22
- 23       + Indicator to initialize the Forward Traffic Channel power control counters  
(If  $RETURN\_IF\_HANDOFF\_FAIL_S$  is equal to '1', set  $TF\_RESET\_FPC_S$  to  
 $RESET\_FPC_R$ )
- 24
- 25
- 26       + Nominal power setting of the target cell ( $NOM\_PWR_S = NOM\_PWR_R$ )
- 27
- 28       + Extended nominal power setting of the target cell (If  $CDMABAND_S =$   
'00000' or  $CDMABAND_S = '00011'$ , then  $NOM\_PWR\_EXT_S = '0'$ ; otherwise,  
 $NOM\_PWR\_EXT_S = NOM\_PWR\_EXT_R$ )
- 29
- 30       + Hard handoff traffic channel preamble count required before transmitting  
a *Handoff Completion Message* or an *Extended Handoff Completion  
Message* ( $NUM\_PREAMBLE_S = NUM\_PREAMBLE_R$  )
- 31
- 32
- 33       + CDMA band class for the Target Frequency  
( $TF\_CDMABAND_S = BAND\_CLASS_R$  and  $CDMABAND_S = BAND\_CLASS_R$ )
- 34
- 35       + Frequency assignment for the Target Frequency  
( $TF\_CDMACH_S = CDMA\_FREQ_R$  and  $CDMACH_S = CDMA\_FREQ_R$ )
- 36
- 37       + Complete search flag ( $COMPLETE\_SEARCH_S = COMPLETE\_SEARCH_R$ )
- 38       + Periodic search flag ( $PERIODIC\_SEARCH_S = PERIODIC\_SEARCH_R$ )

- + Nominal code channel output power offset relative to the Reverse Pilot Channel power ( $\text{RLGAIN\_TRAFFIC\_PILOT}_S = \text{RLGAIN\_TRAFFIC\_PILOT}_R$ )
- If EXTRA\_PARMS is equal to '1' and DEFAULT\_RLAG is equal to '1', the mobile station shall set each entry of the Reverse Link Attribute Adjustment Gain Table and Reverse Channel Adjustment Gain Table (see 2.1.2.3.3 of [2]) to 0.
- If REV\_PARMS\_INCLUDED is included and is equal to '1', the mobile station shall store the following:
  - + [Reverse Supplemental Code Channel Request Message neighbor Neighbor pilot strength measurement threshold offset channel pilot strength offset](#) ( $T_{\text{MULCHAN}}_S = T_{\text{MULCHAN}}_R$ )
  - + Reverse Supplemental Code Channel beginning of transmission preamble length ( $\text{BEGIN\_PREAMBLE}_S = \text{BEGIN\_PREAMBLE}_R$ )
  - + Reverse Supplemental Code Channel resumption of transmission preamble length ( $\text{RESUME\_PREAMBLE}_S = \text{RESUME\_PREAMBLE}_R$ )
- For each pilot included in the message, the mobile station shall store the following:
  - + PILOT\_PN, the pilot PN sequence offset index
  - + PWR\_COMB\_IND, the power control symbol combining indicator
  - If USE\_PWR\_CNTL\_STEP is equal to '1' and PWR\_CNTL\_STEP<sub>R</sub> corresponds to a power control step size supported by the mobile station (see 2.1.2.3.2 of [2]), then the mobile station shall set PWR\_CNTL\_STEPS to PWR\_CNTL\_STEP<sub>R</sub>.
- Set the pilot detection threshold for the Target Frequency and the Candidate Frequency:
  - Set TF\_T\_ADD<sub>S</sub> to T\_ADD<sub>S</sub>.
  - If the Target Frequency is the same as the Candidate Frequency ( $\text{TF\_CDMABAND}_S$  is equal to  $\text{CF\_CDMABAND}_S$  and  $\text{TF\_CDMACH}_S$  is equal to  $\text{CF\_CDMACH}_S$ ), set CF\_T\_ADD<sub>S</sub> to T\_ADD<sub>S</sub>.
- If FOR\_INCLUDED is included and is equal to '0', the mobile station shall perform the following:
  - The mobile station shall update the Code Channel List, CODE\_CHAN\_LIST<sub>S</sub>, as specified in 2.6.8.
  - If USE\_FOR\_HDM\_SEQ<sub>S</sub> is equal to '1' and FOR\_LINKED\_HDM\_SEQ<sub>S</sub> is equal to HDM\_SEQ<sub>R</sub> (this indicates that there is pending Forward Supplemental Code Channel assignment information, received in a *Supplemental Channel Assignment Message*, linked to this *General Handoff Direction Message*), then the mobile station shall perform the following actions:

- + The mobile station shall set USE\_FOR\_HDM\_SEQ<sub>s</sub> to '0'.
- + If SCAM\_FOR\_ORDER<sub>s</sub> is equal to '0', the mobile station shall stop processing all Forward Supplemental Code Channels at the action time of the *General Handoff Direction Message*.
- + If SCAM\_FOR\_ORDER<sub>s</sub> is equal to '1', the mobile station shall start processing the Forward Supplemental Code Channels specified in CODE\_CHAN\_LIST<sub>s</sub> at the action time of the *General Handoff Direction Message*, for a period of time determined by the following rules:
  - o If SCAM\_FOR\_DURATION\_MODE<sub>s</sub> is equal to '1', the mobile station shall continue processing the Forward Supplemental Code Channels for a period of (FOR\_DURATION<sub>s</sub> × 80) ms, until it receives a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Forward Supplemental Code Channel assignment.
  - o If SCAM\_FOR\_DURATION\_MODE<sub>s</sub> is equal to '0', the mobile station shall continue processing the Forward Supplemental Code Channels until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental Code Channel assignment.
- If USE\_FOR\_HDM\_SEQ<sub>s</sub> is equal to '0' or FOR\_LINKED\_HDM\_SEQ<sub>s</sub> is not equal to HDM\_SEQ<sub>r</sub>, and if the mobile station is currently processing Forward Supplemental Code Channels, it shall continue processing the Forward Supplemental Code Channels using the updated Code Channel List, CODE\_CHAN\_LIST<sub>s</sub>.
- If NNSCR\_INCLUDED field is included and set to '1' and SCR\_INCLUDED field is either not included or included but set to '0', the mobile station shall process the received Non-negotiable Service Configuration Record as specified in 2.6.4.1.13 at the action time of this message and the mobile station shall store (if included) the synchronization identifier received from the base station corresponding to this service configuration (SYNC\_ID<sub>s</sub> = SYNC\_ID<sub>r</sub>).
- If FOR\_INCLUDED is included and is equal to '1', then the mobile station shall process the Forward Supplemental Code Channel assignment information as follows:
  - The mobile station shall set USE\_FOR\_HDM\_SEQ<sub>s</sub> to '0'.
  - If FOR\_START\_TIME<sub>s</sub> specifies a time which is after the action time of the *General Handoff Direction Message*, the mobile station shall cancel any pending Forward Supplemental Code Channel assignment and shall set FOR\_START\_TIME<sub>s</sub> to NULL.
  - The mobile station shall update the Code Channel List, CODE\_CHAN\_LIST<sub>s</sub>, in accordance with the value of FOR\_SUP\_CONFIG, as specified in 2.6.8.

- If FOR\_SUP\_CONFIG is equal to ‘00’ or ‘10’, the mobile station should stop processing Forward Supplemental Code Channels, if any, when the message takes effect.
- If FOR\_SUP\_CONFIG is equal to ‘01’ or ‘11’, the mobile station shall set PILOT\_GATING\_USE\_RATE to ‘0’ at the action time of the message and start processing the Forward Supplemental Code Channels in the updated Code Channel List, CODE\_CHAN\_LIST<sub>s</sub>, at the action time of the message, for a period of time determined by the following rules:
  - + If USE\_FOR\_DURATION is equal to ‘1’, the mobile station shall set FOR\_DURATION<sub>s</sub> to FOR\_DURATION<sub>r</sub>. The mobile station shall continue processing the Forward Supplemental Code Channels for a period of (FOR\_DURATION<sub>s</sub> × 80) ms, until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental Code Channel assignment.
  - + If USE\_FOR\_DURATION is equal to ‘0’, the mobile station shall continue processing the Forward Supplemental Code Channels until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental Code Channel assignment.
- If REV\_INCLUDED is included and is equal to ‘0’, the mobile station shall perform the following:
  - If USE\_REV\_HDM\_SEQ<sub>s</sub> is equal to ‘1’ and REV\_LINKED\_HDM\_SEQ<sub>s</sub> is equal to HDM\_SEQ<sub>r</sub> (this indicates that there is pending Reverse Supplemental Code Channel assignment information, received in a *Supplemental Channel Assignment Message*, linked to this *General Handoff Direction Message*), the mobile station shall perform the following actions:
    - + If NUM\_REV\_CODES<sub>s</sub> is equal to ‘000’, the mobile station shall stop transmitting on all Reverse Supplemental Code Channels at the action time of the message.
    - + If NUM\_REV\_CODES<sub>s</sub> is not equal to ‘000’, the mobile station may start transmitting on NUM\_REV\_CODES<sub>s</sub> Reverse Supplemental Code Channels at the action time of the message, for a duration of time determined by the following rules:
      - o If SCAM\_REV\_DURATION\_MODE<sub>s</sub> is equal to ‘1’, the mobile station may continue transmitting on the Reverse Supplemental Code Channels for a period of (REV\_DURATION<sub>s</sub> × 80) ms, until it receives a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Reverse Supplemental Code Channel assignment.

- 1        o If SCAM\_REV\_DURATION\_MODE<sub>s</sub> is equal to '0', the mobile station  
  2              may continue transmitting on the Reverse Supplemental Code  
  3              Channels until it receives a subsequent *General Handoff Direction*  
  4              *Message* or a *Supplemental Channel Assignment Message* that  
  5              specifies a different Reverse Supplemental Code Channel assignment.  
  6              + The mobile station shall set USE\_REV\_HDM\_SEQ<sub>s</sub> to '0'.  
  7        - If USE\_REV\_HDM\_SEQ<sub>s</sub> is equal to '0' or REV\_LINKED\_HDM\_SEQ<sub>s</sub> is not  
  8              equal to HDM\_SEQ<sub>r</sub>, and if the previous Reverse Supplemental Code  
  9              Channel assignment is still valid, the mobile station may continue to  
 10             transmit on the Reverse Supplemental Code Channels according to the  
 11             previously specified Reverse Supplemental Code Channel assignment.  
 12        • If REV\_INCLUDED is included and is equal to '1', then the mobile station shall  
 13             process the Reverse Supplemental Code Channel assignment information as  
 14             follows:  
 15              - The mobile station shall set REV\_DTX\_DURATION<sub>s</sub> to  
 16                REV\_DTX\_DURATION<sub>r</sub>.  
 17              - The mobile station shall set USE\_REV\_HDM\_SEQ<sub>s</sub> to '0'.  
 18              - If REV\_START\_TIME<sub>s</sub> specifies a time which is after the action time of the  
 19                *General Handoff Direction Message*, the mobile station shall cancel any  
 20                pending Reverse Supplemental Code Channel assignment and shall set  
 21                REV\_START\_TIME<sub>s</sub> to NULL.  
 22              - If CLEAR\_RETRY\_DELAY is equal to '1', the mobile station shall cancel any  
 23                previously indicated retry delay and shall set RETRY\_DELAY<sub>s</sub> to 0;  
 24                otherwise, the mobile station shall continue to honor any previously active  
 25                retry delay stored in RETRY\_DELAY<sub>s</sub>.  
 26              - The mobile station shall set NUM\_REV\_CODES<sub>s</sub> to NUM\_REV\_CODES<sub>r</sub>, and  
 27                shall perform the following actions:  
 28                + If NUM\_REV\_CODES<sub>s</sub> is equal to '000', the mobile station shall stop  
 29                transmitting on all Reverse Supplemental Code Channels at the action  
 30                time of the message.  
 31                + If NUM\_REV\_CODES<sub>s</sub> is not equal to '000', the mobile station shall set  
 32                PILOT\_GATING\_USE\_RATE to '0' at the action time of the message and  
 33                may start transmitting on NUM\_REV\_CODES<sub>s</sub> Reverse Supplemental  
 34                Code Channels at the action time of the message, for a duration of time  
 35                determined by the following rules:

- o If USE\_REV\_DURATION<sub>r</sub> is equal to '1', the mobile station shall set REV\_DURATION<sub>s</sub> to REV\_DURATION<sub>r</sub>. The mobile station may continue transmitting on the Reverse Supplemental Code Channels for a period of (REV\_DURATION<sub>s</sub> × 80) ms, until it receives a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Reverse Supplemental Code Channel assignment.
- o If USE\_REV\_DURATION is equal to '0', the mobile station may continue to transmit on the Reverse Supplemental Code Channels until it receives a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Reverse Supplemental Code Channel assignment.
  - The mobile station shall store USE\_T\_ADD\_ABORT<sub>r</sub>, the Reverse Supplemental Code Channel assignment T\_ADD abort indicator, as USE\_T\_ADD\_ABORT<sub>s</sub>.
- The mobile station shall set IGNORE\_SCAM<sub>s</sub> and IGNORE\_ESCAM<sub>s</sub> to '0'.
- If PERIODIC\_SEARCH<sub>s</sub> is equal to '0' and a periodic search is in progress, the mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- Perform a soft or hard handoff depending on the following conditions:
  - If any of the following conditions is true, the mobile station shall perform a hard handoff:
    - + EXTRA\_PARMS is set to '1' and either BAND\_CLASS<sub>r</sub> is not equal to SF\_CDMABAND<sub>s</sub>, CDMA\_FREQ<sub>r</sub> is not equal to SF\_CDMACH<sub>s</sub>, or FRAME\_OFFSET<sub>r</sub> is not equal to SF\_FRAME\_OFFSET<sub>s</sub>, or
    - + The set of pilots specified by the message is disjoint from the Active Set prior to the action time of the message.
  - If the mobile station performs a hard handoff, it shall do the following:
    - + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the mobile station shall abort the procedure (see 2.6.6.2.12).
    - + If a Candidate Frequency periodic search is in progress, the mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
    - + The mobile station shall cancel the Forward Supplemental Channel assignment or the Reverse Supplemental Channel assignment (if any).
    - + If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '0', the mobile station shall perform actions specified in 2.6.6.2.8.1. If the message specifies more than one pilot, the mobile station shall also perform actions specified in 2.6.6.2.7.1 and 2.6.6.2.7.2.

- + If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to ‘1’, the mobile station shall perform actions specified in 2.6.6.2.8.2. If the message specifies more than one pilot, the mobile station shall also perform actions specified in 2.6.6.2.7.1 and 2.6.6.2.7.2.
- Otherwise, the mobile station shall perform a soft handoff as specified in 2.6.6.2.7.

10. *Periodic Pilot Measurement Request Order*: The mobile station shall perform the following:

- If the PPSMM timer is enabled, disable it.
- If ORDQ is equal to ‘11111111’, the mobile station shall send a *Periodic Pilot Strength Measurement Message* to the base station within T<sub>56m</sub> seconds.
- If ORDQ is not equal to ‘11111111’, the mobile station shall perform the following:
  - Set the MIN\_PILOT\_PWR\_THRESH<sub>s</sub> to MIN\_PILOT\_PWR\_THRESH<sub>r</sub> received from the *Periodic Pilot Strength Measurement Request Order*.
  - Set the MIN\_PILOT\_EC\_IO\_THRESH<sub>s</sub> to MIN\_PILOT\_EC\_IO\_THRESH<sub>r</sub> received from the *Periodic Pilot Strength Measurement Request Order*.
  - Set PPSMM\_PERIOD<sub>s</sub> equal to the larger value of ORDQ and the total length of time, in units of 80 ms, required by the mobile station to update the pilot strength measurement of each pilot in the Active Set and the Candidate Set.
  - Perform the Periodic Serving Frequency Pilot Report Procedure as specified in 2.6.6.2.12.
- If the mobile station sends the *Periodic Pilot Strength Measurement Message* and if INCL\_SETPT<sub>r</sub> is equal to ‘1’, the mobile station shall include outer loop E<sub>b</sub>/N<sub>t</sub> setpoint information corresponding to the physical channel specified by FPC\_PRI\_CHAN<sub>s</sub>, and Supplemental Channel outer loop E<sub>b</sub>/N<sub>t</sub> setpoint information if one or more Supplemental Channels are assigned, in the *Periodic Pilot Strength Measurement Message*.

11. *Universal Handoff Direction Message*: The mobile station shall process the message as follows:

In addition to the requirements in this section, if the SCR\_INCLUDED field is included in this message and is set to ‘1’ the mobile station shall also process this message in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to the specified value if any of the following conditions is true, and shall not perform any other action described in this section for processing the *Universal Handoff Direction Message*:

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field

- 1           set to '00000110' (capability not supported), if the mobile station does not  
 2           support the band class specified in *the Universal Handoff Direction Message*.
- 3       • If the SCR\_INCLUDED field is included in this message and is set to '1', the  
 4           mobile station shall do the following:
    - 5           - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
 6           field set to '00000111' (message cannot be handled by the current mobile  
 7           station configuration), if the mobile station does not support the service  
 8           configuration specified in *the Universal Handoff Direction Message*.
    - 9           - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
 10           '00000111') within  $T_{56m}$  seconds, if the mobile station supports the service  
 11           configuration specified but does not accept the service configuration specified  
 12           in *the Universal Handoff Direction Message*.
  - 13      • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 14           set to '00000111' (message cannot be handled by the current mobile station  
 15           configuration), if the NNSCR\_INCLUDED field is included and set to '1' and the  
 16           SCR\_INCLUDED field is either not included or included but set to '0', and the  
 17           mobile station does not support the configuration specified in the non-negotiable  
 18           service configuration information record in *the Universal Handoff Direction  
 19           Message*.
  - 20      • If the CC\_INFO\_INCL field is included in this message and is set to '1', the  
 21           mobile station shall perform the following for each of the NUM\_CALLS\_ASSIGN  
 22           call assignments included in this message:
    - 23           - If there already exists or currently pending instantiation a Call Control  
 24           instance identified by CON\_REF<sub>r</sub>, the mobile station shall send a *Mobile  
 25           Station Reject Order* with ORDQ field set to '00010010' (a call control instance  
 26           is already present with the specified identifier), with the CON\_REF field of the  
 27           order set to CON\_REF<sub>r</sub>.
    - 28           - If RESPONSE\_IND<sub>r</sub> equals '1' and TAG<sub>r</sub> does not match any of the TAG  
 29           values contained in the list TAG\_OUTSTANDING\_LIST, the mobile station  
 30           shall send a *Mobile Station Reject Order* with ORDQ field set to '00010011'  
 31           (TAG received does not match TAG stored), with the TAG field of the order set  
 32           to TAG<sub>r</sub>, and the CON\_REF field of the order set to CON\_REF<sub>r</sub>.
    - 33           - If the mobile station does not accept this call assignment, the mobile station  
 34           shall send a *Mobile Station Reject Order* with ORDQ field set to '00010000'  
 35           (call assignment not accepted), with the CON\_REF field of the order set to  
 36           CON\_REF<sub>r</sub>.
  - 37      • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 38           set to '00001010' (search set not specified), if the PERIODIC\_SEARCH field is

1 included in the *Universal Handoff Direction Message* and is set to ‘1’ and the  
 2 Candidate Frequency Search Set is empty.

- 3 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 4 set to ‘00000011’ (message structure not acceptable), if the message specifies the  
 5 Forward/Reverse Supplemental Channel assignment and the most significant  
 6 bit of CH\_IND<sub>r</sub> is set to ‘0’.
- 7 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 8 set to ‘00000111’ (message can not be handled by the current mobile station  
 9 configuration), if the message includes a reverse Supplemental Channel  
 10 assignment, and any of the mobile station’s reverse supplemental channel  
 11 configuration parameter for the corresponding Supplemental Channel  
 12 ~~(REV\_SCH\_MUX<sub>s</sub>, REV\_SCH\_RC<sub>s</sub>, REV\_SCH\_CODING<sub>s</sub>, or~~  
 13 ~~REV\_SCH\_FRAME\_LENGTH<sub>s</sub>)~~ is NULL.
- 14 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 15 set to ‘00000111’ (message can not be handled by the current mobile station  
 16 configuration), if the message includes a forward Supplemental Channel  
 17 assignment and any of the mobile station’s forward supplemental channel  
 18 configuration parameters for the corresponding Supplemental Channel ~~is not~~  
 19 ~~included in the message and its stored value (FOR\_SCH\_MUX<sub>s</sub>, FOR\_SCH\_RC<sub>s</sub>,~~  
 20 ~~FOR\_SCH\_CODING<sub>s</sub>, FOR\_SCH\_FRAME\_LENGTH<sub>s</sub>, QOF\_ID<sub>s</sub> for the~~  
 21 ~~corresponding SCCL\_INDEX<sub>s</sub>, or FOR\_SCH\_CC\_INDEX<sub>s</sub> for the corresponding~~  
 22 ~~SCCL\_INDEX<sub>s</sub>)~~ is NULL.
- 23 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set  
 24 to ‘00001101’ (search period too short), if the PERIODIC\_SEARCH field is included  
 25 in the *Universal Handoff Direction Message* and is set to ‘1’, and *search\_period* is less  
 26 than (max (*fwd\_time*, *rev\_time*) + T<sub>71m</sub> seconds), where

27     *search\_period* = time period corresponding to SEARCH\_PERIOD<sub>s</sub> shown in  
 28 Table 2.6.6.2.8.3.2-1,

29     *fwd\_time* = the mobile station’s estimate of the total length of time, in seconds,  
 30 for which the mobile station will need to suspend its current Forward Traffic  
 31 Channel processing in order to tune to the CDMA Candidate Frequency, to search  
 32 the Candidate Frequency Search Set, and to re-tune to the Serving Frequency; if the  
 33 mobile station searches the Candidate Frequency Search Set in multiple visits,  
 34 *fwd\_time* is the total time for all visits to the CDMA Candidate Frequency in a search  
 35 period (see 2.6.6.2.8.3.2),

36 and

1            $rev\_time$  = the mobile station's estimate of the total length of time, in seconds, for  
 2           which the mobile station will need to suspend its current Reverse Traffic Channel  
 3           processing in order to tune to the CDMA Candidate Frequency, to search the  
 4           Candidate Frequency Search Set, and to re-tune to the Serving Frequency; if the  
 5           mobile station searches the Candidate Frequency Search Set in multiple visits,  
 6            $rev\_time$  is the total time for all visits to the CDMA Candidate Frequency in a search  
 7           period.

8       If none of the above conditions is true, the mobile station shall perform the actions  
 9       described in the remainder of this section to process the *Universal Handoff Direction*  
 10      Message at the action time of the message.

11      If EXTRA\_PARMS is equal to '1', the mobile station shall store the return on failure  
 12      indicator from the *Universal Handoff Direction Message*  
 13      ( $RETURN\_IF\_HANDOFF\_FAIL_S = RETURN\_IF\_HANDOFF\_FAIL_T$ ); otherwise the  
 14      mobile station shall set  $RETURN\_IF\_HANDOFF\_FAIL_S$  to '0'.

15      The mobile station shall set  $RETURN\_IF\_HANDOFF\_FAIL_S$  to '0' (disable return on  
 16      failure) if any of the following conditions is true:

- 17       • If  $P\_REV\_IN\_USE_S$  is less than or equal to four and the mobile station does not  
 18        support hard handoff with return on failure, or
- 19       • At least one of the pilots specified by the message is also included in the Active  
 20        Set prior to the action time of the message, and one of the following conditions is  
 21        true:
  - 22           – EXTRA\_PARMS is equal to '0', or
  - 23           – EXTRA\_PARMS is equal to '1', the message specifies the same Frequency  
 24           Assignment as the Serving Frequency ( $BAND\_CLASS_T$  is equal to  
 25            $CDMABAND_S$  and  $CDMA\_FREQ_T$  is equal to  $CDMACH_S$ ), and  
 26            $FRAME\_OFFSET_T$  is equal to  $FRAME\_OFFSET_S$ .

27      The mobile station shall store the following parameters from its current  
 28      configuration:

- 29       • CDMA band class ( $SF\_CDMABAND_S = CDMABAND_S$ )
- 30       • Frequency assignment ( $SF\_CDMACH_S = CDMACH_S$ )
- 31       • Frame Offset ( $SF\_FRAME\_OFFSET_S = FRAME\_OFFSET_S$ )

32      If  $RETURN\_IF\_HANDOFF\_FAIL_S$  is equal to '1', the mobile station shall also store the  
 33      following parameters from its current configuration:

- 34       • Protocol revision level ( $SF\_P\_REV_S = P\_REV_S$ )
- 35       • Protocol revision level in use on the Serving Frequency ( $SF\_P\_REV\_IN\_USE_S =$   
 36            $P\_REV\_IN\_USE_S$ )
- 37       • Search window size for the Active Set and Candidate Set ( $SF\_SRCH\_WIN\_A_S =$   
 38            $SRCH\_WIN\_A_S$ )

- 1     • Search window size for the Neighbor Set  
(SF\_SRCH\_WIN\_N<sub>S</sub> = SRCH\_WIN\_N<sub>S</sub>),
- 2
- 3     • Search window size for the Remainder Set  
(SF\_SRCH\_WIN\_R<sub>S</sub> = SRCH\_WIN\_R<sub>S</sub>)
- 4
- 5     • Pilot detection threshold (SF\_T\_ADD<sub>S</sub> = T\_ADD<sub>S</sub>)
- 6
- 7     • Pilot drop threshold (SF\_T\_DROP<sub>S</sub> = T\_DROP<sub>S</sub>)
- 8
- 9     • Active Set versus Candidate Set comparison threshold  
(SF\_T\_COMP<sub>S</sub> = T\_COMP<sub>S</sub>)
- 10
- 11     • Drop timer value (SF\_T\_TDROPS = T\_TDROPS)
- 12
- 13     • Soft slope for the dynamic add and drop thresholds  
(SF\_SOFT\_SLOPE<sub>S</sub> = SOFT\_SLOPE<sub>S</sub>)
- 14
- 15     • Intercept for the dynamic add threshold  
(SF\_ADD\_INTERCEPT<sub>S</sub> = ADD\_INTERCEPT<sub>S</sub>)
- 16
- 17     • Intercept for the dynamic drop threshold  
(SF\_DROP\_INTERCEPT<sub>S</sub> = DROP\_INTERCEPT<sub>S</sub>)
- 18
- 19     • Private long code mask indicator: If the mobile station is using the private long code mask on the Serving Frequency, it shall set SF\_PRIVATE\_LCM<sub>S</sub> to '1'; otherwise, it shall set SF\_PRIVATE\_LCM<sub>S</sub> to '0'.
- 20
- 21     • Service negotiation type (SF\_SERV\_NEG<sub>S</sub> = SERV\_NEG<sub>S</sub>)
- 22
- 23     • Service configuration: Store the current service configuration (service configuration record and non-negotiable service configuration record) in SF\_SERVICE\_CONFIG<sub>S</sub>
- 24
- 25         **Call Information:**  
Store the list of current calls (Call Control instances, etc.) in SF\_CALLS<sub>S</sub>
- 26
- 27
- 28         • Message encryption mode: If message encryption is on, the mobile station shall set SF\_ENCRYPT\_MODE<sub>S</sub> to '1'; otherwise, the mobile station shall set SF\_ENCRYPT\_MODE<sub>S</sub> to '0'.
- 29
- 30
- 31
- 32
- 33         • If NNSCR\_INCLUDED field is included and set to '1' and SCR\_INCLUDED field is either not included or included but set to '0', the mobile station shall process the received Non-negotiable Service Configuration Record as specified in 2.6.4.1.13 at the action time of this message and the mobile station shall store (if included) the synchronization identifier received from the base station corresponding to this service configuration (SYNC\_ID<sub>S</sub> = SYNC\_ID<sub>R</sub>).
- 34
- 35
- 36
- 37             – Extended nominal power setting of the current cell  
(SF\_NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>S</sub>)
- 38
- 39             – Nominal power setting of the current cell (SF\_NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>S</sub>)
- 40
- 41             – Power control step (SF\_PWR\_CNTL\_STEP<sub>S</sub> = PWR\_CNTL\_STEP<sub>S</sub>)

- Serving Frequency Active Set (SF Active Set = (For each pilot in the current Active Set: (PILOT\_PN, PWR\_COMB\_IND) ))
- Serving Frequency Code Channel List (SF\_CODE\_CHAN\_LIST<sub>s</sub> = CODE\_CHAN\_LIST<sub>s</sub>)

When the message takes effect, the mobile station shall perform the following actions:

- The mobile station shall send a *Handoff Completion Message* or an *Extended Handoff Completion Message* as specified in 2.6.6.2.5.2.
- Update the Active Set, Candidate Set, and Neighbor Set in accordance with the *Universal Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and 2.6.6.2.6.3).
- Discontinue use of all Forward Traffic Channels associated with pilots not in the updated Active Set.
- If PARMS\_INCL is equal to ‘1’, perform the following actions:
  - Set protocol revision level ( $P_{REV_s} = P_{REV_r}$ ), and protocol revision level currently in use ( $P_{REV\_IN\_USE_s} = \min(P_{REV_s}, MOB\_P_{REV_p}$  of the current band class)).
  - If SERV\_NEG\_TYPE<sub>r</sub> is equal to ‘1’, set SERV\_NEG<sub>s</sub> to enabled; otherwise set SERV\_NEG<sub>s</sub> to disabled. • If EXTRA\_PARMS is equal to ‘1’, perform the following actions:
  - If EXTRA\_PARMS is equal to ‘1’, perform the following actions:
    - If FRAME\_OFFSET<sub>r</sub> is not equal to FRAME\_OFFSET<sub>s</sub>, change the frame offset on all of the code channels of the Forward Traffic Channel and of the Reverse Traffic Channel.
    - If RESET\_L2<sub>r</sub> is equal to ‘1’, and RETURN\_IF\_HANDOFF\_FAILS is equal to ‘0’, Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset the acknowledgment procedures, as specified in 2.2.1.1 and 2.2.2.1 of [4]. The mobile station shall reset the acknowledgment procedures immediately after the action time of the *Universal Handoff Direction Message*.
    - If RESET\_FPC<sub>r</sub> is equal to ‘1’ and RETURN\_IF\_HANDOFF\_FAILS is equal to ‘0’, initialize the Forward Traffic Channel power control counters, as specified in 2.6.4.1.1.1.
    - Use the long code mask specified by the PRIVATE\_LCM<sub>r</sub> (see 2.3.12.3) and indicate to the user the voice privacy mode status.
    - Process the ENCRYPT\_MODE field, as specified in 2.3.12.2.
    - If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is included, the mobile station shall set D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to D\_SIG\_ENCRYPT\_MODE<sub>r</sub>.
    - If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is included, the mobile station shall perform the following:

- 1           + If  $D_{SIG\_ENCRYPT\_MODE_f}$  is equal to '000', the mobile station shall  
 2           set  $D_{SIG\_ENCRYPT\_MODE_s}$  to  $C_{SIG\_ENCRYPT\_MODE_s}$ ; otherwise,  
 3           the mobile station shall set  $D_{SIG\_ENCRYPT\_MODE_s}$  to  
 4            $D_{SIG\_ENCRYPT\_MODE_f}$  and set  $KEY_s$  to the most recently  
 5           generated CMEAKEY in the mobile station.
- 6        – If  $USE\_NEW\_KEY_f$  is not included, or is include and is set to '1', the mobile  
 7           station shall use the session key generated at the most recent registration for  
 8           encryption of signaling and user information. The mobile station shall store  
 9           the session key in  $KEY_s[KEY\_SEQ\_NEW_{s\_p}]$ . The mobile station shall store  
 10           $KEY\_SIZE_f$  in  $KEY\_SIZE_s$ . The mobile station shall then increment the  
 11          variable  $KEY\_SEQ\_NEW_{s\_p}$  by one (modulo 16). If  $ENC\_KEY\_SIZE_r$  is  
 12          included, the mobile station shall set  $ENC\_KEY\_SIZE_s$  to  $ENC\_KEY\_SIZE_r$ .
- 13        – If  $USE\_NEW\_KEY_f$  is included and is set to '0', the mobile station shall use  
 14           $KEY_s[KEY\_SEQ_f]$  as the session key with the key size specified by  
 15           $KEY\_SIZE_f$ .
- 16       • If EXTRA\_PARMS is equal to '0', set the following variables to the values  
 17           indicated:
- 18           – Hard handoff traffic channel preamble count required before transmitting  
 19           a *Handoff Completion Message* or an *Extended Handoff Completion  
 20           Message* ( $NUM\_PREAMBLE_s = '000'$ )
- 21           – Complete search flag ( $COMPLETE\_SEARCH_s = '1'$ )
- 22           – CDMA band class for the Target Frequency  
 23           ( $TF\_CDMABAND_s = SF\_CDMABAND_s$ )
- 24           – Frequency assignment for the Target Frequency  
 25           ( $TF\_CDMACH_s = SF\_CDMACH_s$ )
- 26       • Store the following parameters from the *Universal Handoff Direction Message*:
- 27           – *Universal Handoff Direction Message* sequence number  
 28           ( $HDM\_SEQ_s = HDM\_SEQ_r$ )
- 29           – Forward power control subchannel relative gain ( $FPC\_SUBCHAN\_GAIN_s =$   
 30            $FPC\_SUBCHAN\_GAIN_r$ ).
- 31           – If the mobile station uses  $FPC\_SUBCHAN\_GAIN_s$ , the mobile station shall  
 32           perform the following:
- 33            + If  $PC\_ACTION\_TIME_r$  is received, the mobile station shall apply its  
 34           usage of the  $FPC\_SUBCHAN\_GAIN_s$  at the time specified by  
 35            $PC\_ACTION\_TIME_r$ .
- 36            + If  $PC\_ACTION\_TIME$  is not received and the explicit action time is  
 37           received, the mobile station shall apply its usage of the  
 38            $FPC\_SUBCHAN\_GAIN_s$  at the action time.

- + If neither PC\_ACTION\_TIME<sub>r</sub> nor explicit action time is received, the mobile station shall apply its usage of the FPC\_SUBCHAN\_GAIN<sub>s</sub> at the first 80ms boundary occurring at least 80ms after the end of the frame containing the last bit of the *Universal Handoff Direction Message* sent to the mobile station.
- Reverse Eighth Gating Mode (REV\_FCH\_GATING\_MODE<sub>s</sub> = REV\_FCH\_GATING\_MODE<sub>r</sub>).
- Reverse Power Control Delay if REV\_PWR\_CNTL\_DELAY\_INCL<sub>r</sub> is equal to '1' (REV\_PWR\_CNTL\_DELAY<sub>s</sub> = REV\_PWR\_CNTL\_DELAY<sub>r</sub>).
- If SEARCH\_INCLUDED is equal to '1', store the following:
  - + Search window size for the Active Set and Candidate Set (SRCH\_WIN\_AS = SRCH\_WIN\_AR)
  - + Pilot detection threshold (T\_ADD<sub>s</sub> = T\_ADD<sub>r</sub>)
  - + Pilot drop threshold (T\_DROP<sub>s</sub> = T\_DROP<sub>r</sub>)
  - + Active Set versus Candidate Set comparison threshold (T\_COMP<sub>s</sub> = T\_COMP<sub>r</sub>)
  - + Drop timer value (T\_TDROP<sub>s</sub> = T\_TDROP<sub>r</sub>)
  - + Soft slope for the dynamic add and drop thresholds (SOFT\_SLOPE<sub>s</sub> = SOFT\_SLOPE<sub>r</sub>)
  - + Intercept for the dynamic add threshold (ADD\_INTERCEPT<sub>s</sub> = ADD\_INTERCEPT<sub>r</sub>)
  - + Intercept for the dynamic drop threshold (DROP\_INTERCEPT<sub>s</sub> = DROP\_INTERCEPT<sub>r</sub>)
- If EXTRA\_PARMS is equal to '1', store the following:
  - + If the mobile station supports packet data service options, the packet data services zone identifier (PACKET\_ZONE\_ID<sub>s</sub> = PACKET\_ZONE\_ID<sub>r</sub>)
  - + Frame offset (FRAME\_OFFSET<sub>s</sub> = FRAME\_OFFSET<sub>r</sub>)
  - + Acknowledgment procedures reset indicator (If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', set TF\_RESET\_L2<sub>s</sub> to RESET\_L2<sub>r</sub>)
  - + Indicator to initialize the Forward Traffic Channel power control counters (If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', set TF\_RESET\_FPC<sub>s</sub> to RESET\_FPC<sub>r</sub>)
  - + Nominal power setting of the target cell (NOM\_PWR<sub>s</sub> = NOM\_PWR<sub>r</sub>)
  - + Extended nominal power setting of the target cell (If CDMABAND<sub>s</sub> = '00000' or CDMABAND<sub>s</sub> = '00011', then NOM\_PWR\_EXT<sub>s</sub> = '0'; otherwise, NOM\_PWR\_EXT<sub>s</sub> = NOM\_PWR\_EXT<sub>r</sub>)

- + Hard handoff traffic channel preamble count required before transmitting a *Handoff Completion Message* or an *Extended Handoff Completion Message* ( $\text{NUM\_PREAMBLE}_S = \text{NUM\_PREAMBLE}_r$ )
- + CDMA band class for the Target Frequency ( $\text{TF\_CDMABAND}_S = \text{BAND\_CLASS}_r$  and  $\text{CDMABAND}_S = \text{BAND\_CLASS}_r$ )
- + Frequency assignment for the Target Frequency ( $\text{TF\_CDMACH}_S = \text{CDMA\_FREQ}_r$  and  $\text{CDMACH}_S = \text{CDMA\_FREQ}_r$ )
- + Complete search flag ( $\text{COMPLETE\_SEARCH}_S = \text{COMPLETE\_SEARCH}_r$ )
- + Periodic search flag ( $\text{PERIODIC\_SEARCH}_S = \text{PERIODIC\_SEARCH}_r$ )
- + Nominal code channel output power offset relative to the Reverse Pilot Channel power ( $\text{RLGAIN\_TRAFFIC\_PILOT}_S = \text{RLGAIN\_TRAFFIC\_PILOT}_r$ )
- If  $\text{EXTRA\_PARMS}$  is equal to ‘1’ and  $\text{DEFAULT\_RLAG}$  is equal to ‘1’, the mobile station shall set each entry of the Reverse Link Attribute Adjustment Gain Table and Reverse Channel Adjustment Gain Table (see 2.1.2.3.3 of [2]) to 0.
- If  $\text{USE\_PWR\_CNTL\_STEP}$  is equal to ‘1’ and  $\text{PWR\_CNTL\_STEP}_r$  corresponds to a power control step size supported by the mobile station (see of [2]), then the mobile station shall set  $\text{PWR\_CNTL\_STEP}_S$  to  $\text{PWR\_CNTL\_STEP}_r$ .
- If  $\text{CLEAR_RETRY_DELAY}_r$  is equal to ‘1’, the mobile station shall cancel any previously indicated retry delay and shall set  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  to 0, where  $\text{RETRY\_TYPE}$  is equal to ‘001’, ‘010’ or ‘011’; otherwise, the mobile station shall continue to honor any previously active retry delay stored in  $\text{RETRY\_DELAY}_S$ .
- If  $\text{3XFL\_1XRL\_INCL}_r$  is equal to ‘1’, the mobile station shall set  $\text{1XRL\_FREQ\_OFFSET}_S$  to  $\text{1XRL\_FREQ\_OFFSET}_r$ .
- If  $\text{SCH\_INCL}_r$  is equal to ‘1’ and  $\text{NUM\_FOR\_ASSIGN}_r$  is not equal to ‘00’, the mobile station shall store the following information for each occurrence of the record and process the Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:
  - +  $\text{FOR\_SCH\_START\_TIME\_INCL}_S[\text{FOR\_SCH\_ID}_r] = \text{FOR\_SCH\_START\_TIME\_INCL}_r$
  - + If  $\text{FOR\_SCH\_START\_TIME\_INCL}_S[\text{FOR\_SCH\_ID}_r]$  is equal to ‘1’, set  $\text{FOR\_SCH\_START\_TIME}_S[\text{FOR\_SCH\_ID}_r] = \text{FOR\_SCH\_START\_TIME}_r$
  - +  $\text{FOR\_SCH\_DURATION}_S[\text{FOR\_SCH\_ID}_r] = \text{FOR\_SCH\_DURATION}_r$
  - +  $\text{SCCL\_INDEX}_S[\text{FOR\_SCH\_ID}_r] = \text{SCCL\_INDEX}_r$

- If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_ASSIGN<sub>r</sub> is not equal to '00', the mobile station shall store the following information for each occurrence of the record and process the Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:
  - + REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME\_INCL<sub>r</sub>
  - + If REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is equal to '1', set REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME<sub>r</sub>
  - + REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_DURATION<sub>r</sub>
  - + REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>
- If CH\_IND<sub>r</sub> is equal to '101', the mobile station shall perform the following:
  - + The mobile station shall set CH\_IND<sub>s</sub> = '01'.
  - + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_FOR\_SCH is not equal to '00000', for all the NUM\_FOR\_SCH occurrences, the mobile station shall perform the following:
    - o The mobile station shall determine, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number of information bits per Forward Supplemental Channel frame identified by FOR\_SCH\_ID and corresponding to the index SCCL\_INDEX according to the following rules:
      - ◊ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000', then:
        - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set the number of information bits per frame, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] and number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], according to Table 3.7.3.3.2.37-2 using FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> as the index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then the mobile station shall set the number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] as the index to the table.  
The mobile station shall also set the number of information bits per frame corresponding to SCCL\_INDEX<sub>r</sub>, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
- ◊ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000', then:
  - The mobile station shall set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], the set of indices to the number of information bits per frame as follows:
    - + If FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> is equal to '0000', then N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = {FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>},
    - + otherwise the mobile station shall set (initialize) N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = {FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>} and for i=1, ..., FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> the mobile station shall add FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> - VAR\_FSCH\_RATE\_OFFSET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>][i] to the set specified by N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]
  - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows. The *i*<sup>th</sup> member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is obtained using Table 3.7.3.3.2.37-2 and the *i*<sup>th</sup> member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] as the index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then
  - + the mobile station shall set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows.  
The  $t^{\text{th}}$  member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is equal to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]] [N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]], where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $t^{\text{th}}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] and,
  - + the mobile station shall set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number CRC bits per frame as follows.  
The  $t^{\text{th}}$  member of the set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]] [N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]] as the index to the table, where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $t^{\text{th}}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>].
- + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_SCH is not equal to '00000', for all the NUM\_REV\_SCH occurrences, the mobile station shall perform the following:
  - o Set REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>.
  - o Set REV\_WALSH\_ID<sub>s</sub> [REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>] to REV\_WALSH\_ID<sub>r</sub>.
- + For each member of the Active Set included in the message, the mobile station shall perform the following:
  - o Set PILOT\_PN to PILOT\_PNr.
  - o If SRCH\_OFFSET\_INCL<sub>r</sub> equals to '1', set the SRCH\_OFFSET field of PILOT\_REC to SRCH\_OFFSET<sub>r</sub>; otherwise, set the SRCH\_OFFSET field of PILOT\_REC to '000'.
  - o Set ADD\_PILOT\_REC\_INCL to ADD\_PILOT\_REC\_INCL<sub>r</sub>.

- 1        o If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals ‘1’, the mobile station shall also  
2              perform the following:
  - 3                ◊ Set the PILOT\_REC\_TYPE field of PILOT\_REC to  
4                      PILOT\_REC\_TYPE<sub>r</sub>.
  - 5                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘000’, the mobile station shall  
6                      set the TD\_POWER\_LEVEL field of PILOT\_REC to  
7                      TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of  
8                      NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
  - 9                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘001’, the mobile station shall:
    - 10                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
    - 11                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
12                      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified  
13                      by WALSH\_LENGTH<sub>r</sub>.
  - 14                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘010’, the mobile station shall:
    - 15                  – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
    - 16                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
17                      AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by  
18                      WALSH\_LENGTH<sub>r</sub>.
    - 19                  – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to  
20                      AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
    - 21                  – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
  - 22                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘011’, the mobile station shall:
    - 23                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
24                      SR3\_PRIMARY\_PILOT<sub>r</sub>.
    - 25                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
26                      SR3\_PILOT\_POWER1<sub>r</sub>.
    - 27                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
28                      SR3\_PILOT\_POWER2<sub>r</sub>.
  - 29                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘100’, the mobile station shall:
    - 30                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
31                      SR3\_PRIMARY\_PILOT<sub>r</sub>.
    - 32                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
33                      SR3\_PILOT\_POWER1<sub>r</sub>.
    - 34                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
35                      SR3\_PILOT\_POWER2<sub>r</sub>.
    - 36                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.

- 1        – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
2        AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified  
3        by WALSH\_LENGTH<sub>r</sub>.
- 4        – If ADD\_INFO\_INCL1<sub>r</sub> is equal to ‘1’, set the  
5        AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set  
6        the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
7        AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length  
8        specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the  
9        AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set the  
10      AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
11      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified  
12      by WALSH\_LENGTH<sub>r</sub>.
- 13      – If ADD\_INFO\_INCL2<sub>r</sub> is equal to ‘1’, set the  
14      AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF2<sub>r</sub> and set  
15      the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to  
16      AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length  
17      specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the  
18      AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set the  
19      AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to  
20      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified  
21      by WALSH\_LENGTH<sub>r</sub>.
- 22      o Store PWR\_COMB\_IND, CODE\_CHAN\_FCH and  
23      QOF\_MASK\_ID\_FCH.
- 24      o If SCH\_INCL<sub>r</sub> is equal to ‘1’ and NUM\_SCH is equal to ‘00000’, the  
25      mobile station shall delete the corresponding pilot from the all  
26      entries of the corresponding Supplemental Channel.
- 27      o If SCH\_INCL<sub>r</sub> is equal to ‘1’ and NUM\_SCH is not equal to ‘00000’,  
28      for each Supplemental Channel included in this record, the  
29      mobile station shall:
  - 30        ◊ If PILOT\_INCL is equal to ‘0’, the mobile station shall delete  
31        the corresponding pilot from the Active Set of Supplemental  
32        Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
  - 33        ◊ If PILOT\_INCL is equal to ‘1’, for each Supplemental Channel  
34        included in this record, the mobile station shall set PILOT\_PNs  
35        [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to PILOT\_Pn<sub>r</sub>,  
36        QOF\_IDs[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
37        QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
38        FOR\_SCH\_CC\_INDEXs[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
39        CODE\_CHAN\_SCH<sub>r</sub>.

- 1                   ◊ The mobile station shall delete all pilots that are not included  
 2                   in the list specified by the NUM\_PILOTS field from the Active  
 3                   Set of Supplemental Channel for the corresponding  
 4                   SCCL\_INDEX<sub>r</sub>.
- 5       + If 3X\_FCH\_INFO\_INCL<sub>r</sub> equals to ‘1’, for each included member of the  
 6                   Active Set, the mobile station store the following:
- 7                   o If 3X\_FCH\_LOW\_INCL<sub>r</sub> equals ‘1’, set the  
 8                   QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH\_LOW<sub>r</sub> and  
 9                   the CODE\_CHAN\_FCH\_LOW field to CODE\_CHAN\_FCH\_LOW<sub>r</sub>.  
 10                  Otherwise, set the QOF\_MASK\_ID\_FCH\_LOW field to  
 11                  QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW to  
 12                  CODE\_CHAN\_FCH<sub>r</sub>.
- 13                  o If 3X\_FCH\_HIGH\_INCL<sub>r</sub> equals ‘1’, set the  
 14                  QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH\_HIGH<sub>r</sub>  
 15                  and the CODE\_CHAN\_FCH\_HIGH field to  
 16                  CODE\_CHAN\_FCH\_HIGH<sub>r</sub>. Otherwise, set the  
 17                  QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the  
 18                  CODE\_CHAN\_FCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.
- 19                  o If 3X\_SCH\_INFO\_INCL<sub>r</sub> equals to ‘1’, for each Supplemental  
 20                  Channel included, the mobile station store the following:
- 21                   ◊ If 3X\_SCH\_LOW\_INCL<sub>r</sub> equals ‘1’, set the QOF\_ID\_SCH\_LOW<sub>s</sub>  
 22                   [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
 23                   QOF\_MASK\_ID\_SCH\_LOW<sub>r</sub> and the  
 24                   FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
 25                   field to CODE\_CHAN\_SCH\_LOW<sub>r</sub>. Otherwise, set  
 26                   QOF\_ID\_SCH\_LOW<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
 27                   QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
 28                   FOR\_SCH\_CC\_INDEX\_LOW<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
 29                   to CODE\_CHAN\_SCH<sub>r</sub>.
- 30                   ◊ If 3X\_SCH\_HIGH\_INCL<sub>r</sub> equals ‘1’, set the  
 31                   QOF\_ID\_SCH\_HIGH<sub>s</sub> [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
 32                   QOF\_MASK\_ID\_SCH\_HIGH<sub>r</sub> and the  
 33                   FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
 34                   field to CODE\_CHAN\_SCH\_HIGH<sub>r</sub>. Otherwise, set  
 35                   QOF\_ID\_SCH\_HIGH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
 36                   QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
 37                   FOR\_SCH\_CC\_INDEX\_HIGH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
 38                   to CODE\_CHAN\_SCH<sub>r</sub>.
- 39       + The mobile station shall delete all pilots that are not listed in the  
 40                   NUM\_PILOTS field from the Active Set of Fundamental Channel.

- + The mobile station shall delete all pilots that are not listed in the Active Set of the Fundamental Channel from the Active Set of the Supplemental Channel for the Forward Supplemental Channel Assignment (if any). If these deleted pilots include all pilots in the Active Set of the Supplemental Channel, the mobile station shall cancel the Forward Supplemental Channel Assignment.
- If CH\_IND<sub>r</sub> is equal to '010' or '110', the mobile station shall perform the following:
  - + The mobile station shall set CH\_IND<sub>s</sub> = '10'.
  - + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_FOR\_SCH is not equal to '00000', for all the NUM\_FOR\_SCH occurrences, the mobile station shall perform the following:
    - o The mobile station shall determine, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number of information bits per Forward Supplemental Channel frame identified by FOR\_SCH\_ID and corresponding to the index SCCL\_INDEX according to the following rules:
      - ◊ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000', then:
        - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set the number of information bits per frame, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] and number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], according to Table 3.7.3.3.2.37-2 using FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> as the index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then the mobile station shall set the number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] as the index to the table.  
The mobile station shall also set the number of information bits per frame corresponding to SCCL\_INDEX<sub>r</sub>, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
- ◊ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000', then:
  - The mobile station shall set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], the set of indices to the number of information bits per frame as follows:
    - + If FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> is equal to '0000', then N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = {FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>},
    - + otherwise the mobile station shall set (initialize) N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = {FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>} and for i=1, ..., FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> the mobile station shall add FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> - VAR\_FSCH\_RATE\_OFFSET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>][i] to the set specified by N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]
  - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows. The *i*<sup>th</sup> member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is obtained using Table 3.7.3.3.2.37-2 and the *i*<sup>th</sup> member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] as the index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then
  - + the mobile station shall set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows.  
The  $t^{\text{th}}$  member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is equal to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]] [N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]], where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $t^{\text{th}}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] and,
  - + the mobile station shall set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number CRC bits per frame as follows.  
The  $t^{\text{th}}$  member of the set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]] [N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]] as the index to the table, where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $t^{\text{th}}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>].
- + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_SCH is not equal to '00000', for all the NUM\_REV\_SCH occurrences, the mobile station shall perform the following:
  - o Set REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>.
  - o Set REV\_WALSH\_ID<sub>s</sub> [REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>] to REV\_WALSH\_ID<sub>r</sub>.
- + For each member of the Active Set included in the message, the mobile station shall perform the followings:
  - o Set PILOT\_PN to PILOT\_PNr.
  - o If SRCH\_OFFSET\_INCL<sub>r</sub> equals to '1', set the SRCH\_OFFSET field of PILOT\_REC to SRCH\_OFFSET<sub>r</sub>; otherwise, set the SRCH\_OFFSET field of PILOT\_REC to '000'.
  - o Set ADD\_PILOT\_REC\_INCL to ADD\_PILOT\_REC\_INCL<sub>r</sub>.

- 1        o If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals ‘1’, the mobile station shall also  
2              perform the following:
  - 3                ◊ Set the PILOT\_REC\_TYPE field of PILOT\_REC to  
4                      PILOT\_REC\_TYPE<sub>r</sub>.
  - 5                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘000’, the mobile station shall  
6                      set the TD\_POWER\_LEVEL field of PILOT\_REC to  
7                      TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of  
8                      PILOT\_REC to TD\_MODE<sub>r</sub>.
  - 9                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘001’, the mobile station shall:
    - 10                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
    - 11                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
12                      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified  
13                      by WALSH\_LENGTH<sub>r</sub>.
  - 14                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘010’, the mobile station shall:
    - 15                  – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
    - 16                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
17                      AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by  
18                      WALSH\_LENGTH<sub>r</sub>.
    - 19                  – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to  
20                      AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
    - 21                  – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
  - 22                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘011’, the mobile station shall:
    - 23                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
24                      SR3\_PRIMARY\_PILOT<sub>r</sub>.
    - 25                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
26                      SR3\_PILOT\_POWER1<sub>r</sub>.
    - 27                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
28                      SR3\_PILOT\_POWER2<sub>r</sub>.
  - 29                ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘100’, the mobile station shall:
    - 30                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
31                      SR3\_PRIMARY\_PILOT<sub>r</sub>.
    - 32                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
33                      SR3\_PILOT\_POWER1<sub>r</sub>.
    - 34                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
35                      SR3\_PILOT\_POWER2<sub>r</sub>.
    - 36                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.

- Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- If ADD\_INFO\_INCL1<sub>r</sub> is equal to ‘1’, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- If ADD\_INFO\_INCL2<sub>r</sub> is equal to ‘1’, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- o Store PWR\_COMB\_IND, CODE\_CHAN\_DCCH and QOF\_MASK\_ID\_DCCH.
- o If SCH\_INCL<sub>r</sub> is equal to ‘1’ and NUM\_SCH is equal to ‘00000’, the mobile station shall delete the corresponding pilot from all entries of the corresponding Supplemental Channel.
- o If SCH\_INCL<sub>r</sub> is equal to ‘1’ and NUM\_SCH is not equal to ‘00000’, the mobile station shall:
  - ◊ If PILOT\_INCL is equal to ‘0’, the mobile station shall delete the corresponding pilot from the Active Set of Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
  - ◊ If PILOT\_INCL is equal to ‘1’, for each Supplemental Channel included in this record, the mobile station shall set PILOT\_PNs [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>S</sub>][i] to PILOT\_PN<sub>r</sub>, QOF\_ID<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>S</sub>][i] to QOF\_MASK\_ID\_SCH<sub>r</sub>, and FOR\_SCH\_CC\_INDEX<sub>S</sub> [FOR\_SCH\_ID<sub>S</sub>][SCCL\_INDEX<sub>S</sub>][i] to CODE\_CHAN\_SCH<sub>r</sub>.
  - ◊ The mobile station shall delete all pilots that are not included in the list specified by the NUM\_PILOTS field from the Active Set of Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.

- + If  $3X_{DCCH\_INFO\_INCL_r}$  equals to ‘1’, for each included member of the Active Set, the mobile station store the following:
  - o If  $3X_{DCCH\_LOW\_INCL_r}$  equals ‘1’, set the  $QOF\_MASK\_ID\_DCCH\_LOW$  field to  $QOF\_MASK\_ID\_DCCH\_LOW_r$  and the  $CODE\_CHAN\_DCCH\_LOW$  field to  $CODE\_CHAN\_DCCH\_LOW_r$ . Otherwise, set the  $QOF\_MASK\_ID\_DCCH\_LOW$  field to  $QOF\_MASK\_ID\_FCH_r$  and the  $CODE\_CHAN\_DCCH\_LOW$  to  $CODE\_CHAN\_FCH_r$ .
  - o If  $3X_{DCCH\_HIGH\_INCL_r}$  equals ‘1’, set the  $QOF\_MASK\_ID\_DCCH\_HIGH$  field to  $QOF\_MASK\_ID\_DCCH\_HIGH_r$  and the  $CODE\_CHAN\_DCCH\_HIGH$  field to  $CODE\_CHAN\_DCCH\_HIGH_r$ . Otherwise, set the  $QOF\_MASK\_ID\_DCCH\_HIGH$  field to  $QOF\_MASK\_ID\_FCH_r$  and the  $CODE\_CHAN\_DCCH\_HIGH$  to  $CODE\_CHAN\_FCH_r$ .
  - o If  $3X_{SCH\_INFO\_INCL_r}$  equals to ‘1’, for each Supplemental Channel included, the mobile station store the following:
    - ◊ If  $3X_{SCH\_LOW\_INCL_r}$  equals ‘1’, set  $QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  $QOF\_MASK\_ID\_SCH\_LOW_r$  and  $FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  field to  $CODE\_CHAN\_SCH\_LOW_r$ . Otherwise, set  $QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  $QOF\_MASK\_ID\_SCH_r$ , and  $FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  $CODE\_CHAN\_SCH_r$ .
    - ◊ If  $3X_{SCH\_HIGH\_INCL_r}$  equals ‘1’, set  $QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  $QOF\_MASK\_ID\_SCH\_HIGH_r$  and the  $FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  field to  $CODE\_CHAN\_SCH\_HIGH_r$ . Otherwise, set  $QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  $QOF\_MASK\_ID\_SCH_r$ , and  $FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  $CODE\_CHAN\_SCH_r$ .
- + The mobile station shall delete all pilots that are not listed in the  $NUM\_PILOTS$  field from the Active Set of Dedicated Control Channel.
- + The mobile station shall delete all pilots that are not listed in the Active Set of the Dedicated Control Channel from the Active Set of the Supplemental Channel for the Forward Supplemental Channel Assignment (if any). If these deleted pilots include all pilots in the Active Set of the Supplemental Channel, the mobile station shall cancel the Forward Supplemental Channel Assignment.

- If CH\_IND<sub>r</sub> is equal to '111', the mobile station shall perform the following:
  - + The mobile station shall set CH\_IND<sub>s</sub> = '11'.
  - + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_FOR\_SCH is not equal to '00000', for all the NUM\_FOR\_SCH occurrences, the mobile station shall perform the following:
    - o The mobile station shall determine, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number of information bits per Forward Supplemental Channel frame identified by FOR\_SCH\_ID and corresponding to the index SCCL\_INDEX according to the following rules:
      - ◊ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000', then:
        - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set the number of information bits per frame, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] and number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], according to Table 3.7.3.3.2.37-2 using FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> as the index to the table.
        - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then the mobile station shall set the number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] as the index to the table.
      - The mobile station shall also set the number of information bits per frame corresponding to SCCL\_INDEX<sub>r</sub>, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
    - ◊ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000', then:
      - The mobile station shall set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], the set of indices to the number of information bits per frame as follows:

- + If FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> is equal to '0000', then  
 $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r] = \{$   
 $FOR\_SCH\_NUM\_BITS\_IDX_r\},$
- + otherwise the mobile station shall set (initialize)  
 $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r] = \{FOR\_SCH\_NUM\_BITS\_IDX_r\}$  and for i=1, ...,  
 $FOR\_SCH\_NUM\_BITS\_IDX_r$  the mobile station shall  
add  $FOR\_SCH\_NUM\_BITS\_IDX_r - VAR_{FSCH\_RATE\_OFFSET_s}[FOR\_SCH\_ID_r][FOR\_SCH\_NUM\_BITS\_IDX_r][i]$  to the set specified by  
 $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$
- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if  
USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and  
FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000',  
then the mobile station shall set  
 $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$ , the  
set of number of information bits per frame as follows.  
The  $i^{\text{th}}$  member of the set  
 $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  is  
obtained using Table 3.7.3.3.2.37-2 and the  $i^{\text{th}}$  member of  
the set  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$  as the  
index to the table.
- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and  
FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to  
'0000', then
  - + the mobile station shall set  
 $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$ ,  
the set of number of information bits per frame as  
follows.  
The  $i^{\text{th}}$  member of the set  
 $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  is  
equal to  
 $NUM\_BITS_s[FSCH\_NBIT\_TABLE\_ID_s[FOR\_SCH\_ID_r]]$   
 $[N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r][i]],$  where  
 $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r][i]$  denotes the  
 $i^{\text{th}}$  member of the set  
 $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$  and,

- + the mobile station shall set  $FSCH\_CRC\_LEN\_SET_s[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$ , the set of number CRC bits per frame as follows.  
The  $t^{\text{th}}$  member of the set  $FSCH\_CRC\_LEN\_SET_s[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  using Table 3.7.5.20-1 and  $CRC\_LEN\_IDX_s[FSCH\_NBIT\_TABLE\_ID_s[FOR\_SCH\_ID_r]][N\_FSCH\_BITS\_IDX\_SET_s[FOR\_SCH\_ID_r][i]]$  as the index to the table, where  $N\_FSCH\_BITS\_IDX\_SET_s[FOR\_SCH\_ID_r][i]$  denotes the  $t^{\text{th}}$  member of the set  $N\_FSCH\_BITS\_IDX\_SET_s[FOR\_SCH\_ID_r]$ .
- + If  $SCH\_INCL_r$  is equal to ‘1’ and  $NUM\_REV\_SCH$  is not equal to ‘00000’, for all the  $NUM\_REV\_SCH$  occurrences, the mobile station shall perform the following:
  - o Set  $REV\_SCH\_NUM\_BITS\_IDX_s[REV\_SCH\_ID_r]$  to  $REV\_SCH\_NUM\_BITS\_IDX_r$ .
  - o Set  $REV\_WALSH\_ID_s[REV\_SCH\_ID_r][REV\_SCH\_NUM\_BITS\_IDX_s]$  to  $REV\_WALSH\_ID_r$ .
- + For each member in the Active Set included in the message, the mobile station shall perform the followings:
  - o Set  $PILOT\_PN$  to  $PILOT\_PN_r$ .
  - o If  $SRCH\_OFFSET\_INCL_r$  equals to ‘1’, set the  $SRCH\_OFFSET$  field of  $PILOT\_REC$  to  $SRCH\_OFFSET_r$ ; otherwise, set the  $SRCH\_OFFSET$  field of  $PILOT\_REC$  to ‘000’.
  - o Set  $ADD\_PILOT\_REC\_INCL$  to  $ADD\_PILOT\_REC\_INCL_r$ .
  - o If  $ADD\_PILOT\_REC\_INCL_r$  equals ‘1’, the mobile station shall also perform the following:
    - ◊ Set the  $PILOT\_REC\_TYPE$  field of  $PILOT\_REC$  to  $PILOT\_REC\_TYPE_r$ .
    - ◊ If  $PILOT\_REC\_TYPE_r$  is equal to ‘000’, the mobile station shall set the  $TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to  $TD\_POWER\_LEVEL_r$  and set the  $TD\_MODE$  field of  $PILOT\_REC$  to  $TD\_MODE_r$ .
    - ◊ If  $PILOT\_REC\_TYPE_r$  is equal to ‘001’, the mobile station shall:
      - Set the  $AUX\_PILOT\_QOF$  field of  $PILOT\_REC$  to  $QOF_r$ .
      - Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to  $AUX\_PILOT\_WALSH_r$  with the Walsh Code length specified by  $WALSH\_LENGTH_r$ .
    - ◊ If  $PILOT\_REC\_TYPE_r$  is equal to ‘010’, the mobile station shall:

- Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
  - Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to SR3\_PILOT\_POWER2<sub>r</sub>.
- ◊ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
  - Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to SR3\_PILOT\_POWER2<sub>r</sub>.
  - Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
  - Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.

- If ADD\_INFO\_INCL<sub>2r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>2r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>2r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>2r</sub>; otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- o Store PWR\_COMB\_IND, CODE\_CHAN\_FCH, QOF\_MASK\_ID\_FCH, CODE\_CHAN\_DCCH and QOF\_MASK\_ID\_DCCH.
- o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is equal to '00000', the mobile station shall delete the corresponding pilot from all entries of the corresponding Supplemental Channel.
- o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is not equal to '00000', the mobile station shall:
  - ◊ If PILOT\_INCL is equal to '0', the mobile station shall delete the corresponding pilot from the Active Set of Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
  - ◊ If PILOT\_INCL is equal to '1', for each Supplemental Channel included in this record, the mobile station shall set PILOT\_PNs<sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]</sub> to PILOT\_PN<sub>r</sub>, QOF\_IDs<sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]</sub> to QOF\_MASK\_ID\_SCH<sub>r</sub>, and FOR\_SCH\_CC\_INDEXs<sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]</sub> to CODE\_CHAN\_SCH<sub>r</sub>.
  - ◊ The mobile station shall delete all pilots that are not included in the list specified by the NUM\_PILOTS field from the Active Set of Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
- + If 3X\_FCH\_INFO\_INCL<sub>r</sub> equals to '1', for each included member of the Active Set, the mobile station store the following:
  - o If 3X\_FCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH\_LOW<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW field to CODE\_CHAN\_FCH\_LOW<sub>r</sub>. Otherwise, set the QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.

- 1           o If  $3X_{-}FCH_{-}HIGH_{-}INCL_r$  equals ‘1’, set the  
   2            QOF\_MASK\_ID\_FCH\_HIGH field to  $QOF_{-}MASK_{-}ID_{-}FCH_{-}HIGH_r$   
   3            and the CODE\_CHAN\_FCH\_HIGH field to  
   4            CODE\_CHAN\_FCH\_HIGH<sub>r</sub>. Otherwise, set the  
   5            QOF\_MASK\_ID\_FCH\_HIGH field to  $QOF_{-}MASK_{-}ID_{-}FCH_r$  and the  
   6            CODE\_CHAN\_FCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.
- 7           + If  $3X_{-}DCCH_{-}INFO_{-}INCL_r$  equals to ‘1’, for each included member of  
   8            the Active Set, the mobile station store the following:  
- 9             o If  $3X_{-}DCCH_{-}LOW_{-}INCL_r$  equals ‘1’, set the  
   10            QOF\_MASK\_ID\_DCCH\_LOW field to  $QOF_{-}MASK_{-}ID_{-}DCCH_{-}LOW_r$   
   11            and the CODE\_CHAN\_DCCH\_LOW field to  
   12            CODE\_CHAN\_DCCH\_LOW<sub>r</sub>. Otherwise, set the  
   13            QOF\_MASK\_ID\_DCCH\_LOW field to  $QOF_{-}MASK_{-}ID_{-}FCH_r$  and the  
   14            CODE\_CHAN\_DCCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.
- 15             o If  $3X_{-}DCCH_{-}HIGH_{-}INCL_r$  equals ‘1’, set the  
   16            QOF\_MASK\_ID\_DCCH\_HIGH field to  
   17            QOF\_MASK\_ID\_DCCH\_HIGH<sub>r</sub> and the CODE\_CHAN\_DCCH\_HIGH  
   18            field to CODE\_CHAN\_DCCH\_HIGH<sub>r</sub>. Otherwise, set the  
   19            QOF\_MASK\_ID\_DCCH\_HIGH field to  $QOF_{-}MASK_{-}ID_{-}FCH_r$  and  
   20            the CODE\_CHAN\_DCCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.
- 21           + If  $3X_{-}FCH_{-}INFO_{-}INCL_r$  or  $3X_{-}DCCH_{-}INFO_{-}INCL_r$  equals to ‘1’, for  
   22            each included member of the Active Set, the mobile station store the  
   23            following:  
- 24             o If  $3X_{-}SCH_{-}INFO_{-}INCL_r$  equals to ‘1’, for each Supplemental  
   25            Channel included, the mobile station store the following:  
- 26               ◊ If  $3X_{-}SCH_{-}LOW_{-}INCL_r$  equals ‘1’, set  
   27                QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
   28                QOF\_MASK\_ID\_SCH\_LOW<sub>r</sub> and the  
   29                FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
   30                field to CODE\_CHAN\_SCH\_LOW<sub>r</sub>. Otherwise, set  
   31                QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
   32                QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
   33                FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
   34                to CODE\_CHAN\_SCH<sub>r</sub>.
- 35               ◊ If  $3X_{-}SCH_{-}HIGH_{-}INCL_r$  equals ‘1’, set  
   36                QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
   37                QOF\_MASK\_ID\_SCH\_HIGH<sub>r</sub> and the  
   38                FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
   39                field to CODE\_CHAN\_SCH\_HIGH<sub>r</sub>. Otherwise, set  
   40                QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
   41                QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
   42                FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
   43                to CODE\_CHAN\_SCH<sub>r</sub>.

- + The mobile station shall delete all pilots that are not listed in the NUM\_PILOTS field from the Active Set of Fundamental Channel and Dedicated Control Channel.
- + The mobile station shall delete all pilots that are not listed in the Active Set of the Fundamental Channel and Dedicated Control Channel from the Active Set of the Supplemental Channel for the Forward Supplemental Channel Assignment (if any). If these deleted pilots include all pilots in the Active Set of the Supplemental Channel, the mobile station shall cancel the Forward Supplemental Channel Assignment.
- If the most significant bit of CH\_IND<sub>r</sub> is set to '1' and PILOT\_GATING\_USE\_RATE is equal to '1', the mobile station shall set PILOT\_GATING\_USE\_RATE to '0' and shall start the continuous reverse pilot at the specified action time. If the most significant bit of CH\_IND<sub>r</sub> is set to '0' and PILOT\_GATING\_USE\_RATE is equal to '0', the mobile station shall perform the following:
  - The mobile station shall set PILOT\_GATING\_USE\_RATE to '1' and shall start the reverse pilot gating at the specified action time.
  - If the Fundamental Channel is also being released, the mobile station shall store the configuration used for the Fundamental Channel.
  - The mobile station shall cancel the forward and reverse supplemental channel assignment, if any.
- The mobile station shall set IGNORE\_ESCAM<sub>S</sub> and IGNORE\_SCAM<sub>S</sub> to '0'.
- Set the pilot detection threshold for the Target Frequency and the Candidate Frequency:
  - Set TF\_T\_ADD<sub>S</sub> to T\_ADD<sub>S</sub>.
  - If the Target Frequency is the same as the Candidate Frequency (TF\_CDMABAND<sub>S</sub> is equal to CF\_CDMABAND<sub>S</sub> and TF\_CDMACH<sub>S</sub> is equal to CF\_CDMACH<sub>S</sub>), set CF\_T\_ADD<sub>S</sub> to T\_ADD<sub>S</sub>.
- If PERIODIC\_SEARCH<sub>S</sub> is equal to '0' and a periodic search is in progress, the mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- Perform a soft or hard handoff depending on the following conditions:
  - If any of the following conditions is true, the mobile station shall perform a hard handoff:
    - + EXTRA\_PARMS is set to '1' and either BAND\_CLASS<sub>r</sub> is not equal to SF\_CDMABAND<sub>S</sub>, CDMA\_FREQ<sub>r</sub> is not equal to SF\_CDMACH<sub>S</sub>, or FRAME\_OFFSET<sub>r</sub> is not equal to SF\_FRAME\_OFFSET<sub>S</sub>, or
    - + The set of pilots specified by the message is disjoint from the Active Set prior to the action time of the message.

- If the mobile station performs a hard handoff, it shall do the following:
  - + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the mobile station shall abort the procedure (see 2.6.6.2.12).
  - + If a Candidate Frequency periodic search is in progress, the mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
  - + If a Forward Supplemental Channel assignment or a Reverse Supplemental Channel assignment is in progress, the mobile station shall abort it.
  - + The mobile station shall cancel any outstanding Forward Supplemental Channel assignment or Reverse Supplemental Channel assignment that is not specified by this message.
  - + The mobile station shall cancel the current Forward Supplemental Channel assignment or the Reverse Supplemental Channel assignment, if it is in progress. If the message does not specify another Forward Supplemental Channel assignment or Reverse Supplemental Channel assignment, the mobile station shall cancel the outstanding Forward Supplemental Channel assignment or Reverse Supplemental Channel assignment, if any.
  - + If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '0', the mobile station shall perform actions specified in 2.6.6.2.8.1. If the message specifies more than one pilot, the mobile station shall also perform actions specified in 2.6.6.2.7.1 and 2.6.6.2.7.2.
  - + If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', the mobile station shall perform actions specified in 2.6.6.2.8.2. If the message specifies more than one pilot, the mobile station shall also perform actions specified in 2.6.6.2.7.1 and 2.6.6.2.7.2.
- Otherwise, the mobile station shall perform a soft handoff as specified in 2.6.6.2.7.

12. *Mobile Assisted Burst Operation Parameters Message:* The mobile station shall process this message as follows:

- The mobile station shall set ORDER\_FLAG<sub>s</sub> to ORDER\_FLAG<sub>r</sub>.
- If ORDER\_FLAG<sub>r</sub> is equal to '1', the mobile station shall perform the following:
  - The mobile station shall set PS\_MIN\_DELTA<sub>s</sub> to PS\_MIN\_DELTA<sub>r</sub> + 1.
  - The mobile station shall set ORDER\_INTERVAL<sub>s</sub> to ORDER\_INTERVAL<sub>r</sub>.
- If ORDER\_FLAG<sub>r</sub> is equal to '0', the mobile station shall perform the following:
  - The mobile station shall set PS\_MIN\_DELTA<sub>s</sub> to 0.

- 1           – The mobile station shall set ORDER\_INTERVAL<sub>s</sub> to 0.
- 2           • The mobile station shall set PERIODIC\_FLAG<sub>s</sub> to PERIODIC\_FLAG<sub>r</sub>.
- 3           • If PERIODIC\_FLAG<sub>r</sub> is equal to ‘1’, the mobile station shall perform the  
4           following:
  - 5           – The mobile station shall set NUM\_PILOTS<sub>s</sub> to NUM\_PILOTS<sub>r</sub>.
  - 6           – The mobile station shall set PERIODIC\_INTERVAL<sub>s</sub> to  
7           PERIODIC\_INTERVAL<sub>r</sub>.
- 8           • If PERIODIC\_FLAG<sub>r</sub> is equal to ‘0’, the mobile station shall perform the  
9           following:
  - 10          – The mobile station shall set NUM\_PILOTS<sub>s</sub> to 0.
  - 11          – The mobile station shall set PERIODIC\_INTERVAL<sub>s</sub> to 0.
- 12          • The mobile station shall set THRESHOLD\_FLAG<sub>s</sub> to THRESHOLD\_FLAG<sub>r</sub>.
- 13          • If THRESHOLD\_FLAG<sub>r</sub> is equal to ‘1’, the mobile station shall perform the  
14           following:
  - 15           – The mobile station shall set PS\_FLOOR\_LOW<sub>s</sub> to PS\_FLOOR\_LOW<sub>r</sub>.
  - 16           – The mobile station shall set PS\_FLOOR\_HIGH<sub>s</sub> to PS\_FLOOR\_HIGH<sub>r</sub>.
  - 17           – The mobile station shall set PS\_CEILING\_LOW<sub>s</sub> to PS\_CEILING\_LOW<sub>r</sub>.
  - 18           – The mobile station shall set PS\_CEILING\_HIGH<sub>s</sub> to PS\_CEILING\_HIGH<sub>r</sub>.
- 19          • If THRESHOLD\_FLAG<sub>r</sub> is equal to ‘0’, the mobile station shall perform the  
20           following:
  - 21           – The mobile station shall set PS\_FLOOR\_LOW<sub>s</sub> to ‘0’.
  - 22           – The mobile station shall set PS\_FLOOR\_HIGH<sub>s</sub> to ‘0’.
  - 23           – The mobile station shall set PS\_CEILING\_LOW<sub>s</sub> to ‘0’.
  - 24           – The mobile station shall set PS\_CEILING\_HIGH<sub>s</sub> to ‘0’.

25         13. *Extended Supplemental Channel Assignment Message*: The mobile station shall  
26           process this message as follows:

27         The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
28           set to the specified value if any of the following conditions is true, and shall not  
29           perform any other action described in this section for processing the *Extended  
30           Supplemental Channel Assignment Message*:

- 31           • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
32           field set to ‘00000110’ (capability not supported), if the number of forward or  
33           reverse Supplemental Channels specified in the *Extended Supplemental  
34           Channel Assignment Message* is greater than the maximum number of  
35           Supplemental Channels supported by the mobile station.

- 1     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
2       field set to ‘00000100’ (message field not in valid range), if PILOT\_PN  
3       specified in the *Extended Supplemental Channel Assignment Message* is not  
4       in the Active Set.
- 5     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
6       field set to ‘00000111’ (message can not be handled by the current mobile  
7       station configuration), if the message includes a reverse Supplemental  
8       Channel assignment, and any of the mobile station’s reverse supplemental  
9       channel configuration parameter for the corresponding Supplemental  
10      Channel ~~is not included in the message and its stored value  
(REV\_SCH\_MUX<sub>s</sub>, REV\_SCH\_RC<sub>s</sub>, REV\_SCH\_CODING<sub>s</sub>,~~  
~~REV\_SCH\_FRAME\_LENGTH<sub>s</sub>, QOF\_ID<sub>s</sub> for the corresponding SCCL\_INDEX<sub>r</sub>,~~  
~~or FOR\_SCH\_CC\_INDEX<sub>s</sub> for the corresponding SCCL\_INDEX<sub>r</sub>)~~ is NULL.
- 11     • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
12       field set to ‘00000111’ (message can not be handled by the current mobile  
13       station configuration), if the message includes a forward Supplemental  
14       Channel assignment and any of the mobile station’s forward supplemental  
15       channel configuration parameter for the corresponding Supplemental  
16       Channel ~~(FOR\_SCH\_MUX<sub>s</sub>, FOR\_SCH\_RC<sub>s</sub>, FOR\_SCH\_CODING<sub>s</sub>, or  
FOR\_SCH\_FRAME\_LENGTH<sub>s</sub>)~~ is NULL.

21     If none of the above conditions is true, the mobile station shall perform the  
22     following:

- 23     • The mobile station shall store REV\_SCH\_DTX\_DURATION<sub>r</sub>, Reverse  
24       Supplemental Channel Discontinuous Transmission Duration, as  
25       REV\_SCH\_DTX\_DURATION<sub>s</sub>.
- 26     • The mobile station shall store the unit for START\_TIME\_UNIT<sub>s</sub> =  
27       START\_TIME\_UNIT<sub>r</sub>.
- 28     • The mobile station shall store USE\_T\_ADD\_ABORT<sub>r</sub>, Reverse Supplemental  
29       Channel assignment T\_ADD abort indicator, as USE\_T\_ADD\_ABORT<sub>s</sub>.
- 30     • If IGNORE\_ESCAM<sub>s</sub> is equal to ‘1’ and SCRM\_SEQ\_NUM<sub>r</sub> is not present or is  
31       present and is not equal to SCRM\_SEQ\_NUM<sub>s</sub>, then the mobile station shall  
32       not process the remaining Reverse Supplemental Channel assignment  
33       information in this message.
- 34     • If IGNORE\_ESCAM<sub>s</sub> is equal to ‘1’ and SCRM\_SEQ\_NUM<sub>r</sub> is present and is  
35       equal to SCRM\_SEQ\_NUM<sub>s</sub>, then the mobile station shall set  
36       IGNORE\_ESCAM<sub>s</sub> to ‘0’.
- 37     • If ADD\_INFO\_INCL<sub>r</sub> is equal to ‘1’, the message includes a Supplemental  
38       Channel assignment (that is, NUM\_FOR\_SCH<sub>r</sub> is not equal to ‘00’ and/or  
39       NUM\_REV\_SCH<sub>r</sub> is not equal to ‘00’), and PILOT\_GATING\_USE\_RATE is  
40       equal to ‘1’, the mobile station shall process the following information of the  
41       *Extended Supplemental Channel Assignment Message* as follows:

- The mobile station shall set FPC\_PRI\_CHAN<sub>s</sub> = FPC\_PRI\_CHAN<sub>r</sub> at the action time of the message.
- ~~- The mobile station shall set PILOT\_GATING\_USE\_RATE to '0' and shall start the continuous reverse pilot at the specified action time.~~
- ~~If the Fundamental Channel was previously established prior to transitioning to the Control Hold Mode, the mobile station shall start processing F FCH and start transmitting on R FCH at the action time of the message. The mobile station shall establish the Fundamental Channel with the same configuration as previously used.~~
- If REV\_CFG\_INCLUDED is equal to '1', for all the (NUM\_REV\_CFG\_RECS + 1) occurrences of the reverse configuration record, the mobile station shall store the REV\_WALSH\_ID matrix as follows:
  - REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] = REV\_WALSH\_ID<sub>r</sub>
  - If NUM\_REV\_SCH<sub>r</sub> is not equal to '00', then the mobile station ~~set PILOT\_GATING\_USE\_RATE to '0' and~~ shall store the following information for each occurrence of the record and process the Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:
    - REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME\_INCL<sub>r</sub>
    - If REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is set to '1', set REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME<sub>r</sub>
    - REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_DURATION<sub>r</sub>
    - REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>
  - If NUM\_FOR\_SCH<sub>r</sub> is not equal to '00', then the mobile station shall ~~set PILOT\_GATING\_USE\_RATE to '0' and~~ store the following information for each occurrence of the record and process the Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:
    - FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_START\_TIME\_INCL<sub>r</sub>
    - If FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is set to '1', set FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_START\_TIME<sub>r</sub>
    - FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_DURATION<sub>r</sub>
    - FOR\_SCH\_FER\_REP<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_FER\_REP<sub>r</sub>
    - SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = SCCL\_INDEX<sub>r</sub>
  - ~~If FOR\_CFG\_INCLUDED is equal to '1', the mobile station shall perform the following: Set FOR\_SCH\_FER\_REP<sub>s</sub> to FOR\_SCH\_FER\_REP<sub>r</sub>.~~

- If FOR\_CFG\_INCLUDED is equal to '1', the mobile station shall perform the following:
  - Set FOR\_SCH\_FER REP<sub>s</sub> to FOR\_SCH\_FER REP<sub>r</sub>.
  - If FOR\_SCH\_FER REP<sub>r</sub> is equal to '0', set SCH\_TOT\_FRAMES<sub>s</sub> and SCH\_BAD\_FRAMES<sub>s</sub> to 0.
  - Store NUM\_FOR\_CFG\_RECS occurrences of Forward Supplemental Channel Configuration associated with the identification of Forward Supplemental Channel.
- For each record of the Forward Supplemental Channel Code list the mobile station shall store the Forward Supplemental Channel Code list associated with the FOR\_SCH\_ID<sub>r</sub> as follows:
  - NUM\_SUP\_SHO<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] = NUM\_SUP\_SHO<sub>r</sub>.
  - The mobile station shall determine, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number of information bits per Forward Supplemental Channel frame identified by FOR\_SCH\_ID and corresponding to the index SCCL\_INDEX according to the following rules:
    - + If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000', then:
      - o If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set the number of information bits per frame, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] and number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], according to Table 3.7.3.3.2.37-2 using FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> as the index to the table.
      - o If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then the mobile station shall set the number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] as the index to the table.
    - The mobile station shall also set the number of information bits per frame corresponding to SCCL\_INDEX<sub>r</sub>, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
    - + If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000', then:

- o The mobile station shall set  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$ , the set of indices to the number of information bits per frame as follows:
  - ◊ If  $FOR\_SCH\_NUM\_BITS\_IDX_r$  is equal to '0000', then  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r] = \{ FOR\_SCH\_NUM\_BITS\_IDX_r \}$ ,
  - ◊ otherwise the mobile station shall set (initialize)  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r] = \{FOR\_SCH\_NUM\_BITS\_IDX_r\}$  and for  $i=1, \dots, FOR\_SCH\_NUM\_BITS\_IDX_r$  the mobile station shall add  $FOR\_SCH\_NUM\_BITS\_IDX_r - VAR\_FSCH\_RATE\_OFFSET_s[FOR\_SCH\_ID_r][FOR\_SCH\_NUM\_BITS\_IDX_r][i]$  to the set specified by  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$
- o If  $USE\_FLEX\_NUM\_BITS_s$  is equal to '0' or if  $USE\_FLEX\_NUM\_BITS_s$  is equal to '1' and  $FSCH\_NBIT\_TABLE\_ID_s[FOR\_SCH\_ID_r]$  is equal to '0000', then the mobile station shall set  $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$ , the set of number of information bits per frame as follows.  
The  $i^{\text{th}}$  member of the set  $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  is obtained using Table 3.7.3.3.2.37-2 and the  $i^{\text{th}}$  member of the set  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$  as the index to the table.
- o If  $USE\_FLEX\_NUM\_BITS_s$  is equal to '1' and  $FSCH\_NBIT\_TABLE\_ID_s[FOR\_SCH\_ID_r]$  is not equal to '0000', then
  - ◊ the mobile station shall set  $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$ , the set of number of information bits per frame as follows.  
The  $i^{\text{th}}$  member of the set  $N_{FSCH\_BITS\_SET_s}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  is equal to  $NUM\_BITS_s[FSCH\_NBIT\_TABLE\_ID_s[FOR\_SCH\_ID_r]] [N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r][i]]$ , where  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r][i]$  denotes the  $i^{\text{th}}$  member of the set  $N_{FSCH\_BITS\_IDX\_SET_s}[FOR\_SCH\_ID_r]$  and,

1           ◊ the mobile station shall set  
 2            FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set  
 3            of number CRC bits per frame as follows.  
 4            The  $i^{\text{th}}$  member of the set  
 5            FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] using  
 6            Table 3.7.5.20-1 and  
 7            CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][N\_FS  
 8            CH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]] as the index to the  
 9            table, where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]  
 10          denotes the  $t^{\text{th}}$  member of the set  
 11          N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>].

- 12        – For the  $i^{\text{th}}$  record of the Forward Supplemental Channel Active Set (for all  
 13        values of  $i$  between 1 and NUM\_SUP\_SHO+1) specified in this message,  
 14        the mobile station shall store the following three entries corresponding to  
 15        the SCCL\_INDEX<sub>r</sub> as follows:
  - 16           + PILOT\_PN<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] = PILOT\_PN<sub>r</sub>,
  - 17           + Set the ADD\_PILOT\_REC\_INCL field to ADD\_PILOT\_REC\_INCL<sub>r</sub>. If  
 18            ADD\_PILOT\_REC\_INCL<sub>r</sub> equals ‘1’, the mobile station shall store the  
 19            following:
    - 20            o Set the PILOT\_REC\_TYPE field of PILOT\_REC to  
 21              PILOT\_REC\_TYPE<sub>r</sub>.
    - 22            o If PILOT\_REC\_TYPE<sub>r</sub> equals ‘000’, the mobile station shall set the  
 23              TD\_POWER\_LEVEL field of PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub>  
 24              and set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
    - 25            o If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘001’, the mobile station shall:
      - 26              – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
      - 27              – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
 28                AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
 29                WALSH\_LENGTH<sub>r</sub>.
    - 30            o If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘010’, the mobile station  
 31            shall:
      - 32              – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
      - 33              – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
 34                AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by  
 35                WALSH\_LENGTH<sub>r</sub>.
      - 36              – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to  
 37                AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
      - 38              – Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
    - 39            o If PILOT\_REC\_TYPE<sub>r</sub> is equal to ‘011’, the mobile station shall:

- Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
- Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.
- Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to SR3\_PILOT\_POWER2<sub>r</sub>.
- o If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
  - Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to SR3\_PILOT\_POWER2<sub>r</sub>.
  - Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
  - Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH1<sub>r</sub>.
  - Otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH2<sub>r</sub>.
  - Otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- + QOF\_MASK\_ID\_SCH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] = QOF\_MASK\_ID\_SCH<sub>r</sub>,
- + FOR\_SCH\_CC\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]= CODE\_CHAN\_SCH<sub>r</sub>.

- 1     • The mobile station may soft-combine the Forward Supplemental Channel  
2       frames received on the Forward Supplemental Channels in the same Forward  
3       Supplemental Channel Active Set.
- 4     • If the mobile station supports any Radio Configuration greater than 2, the  
5       mobile station shall perform the following:  
6       – If FPC\_INCL<sub>r</sub> is equal to '1', the mobile station shall:  
7           + Set FPC\_MODE\_SCH<sub>s</sub> to FPC\_MODE\_SCH<sub>r</sub>.  
8           – If FPC\_INCL is equal to '1' and FPC\_MODE is equal to '001', '010', '101',  
9            or '110', the mobile station shall:  
10           + Set FPC\_SEC\_CHAN<sub>s</sub> to FPC\_SEC\_CHAN<sub>r</sub>.  
11           – If NUM\_SUP<sub>r</sub> is included and not equal to '00', for each Supplemental  
12        Channel included in the message, the mobile station shall:  
13           + Set SCH\_ID<sub>s</sub> to SCH\_ID<sub>r</sub>.  
14           + Set FPC\_SCH\_FER<sub>s</sub> to FPC\_SCH\_FER<sub>r</sub>.  
15           + Set FPC\_SCH\_INIT\_SETPT<sub>s</sub> as follows:  
16             o If FPC\_SCH\_INIT\_SETPT\_OP<sub>r</sub> is set to '0', set  
17               FPC\_SCH\_INIT\_SETPT<sub>s</sub> to FPC\_SCH\_INIT\_SETPT<sub>r</sub>.  
18             o If FPC\_SCH\_INIT\_SETPT\_OP<sub>r</sub> is set to '1':  
19               ◊ If FPC\_PRI\_CHAN<sub>r</sub> is equal to '0', set FPC\_SCH\_INIT\_SETPT<sub>s</sub>  
20                to (FPC\_FCH\_CURR\_SETPT<sub>s</sub> + FPC\_SCH\_INIT\_SETPT<sub>r</sub>).  
21               ◊ Otherwise, set FPC\_SCH\_INIT\_SETPT<sub>s</sub> to  
22                (FPC\_DCCH\_CURR\_SETPT<sub>s</sub> + FPC\_SCH\_INIT\_SETPT<sub>r</sub>).  
23           + Set FPC\_SCH\_MIN\_SETPT<sub>s</sub> to FPC\_SCH\_MIN\_SETPT<sub>r</sub>.  
24           + Set FPC\_SCH\_MAX\_SETPT<sub>s</sub> to FPC\_SCH\_MAX\_SETPT<sub>r</sub>.  
25       – If FPC\_THRESH\_SCH\_INCL is included and equal to '1', the mobile  
26        station shall set FPC\_SETPT\_THRESH\_SCH<sub>s</sub> to SETPT\_THRESH\_SCH<sub>r</sub>.  
27     • If RPC\_INCL is equal to '1', the mobile station shall set RLGAIN\_SCH\_PILOT<sub>s</sub>  
28        to RLGAIN\_SCH\_PILOT<sub>r</sub>.  
29     • If NUM\_3X\_CFG<sub>r</sub> is not equal to '00', the mobile station shall store the  
30       Forward 3X Supplemental Channel Configuration associated with the  
31       identification of Forward Supplemental Channel (NUM\_3X\_CFG<sub>s</sub> =  
32       NUM\_3X\_CFG<sub>r</sub>).  
33     • For each 3X SCH record included in this message, the mobile station shall  
34       update the Forward Supplemental Channel Code list associated with the  
35       FOR\_SCH\_ID<sub>r</sub> as follows:

- 1           – For the  $i^{\text{th}}$  record of the Forward Supplemental Channel Active Set (for all  
 2           values of  $i$  between 1 and  $\text{NUM\_SUP\_SHO}+1$ ) specified in this message,  
 3           the mobile station shall store the following three entries corresponding to  
 4           the  $\text{SCCL\_INDEX}_r$  as follows:
- 5            + If  $3X_{\text{SCH\_LOW}}_{\text{INCL}_r}$  equals ‘1’, set  
 6               $\text{QOF\_MASK\_ID\_SCH\_LOW}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 7               $\text{QOF\_MASK\_ID\_SCH\_LOW}_r$  and  
 8               $\text{FOR\_SCH\_CC\_INDEX\_LOW}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 9               $\text{CODE\_CHAN\_SCH\_LOW}_r$ . Otherwise, set  
 10              $\text{QOF\_MASK\_ID\_SCH\_LOW}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 11              $\text{QOF\_MASK\_ID\_SCH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  and  
 12              $\text{FOR\_SCH\_CC\_INDEX\_LOW}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 13              $\text{CODE\_CHAN\_SCH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$ .
- 14            + If  $3X_{\text{SCH\_HIGH}}_{\text{INCL}_r}$  equals ‘1’, set  
 15               $\text{QOF\_MASK\_ID\_SCH\_HIGH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 16               $\text{QOF\_MASK\_ID\_SCH\_HIGH}_r$  and  
 17               $\text{FOR\_SCH\_CC\_INDEX\_HIGH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 18               $\text{CODE\_CHAN\_SCH\_HIGH}_r$ . Otherwise, set  
 19               $\text{QOF\_MASK\_ID\_SCH\_HIGH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 20               $\text{QOF\_MASK\_ID\_SCH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  and  
 21               $\text{FOR\_SCH\_CC\_INDEX\_HIGH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$  to  
 22               $\text{CODE\_CHAN\_SCH}[\text{FOR\_SCH\_ID}_r][\text{SCCL\_INDEX}_r][i]$ .
- 23           • If  $\text{PILOT\_GATING\_USE\_RATE}$  is set to ‘1’ and if  $\text{NUM\_REV\_SCH}_r$  or  
 24            $\text{NUM\_FOR\_SCH}_r$  is not equal to ‘00’, the mobile station shall perform the  
 25           following:
- 26            – The mobile station shall set  $\text{PILOT\_GATING\_USE\_RATE}$  to ‘0’ and shall  
 27           start the continuous reverse pilot at the specified action time.
- 28            – If the Fundamental Channel was previously established prior to  
 29           transitioning to the *Control Hold Mode*, the mobile station shall start  
 30           processing F-FCH and start transmitting on R-FCH at the action time of  
 31           the message. The mobile station shall establish the Fundamental  
 32           Channel with the same configuration as previously used.

- 33          14. *Forward Supplemental Channel Assignment Mini Message*: The mobile station  
 34          shall process this message as follows:

35          The mobile station shall send a *Mobile Station Reject Order* with the  $\text{ORDQ}$  field  
 36          set to ‘00000111’ (message can not be handled by the current mobile station  
 37          configuration), if any of the mobile station’s forward supplemental channel  
 38          configuration parameters for the corresponding Supplemental Channel  
 39          ( $\text{FOR\_SCH\_MUX}_s$ ,  $\text{FOR\_SCH\_RC}_s$ ,  $\text{FOR\_SCH\_CODING}_s$ ,  
 40           $\text{FOR\_SCH\_FRAME\_LENGTH}_s$ ,  $\text{QOF\_ID}_s$  for the corresponding  $\text{SCCL\_INDEX}_s$ , or  
 41           $\text{FOR\_SCH\_CC\_INDEX}_s$  for the corresponding  $\text{SCCL\_INDEX}_s$ ) is NULL.

42          Otherwise, the mobile station shall store the following information and process

1 the Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:

- 2 • Set FOR\_SCH\_START\_TIME\_INCL<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] to ‘1’
- 3 • FOR\_SCH\_START\_TIME<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_START\_TIME<sub>r</sub>
- 4 • FOR\_SCH\_DURATION<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_DURATION<sub>r</sub>
- 5 • SCCL\_INDEX<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] = SCCL\_INDEX<sub>r</sub>
- 6 • If PILOT\_GATING\_USE\_RATE is set to ‘1’, the mobile station shall perform  
7 the following:
  - 8 – The mobile station shall set PILOT\_GATING\_USE\_RATE to ‘0’ and shall  
9 start the continuous reverse pilot at the specified action time.
  - 10 – If the Fundamental Channel was previously established prior to  
11 transitioning to the *Control Hold Mode*, the mobile station shall start  
12 processing F-FCH and start transmitting on R-FCH at the action time of  
13 the message. The mobile station shall establish the Fundamental  
14 Channel with the same configuration as previously used.

15 15. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station shall  
16 process this message as follows:

17 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
18 set to ‘00000111’ (message can not be handled by the current mobile station  
19 configuration), if any of the mobile station’s reverse supplemental channel  
20 configuration parameters for the corresponding Supplemental Channel  
21 (~~REV\_SCH\_MUX<sub>S</sub>, REV\_SCH\_RC<sub>S</sub>, REV\_SCH\_CODING<sub>S</sub>, or~~  
22 ~~REV\_SCH\_FRAME\_LENGTH<sub>S</sub>~~) is NULL.

23 If IGNORE\_ESCAM<sub>S</sub> is equal to ‘1’, the mobile station shall not process the  
24 Reverse Supplemental Channel assignment information in this message.

25 Otherwise, the mobile station shall store the following information and process  
26 the Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:

- 27 • Set REV\_SCH\_START\_TIME\_INCL<sub>S</sub>[REV\_SCH\_ID<sub>r</sub>] to ‘1’
- 28 • REV\_SCH\_START\_TIME<sub>S</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME<sub>r</sub>
- 29 • REV\_SCH\_DURATION<sub>S</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_DURATION<sub>r</sub>
- 30 • REV\_SCH\_NUM\_BITS\_IDX<sub>S</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>
- 31 • If PILOT\_GATING\_USE\_RATE is set to ‘1’, the mobile station shall perform  
32 the following:
  - 33 – The mobile station shall set PILOT\_GATING\_USE\_RATE to ‘0’ and shall  
34 start the continuous reverse pilot at the specified action time.

- 1           – If the Fundamental Channel was previously established prior to  
 2           transitioning to the *Control Hold Mode*, the mobile station shall start  
 3           processing F-FCH and start transmitting on R-FCH at the action time of  
 4           the message. The mobile station shall establish the Fundamental  
 5           Channel with the same configuration as previously used.

6        2.6.6.2.5.1.1 Processing of the Forward Supplemental Burst Assignment

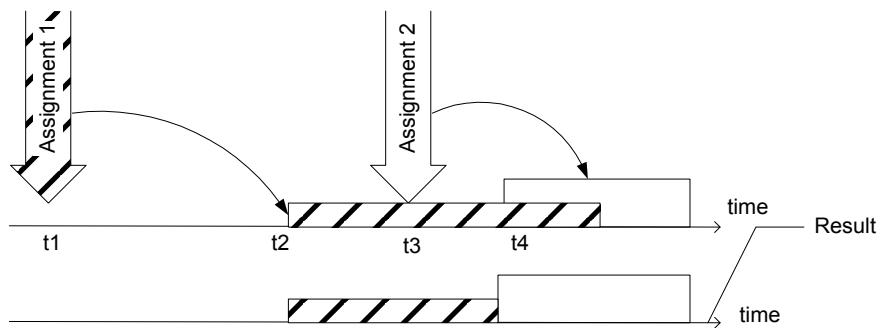

7        A Forward Supplemental Assignment specifies the explicit start time identified by  
 8        FOR\_SCH\_START\_TIME or the implicit start time (if FOR\_SCH\_START\_TIME\_INCL is set to  
 9        '0'), FOR\_SCH\_DURATION, and SCCL\_INDEX of a forward burst assignment. The time  
 10      interval of duration is specified by FOR\_SCH\_DURATION (see Table 3.7.3.3.2.37-3) and  
 11      starts at the time specified by the explicit start time FOR\_SCH\_START\_TIME or the implicit  
 12      start time (if FOR\_SCH\_START\_TIME\_INCL is set to '0'). This time interval for a Forward  
 13      Supplemental Assignment is called the Forward Supplemental Assignment Interval. A  
 14      value of FOR\_SCH\_DURATION equal to '1111' indicates infinite duration. The variable  
 15      SCCL\_INDEX<sub>S</sub>[FOR\_SCH\_ID] specifies the rate, QOF index and the Active Set for the  
 16      Forward Supplemental Channel identified by FOR\_SCH\_ID for a given Forward  
 17      Supplemental Assignment. A value of FOR\_SCH\_DURATION equal to '0000' indicates that  
 18      the mobile station should stop processing the forward Supplemental Channels at the  
 19      explicit start time specified by FOR\_SCH\_START\_TIME or the implicit start time (if  
 20      FOR\_SCH\_START\_TIME\_INCL is set to '0'). The implicit start time is the time occurring no  
 21      later than the first 80 ms boundary (relative to System Time) which occurs at least 80 ms  
 22      after the end of the frame containing the last bit of the *Extended Supplemental Channel  
 23      Assignment Message*.

24      For each Forward Supplemental Assignment the mobile station shall determine the start  
 25      time for processing forward supplemental channel as the time for which the following  
 26      equation holds:

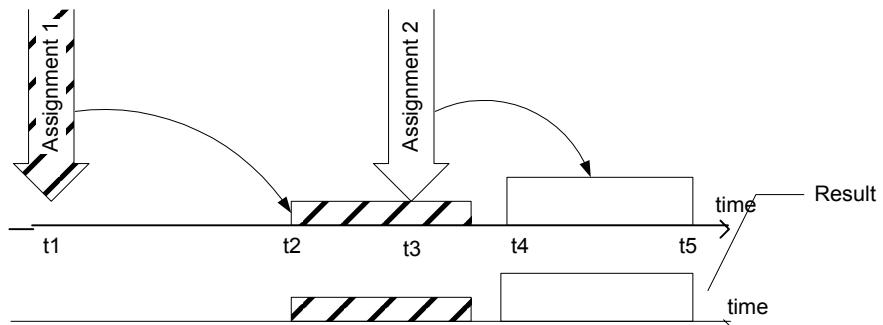

$$(\lfloor t / (\text{START\_TIME\_UNIT}_S + 1) \rfloor - \text{FOR\_SCH\_START\_TIME}_r) \bmod 32 = 0,$$

28      where t is the System Time in units of 20 ms.

29      Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Forward Supplemental  
 30      Assignment is received while the mobile station is processing the forward supplemental  
 31      channel according to a previously received assignment. Two cases are displayed in Figure  
 32      2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the start time of the  
 33      second assignment and Case b) where the first assignment ends before the second one  
 34      starts.

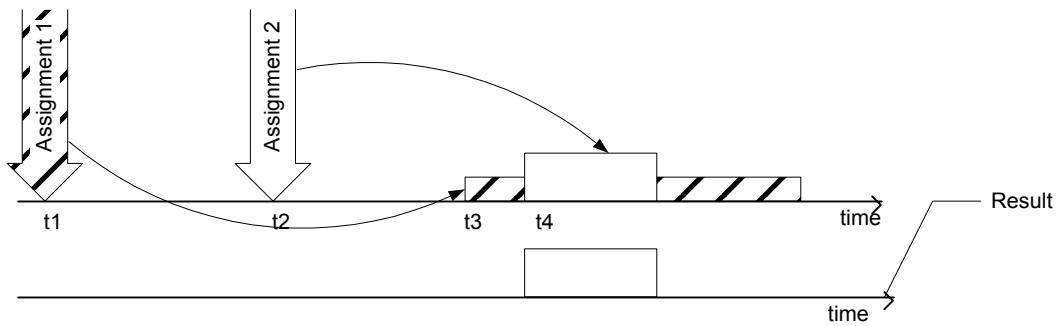

a) "Assignment 1" extends beyond the start time for "Assignment 2"

b) "Assignment 1" ends prior to the start time of "Assignment 2"

**Figure 2.6.6.2.5.1.1-1. New Supplemental Channel Assignment Received while a Previous Supplemental Channel Assignment is in Progress**

Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a second Forward Supplemental Assignment before it starts processing the supplemental channel according to the first assignment. In this case, the second assignment simply replaces the first assignment.

**Figure 2.6.6.2.5.1.1-2. New Supplemental Channel Assignment Received before a Previous Supplemental Channel Assignment starts**

The mobile station shall set  $FPC\_MODE_s$  to  $FPC\_MODE\_SCH_s$  at the  $FOR\_SCH\_START\_TIME_s$  of the forward Supplemental Channel assignment. The mobile station shall set  $FPC\_MODE_s$  to  $FPC\_MODE\_NO\_SCH_s$  at the end of the forward Supplemental Channel assignment.

- 1 For each Forward Supplemental Channel assignment corresponding to each Forward  
 2 Supplemental Channel (identified by FOR\_SCH\_ID), the mobile station should perform the  
 3 following:
- 4     • If FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID] is not equal to '0000', then
- 5         – If the mobile station is currently processing the Forward Supplemental Channel  
 6             identified by FOR\_SCH\_ID, then the mobile station should continue processing  
 7             the Forward Supplemental Channel identified by FOR\_SCH\_ID according to the  
 8             Forward Supplemental Assignment previously received for the Forward  
 9             Supplemental Channel identified by FOR\_SCH\_ID up to the time specified by the  
 10            FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID] (i.e., the mobile station should stop  
 11            processing the forward supplemental channel identified by FOR\_SCH\_ID at  
 12            either the time specified by [FOR\\_SCH\\_START\\_TIME<sub>s</sub>\[FOR\\_SCH\\_ID\]](#), the start  
 13            time of the new assignment, or at the time the previously received assignment  
 14            ends, whichever time is earlier).
- 15             At the time specified by FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID], the mobile  
 16             station should start processing the Forward Supplemental Channel identified by  
 17             FOR\_SCH\_ID for a duration of time specified by  
 18             FOR\_SCH\_DURATION[FOR\_SCH\_ID]<sub>s</sub> with the QOF index, the Supplemental  
 19             Channel Active Set indexed by SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID], and number of  
 20             information bits per frame (or set of number of bits per frame if  
 21             FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000' specified by  
 22             N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>].
- 23             If the set of number of bits per frame,  
 24             N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], has more than one member  
 25             and F\_INC\_RATE\_ALLOWED<sub>s</sub> is equal to '0', then the following rule applies for  
 26             the duration of this assignment:
- 27                 + Once the mobile station determines the forward Supplemental Channel  
 28                 number of bits per frame, the number of bits per frame in the subsequent  
 29                 Forward Supplemental Channel frames may be any member of the set  
 30                 N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] which is smaller or equal  
 31                 to the number of bits in the current frame.
- 32                 – Otherwise, if the mobile station is not currently processing the Forward  
 33                 Supplemental Channel identified by FOR\_SCH\_ID, then at the time specified by  
 34                 FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID], the mobile station should start  
 35                 processing the Forward Supplemental Channel identified by FOR\_SCH\_ID for a  
 36                 duration of time specified by FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID] with the QOF  
 37                 index, the Supplemental Channel Active Set indexed by  
 38                 SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID], and number of bits per frame (or set of number of  
 39                 information bits per frame if FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal  
 40                 to '000' specified by N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>].

If the set of number of bits per frame,  $N_{FSCH\_BITS\_SETs}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  and  $F\_INC\_RATE\_ALLOWED_s$  is equal to '0', has more than one member, then the following rule applies for the duration of this assignment:

- + Once the mobile station determines the forward Supplemental Channel number of bits per frame, the number of bits per frame in the subsequent Forward Supplemental Channel frames may be any member of the set  $N_{FSCH\_BITS\_SETs}[FOR\_SCH\_ID_r][SCCL\_INDEX_r]$  which is smaller or equal to the number of bits in the current frame.
- If  $FOR\_SCH\_DURATION_s[FOR\_SCH\_ID]$  is equal to '0000', the mobile station should perform the following:
  - If the mobile station is currently processing the Forward Supplemental Channel identified by FOR\_SCH\_ID, then the mobile station should continue processing the Forward Supplemental Channel identified by FOR\_SCH\_ID according to the Forward Supplemental Assignment previously received for the Forward Supplemental Channel identified by FOR\_SCH\_ID up to the time specified by the implicit start time (FOR\_SCH\_START\_TIME\_INCL\_s is set to '0') or the explicit start time (FOR\_SCH\_START\_TIME\_INCL\_s is set to '1') (i.e., the mobile station should stop processing the forward supplemental channel identified by FOR\_SCH\_ID at the time specified by the implicit start time or the explicit start time, or at the time the previously received assignment ends, whichever time is earlier). The mobile station should cancel the pending Forward Supplemental Channel assignment if any.
  - + — If  $FOR\_SCH\_START\_TIME\_INCL_s$  is equal to '1', the mobile station should stop processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$  at the time specified by  $FOR\_SCH\_START\_TIME_s[FOR\_SCH\_ID]$ .
  - + — If  $FOR\_SCH\_START\_TIME\_INCL_s$  is equal to '0', the mobile station should stop processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$  no later than the first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end of the frame containing the last bit of the message.
  - Otherwise, if the mobile station is not currently processing the Forward Supplemental Channel identified by FOR\_SCH\_ID, the mobile station should cancel the pending Forward Supplemental Channel assignment if any.
  - If the PILOT\_GATING\_USE\_RATE to equal to '0', the mobile station shall start the continuous reverse pilot at the specified action time.

### 2.6.6.2.5.1.2 Processing of the Reverse Supplemental Burst Assignment

A Reverse Supplemental Assignment specifies the explicit start time identified by  $REV\_SCH\_START\_TIME$  or the implicit start time (if  $REV\_SCH\_START\_TIME\_INCL$  is set to '0'),  $REV\_SCH\_DURATION$ , and  $REV\_SCH\_NUM\_BITS\_IDX$  of a reverse burst assignment.

1 The time interval of duration is specified by REV\_SCH\_DURATION (see Table 3.7.3.3.2.37-3)  
 2 and starts at the time specified by the explicit start time REV\_SCH\_START\_TIME or the  
 3 implicit start time (if REV\_SCH\_START\_TIME\_INCL is set to '0'). This time interval for a  
 4 Reverse Supplemental Assignment is called the reverse supplemental assignment interval.  
 5 A value of REV\_SCH\_DURATION equal to '1111' indicates infinite duration. A value of  
 6 REV\_SCH\_DURATION equal to '0000' indicates that the mobile station should stop  
 7 transmitting the reverse Supplemental Channels at the explicit start time specified by  
 8 REV\_SCH\_START\_TIME or the implicit start time (if REV\_SCH\_START\_TIME\_INCL is set to  
 9 '0'). The implicit start time is the time occurring no later than the first 80 ms boundary  
 10 (relative to System Time) which occurs at least 80 ms after the end of the frame containing  
 11 the last bit of the *Extended Supplemental Channel Assignment Message*.

12 For each Reverse Supplemental Assignment the mobile station shall determine the start  
 13 time for processing reverse supplemental channel as the time for which the following  
 14 equation holds:

$$\lfloor t / (\text{START\_TIME\_UNIT}_S + 1) \rfloor - \text{REV\_SCH\_START\_TIME}_R \bmod 32 = 0,$$

16 where  $t$  is the System Time in units of 20 ms.

17 Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Reverse Supplemental  
 18 Assignment is received while the mobile station is transmitting on the reverse supplemental  
 19 channel according to a previously received assignment. Two cases are displayed in Figure  
 20 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the start time of the  
 21 second assignment and Case b) where the first assignment ends before the second one  
 22 starts.

23 Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a  
 24 second Reverse Supplemental Assignment before it starts transmitting on the supplemental  
 25 channel according to the first assignment. In this case, the second assignment simply  
 26 replaces the first assignment.

27 For each Reverse Supplemental Channel assignment corresponding to each Reverse  
 28 Supplemental Channel (identified by REV\_SCH\_ID), the mobile station shall perform the  
 29 following:

- 30 • The mobile station shall determine,  $N_{RSCH\_BITS}_S[REV\_SCH\_ID_R]$ , the number of  
 31 information bits per Reverse Supplemental Channel frame identified by  
 32 REV\_SCH\_ID according to the following rules:
  - 33 – If  $RSCH\_VAR\_TABLE\_IDs[REV\_SCH\_ID_R]$  is equal to '000', then:
    - 34 + If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if  $USE\_FLEX\_NUM\_BITS_S$  is equal  
 35 to '1' and  $RSCH\_NBIT\_TABLE\_IDs[REV\_SCH\_ID_R]$  is equal to '0000', then the  
 36 mobile station shall set the number of information bits per frame,  
 37  $N_{RSCH\_BITS\_SET}_S[REV\_SCH\_ID_R]$  and number of CRC bits per frame,  
 38  $RSCH\_CRC\_LEN\_SET}_S[REV\_SCH\_ID_R]$ , according to Table 3.7.3.3.2.37-[24](#)  
 39 using  $REV\_SCH\_NUM\_BITS\_IDX_R$  as the index to the table.

- + If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is not equal to '0000', then the mobile station shall set the number of CRC bits per frame, RSCH\_CRC\_LEN\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], according to Table 3.7.5.20-1 using CRC\_LEN\_IDX<sub>s</sub>[RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]][REV\_SCH\_NUM\_BIT S\_IDX<sub>r</sub>] as the index to the table. The mobile station shall also set the number of information bits per frame, N\_SCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], to NUM\_BITS<sub>s</sub>[RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]] [REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
- If RSCH\_VAR\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is not equal to '000', then:
  - + The mobile station shall set N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the set of indices to the number of information bits per frame as follows:
    - o If REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub> is equal to '0000', then N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = {REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>},
    - o otherwise, the mobile station shall set (initialize) N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = { REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub> }, and for i=1, ..., REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub> the mobile station shall add REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub> - VAR\_RSCH\_RATE\_OFFSET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>][i] to the set specified by N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]
  - + If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall determine N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the set of number of information bits per frame as follows. The *i*<sup>th</sup> member of the set N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is obtained using Table 3.7.3.3.2.37-1 and the *i*<sup>th</sup> member of the set N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] as the index to the table.
  - + If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then
    - o the mobile station shall set N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the set of number of information bits per frame as follows. The *i*<sup>th</sup> member of the set N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is equal to NUM\_BITS<sub>s</sub>[SCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]] [N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][i]], where N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][i] denotes the *i*<sup>th</sup> member of the set N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>].

- 1           o the mobile station shall set RSCH\_CRC\_LEN\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the  
 2           set of number of information bits per frame as follows.  
 3           The  $i^{\text{th}}$  member of the set RSCH\_CRC\_LEN\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is  
 4           equal to  
 5           CRC\_LEN\_IDX<sub>s</sub>[RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]][N\_RSCH\_BITS\_I  
 6           DX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][i]], where  
 7           N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][i] denotes the  $i^{\text{th}}$  member of the  
 8           set N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>].

- 9       • If REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID] is not equal to '0000', then  
 10      – If the mobile station is currently transmitting on the Reverse Supplemental  
        Channel identified by REV\_SCH\_ID, then the mobile station may continue  
        transmitting on the Reverse Supplemental Channel identified by REV\_SCH\_ID  
        with the Walsh cover specified by  
        REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX[REV\_SCH\_ID<sub>r</sub>]]  
        according to the current Reverse Supplemental Assignment for the Reverse  
        Supplemental Channel identified by REV\_SCH\_ID up to the time specified by the  
        REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] (i.e., the mobile station shall stop  
        transmitting on the reverse supplemental channel identified by REV\_SCH\_ID at  
        either the time specified by [REV\\_SCH\\_START\\_TIME<sub>s</sub>\[REV\\_SCH\\_ID\]](#), the start  
        time of the new assignment, or at the time the previously received assignment  
        ends, whichever time is earlier).

22       At the time specified by REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the mobile  
 23       station may start transmitting on the Reverse Supplemental Channel identified  
 24       by REV\_SCH\_ID with the Walsh cover specified by  
 25       REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]] ~~and~~  
 26       and number of bits per frame (or set of number of information bits per frame if  
 27       RSCH\_VAR\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is not equal to '000') specified by  
 28       N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>].

29       If the set of number of bits per frame, N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], has  
 30       more than one member and R\_INC\_RATE\_ALLOWED<sub>s</sub> is equal to '0', then the  
 31       following rule applies for the duration of this assignment:

- 32       + Once the mobile station transmits  $n$  number of bits per Reverse  
 33       Supplemental Channel specifies by REV\_SCH\_ID, where  $n$  is a member of the  
 34       set N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the mobile station shall not transmit  
 35       at a rate higher than the one specifies by  $n$  information bits per frame for the  
 36       duration of the assignment.

- 1    – If the mobile station is not currently transmitting on the Reverse Supplemental  
 2    Channel identified by REV\_SCH\_ID<sub>r</sub>, then at the time specified by  
 3    REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the mobile station may start  
 4    transmitting on the Reverse Supplemental Channel identified by REV\_SCH\_ID  
 5    with the Walsh cover specified by  
 6    REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]] and  
 7    number of bits per frame (or set of number of information bits per frame if  
 8    RSCH\_VAR\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is not equal to '000') specified by  
 9    N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]. If the set of number of bits per frame,  
 10   N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], has more than one member and  
 11   R\_INC\_RATE\_ALLOWED<sub>s</sub> is equal to '0', then the following rule applies for the  
 12   duration of this assignment:
  - 13     + Once the mobile station transmits  $n$  number of bits per Reverse  
 14       Supplemental Channel specifies by REV\_SCH\_ID, where  $n$  is a member of the  
 15       set N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the mobile station shall not transmit  
 16       at a rate higher than the one specifies by  $n$  information bits per frame for the  
 17       duration of the assignment.
- 18   • If REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is equal to '0000', the mobile station shall  
 19       perform the followings:
  - 20       – If the mobile station is currently transmitting on the Reverse Supplemental  
 21       Channel identified by REV\_SCH\_ID, then the mobile station may continue  
 22       transmitting on the Reverse Supplemental Channel identified by REV\_SCH\_ID  
 23       with the Walsh cover specified by  
 24       REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX[REV\_SCH\_ID<sub>r</sub>]]  
 25       according to the current Reverse Supplemental Assignment for the Reverse  
 26       Supplemental Channel identified by REV\_SCH\_ID up to the time specified by the  
 27       implicit start time (if REV\_START\_TIME\_INCL<sub>s</sub> is equal to '1') or the explicit start  
 28       time (if REV\_START\_TIME\_INCL<sub>s</sub> is equal to '1') (i.e., the mobile station shall  
 29       stop transmitting on the reverse supplemental channel identified by  
 30       REV\_SCH\_ID at the implicit start time or the explicit start time, or at the time  
 31       the previously received assignment ends, whichever time is earlier). The mobile  
 32       station shall cancel the pending Reverse Supplemental Channel assignment if  
 33       any.  
 34       + — If REV\_START\_TIME\_INCL<sub>s</sub> is equal to '1', the mobile station shall stop  
 35       transmitting on the Reverse Supplemental Channel identified by  
 36       REV\_SCH\_ID<sub>r</sub> at the time specified by  
 37       REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>].
  - 38       + — If REV\_START\_TIME\_INCL<sub>s</sub> is equal to '0', the mobile station shall stop  
 39       transmitting on the Reverse Supplemental Channel identified by  
 40       REV\_SCH\_ID<sub>r</sub> no later than the first 80 ms boundary (relative to System  
 41       Time) occurring at least 80 ms after the end of the frame containing the last  
 42       bit of the message.

- Otherwise, if the mobile is not currently transmitting on the Reverse Supplemental Channel identified by REV SCH ID, the mobile station shall cancel the pending Forward Supplemental Channel assignment if any.
- If the PILOT\_GATING\_USE\_RATE is equal to '0', the mobile station shall start the continuous reverse pilot at the specified action time.

#### 2.6.6.2.5.2 Processing of Reverse Traffic Channel Handoff Messages

The mobile station sends the following messages on the Reverse Traffic Channel in support of handoff when its transmitter is enabled, following the receipt of a *forward dedicated channel acquired* indication from Layer 2 (see 2.2.2.1.2 of [4]):

1. *Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message:* The mobile station shall send an autonomous *Pilot Strength Measurement Message* if P\_REV\_IN\_USE is less than seven or *Extended Pilot Strength Measurement Message* if P\_REV\_IN\_USE is equal to or greater than seven in assured mode. The mobile station shall send either *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* containing measurements consistent with the event whenever any of the following events occur:
  - P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three or SOFT\_SLOPE<sub>s</sub> is equal to '000000' and the strength of a Neighbor Set or Remaining Set pilot is found to be above T\_ADD<sub>s</sub>.
  - P\_REV\_IN\_USE<sub>s</sub> is greater than three, SOFT\_SLOPE<sub>s</sub> is not equal to '000000', and the strength PS, as specified in 2.6.6.2.2, of any Candidate Set pilot is found to satisfy the following inequality:

$$10 \times \log_{10} \text{PS} > \frac{\text{SOFT\_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} \text{PS}_i + \frac{\text{ADD\_INTERCEPT}_s}{2}$$

where the summation is performed over all pilots currently in the Active Set and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.

- P\_REV\_IN\_USE<sub>s</sub> is greater than three, SOFT\_SLOPE<sub>s</sub> is not equal to '000000', and the strength PS, as specified in 2.6.6.2.2, of any Neighbor Set or Remaining Set pilot is found to satisfy the following inequality:

$$10 \times \log_{10} \text{PS} > \max\left(\frac{\text{SOFT\_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} \text{PS}_i + \frac{\text{ADD\_INTERCEPT}_s}{2}, - \frac{T\_ADD_s}{2}\right)$$

where the summation is performed over all pilots currently in the Active Set.

- 1     • P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three or SOFT\_SLOPE<sub>s</sub> is equal to  
 2       ‘000000’, the strength of a Candidate Set pilot exceeds the strength of an Active  
 3       Set pilot by T\_COMP<sub>s</sub> × 0.5 dB, and a *Pilot Strength Measurement Message*  
 4       carrying this information has not been sent since the last *Extended Handoff*  
 5       *Direction Message*, *General Handoff Direction Message* or *Universal Handoff*  
 6       *Direction Message* was received.
- 7     • P\_REV\_IN\_USE<sub>s</sub> is greater than three, SOFT\_SLOPE<sub>s</sub> is not equal to ‘000000’,  
 8       and the strength of a Candidate Set pilot exceeds the strength of an Active Set  
 9       pilot by T\_COMP<sub>s</sub> × 0.5 dB and satisfies the following inequality:

10    
$$10 \times \log_{10} PS > \frac{\text{SOFT\_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD\_INTERCEPT}_s}{2}$$

---

11 where the summation is performed over all pilots currently in the Active Set and  
 12 a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement*  
 13 *Message* carrying this information has not been sent since the last *Extended*  
 14 *Handoff Direction Message*, *General Handoff Direction Message* or *Universal*  
 15 *Handoff Direction Message* was received.

- 16    • The handoff drop timer of an Active Set pilot has expired and a *Pilot Strength*  
 17 *Measurement Message* or an *Extended Pilot Strength Measurement Message*  
 18 carrying this information has not been sent since the last *Extended Handoff*  
 19 *Direction Message*, *General Handoff Direction Message*, or *Universal handoff*  
 20 *Direction Message* was received.
- 21    2. *Handoff Completion Message* or *Extended Handoff Completion Message*: The mobile  
 22 station shall send a *Handoff Completion Message* if P\_REV\_IN\_USE is less than  
 23 seven or an *Extended Handoff Completion Message* if P\_REV\_IN\_USE is equal to or  
 24 greater than seven in assured mode as follows:
- 25    • If the handoff message (*Extended Handoff Direction Message*, *General Handoff*  
 26 *Direction Message* or *Universal Handoff Direction Message*) specifies a soft  
 27 handoff, the mobile station shall send the *Handoff Completion Message* if  
 28 P\_REV\_IN\_USE is less than seven or an *Extended Handoff Completion Message* if  
 29 P\_REV\_IN\_USE is equal to or greater than seven within T<sub>56m</sub> seconds after the  
 30 action time of the received handoff message.
- 31    • If the handoff message (*Extended Handoff Direction Message*, *General Handoff*  
 32 *Direction Message* or *Universal Handoff Direction Message*) specifies a hard  
 33 handoff without return on failure (see 2.6.6.2.8.1), the mobile station shall send  
 34 the *Handoff Completion Message* if P\_REV\_IN\_USE is less than seven or an  
 35 *Extended Handoff Completion Message* if P\_REV\_IN\_USE is equal to or greater  
 36 than seven within T<sub>73m</sub> seconds after the action time of the received handoff  
 37 message.

- 1     • If the handoff message (*General Handoff Direction Message* or *Universal Handoff  
Direction Message*) specifies a hard handoff with return on failure (see  
2       2.6.6.2.8.2), the mobile station shall send the *Handoff Completion Message* if  
3       P\_REV\_IN\_USE is less than seven or an *Extended Handoff Completion Message* if  
4       P\_REV\_IN\_USE is equal to or greater than seven within T<sub>56m</sub> seconds after  
5       mobile station declares the handoff to be successful (see 2.6.6.2.8.2).

6     3. *Candidate Frequency Search Report Message*: The mobile station shall send a  
7       *Candidate Frequency Search Report Message* in assured mode, whenever any of the  
8       following events occur:

- 9       • RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', and a handoff attempt is  
10      unsuccessful (see 2.6.6.2.8.2). In this case, the mobile station shall send a  
11       *Candidate Frequency Search Report Message* within T<sub>56m</sub> seconds after  
12       completing a search of all pilots in the Candidate Frequency Search Set and  
13       resuming the use of the Serving Frequency Active Set (see 2.6.6.2.8.2.1).
- 14       • RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', an inter-frequency handoff attempt  
15      is unsuccessful (see 2.6.6.2.8.2), and PERIODIC\_SEARCH<sub>s</sub> is equal to '1'. In  
16      this case, the mobile station shall send a *Candidate Frequency Search Report  
17       Message* in a search period if the conditions specified in 2.6.6.2.8.3.2 are met.
- 18       • The mobile station receives a *Candidate Frequency Search Request Message* or a  
19       *Candidate Frequency Search Control Message* with SEARCH\_TYPE set to '01'. If  
20       none of the conditions requiring the mobile station to send a *Mobile Station  
21       Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send a *Candidate  
22       Frequency Search Report Message*, as described in 2.6.6.2.8.3.1 and  
23       2.6.6.2.10.1.
- 24       • The mobile station receives a *Candidate Frequency Search Request Message* or  
25       *Candidate Frequency Search Control Message* with SEARCH\_TYPE set to '11',  
26       SEARCH\_MODE<sub>s</sub> is equal to '0000' and the Candidate Frequency Search Set is  
27       not empty. If none of the conditions requiring the mobile station to send a  
28       *Mobile Station Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send  
29       a *Candidate Frequency Search Report Message* in a search period if the  
30       conditions specified in 2.6.6.2.8.3.2 are met.
- 31       • The mobile station receives a *Candidate Frequency Search Request Message* or  
32       *Candidate Frequency Search Control Message* with SEARCH\_TYPE set to '11',  
33       SEARCH\_MODE<sub>s</sub> is equal to '0001' and the Candidate Frequency Analog Search  
34       Set is not empty. If none of the conditions requiring the mobile station to send a  
35       *Mobile Station Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send  
36       a *Candidate Frequency Search Report Message* in a search period if the  
37       conditions specified in 2.6.6.2.10.2 are met.
- 38     4. *Periodic Pilot Strength Measurement Message*: The mobile station shall send a  
39       *Periodic Pilot Strength Measurement Message* in unassured mode, as specified in  
40       2.6.6.2.5.1 and 2.6.6.2.12.
- 41     5. *Pilot Strength Measurement Mini Message*: If the mobile station supports the Mobile

1 Assisted Burst operation capability, the mobile station shall send this message while  
 2 processing any Supplemental Channel, according to the following:

- 3     • The mobile station shall transmit a *Pilot Strength Measurement Mini Message* for  
 4       a pilot  $p$  in the Active Set on the r-dsch logical channel whenever all of the  
 5       following conditions are true:
  - 6         – ORDER\_FLAG<sub>s</sub> is equal to '1'.
  - 7         – The pilot  $p$  in the Active Set has a received signal strength that is greater  
 8           than the signal strength of another pilot in the Active Set by  
 9           PS\_MIN\_DELTA<sub>s</sub>, in units of 0.5 dB, at the current time and has been for  
 10          ORDER\_INTERVAL<sub>s</sub> most recent successive 20 ms frame intervals since this  
 11          pilot was last reported in a rank order based *Pilot Strength Measurement Mini*  
 12          *Message*.
  - 13         – The rank order of pilot  $p$  has changed.
- 14     • If PERIODIC\_FLAG<sub>s</sub> is equal to '1', the mobile station shall transmit a *Pilot*  
 15       *Strength Measurement Mini Message* within PERIODIC\_INTERVAL<sub>s</sub> 20 ms frame  
 16       intervals on the r-dsch for each of the  $n$  pilots in the Active Set with the largest  
 17       signal strengths, where  $n = (\min(\text{NUM_PILOTS}, \text{the number of pilots in the})$   
 18       Active Set)), whenever the following condition is true:
  - 19         – The mobile station has not transmitted another *Pilot Strength*  
 20           *Measurement Mini Message* for the corresponding pilot during the last  
 21           PERIODIC\_INTERVAL<sub>s</sub> 20 ms frame intervals.
- 22     • If THRESHOLD\_FLAG<sub>s</sub> is equal to '1', the mobile station shall transmit a *Pilot*  
 23       *Strength Measurement Mini Message* for pilot  $p$  on the r-dsch logical channel  
 24       whenever all of the following conditions are true:
  - 25         – The mobile station has not transmitted a previous *Pilot Strength Measurement*  
 26           *Mini Message* for pilot  $p$  within the most recent THRESHOLD\_INTERVAL<sub>s</sub> 20  
 27           ms frames intervals.
  - 28         – Pilot  $p$  is in the Active Set.
  - 29         – The signal strength of pilot  $p$  is greater than PS\_CEILING\_HIGH<sub>s</sub> and the  
 30           signal strength of pilot  $p$  was less than or equal to PS\_CEILING\_LOW<sub>s</sub> at any  
 31           time since the mobile station last sent a *Pilot Strength Measurement Mini*  
 32           *Message* for pilot  $p$ ; or the signal strength of pilot  $p$  is less than  
 33           PS\_FLOOR\_LOW<sub>s</sub> and the signal strength for pilot  $p$  was greater than or  
 34           equal to PS\_FLOOR\_HIGH<sub>s</sub> at any time since the last time that the mobile  
 35           station sent a *Pilot Strength Measurement Mini Message* for pilot  $p$ .

36     2.6.6.2.6 Set Maintenance

37       2.6.6.2.6.1 Maintenance of the Active Set

38       The mobile station shall support a maximum Active Set size of N<sub>6m</sub> pilots. The mobile  
 39       station shall track the pilot strengths of all pilots in the Active Set.

When the mobile station is first assigned Forward Traffic Channels, the mobile station shall initialize the Active Set to contain the pilots associated with the assigned Forward Traffic Channels. When the mobile station processes an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or *Universal Handoff Direction Message*, then at the action time of the message the mobile station shall replace the pilots in the Active Set with the pilots listed in the message.

#### 2.6.6.2.6.2 Maintenance of the Candidate Set

The mobile station shall support a maximum Candidate Set size of  $N_{7m}$  pilots.

When the mobile station is first assigned a Forward Traffic Channel, the mobile station shall initialize the Candidate Set to contain no pilots. The mobile station shall adjust the Candidate Set whenever any of the following events occur:

- If the mobile station detects that the strength of a Neighbor Set pilot or a Remaining Set pilot exceeds  $T_{ADD_s}$ , the mobile station shall add the pilot to the Candidate Set.
- If the mobile station processes an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message* which does not list a pilot in the current Active Set, and the handoff drop timer corresponding to that pilot has not expired at the action time of the message, the mobile station shall add the pilot to the Candidate Set at the action time of the message.
- If  $P_{REV\_IN\_USE_s}$  is greater than three, and  $SOFT\_SLOPE_s$  is not equal to '000000', the mobile station shall perform the following: If the mobile station processes a *General Handoff Direction Message* or a *Universal Handoff Direction Message* which does not list a pilot in the current Active Set, the handoff drop timer corresponding to that pilot has expired at the action time of the message, and that pilot is found to be above  $T_{DROP_s}$ , the mobile station shall add the pilot to the Candidate Set at the action time of the message.
- If the mobile station processes an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or *Universal Handoff Direction Message*, which lists a pilot in the current Candidate Set, the mobile station shall delete the pilot from the Candidate Set at the action time of the message.
- If the handoff drop timer corresponding to a Candidate Set pilot expires, the mobile station shall delete the pilot from the Candidate Set.
- If the mobile station adds a pilot to the Candidate Set, and the resulting Candidate Set size exceeds  $N_{7m}$ , the mobile station shall delete from the Candidate Set the pilot whose handoff drop timer is closest to expiration. If more than one such pilot exists, the mobile station shall delete one such pilot that has the lowest strength. If no pilot in the Candidate Set has an enabled handoff drop timer, the mobile station shall delete from the Candidate Set the pilot that has the lowest strength.

#### 2.6.6.2.6.3 Maintenance of the Neighbor Set

The mobile station shall support a Neighbor Set size of at least  $N_{8m}$  pilots.

1 When the mobile station is first assigned a Forward Traffic Channel, the mobile station  
 2 shall initialize the Neighbor Set to contain all the pilots specified in the most recently  
 3 received *Neighbor List Message*, *Extended Neighbor List Message* or *General Neighbor List*  
 4 *Message*.

5 The mobile station shall maintain a counter, AGE<sub>S</sub>, for each pilot in the Neighbor Set. The  
 6 mobile station shall initialize this counter to zero when it moves the pilot from the Active  
 7 Set or the Candidate Set to the Neighbor Set. The mobile station shall initialize this  
 8 counter to NGHBR\_MAX\_AGE<sub>S</sub> when it moves the pilot from the Remaining Set to the  
 9 Neighbor Set. The mobile station shall increment AGE<sub>S</sub> for each pilot in the Neighbor Set  
 10 upon receipt of a *Neighbor List Update Message* or an *Extended Neighbor List Update*  
 11 *Message*. When the mobile station is first assigned to a Forward Traffic Channel, the  
 12 mobile station shall set AGE<sub>S</sub> for each pilot in the Neighbor Set to NGHBR\_MAX\_AGE<sub>S</sub>.

13 The mobile station shall adjust the Neighbor Set whenever any of the following events  
 14 occur:

- 15     • If the mobile station receives a *Neighbor List Update Message* or an *Extended*  
     16 *Neighbor List Update Message*, it shall perform the following:
  - 17         – Increment AGE<sub>S</sub> for each pilot in the Neighbor Set.
  - 18         – Delete from the Neighbor Set all pilots whose AGE<sub>S</sub> exceeds NGHBR\_MAX\_AGE<sub>S</sub>.
  - 19         – Add to the Neighbor Set each pilot named in the message, if it is not already a  
 20           pilot of the Active Set, Candidate Set, or Neighbor Set. If the mobile station can  
 21           store in the Neighbor Set only k additional pilots, and more than k new pilots  
 22           were sent in the *Neighbor List Update Message* or the *Extended Neighbor List*  
 23           *Update Message*, the mobile station shall store the first k new pilots listed in the  
 24           message.
- 25     • If the handoff drop timer of a pilot in the Candidate Set expires, the mobile station  
     26 shall add the pilot to the Neighbor Set.
- 27     • If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to three or SOFT\_SLOPE<sub>S</sub> is equal to  
     28 ‘000000’, the mobile station shall perform the following: If the mobile station  
     29 processes an *Extended Handoff Direction Message*, a *General Handoff Direction*  
     30 *Message*, or a *Universal Handoff Direction Message* in which a pilot in the Active Set  
     31 is not listed, and the handoff drop timer corresponding to the pilot has expired, the  
     32 mobile station shall add the pilot to the Neighbor Set.
- 33     • If P\_REV\_IN\_USE<sub>S</sub> is greater than three, and SOFT\_SLOPE<sub>S</sub> is not equal to ‘000000’,  
     34 the mobile station shall perform the following: If the mobile station processes an  
     35 *Extended Handoff Direction Message*, a *General Handoff Direction Message*, or a  
     36 *Universal Handoff Direction Message* which does not list a pilot in the current Active  
     37 Set, the handoff drop timer corresponding to that pilot has expired, and that pilot is  
     38 found to be below T\_DROP<sub>S</sub>, the mobile station shall add the pilot to the Neighbor  
     39 Set.

- If the mobile station adds a pilot to the Candidate Set, and the resulting Candidate Set size exceeds the size supported by the mobile station, the mobile station shall add the deleted Candidate Set pilot to the Neighbor Set (see 2.6.6.2.6.2).
- If the mobile station detects that the strength of a Neighbor Set pilot exceeds  $T_{ADD_S}$ , the mobile station shall delete the pilot from the Neighbor Set.
- If the mobile station processes an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message* which lists a pilot in the current Neighbor Set, the mobile station shall delete the pilot from the Neighbor Set.
- If the mobile station adds a pilot to the Neighbor Set, and the resulting Neighbor Set size exceeds the size supported by the mobile station, the mobile station shall delete from the Neighbor Set the pilot whose  $AGE_S$  is the largest. If more than one such pilot exists, the mobile station shall delete one such pilot that has the lowest strength.

#### 2.6.6.2.7 Soft Handoff

##### 2.6.6.2.7.1 Forward Traffic Channel Processing

All Forward Traffic Channels associated with pilots in the Active Set of the mobile station carry identical modulation symbols with the exception of the power control subchannel (see [2]).

When the Active Set contains more than one pilot, the mobile station should provide diversity combining of the associated Forward Traffic Channels. The mobile station shall provide for differential propagation delays from zero to at least 150  $\mu s$ .

##### 2.6.6.2.7.2 Reverse Traffic Channel Power Control During Soft Handoff

The *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message* identifies sets of Forward Fundamental ~~Code~~-Channels or Forward Dedicated Control Channels that carry identical closed loop power control subchannels. A set consists of one or more Forward Fundamental ~~Code~~-Channels or Forward Dedicated Control Channels with identical power control information.

In each power control group containing valid power control bits (see [2]), the mobile station should provide diversity combining of the identical closed loop power control subchannels and shall obtain at most one power control bit from each set of identical closed loop power control subchannels. The mobile station should only combine reliable power control bits (see 9.3.8 of [11]) as follows:

- If the reliable power control bits obtained from all sets are equal to '0', the mobile station shall increase its power as specified in [2].
- If the reliable power control bit obtained from any set is equal to '1', the mobile station shall decrease its power as specified in [2].

1        2.6.6.2.7.3 Starting Periodic Search following Soft Handoff

2        If the PERIODIC SEARCH<sub>S</sub> is equal to '1', a periodic search is not already in progress, and  
 3        the Frequency Assignment after handoff is different from the Candidate Frequency  
 4        (CDMABAND<sub>S</sub> is not equal to CF\_CDMABAND<sub>S</sub> or CDMACH<sub>S</sub> is not equal to CF\_CDMACH<sub>S</sub>),  
 5        the mobile station shall do the following:

- 6            • The mobile station shall set ALIGN\_TIMING\_USED<sub>S</sub> to '0' and SEARCH\_OFFSET<sub>S</sub> to  
 7            '000000'.
- 8            • The mobile station shall start a periodic search as described in 2.6.6.2.8.3.2.

9        2.6.6.2.8 CDMA-to-CDMA Hard Handoff

10      The base station directs the mobile station to perform a CDMA-to-CDMA hard handoff by  
 11     sending an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a  
 12     *Universal Handoff Direction Message* in which the mobile station is transitioned between  
 13     disjoint sets of base stations, different Frequency Assignments, or different frame offsets. If  
 14     RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '0', the mobile station performs the actions  
 15     described in 2.6.6.2.8.1. If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', the mobile station  
 16     performs the actions described in 2.6.6.2.8.2.

17      2.6.6.2.8.1 Hard Handoff without Return on Failure

18      At the action time specified in the *Extended Handoff Direction Message*, the *General Handoff*  
 19     *Direction Message* or *Universal Handoff Direction Message* the mobile station shall disable  
 20     its transmitter, reset the fade timer specified in 2.6.4.1.8, suspend incrementing  
 21     TOT\_FRAMES<sub>S</sub>, BAD\_FRAMES<sub>S</sub>, DCCH\_TOT\_FRAMES<sub>S</sub>, and DCCH\_BAD\_FRAMES<sub>S</sub> if  
 22     applicable as specified in 2.6.4.1.1, and tune to the assigned Forward Traffic Channel. The  
 23     mobile station shall perform acquisition of the pilots in the new Active Set.

24      If a periodic Serving Frequency pilot report procedure is in progress, the mobile station  
 25     shall abort it (see 2.6.6.2.12).

26      The mobile station shall begin monitoring the assigned Forward Traffic Channel within the  
 27     time specified below:

- 28            • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or  
 29            *Universal Handoff Direction Message* specifies a CDMA Frequency Assignment  
 30            different from the Serving Frequency and an Active Set containing pilots with pilot  
 31            PN sequence offsets identical to those of the pilots in the Serving Frequency Active  
 32            Set, the mobile station shall begin monitoring the assigned Forward Traffic Channel  
 33            within T<sub>60m</sub> seconds after the action time.
- 34            • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or  
 35            *Universal Handoff Direction Message* specifies a CDMA Frequency Assignment  
 36            different from the Serving Frequency and an Active Set containing a pilot with pilot  
 37            PN sequence offset not equal to that of any pilot in the Serving Frequency Active Set,  
 38            the mobile station shall begin monitoring the assigned Forward Traffic Channel  
 39            within T<sub>61m</sub> seconds after the action time.

- 1     • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or  
 2       *Universal Handoff Direction Message* specifies a CDMA-to-CDMA hard handoff  
 3       without changing the CDMA Frequency Assignment, the mobile station shall begin  
 4       monitoring the assigned Forward Traffic Channel within T<sub>62m</sub> seconds after the  
 5       action time.

6     If the Target Frequency is the same as the Candidate Frequency (TF\_CDMABAND<sub>S</sub> is equal  
 7       to CF\_CDMABAND<sub>S</sub>, and TF\_CDMACH<sub>S</sub> is equal to CF\_CDMACH<sub>S</sub>) and is different from the  
 8       Serving Frequency (TF\_CDMABAND<sub>S</sub> is not equal to SF\_CDMABAND<sub>S</sub>, or TF\_CDMACH<sub>S</sub> is  
 9       not equal to SF\_CDMACH<sub>S</sub>), the mobile station shall perform the following:

- 10    • If applicable, the mobile station shall replace its Neighbor Set with its Candidate  
   11      Frequency Neighbor Set, excluding the pilots in its Active Set. When the mobile  
   12      station adds a pilot from its Candidate Frequency Neighbor Set to its Active Set, it  
   13      shall maintain SEARCH\_PRIORITY<sub>S</sub>, SRCH\_WIN\_NGHBR<sub>S</sub>, and  
   14      SRCH\_OFFSET\_NGHBR<sub>S</sub> associated with the pilot.  
  
 15    • The mobile station shall set PILOT\_INC<sub>S</sub> to CF\_PILOT\_INC<sub>S</sub>, SRCH\_WIN\_N<sub>S</sub> to  
   16      CF\_SRCH\_WIN\_N<sub>S</sub>, and SRCH\_WIN\_R<sub>S</sub> to CF\_SRCH\_WIN\_R<sub>S</sub>.  
  
 17    • The mobile station shall set SEARCH\_PRIORITY\_INCL<sub>S</sub> to  
   18      CF\_SEARCH\_PRIORITY\_INCL<sub>S</sub>, SRCH\_OFFSET\_INCL<sub>S</sub> to CF\_SRCH\_OFFSET\_INCL<sub>S</sub>,  
   19      and SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> to CF\_SRCH\_WIN\_NGHBR\_INCL<sub>S</sub>.

20    After the action time, upon receiving a period of ( $N_{11m} \times 20$ ) ms with sufficient signal  
 21    quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> on the  
 22    assigned Forward Traffic Channel, the mobile station shall re-enable its transmitter. The  
 23    mobile station shall transmit the Traffic Channel Preamble, as described in 2.1.3.6.2.3 of  
 24    [2], followed by a *Handoff Completion Message* or *Extended Handoff Completion Message*.

25    After the action time, upon receiving a period of ( $N_{3m} \times 20$ ) ms with sufficient signal quality  
 26    (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>, the mobile  
 27    station shall resume incrementing TOT\_FRAMES<sub>S</sub>, BAD\_FRAMES<sub>S</sub>, DCCH\_TOT\_FRAMES<sub>S</sub>,  
 28    and DCCH\_BAD\_FRAMES<sub>S</sub> if applicable as specified in 2.6.4.1.1.

29    If the PERIODIC\_SEARCH<sub>S</sub> is equal to '1', a periodic search is not already in progress, and  
 30    the Frequency Assignment after handoff is different from the Candidate Frequency  
 31    (CDMABAND<sub>S</sub> is not equal to CF\_CDMABAND<sub>S</sub> or CDMACH<sub>S</sub> is not equal to CF\_CDMACH<sub>S</sub>),  
 32    the mobile station shall do the following:

- 33      • The mobile station shall set ALIGN\_TIMING\_USED<sub>S</sub> to '0' and SEARCH\_OFFSET<sub>S</sub> to  
 34       '000000'.  
  
 35      • The mobile station shall start a periodic search as described in 2.6.6.2.8.3.2.

### 36    2.6.6.2.8.2 Hard Handoff with Return on Failure

37    At the action time specified in the *General Handoff Direction Message* or *Universal Handoff  
 38    Direction Message*, the mobile station shall do the following:

- 1     • The mobile station shall stop processing the Forward Fundamental **Code**-Channel,  
2       the Forward Dedicated Control Channel, the Forward Supplemental Code Channels  
3       (if any), and the Forward Supplemental Channels (if any).
- 4     • The mobile station shall stop transmitting on the Reverse Fundamental **Code**  
5       Channel, on the Reverse Dedicated Control Channel, and on the Reverse  
6       Supplemental Code Channels (if any), and on the Reverse Supplemental Channels (if  
7       any).
- 8     • The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop  
9       timers corresponding to the Serving Frequency Active Set and Candidate Set (see  
10      2.6.6.2.3), and shall suspend incrementing TOT\_FRAMES<sub>S</sub>, BAD\_FRAMES<sub>S</sub>,  
11      DCCH\_TOT\_FRAMES<sub>S</sub>, and DCCH\_BAD\_FRAMES<sub>S</sub> if applicable (see 2.6.4.1.1).
- 12    • The mobile station shall lock the accumulation of valid level changes in the closed  
13      loop mean output power and shall ignore received power control bits related to the  
14      period that the transmitter is disabled (see 2.1.2.3.2 of [2]).
- 15    • If the Serving Frequency is different from the Target Frequency (SF\_CDMACH<sub>S</sub> is not  
16      equal to TF\_CDMACH<sub>S</sub> or SF\_CDMABAND<sub>S</sub> is not equal to TF\_CDMABAND<sub>S</sub>), the  
17      mobile station shall set CDMACH<sub>S</sub> to TF\_CDMACH<sub>S</sub> and CDMABAND<sub>S</sub> to  
18      TF\_CDMABAND<sub>S</sub>, and shall tune to the Target Frequency.

19    The mobile station shall not change its time reference (see 2.1.5 of [2]) until the handoff is  
20      successfully completed (as described later in this section) or the mobile station resumes  
21      using the Serving Frequency Active Set (as described in 2.6.6.2.8.2.1).

22    The mobile station shall maintain a *handoff* timer. The mobile station shall set the  
23      expiration time for the handoff timer to  $(0.08 \times \text{TF_WAIT_TIME}_S)$  seconds and enable the  
24      timer at the action time of the *General Handoff Direction Message* or *Universal Handoff  
25      Direction Message*.

26    The mobile station shall perform the following actions:

- 27     • If the Target Frequency is different from the Serving Frequency (TF\_CDMABAND<sub>S</sub> is  
28       not equal to SF\_CDMABAND<sub>S</sub>, or TF\_CDMACH<sub>S</sub> is not equal to SF\_CDMACH<sub>S</sub>), the  
29       mobile station shall measure the mean input power on the Target Frequency  
30       (*target\_freq\_pwr*, in dBm/1.23 MHz) and may use *target\_freq\_pwr* along with the  
31       measurement of the average input power on the Serving Frequency  
32       (*avg\_serving\_freq\_pwr*, in dBm/1.23 MHz) in the handoff procedure. The mobile  
33       station may declare the handoff attempt to be unsuccessful if all of the following  
34       conditions are true:
  - 35         – DIFF\_RX\_PWR\_THRESH<sub>S</sub> is not equal to '00000',
  - 36         – the mobile station has been measuring the received power on the Serving  
37           Frequency for at least the last N<sub>12m</sub> frames, and
  - 38         – (*target\_freq\_pwr - avg\_serving\_freq\_pwr*) is less than  $(-30 + 2 \times$   
39           DIFF\_RX\_PWR\_THRESH<sub>S</sub>) dB.

If the mobile station declares the handoff attempt to be unsuccessful, it shall restore the configuration to what it was before the handoff attempt (see 2.6.6.2.5.1) and send a *Candidate Frequency Search Report Message* as described in 2.6.6.2.8.2.1.

- The mobile station shall measure  $E_c/I_o$  for each pilot in the Active Set using the procedures specified in 2.6.6.2.2, if any of the following conditions is true:
  - the Target Frequency is the same as the Serving Frequency ( $TF_{CDMABAND_s}$  is equal to  $SF_{CDMABAND_s}$ , and  $TF_{CDMACH_s}$  is equal to  $SF_{CDMACH_s}$ ),
  - the mobile station does not use the power measurements in the handoff procedure,
  - $DIFF_{RX\_PWR\_THRESH_s}$  is equal to '00000',
  - the mobile station has not been measuring the received power on the Serving Frequency for at least the last  $N_{12m}$  frames, or
  - $(target\_freq\_pwr - avg\_servng\_freq\_pwr)$  is not less than  $(-30 + 2 \times DIFF_{RX\_PWR\_THRESH_s})$  dB.

If the mobile station measures  $E_c/I_o$  for pilots in the Active Set, it shall compare the sum of the measured  $E_c/I_o$  for all pilots with the minimum total pilot  $E_c/I_o$  threshold (MIN\_TOTAL\_PILOT\_EC\_IO\_s).

- If MIN\_TOTAL\_PILOT\_EC\_IO\_s is not equal to '00000', and  $(-20 \times \log_{10} (E_c/I_o)_{total})$  is less greater than MIN\_TOTAL\_PILOT\_EC\_IO\_s, where  $(E_c/I_o)_{total}$  is the sum of the measured  $E_c/I_o$  for the pilots in the Active Set, the mobile station shall declare the handoff attempt to be unsuccessful, and shall do the following:
  - + If COMPLETE\_SEARCH\_s is equal to '1', and the Target Frequency is the same as the Candidate Frequency ( $TF_{CDMABAND_s}$  is equal to  $CF_{CDMABAND_s}$ , and  $TF_{CDMACH_s}$  is equal to  $CF_{CDMACH_s}$ ) and is different from the Serving Frequency ( $TF_{CDMABAND_s}$  is not equal to  $SF_{CDMABAND_s}$ , or  $TF_{CDMACH_s}$  is not equal to  $SF_{CDMACH_s}$ ), the mobile station shall measure the strength of each pilot in its Candidate Frequency Search Set using the procedures specified in 2.6.6.2.2; otherwise, the mobile station shall end the search.
  - + Otherwise, the mobile station shall end the search.
  - + The mobile station shall then restore its configuration to what it was before the handoff attempt (see 2.6.6.2.5.1) and send a Candidate Frequency Search Report Message as described in 2.6.6.2.8.2.1.

The mobile station shall then restore its configuration to what it was before the handoff attempt (see 2.6.6.2.5.1) and send a Candidate Frequency Search Report Message as described in 2.6.6.2.8.2.1.

- 1    – If MIN\_TOTAL\_PILOT\_EC\_IO<sub>S</sub> is equal to ‘00000’, or ( $-20 \times \log_{10} (E_c/I_o)_{total}$ ) is  
 2    not less than MIN\_TOTAL\_PILOT\_EC\_IO<sub>S</sub>, where  $(E_c/I_o)_{total}$  is the sum of the  
 3    measured  $E_c/I_o$  for the pilots in the Active Set, the mobile station shall attempt  
 4    to demodulate the Forward Traffic Channel(s). If the Active Set contains more  
 5    than one pilot, the mobile station shall perform the actions specified in  
 6    2.6.6.2.7. If the Target Frequency is the same as the Candidate Frequency  
 7    (TF\_CDMABAND<sub>S</sub> is equal to CF\_CDMABAND<sub>S</sub>, and TF\_CDMACH<sub>S</sub> is equal to  
 8    CF\_CDMACH<sub>S</sub>), and is different for from the Serving Frequency  
 9    (TF\_CDMABAND<sub>S</sub> is not equal to SF\_CDMABAND<sub>S</sub>, or TF\_CDMACH<sub>S</sub> is not equal  
 10   to SF\_CDMACH<sub>S</sub>), the mobile station shall measure the strength of each pilot in  
 11   its Candidate Frequency Search Set using the procedures specified in 2.6.6.2.2,  
 12   and wait to receive a period of ( $N_{11m} \times 20$ ) ms with sufficient signal quality (e.g.  
 13   good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>. The  
 14   mobile station shall wait for the first of the following events to occur:
- 15   + The handoff timer expires and the mobile station has not received a period of  
 16   ( $N_{11m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the  
 17   physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>. In this case, the mobile  
 18   station shall declare the handoff attempt to be unsuccessful, and do the  
 19   following:
- 20     o If COMPLETE\_SEARCH<sub>S</sub> is equal to ‘1’, and if the Target Frequency is the  
 21       same as the Candidate Frequency (TF\_CDMABAND<sub>S</sub> is equal to  
 22       CF\_CDMABAND<sub>S</sub>, and TF\_CDMACH<sub>S</sub> is equal to CF\_CDMACH<sub>S</sub>) and is  
 23       different from the Serving Frequency (TF\_CDMABAND<sub>S</sub> is not equal to  
 24       SF\_CDMABAND<sub>S</sub>, or TF\_CDMACH<sub>S</sub> is not equal to SF\_CDMACH<sub>S</sub>), and  
 25       the mobile station has not completed the search of all pilots in its  
 26       Candidate Frequency Search Set, then it shall complete the search, i.e.,  
 27       it shall obtain at least one measurement of the strength of each pilot in  
 28       its Candidate Frequency Search Set, using the search procedures  
 29       specified in 2.6.6.2.8.3.
- 30     o Otherwise, the mobile station shall end the search.
- 31   The mobile station shall then restore its configuration to what it was before  
 32   the handoff attempt (see 2.6.6.2.5.1) and send a *Candidate Frequency Search*  
 33   *Report Message* as described in 2.6.6.2.8.2.1.
- 34   + The mobile station receives a period of ( $N_{11m} \times 20$ ) ms with sufficient signal  
 35   quality (e.g. good frames) on the physical channel corresponding to  
 36   FPC\_PRI\_CHAN<sub>S</sub>. In this case, the mobile station shall declare the handoff  
 37   attempt to be successful, and do the following:
- 38     o The mobile station shall disable the handoff timer.
- 39     o If TF\_RESET\_L2<sub>S</sub> is equal to ‘1’, Layer 3 shall send a L2-  
 40   Supervision.Request primitive to Layer 2 to reset the acknowledgment  
 41   procedures as specified in 2.2.1.1 and 2.2.2.1 of [4].

- o If TF\_RESET\_FPC<sub>S</sub> is equal to '1', the mobile station shall initialize the Forward Traffic Channel power control counters as specified in 2.6.4.1.1.1.
- o If the Target Frequency is the same as the Candidate Frequency (TF\_CDMABAND<sub>S</sub> is equal to CF\_CDMABAND<sub>S</sub>, and TF\_CDMACH<sub>S</sub> is equal to CF\_CDMACH<sub>S</sub>) and is different from the Serving Frequency (TF\_CDMABAND<sub>S</sub> is not equal to SF\_CDMABAND<sub>S</sub>, or TF\_CDMACH<sub>S</sub> is not equal to SF\_CDMACH<sub>S</sub>), the mobile station shall do the following:
  - ◊ If applicable, The the mobile station shall replace its Neighbor Set with its Candidate Frequency Neighbor Set, excluding the pilots in its Active Set. When the mobile station adds a pilot from its Candidate Frequency Neighbor Set to its Active Set, it shall maintain SEARCH\_PRIORITY<sub>S</sub>, SRCH\_WIN\_NGHBR<sub>S</sub>, and SRCH\_OFFSET\_NGHBR<sub>S</sub> associated with the pilot.
  - ◊ The mobile station shall set PILOT\_INC<sub>S</sub> to CF\_PILOT\_INC<sub>S</sub>, SRCH\_WIN\_N<sub>S</sub> to CF\_SRCH\_WIN\_N<sub>S</sub>, and SRCH\_WIN\_R<sub>S</sub> to CF\_SRCH\_WIN\_R<sub>S</sub>.
  - ◊ The mobile station shall set SEARCH\_PRIORITY\_INCL<sub>S</sub> to CF\_SEARCH\_PRIORITY\_INCL<sub>S</sub>, SRCH\_OFFSET\_INCL<sub>S</sub> to CF\_SRCH\_OFFSET\_INCL<sub>S</sub>, and SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> to CF\_SRCH\_WIN\_NGHBR\_INCL<sub>S</sub>.
- o The mobile station shall re-enable its transmitter and shall re-enable the fade timer (see 2.6.4.1.8) and reset it for T<sub>5m</sub> seconds. Then, the mobile station shall transmit the Traffic Channel Preamble, as described in 2.1.3.6.2.3 of [2], followed by a *Handoff Completion Message* if P\_REV\_IN\_USE is less than seven or an *Extended Handoff Completion Message* if P\_REV\_IN\_USE is equal to or greater than seven.
- o After starting the handoff timer, upon receiving the first period of (N<sub>3m</sub> × 20) ms with sufficient signal quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>, the mobile station shall resume incrementing TOT\_FRAMES<sub>S</sub>, BAD\_FRAMES<sub>S</sub>, DCCH\_TOT\_FRAMES<sub>S</sub>, and DCCH\_BAD\_FRAMES<sub>S</sub> if applicable as specified in 2.6.4.1.1.
- o If the Target Frequency is same as the Candidate Frequency (TF\_CDMABAND<sub>S</sub> is equal to CF\_CDMABAND<sub>S</sub> and TF\_CDMACH<sub>S</sub> is equal to CF\_CDMACH<sub>S</sub>), then the mobile station shall set PERIODIC\_SEARCH<sub>S</sub> to '0'.
- o If PERIODIC\_SEARCH<sub>S</sub> is equal to '1', the mobile station shall do the following:
  - ◊ The mobile station shall set ALIGN\_TIMING\_USED<sub>S</sub> to '0' and SEARCH\_OFFSET<sub>S</sub> to '000000'.

- 1           ◊ The mobile station shall start a periodic search as described in  
 2           2.6.6.2.8.3.2.
- 3           o The mobile station shall maintain its pilot sets using the procedures  
 4           described in 2.6.6.2.6.

5        2.6.6.2.8.2.1 Restoring the Configuration

6        If the mobile station declares a handoff attempt to be unsuccessful (see 2.6.6.2.8.2), it shall  
 7        perform the following actions:

- 8           • If the handoff timer is enabled, the mobile station shall disable it.
- 9           • The mobile station shall restore the following parameters:
  - 10           – Message encryption mode: If  $SF\_ENCRYPT\_MODE_s$  is equal to '0', the mobile  
 11           station shall turn off message encryption; otherwise, it shall turn on message  
 12           encryption.
  - 13           – Service configuration: The mobile station shall use the service configuration  
 14           stored in  $SF\_SERVICE\_CONFIG_s$  to process Forward and Reverse Traffic  
 15           Channel frames.
  - 16           – The mobile station shall restore the list of calls stored in  $SF\_CALLS_s$ .
  - 17           – Protocol revision level ( $P\_REV_s = SF\_P\_REV_s$ )
  - 18           – Protocol revision level in use on the serving frequency ( $P\_REV\_IN\_USE_s =$   
 19            $SF\_P\_REV\_IN\_USE_s$ )
  - 20           – Service negotiation type ( $SERV\_NEG_s = SF\_SERV\_NEG_s$ )
  - 21           – Long code mask: If  $SF\_PRIVATE\_LCM_s$  is equal to '1', the mobile station shall  
 22           use the private long code mask; otherwise, it shall use the public long code  
 23           mask.
  - 24           – Search window size for the Active Set and Candidate Set  
 25           ( $SRCH\_WIN\_A_s = SF\_SRCH\_WIN\_A_s$ )
  - 26           – Search window size for the Neighbor Set  
 27           ( $SRCH\_WIN\_N_s = SF\_SRCH\_WIN\_N_s$ )
  - 28           – Search window size for the Remaining Set  
 29           ( $SRCH\_WIN\_R_s = SF\_SRCH\_WIN\_R_s$ )
  - 30           – Pilot detection threshold ( $T\_ADD_s = SF\_T\_ADD_s$ )
  - 31           – Pilot drop threshold ( $T\_DROP_s = SF\_T\_DROP_s$ )
  - 32           – Soft slope for the dynamic add and drop threshold ( $SOFT\_SLOPE_s =$   
 33            $SF\_SOFT\_SLOPE_s$ )
  - 34           – Intercept for the dynamic add threshold ( $ADD\_INTERCEPT_s =$   
 35            $SF\_ADD\_INTERCEPT_s$ )
  - 36           – Intercept for the dynamic drop threshold ( $DROP\_INTERCEPT_s =$   
 37            $SF\_DROP\_INTERCEPT_s$ )

- 1     – Active Set versus Candidate Set comparison threshold ( $T_{COMP_S} =$   
2        $SF_{T\_COMP_S}$ )
- 3     – Drop timer value ( $T_{TDROP_S} = SF_{T\_TDROP_S}$ )
- 4     – Frame offset ( $FRAME_{OFFSET_S} = SF_{FRAME\_OFFSET_S}$ )
- 5     – Nominal power setting ( $NOM_{PWR_S} = SF_{NOM\_PWR_S}$ )
- 6     – Extended nominal power setting ( $NOM_{PWR\_EXT_S} = SF_{NOM\_PWR\_EXT_S}$ )
- 7     – Power control step ( $PWR_{CNTL\_STEP_S} = SF_{PWR\_CNTL\_STEP_S}$ )
- 8     – CDMA band class ( $CDMABAND_S = SF_{CDMABAND_S}$ )
- 9     – Frequency assignment ( $CDMACH_S = SF_{CDMACH_S}$ )
- 10    – Active Set (For each pilot in the Serving Frequency Active Set: ( $PILOT\_REC,$   
11       $PWR_{COMB\_IND}$ ))
- 12    – Code channel list ( $CODE\_CHAN\_LIST_S = SF_{CODE\_CHAN\_LIST_S}$ )
- 13   • The mobile station shall tune to the Serving Frequency and resume using the  
14      Serving Frequency Active Set as follows:
- 15      – If the mobile station was processing the Forward Fundamental Channel prior to  
16       tuning to the Candidate Frequency, the mobile station shall resume processing  
17       the Forward Fundamental Channel. If the mobile station was transmitting on  
18       the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,  
19       the mobile station shall resume transmitting on the Reverse Fundamental  
20       Channel.
- 21      – If the mobile station was processing the Forward Dedicated Control Channel  
22       prior to tuning to the Candidate Frequency, the mobile station shall resume  
23       processing the Forward Dedicated Control Channel. If the mobile station was  
24       transmitting on the Reverse Dedicated Control Channel prior to tuning to the  
25       Candidate Frequency, the mobile station shall resume transmitting on the  
26       Reverse Dedicated Control Channel.
- 27      – The mobile station shall not resume transmitting on the Reverse Supplemental  
28       Code Channels and Reverse Supplemental Channels (if any). The mobile station  
29       shall not process on the Forward Supplemental Code Channels and Forward  
30       Supplemental Channels (if any).
- 31      – When the mobile station resumes transmission on the Reverse Traffic Channel,  
32       it shall use the following rules to re-enable its transmitter:
- 33       + If the interval between the time that the mobile station disables its  
34       transmitter and the time that it resumes using the Serving Frequency Active  
35       Set is equal to or greater than ( $N_{2m} \times 20$ ) ms, then the mobile station shall  
36       wait to receive a period of ( $N_{3m} \times 20$ ) ms with sufficient signal quality (e.g.  
37       good frames) on the physical channel corresponding to  $FPC_{PRI\_CHAN_S}$   
38       before it re-enables its transmitter.

- 1       + Otherwise, the mobile station shall re-enable its transmitter no later than  
 2        $N_{3m} \times 20$  ms after the mobile station tunes to the Serving Frequency. The  
 3       mobile station should re-enable its transmitter earlier. After the mobile  
 4       station re-enables its transmitter, the mean output power shall be as  
 5       specified in 2.1.2.4.1 of [2] for a step change in input power. If the mobile  
 6       station re-enables its transmitter earlier than  $N_{3m} \times 20$  ms after it tunes to  
 7       the Serving Frequency, the initial mean output power shall be as specified in  
 8       2.1.2.3.1 of [2], where the initial mean input power estimate is either:  
 9           o within 6 dB of the actual mean input power, or  
 10          o equal to the mean input power before the mobile station tuned to the  
 11           Target Frequency.
- 12       • The mobile station shall enable the fade timer and the handoff drop timers  
 13       corresponding to the pilots in its Active Set and Candidate Set. The mobile station  
 14       shall resume incrementing TOT\_FRAMES<sub>S</sub>, BAD\_FRAMES<sub>S</sub>, DCCH\_TOT\_FRAMES<sub>S</sub>,  
 15       and DCCH\_BAD\_FRAMES<sub>S</sub> if applicable as specified in 2.6.4.1.1.
- 16       • The mobile station shall send a *Candidate Frequency Search Report Message* within  
 17       T<sub>56m</sub> seconds of declaring the handoff attempt to be unsuccessful. The mobile  
 18       station shall report the contents of the *Candidate Frequency Search Report Message*  
 19       as follows:  
 20           – The mobile station shall report the two components of the Target Frequency in  
 21           the CDMA\_FREQ and BAND\_CLASS fields.  
 22           – The mobile station shall report the received power on the Target Frequency and  
 23           on the Serving Frequency in the CF\_TOTAL\_RX\_PWR and SF\_TOTAL\_RX\_PWR  
 24           fields, respectively.  
 25           – For each pilot in the Target Frequency Active Set that measures above  
 26           TF\_T\_ADD<sub>S</sub>, the mobile station shall report its phase and strength in the fields  
 27           PILOT\_PN\_PHASE and PILOT\_STRENGTH, respectively.  
 28           – If the Target Frequency is the same as the Candidate Frequency  
 29           (TF\_CDMABAND<sub>S</sub> is equal to CF\_CDMABAND<sub>S</sub>, and TF\_CDMACH<sub>S</sub> is equal to  
 30           CF\_CDMACH<sub>S</sub>), and is different ~~from~~ from the Serving Frequency  
 31           (TF\_CDMABAND<sub>S</sub> is not equal to SF\_CDMABAND<sub>S</sub> or TF\_CDMACH<sub>S</sub> is not equal  
 32           to SF\_CDMACH<sub>S</sub>), the mobile station shall also report the strength of each pilot  
 33           in the Candidate Frequency Search Set that measures above CF\_T\_ADD<sub>S</sub>.  
 34       • If the Serving Frequency is the same as the Candidate Frequency (SF\_CDMABAND<sub>S</sub>  
 35           is equal to CF\_CDMABAND<sub>S</sub> and SF\_CDMACH<sub>S</sub> is equal to CF\_CDMACH<sub>S</sub>), then the  
 36           mobile station shall set PERIODIC\_SEARCH<sub>S</sub> to '0'.  
 37       • If PERIODIC\_SEARCH<sub>S</sub> is equal to '1' and the Candidate Frequency Search Set is  
 38           not empty, the mobile station shall do the following:  
 39           – The mobile station shall set ALIGN\_TIMING\_USED<sub>S</sub> to '0' and SEARCH\_OFFSET<sub>S</sub>  
 40           to '000000'.

- 1           – The mobile station shall carry out the periodic search procedures described in  
 2           2.6.6.2.8.3.2.

3       2.6.6.2.8.3 Search of Pilots on the CDMA Candidate Frequency

4       If SEARCH\_MODE<sub>s</sub> is equal to '0000', the mobile station shall do the following: If  
 5       PERIODIC\_SEARCH<sub>s</sub> is equal to '0', the mobile station shall search the Candidate  
 6       Frequency Search Set once, as described in 2.6.6.2.8.3.1; otherwise, the mobile station  
 7       shall search the Candidate Frequency Search Set periodically, as described in 2.6.6.2.8.3.2.

8       2.6.6.2.8.3.1 CDMA Candidate Frequency Single Search

9       The mobile station does a single search of the Candidate Frequency Search Set by  
 10      performing the following actions at the action time of the *Candidate Frequency Search  
           Control Message* or the *Candidate Frequency Search Request Message* that started the  
 11      search:

- 13       • If ALIGN\_TIMING\_USED<sub>s</sub> is set to '0', the mobile station shall measure the strength  
         of all pilots in the Candidate Frequency Search Set in one or more visits to the  
         Candidate Frequency, as described in 2.6.6.2.8.3.3.
- 16       • If ALIGN\_TIMING\_USED<sub>s</sub> is set to '1', the mobile station shall measure the strength  
         of all pilots in the Candidate Frequency Search Set in one or more scheduled visits  
         (see below) to the Candidate Frequency, as described in 2.6.6.2.8.3.3.

19       The mobile station shall schedule visits to the Candidate Frequency only at  
 20       $((0.00125 \times \text{SEARCH\_OFFSET}_s) + k \times (\text{SEARCH\_TIME\_RESOLUTION}_s \times$   
 21      *inter\_visit\_time*)) seconds after the action time of the *Candidate Frequency Search  
           Request Message* or the *Candidate Frequency Search Control Message* that started  
 22      the search, where

24            $k =$  an integer between 0 and *max\_num\_visits*, inclusive, where  
 25           *max\_num\_visits* is the value of MAX\_NUM\_VISITS field of the  
 26           last *Candidate Frequency Search Response Message* sent by the  
 27           mobile station,

28       and

29           *inter\_visit\_time* = the value of the INTER\_VISIT\_TIME field of the last *Candidate  
           Frequency Search Response Message* sent by the mobile station.

- 31       • The mobile station shall complete the measurements and send a *Candidate  
           Frequency Search Report Message* within  $((0.00125 \times \text{SEARCH\_OFFSET}_s) +$   
 32      *freshness\_interval*) seconds after the action time of the *Candidate Frequency Search  
           Control Message*, or the *Candidate Frequency Search Request Message*, where  
 33      *freshness\_interval* is determined as follows:  
 34           – If the value of the TOTAL\_OFF\_TIME\_FWD field or of the TOTAL\_OFF\_TIME\_REV  
 35           field of the last *Candidate Frequency Search Response Message* sent by the  
 36           mobile station to the base station is greater than or equal to  $\lceil (T_{70m} - T_{71m}) /$   
 37            $\text{SEARCH\_TIME\_RESOLUTION}_s \rceil$ , then

1                    $\text{freshness\_interval} = (\max(\text{fwd\_time}, \text{rev\_time}) + T_{71m})$  seconds,

2                   where

3                    $\text{fwd\_time} = \text{SEARCH\_TIME\_RESOLUTION}_S \times (\text{value of the}$   
 4                   TOTAL\_OFF\_TIME\_FWD field of the last *Candidate Frequency*  
 5                   *Search Response Message* sent by the mobile station),

6                   and

7                    $\text{rev\_time} = \text{SEARCH\_TIME\_RESOLUTION}_S \times (\text{value of the}$   
 8                   TOTAL\_OFF\_TIME\_REV field of the last *Candidate Frequency*  
 9                   *Search Response Message* sent by the mobile station).

- 10                  – Otherwise,

11                   $\text{freshness\_interval} = T_{70m}$  seconds.

12                  The mobile station shall set the fields of the *Candidate Frequency Search Report*  
 13                  *Message* as follows:

- 14                  – The mobile station shall report the two components of the Candidate Frequency  
                       in the CDMA\_FREQ and BAND\_CLASS fields.
- 16                  – The mobile station shall report the received power on the Candidate Frequency  
                       and on the Serving Frequency in the CF\_TOTAL\_RX\_PWR and  
                       SF\_TOTAL\_RX\_PWR fields, respectively.
- 19                  – For each pilot in the Candidate Frequency Search Set that measures above  
                       CF\_T\_ADD<sub>S</sub>, the mobile station shall report its phase and strength in the fields  
                       PILOT\_PN\_PHASE and PILOT\_STRENGTH, respectively.

#### 22                  2.6.6.2.8.3.2 Candidate Frequency Periodic Search

23                  When the mobile station performs a periodic search, it periodically searches the Candidate  
 24                  Frequency Search Set and reports the results to the base station in the *Candidate*  
 25                  *Frequency Search Report Message*, as described in this section. The mobile station may  
 26                  measure all pilots in the Candidate Frequency Search Set in one visit to the Candidate  
 27                  Frequency, or it may visit the Candidate Frequency several times in a search period, each  
 28                  time measuring all or some of the pilots in the Candidate Frequency Search Set, as  
 29                  described in 2.6.6.2.8.3.3.

30                  If SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to ‘11111’, while tuned to the Serving Frequency  
 31                  (specified by CDMACH<sub>S</sub> and CDMABAND<sub>S</sub>), the mobile station shall measure the total  
 32                  received power spectral density, in mW/1.23 MHz, on the Serving Frequency at least once  
 33                  every 20 ms frame. The mobile station shall maintain the average of the spectral density  
 34                  (*spec\_density*) over the last N<sub>12m</sub> frames.

35                  (In the following, (E<sub>C</sub>/I<sub>O</sub>)<sub>total</sub> is the total E<sub>C</sub>/I<sub>O</sub> of the pilots in the Active Set, measured as  
 36                  specified in 2.6.6.2.2, and *total\_ec* is defined as (10 × log<sub>10</sub> ((E<sub>C</sub>/I<sub>O</sub>)<sub>total</sub> × *spec\_density*)).)

37                  The mobile station shall maintain a periodic search timer as follows:

- When the mobile station starts a periodic search, it shall set the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub> and shall enable the timer.
  - If the periodic search is started by a *Candidate Frequency Search Request Message* or a *Candidate Frequency Search Control Message*, then the mobile station shall start the periodic search ( $0.00125 \times \text{SEARCH\_OFFSET}_S$ ) seconds after the action time of the *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control Message* that started the search.
  - If the periodic search is started following successful or unsuccessful handoff attempt, the mobile station shall start the periodic search:
    - + Upon sending the *Handoff Completion Message* or *Extended Handoff Completion Message*, in the case that the handoff was successful.
    - + Upon sending the *Candidate Frequency Search Report Message*, in the case that the handoff was unsuccessful.
- When the periodic search timer expires, the mobile station shall reset the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub> and shall re-enable the timer.
- If ALIGN\_TIMING\_USED<sub>S</sub> is set to ‘0’, SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to ‘11111’ and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is equal to ‘11111’, the mobile station shall perform the following actions once per frame:
  - Disable the periodic search timer if *total\_ec* is not less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ .
  - Reset the expiration time of the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub>, and re-enable the timer if the following conditions are true:
    - + the periodic search timer is disabled, and
    - + *total\_ec* is less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ .
- If ALIGN\_TIMING\_USED<sub>S</sub> is set to ‘0’, SF\_TOTAL\_EC\_THRESH<sub>S</sub> is equal to ‘11111’ and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is not equal to ‘11111’, the mobile station shall perform the following actions once per frame:
  - Disable the periodic search timer if  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is not greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
  - Reset the expiration time of the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub>, and re-enable the timer if the following conditions are true:
    - + the periodic search timer is disabled, and
    - +  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.

- If ALIGN\_TIMING\_USED<sub>S</sub> is set to '0', SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to '11111' and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is not equal to '11111', the mobile station shall perform the following actions once per frame:
  - Disable the periodic search timer if the following conditions are true:
    - +  $total\_ec$  is not less than  $(-120 + 2 \times SF\_TOTAL\_EC\_THRESH_S)$ , and
    - +  $(-20 \times \log_{10} (E_c/I_o)_{total})$  is not greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
  - Reset the expiration time of the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub>, and re-enable the timer if the following conditions are true:
    - + the periodic search timer is disabled, and
    - +  $total\_ec$  is less than  $(-120 + 2 \times SF\_TOTAL\_EC\_THRESH_S)$ , or  $(-20 \times \log_{10} (E_c/I_o)_{total})$  is greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
- The mobile station shall maintain the periodic search timer independent of the total  $E_c$  and the total  $E_c/I_o$  of the pilots in the Serving Frequency Active Set, if any of the following conditions is true:
  - ALIGN\_TIMING\_USED<sub>S</sub> is set to '1', or
  - SF\_TOTAL\_EC\_THRESH<sub>S</sub> is equal to '11111' and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is equal to '11111'.

**Table 2.6.6.2.8.3.2-1. Search Period Values**

| <b>SEARCH_PERIOD<sub>S</sub></b> | <b>Search Period (seconds)</b> | <b>SEARCH_PERIOD<sub>S</sub></b> | <b>Search Period (seconds)</b> |
|----------------------------------|--------------------------------|----------------------------------|--------------------------------|
| 0                                | 0.48                           | 8                                | 30                             |
| 1                                | 0.96                           | 9                                | 40                             |
| 2                                | 2                              | 10                               | 50                             |
| 3                                | 2.96                           | 11                               | 60                             |
| 4                                | 4                              | 12                               | 80                             |
| 5                                | 4.96                           | 13                               | 100                            |
| 6                                | 10                             | 14                               | 150                            |
| 7                                | 20                             | 15                               | 200                            |

If the periodic search timer is enabled, the mobile station shall perform the following actions before the timer expires:

- If ALIGN\_TIMING\_USED<sub>S</sub> is set to ‘0’, the mobile station shall measure the strength of all pilots in the Candidate Frequency Search Set at least once in one or more visits to the Candidate Frequency, as described in 2.6.6.2.8.3.3.
- If ALIGN\_TIMING\_USED<sub>S</sub> is set to ‘1’, the mobile station shall measure the strength of all pilots in the Candidate Frequency Search Set in one or more scheduled visits (see below) to the Candidate Frequency, as described in 2.6.6.2.8.3.3.

The mobile station shall schedule visits to the Candidate Frequency only at  $((0.00125 \times \text{SEARCH\_OFFSET}_S) + k \times (\text{SEARCH\_TIME\_RESOLUTION}_S \times \text{inter\_visit\_time}))$  seconds after the action time of the *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control Message* that started the search, where

$k =$  an integer between 0 and *max\_num\_visits*, inclusive, where  
*max\_num\_visits* is the value of MAX\_NUM\_VISITS field of the last *Candidate Frequency Search Response Message* sent by the mobile station,

and

*inter\_visit\_time* = the value of the INTER\_VISIT\_TIME field of the last *Candidate Frequency Search Response Message* sent by the mobile station.

- The mobile station shall abort a scheduled visit to the Candidate Frequency if at the scheduled time, one or both of the following conditions hold:
  - + SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to ‘11111’ and *total\_ec* is not less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ , or
  - + SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is not equal to ‘11111’ and  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is not greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
- If the mobile station aborts a scheduled visit during a search period, it may abort all remaining scheduled visits in that search period.
- The mobile station shall send a *Candidate Frequency Search Report Message* if MIN\_TOTAL\_PILOT\_EC\_IO<sub>S</sub> is equal to ‘00000’ or if  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is ~~not~~ less than or equal to MIN\_TOTAL\_PILOT\_EC\_IO<sub>S</sub>, where  $(E_c/I_o)_{\text{total}}$  is the sum of  $E_c/I_o$  for all those pilots that measure above CF\_T\_ADD<sub>S</sub> in the current search period.

The mobile station shall report the contents of the *Candidate Frequency Search Report Message* as follows:

- The mobile station shall report the two components of the Candidate Frequency in the CDMA\_FREQ and BAND\_CLASS fields.
- The mobile station shall report the received power on the Candidate Frequency and on the Serving Frequency in the CF\_TOTAL\_RX\_PWR and SF\_TOTAL\_RX\_PWR fields, respectively.

- For each pilot in the Candidate Frequency Search Set that measures above CF\_T\_ADD<sub>s</sub>, the mobile station shall report its phase and strength in the fields PILOT\_PN\_PHASE and PILOT\_STRENGTH, respectively.
- The mobile station shall ensure that the strength measurement for all pilots in the Candidate Frequency Search Set were obtained within *freshness\_interval* before the *Candidate Frequency Search Report Message* is sent, where *freshness\_interval* is determined as follows:
  - If the value of the TOTAL\_OFF\_TIME\_FWD field or of the TOTAL\_OFF\_TIME\_REV field of the last *Candidate Frequency Search Response Message* sent by the mobile station to the base station is greater than or equal to  $\lceil(T_{70m} - T_{71m})/\text{SEARCH\_TIME\_RESOLUTION}_s \rceil$ , then
 
$$\text{freshness\_interval} = (\max(fwd\_time, rev\_time)) + T_{71m}$$
 seconds,
 where
 
$$fwd\_time = \text{SEARCH\_TIME\_RESOLUTION}_s \times (\text{value of the TOTAL\_OFF\_TIME\_FWD field of the last } \textit{Candidate Frequency Search Response Message} \text{ sent by the mobile station}),$$
 and
 
$$rev\_time = \text{SEARCH\_TIME\_RESOLUTION}_s \times (\text{value of the TOTAL\_OFF\_TIME\_REV field of the last } \textit{Candidate Frequency Search Response Message} \text{ sent by the mobile station}).$$
  - Otherwise,

### 2.6.6.2.8.3.3 Candidate Frequency Pilot Measurements

The mobile station measures the strength of all pilots in the Candidate Frequency Search Set in one or more visits to the Candidate Frequency. The mobile station shall perform the following actions each time it visits the Candidate Frequency to measure pilot strengths:

- If the mobile station is processing the Forward Fundamental Channel, the mobile station shall stop processing the Forward Fundamental [Code](#)-Channel. If the mobile station is transmitting on the Reverse Fundamental Channel, the mobile station shall stop transmitting on the Reverse Fundamental Channel.
- If the mobile station is processing the Forward Dedicated Control Channel, the mobile station shall stop processing the Forward Dedicated Control Channel. If the mobile station is transmitting on the Reverse Dedicated Control Channel, the mobile station shall stop transmitting on the Reverse Dedicated Control Channel.
- The mobile station shall stop processing the Forward Supplemental Code Channels and Forward Supplemental Channels (if any). The mobile station shall stop transmitting on the Reverse Supplemental Code Channels and Reverse Supplemental Channels (if any).

- The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop timers corresponding to its current Active Set and Candidate Set (see 2.6.6.2.3), and shall suspend incrementing TOT\_FRAMESS<sub>S</sub>, BAD\_FRAMESS<sub>S</sub>, DCCH\_TOT\_FRAMESS<sub>S</sub>, DCCH\_BAD\_FRAMESS<sub>S</sub>, SCH\_TOT\_FRAMESS<sub>S</sub>, and SCH\_BAD\_FRAMESS<sub>S</sub> if applicable (see 2.6.4.1.1).
  - The mobile station shall lock the accumulation of valid level changes in the closed loop mean output power and shall ignore received power control bits related to the period that the transmitter is disabled (see 2.1.2.3.1 of [2]).
  - The mobile station shall store the following parameters from its current configuration:
    - CDMA band class ( $SF\_CDMABAND_S = CDMABAND_S$ )
    - Frequency Assignment ( $SF\_CDMACH_S = CDMACH_S$ )
    - Pilot detection threshold ( $SF\_T\_ADD_S = T\_ADD_S$ )
  - The mobile station shall set the following parameters:
    - $CDMABAND_S = CF\_CDMABAND_S$
    - $CDMACH_S = CF\_CDMACH_S$
    - $T\_ADD_S = CF\_T\_ADD_S$
- The mobile station shall tune to the Candidate Frequency.
- The mobile station shall not change its time reference (see 2.1.5 of [2]) until it resumes using the Serving Frequency Active Set, as described below.
  - The mobile station shall measure the mean input power on the Candidate Frequency ( $cand\_freq\_pwr$ , in dBm / 1.23 MHz), and may use  $cand\_freq\_pwr$  along with the measurement of the mean input power on the Serving Frequency ( $avg\_serving\_freq\_pwr$ , in dBm / 1.23 MHz) in the search procedure as follows:
    - If  $DIFF\_RX\_PWR\_THRESH_S$  is not equal to '00000', and ( $cand\_freq\_pwr - avg\_serving\_freq\_pwr$ ) is less than  $(-30 + 2 \times DIFF\_RX\_PWR\_THRESH_S)$  dB, the mobile station may terminate the search for pilots in the current visit to the Candidate Frequency.
    - If  $DIFF\_RX\_PWR\_THRESH_S$  is equal to '00000', the mobile station does not use the power measurements in the search procedure, or ( $cand\_freq\_pwr - avg\_serving\_freq\_pwr$ ) is not less than  $(-30 + 2 \times DIFF\_RX\_PWR\_THRESH_S)$  dB, the mobile station shall measure  $E_C/I_0$  for all or some of the pilots in its Candidate Frequency Search Set, using the search procedures specified in 2.6.6.2.2.
  - The mobile station shall restore the following parameters:
    - Pilot detection threshold ( $T\_ADD_S = SF\_T\_ADD_S$ )
    - CDMA band class ( $CDMABAND_S = SF\_CDMABAND_S$ )
    - Frequency assignment ( $CDMACH_S = SF\_CDMACH_S$ )

- 1     • The mobile station shall tune to the Serving Frequency and shall resume using the  
2       Serving Frequency Active Set as follows:
  - 3         – If the mobile station was processing the Forward Fundamental Channel prior to  
4           tuning to the Candidate Frequency, the mobile station shall resume processing  
5           the Forward Fundamental Channel. If the mobile station was transmitting on  
6           the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,  
7           the mobile station shall resume transmitting on the Reverse Fundamental  
8           Channel.
  - 9         – If the mobile station was processing the Forward Dedicated Control Channel  
10          prior to tuning to the Candidate Frequency, the mobile station shall resume  
11          processing the Forward Dedicated Control Channel. If the mobile station was  
12          transmitting on the Reverse Dedicated Control Channel prior to tuning to the  
13          Candidate Frequency, the mobile station shall resume transmitting on the  
14          Reverse Dedicated Control Channel.
  - 15         – If the Forward Supplemental Code Channels and Forward Supplemental  
16          Channels assignment has not expired, the mobile station shall resume  
17          processing the Forward Supplemental Code Channels and Forward  
18          Supplemental Channels (if any). If the Reverse Supplemental Code Channel and  
19          Reverse Supplemental Channels assignment has not expired, the mobile station  
20          may resume transmitting on the Reverse Supplemental Code Channels and  
21          Reverse Supplemental Channels (if any).
  - 22         – When the mobile station resumes transmission on the Reverse Traffic Channel,  
23          it shall use the following rules to re-enable its transmitter:
    - 24             + If the interval between the time that the mobile station disables its  
25               transmitter and the time that it resumes using the Serving Frequency Active  
26               Set is equal to or greater than  $(N_{2m} \times 20)$  ms, then the mobile station shall  
27               wait to receive a period of  $(N_{3m} \times 20)$  ms with sufficient signal quality (e.g.  
28               good frames) on the physical channel corresponding to FPC\_PRI\_CHANs  
29               before it re-enables its transmitter.
    - 30             + Otherwise, the mobile station shall re-enable its transmitter no later than  
31                $N_{3m} \times 20$  ms after the mobile station tunes to the Serving Frequency. The  
32               mobile station should re-enable its transmitter earlier. After the mobile  
33               station re-enables its transmitter, the mean output power shall be as  
34               specified in 2.1.2.4.1 for a step change in input power. If the mobile station  
35               re-enables its transmitter earlier than  $N_{3m} \times 20$  ms after it tunes to the  
36               Serving Frequency, the initial mean output power shall be as specified in  
37               2.1.2.3.1 of [2], where the initial mean input power estimate is either:
      - 38                     o within 6 dB of the actual mean input power, or
      - 39                     o equal to the mean input power before the mobile station tuned to the  
40                     Target Frequency.

- The mobile station shall enable the fade timer and the handoff drop timers corresponding to the pilots in its Active Set and Candidate Set. The mobile station shall resume incrementing TOT\_FRAMESS<sub>s</sub>, BAD\_FRAMESS<sub>s</sub>, DCCH\_TOT\_FRAMESS<sub>s</sub>, DCCH\_BAD\_FRAMESS<sub>s</sub>, SCH\_TOT\_FRAMESS<sub>s</sub>, and SCH\_BAD\_FRAMESS<sub>s</sub> if applicable as specified in 2.6.4.1.8.

#### 2.6.6.2.8.3.4 Aborting CDMA Candidate Frequency Periodic Search

When the mobile station aborts a periodic search, it shall do the following:

- The mobile station shall cancel any remaining visits to the Candidate Frequency in the current search period, and shall not send a *Candidate Frequency Search Report Message* for the current search period.
- The mobile station shall disable the periodic search timer.

#### 2.6.6.2.9 CDMA-to-Analog Handoff

The base station directs the mobile station to perform a CDMA-to-Analog handoff by sending an *Analog Handoff Direction Message*. If the mobile station has narrow analog capability, the base station may direct the handoff to a narrow analog channel.

If the mobile station supports analog operation in the requested band class, the mobile station shall set DTX<sub>s</sub> to '00' and store the following parameters from the *Analog Handoff Direction Message*.

- System identification (SID<sub>s</sub> = SID<sub>r</sub>)
- Voice mobile station attenuation code (VMAC<sub>s</sub> = VMAC<sub>r</sub>)
- Analog voice channel number (ANALOG\_CHAN<sub>s</sub> = ANALOG\_CHAN<sub>r</sub>)
- SAT color code (SCC<sub>s</sub> = SCC<sub>r</sub>)
- Message encryption mode indicator (MEM<sub>s</sub> = MEM<sub>r</sub>)
- Analog voice channel type (AN\_CHAN\_TYPE<sub>s</sub> = AN\_CHAN\_TYPE<sub>r</sub>)
- Digital supervisory audio color code (DSCC<sub>s</sub> = DSCC\_MSBR × 4 + SCC<sub>r</sub>)

If the mobile station does not support analog operation in the requested band class, the mobile station shall discard the message and send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported by the mobile station).

At the action time specified by the *Analog Handoff Direction Message* (see 2.6.4.1.5), the mobile station shall disable its transmitter. The mobile station shall enable its transmitter on the wide analog voice channel or optional narrow analog voice channel within T<sub>63m</sub> seconds after the action time.

#### 2.6.6.2.10 Search of Analog Frequencies

If SEARCH\_MODE<sub>s</sub> is equal to '0001', and the mobile station supports analog searching, the mobile station shall do the following: If PERIODIC\_SEARCH<sub>s</sub> is equal to '0', the mobile station shall search the Candidate Analog Frequency Search Set once, as described in

1    2.6.6.2.10.1; otherwise, the mobile station shall search the Candidate Frequency Analog  
 2    Search Set periodically, as described in 2.6.6.2.10.2.

3    2.6.6.2.10.1 Analog Frequencies Single Search

4    The mobile station does a single search of the Candidate Frequency Analog Search Set by  
 5    performing the following actions at the action time of the *Candidate Frequency Search*  
 6    *Control Message* or the *Candidate Frequency Search Request Message* that started the  
 7    search:

- 8    • If ALIGN\_TIMING\_USED<sub>S</sub> is set to '0', the mobile station shall measure the strength  
 9       of all analog frequencies in the Candidate Frequency Analog Search Set in one or  
 10   more visits away from the Serving Frequency, as described in 2.6.6.2.10.3.
- 11   • If ALIGN\_TIMING\_USED<sub>S</sub> is set to '1', the mobile station shall measure the strength  
 12      of analog frequencies in the Candidate Frequency Analog Search Set in one or more  
 13   scheduled visits (see below) away from the Serving Frequency, as described in  
 14   2.6.6.2.10.3.

15   The mobile station shall schedule visits away from the Serving Frequency only at  
 16    $((0.00125 \times \text{SEARCH\_OFFSET}_S) + k \times (\text{SEARCH\_TIME\_RESOLUTION}_S \times$   
 17   *inter\_visit\_time*)) seconds after the action time of the *Candidate Frequency Search*  
 18   *Request Message* or the *Candidate Frequency Search Control Message* that started  
 19   the search, where

20          $k =$  an integer between 0 and *max\_num\_visits*, inclusive, where  
 21         *max\_num\_visits* is the value of MAX\_NUM\_VISITS field of the  
 22   last *Candidate Frequency Search Response Message* sent by the  
 23   mobile station,

24   and

25         *inter\_visit\_time* = the value of the INTER\_VISIT\_TIME field of the last *Candidate*  
 26         *Frequency Search Response Message* sent by the mobile station.

- 27   • The mobile station shall complete the measurements and send a *Candidate*  
 28         *Frequency Search Report Message* within  $((0.00125 \times \text{SEARCH\_OFFSET}_S) +$   
 29         *freshness\_interval*) seconds after the action time of the *Candidate Frequency Search*  
 30         *Control Message* or the *Candidate Frequency Search Request Message*, where  
 31         *freshness\_interval* is determined as follows:
  - 32         – If the value of the TOTAL\_OFF\_TIME\_FWD field or of the TOTAL\_OFF\_TIME\_REV  
 33         field of the last *Candidate Frequency Search Response Message* sent by the  
 34         mobile station to the base station is greater than or equal to  $\lceil (T_{70m} - T_{71m}) /$   
 35         *SEARCH\_TIME\_RESOLUTION\_S*  $\rceil$ , then

36         *freshness\_interval* =  $(\max(fwd\_time, rev\_time) + T_{71m})$  seconds,

37   where

38         *fwd\_time* = *SEARCH\_TIME\_RESOLUTION\_S*  $\times$  (value of the  
 39         TOTAL\_OFF\_TIME\_FWD field of the last *Candidate Frequency*  
 40         *Search Response Message* sent by the mobile station),

1 and

2  $rev\_time = \text{SEARCH\_TIME\_RESOLUTION}_S \times (\text{value of the}$   
 3                     $\text{TOTAL\_OFF\_TIME\_REV field of the last } Candidate Frequency$   
 4                     $Search Response Message sent by the mobile station}).$

- 5     – Otherwise,

6         $freshness\_interval = T_{70m}$  seconds.

7     2.6.6.2.10.2 Analog Frequencies Periodic Search

8     When the mobile station performs a periodic search, it periodically searches the Candidate  
 9     Frequency Analog Search Set, and reports the results to the base station in the *Candidate*  
 10    *Frequency Search Report Message*, as described in this section. The mobile station may  
 11    measure all analog frequencies in the Candidate Frequency Analog Search Set in one visit  
 12    away from the Serving Frequency, or it may make multiple visits in a search period, each  
 13    time measuring all or some of the analog frequencies in the Candidate Frequency Analog  
 14    Search Set, as described in 2.6.6.2.10.3.

15    If SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to '11111', while tuned to the Serving Frequency  
 16    (specified by CDMACH<sub>S</sub> and CDMABAND<sub>S</sub>), the mobile station shall measure the total  
 17    received power spectral density, in mW/1.23 MHz, on the Serving Frequency at least once  
 18    every 20 ms frame. The mobile station shall maintain the average of the spectral density  
 19    (*spec\_density*) over the last N<sub>12m</sub> frames.

20    (In the following, (E<sub>c</sub>/I<sub>o</sub>)<sub>total</sub> is the total E<sub>c</sub>/I<sub>o</sub> of the pilots in the Active Set, measured as  
 21    specified in 2.6.6.2.2, and *total\_ec* is defined as  $(10 \times \log_{10} ((E_c/I_o)_{total} \times spec\_density))$ .)

22    The mobile station shall maintain a periodic search timer as follows:

- 23     • When the mobile station starts a periodic search, it shall set the periodic search  
 24        timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub> and  
 25        shall enable the timer.
  - 26        – If the periodic search is started by a *Candidate Frequency Search Request*  
 27          *Message* or a *Candidate Frequency Search Control Message*, then the mobile  
 28          station shall begin the periodic search  $(0.00125 \times \text{SEARCH\_OFFSET}_S)$  seconds  
 29          after the action time of the *Candidate Frequency Search Request Message* or the  
 30          *Candidate Frequency Search Control Message* that started the search.
  - 31        – If the periodic search is started following successful or unsuccessful handoff  
 32          attempt, the mobile station shall start the periodic search:
    - 33           + Upon sending the *Handoff Completion Message* or *Extended Handoff*  
 34              *Completion Message*, in the case that the handoff was successful.
    - 35           + Upon sending the *Candidate Frequency Search Report Message*, in the case  
 36              that the handoff was unsuccessful.
- 37     • When the periodic search timer expires, the mobile station shall reset the periodic  
 38        search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to  
 39        SEARCH\_PERIOD<sub>S</sub> and shall re-enable the timer.

- If ALIGN\_TIMING\_USED<sub>S</sub> is set to '0', SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to '11111' and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is equal to '11111', the mobile station shall perform the following actions once per frame:
  - Disable the periodic search timer if *total\_ec* is not less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ .
  - Reset the expiration time of the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub>, and re-enable the timer if the following conditions are true:
    - + the periodic search timer is disabled, and
    - + *total\_ec* is less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ .
- If ALIGN\_TIMING\_USED<sub>S</sub> is set to '0', SF\_TOTAL\_EC\_THRESH<sub>S</sub> is equal to '11111' and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is not equal to '11111', the mobile station shall perform the following actions once per frame:
  - Disable the periodic search timer if  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is not greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
  - Reset the expiration time of the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub>, and re-enable the timer if the following conditions are true:
    - + the periodic search timer is disabled, and
    - +  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
- If ALIGN\_TIMING\_USED<sub>S</sub> is set to '0', SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to '11111' and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is not equal to '11111', the mobile station shall perform the following actions once per frame:
  - Disable the periodic search timer if the following conditions are true:
    - + *total\_ec* is not less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ , and
    - +  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is not greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
  - Reset the expiration time of the periodic search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH\_PERIOD<sub>S</sub>, and re-enable the timer if the following conditions are true:
    - + the periodic search timer is disabled, and
    - + *total\_ec* is less than  $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ , or
    - +  $(-20 \times \log_{10} (E_c/I_o)_{\text{total}})$  is greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
- The mobile station shall maintain the periodic search timer independent of the total E<sub>C</sub> and the total E<sub>C</sub>/I<sub>O</sub> of the pilots in the Serving Frequency Active Set, if any of the following conditions is true:
  - ALIGN\_TIMING\_USED<sub>S</sub> is set to '1', or

- 1       – SF\_TOTAL\_EC\_THRESH<sub>S</sub> is equal to ‘11111’ and SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is  
 2       equal to ‘11111’.

3       If the periodic search timer is enabled, the mobile station shall perform the following  
 4       actions before the timer expires:

- 5       • If ALIGN\_TIMING\_USED<sub>S</sub> is set to ‘0’, the mobile station shall measure the strength  
 6       of all analog frequencies in the Candidate Frequency Analog Search Set at least once  
 7       in one or more visits away from the Serving Frequency, as described in 2.6.6.2.10.3.
- 8       • If ALIGN\_TIMING\_USED<sub>S</sub> is set to ‘1’, the mobile station shall measure the strength  
 9       of analog frequencies in the Candidate Frequency Analog Search Set in one or more  
 10      scheduled visits (see below) away from the Serving Frequency, as described in  
 11      2.6.6.2.10.3.

12      The mobile station shall schedule visits away from the Serving Frequency only at  
 13       $((0.00125 \times \text{SEARCH\_OFFSET}_S) + k \times (\text{SEARCH\_TIME\_RESOLUTION}_S \times$   
 14      *inter\_visit\_time*) seconds after the action time of the *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control Message* that started  
 15      the search, where

16       $k =$  an integer between 0 and *max\_num\_visits*, inclusive, where  
 17      *max\_num\_visits* is the value of MAX\_NUM\_VISITS field of the  
 18      last *Candidate Frequency Search Response Message* sent by the  
 19      mobile station,

20      and

21      *inter\_visit\_time* = the value of the INTER\_VISIT\_TIME field of the last *Candidate Frequency Search Response Message* sent by the mobile station.

- 22       – The mobile station shall abort a scheduled visit away from the Serving  
 23       Frequency if at the scheduled time, one or both of the following conditions hold:
  - 24           + SF\_TOTAL\_EC\_THRESH<sub>S</sub> is not equal to ‘11111’ and *total\_ec* is not less than  
 25            $(-120 + 2 \times \text{SF\_TOTAL\_EC\_THRESH}_S)$ , or
  - 26           + SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub> is not equal to ‘11111’ and  $(-20 \times \log_{10} (E_C/I_0)_{\text{total}})$  is not greater than SF\_TOTAL\_EC\_IO\_THRESH<sub>S</sub>.
- 27       – If the mobile station aborts a scheduled visit during a search period, it may  
 28       abort all remaining scheduled visits in that search period.
- 29       • The mobile station shall set the fields of the *Candidate Frequency Search Report Message* as follows: The mobile station shall report the received power on the  
 30       Serving Frequency in the TOTAL\_RX\_PWR\_SF field. For each frequency in the  
 31       Candidate Frequency Analog Search Set, the mobile station shall report its  
 32       frequency and strength in the fields ANALOG\_FREQ and SIGNAL\_STRENGTH,  
 33       respectively.

- 1     • The mobile station shall ensure that the strength measurements for all analog  
 2       frequencies in the Candidate Frequency Analog Search Set were obtained within  
 3        $freshness\_interval$  before the *Candidate Frequency Search Report Message* is sent,  
 4       where  $freshness\_interval$  is determined as follows:  
 5           – If the value of the TOTAL\_OFF\_TIME\_FWD field or of the TOTAL\_OFF\_TIME\_REV  
 6           field of the last *Candidate Frequency Search Response Message* sent by the  
 7           mobile station to the base station is greater than or equal to  $\lceil (T_{70m} - T_{71m}) /$   
 8           SEARCH\_TIME\_RESOLUTION<sub>S</sub>  $\rceil$ , then

$$9 \quad freshness\_interval = (\max(fwd\_time, rev\_time) + T_{71m}) \text{ seconds,}$$

10 where

$$11 \quad fwd\_time = \text{SEARCH\_TIME\_RESOLUTION}_S \times (\text{value of the} \\ 12 \quad \text{TOTAL\_OFF\_TIME\_FWD field of the last } Candidate Frequency \\ 13 \quad \text{Search Response Message sent by the mobile station}),$$

14 and

$$15 \quad rev\_time = \text{SEARCH\_TIME\_RESOLUTION}_S \times (\text{value of the} \\ 16 \quad \text{TOTAL\_OFF\_TIME\_REV field of the last } Candidate Frequency \\ 17 \quad \text{Search Response Message sent by the mobile station}).$$

- 18           – Otherwise,

$$19 \quad freshness\_interval = T_{70m} \text{ seconds.}$$

#### 20     2.6.6.2.10.3 Analog Frequency Measurements

21     The mobile station measures the strength of all analog frequencies in the Candidate  
 22     Frequency Analog Search Set in one or more visits away from the Serving Frequency. The  
 23     mobile station shall perform the following actions during each visit away from the Serving  
 24     Frequency to measure analog frequency signal strengths:

- 25       • If the mobile station is processing the Forward Fundamental Channel, the mobile  
 26           station shall stop processing the Forward Fundamental Channel. If the mobile  
 27           station is transmitting on the Reverse Fundamental Channel, the mobile station  
 28           shall stop transmitting on Reverse Fundamental Channel.
- 29       • If the mobile station is processing the Forward Dedicated Control Channel, the  
 30           mobile station shall stop processing Forward Dedicated Control Channel. If the  
 31           mobile station is transmitting on the Reverse Dedicated Control Channel, the mobile  
 32           station shall stop transmitting on Reverse Dedicated Control Channel.
- 33       • The mobile station shall stop processing the Forward Supplemental Code Channels  
 34           and Forward Supplemental Channels (if any). The mobile station shall stop  
 35           transmitting on the Reverse Supplemental Code Channels and Reverse  
 36           Supplemental Channels (if any).

- 1     • The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop  
2       timers corresponding to its current Active Set and Candidate Set (see 2.6.6.2.3), and  
3       shall suspend incrementing TOT\_FRAMESS<sub>S</sub>, BAD\_FRAMESS<sub>S</sub>, DCCH\_TOT\_FRAMESS<sub>S</sub>,  
4       DCCH\_BAD\_FRAMESS<sub>S</sub>, SCH\_TOT\_FRAMESS<sub>S</sub>, and SCH\_BAD\_FRAMESS<sub>S</sub> if applicable  
5       (see 2.6.4.1.1).
- 6     • The mobile station shall lock the accumulation of valid level changes in the closed  
7       loop mean output power and shall ignore received power control bits related to the  
8       period that the transmitter is disabled (see [2]).
- 9     • The mobile station shall tune to one of the analog frequencies in the Candidate  
10      Frequency Analog Search Set, and shall measure the mean input power on the  
11      analog frequency.
- 12    • The mobile station may tune to other frequencies in the Candidate Frequency  
13      Analog Search Set and make power measurements during this visit away from the  
14      Serving Frequency.
- 15    • The mobile station shall not change its time reference (see 2.1.5 of [2]) until it  
16      resumes using the Serving Frequency Active Set, as described below.
- 17    • The mobile station shall tune to the Serving Frequency and resume using the  
18      Serving Frequency Active Set as follows:
  - 19       – If the mobile station was processing the Forward Fundamental Channel prior to  
20          tuning to the Candidate Frequency, the mobile station shall resume processing  
21          the Forward Fundamental Channel. If the mobile station was transmitting on  
22          the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,  
23          the mobile station shall resume transmitting on the Reverse Fundamental  
24          Channel.
  - 25       – If the mobile station was processing the Forward Dedicated Control Channel  
26          prior to tuning to the Candidate Frequency, the mobile station shall resume  
27          processing the Forward Dedicated Control Channel. If the mobile station was  
28          transmitting on the Reverse Dedicated Control Channel prior to tuning to the  
29          Candidate Frequency, the mobile station shall resume transmitting on the  
30          Reverse Dedicated Control Channel.
  - 31       – If the Forward Supplemental Code Channels or Forward Supplemental Channels  
32          assignment has not expired, the mobile station shall resume processing the  
33          Forward Supplemental Code Channels or Forward Supplemental Channels  
34          respectively (if any).
  - 35       – If the Reverse Supplemental Code Channel or Reverse Supplemental Channels  
36          assignment has not expired, the mobile station may resume transmitting on the  
37          Reverse Supplemental Code Channels or Reverse Supplemental Channels  
38          respectively (if any).
  - 39       – When the mobile station resumes transmission on the Reverse Traffic Channel,  
40          it shall use the following rules to re-enable its transmitter:

- + If the interval between the time that the mobile station disables its transmitter and the time that it resumes using the Serving Frequency Active Set is equal to or greater than ( $N_{2m} \times 20$ ) ms, then the mobile station shall wait to receive a period of ( $N_{3m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the physical channel corresponding to FPC\_PRI\_CHANs before it re-enables its transmitter.
- + Otherwise, the mobile station shall re-enable its transmitter no later than  $N_{3m} \times 20$  ms after the mobile station tunes to the Serving Frequency. The mobile station should re-enable its transmitter earlier. After the mobile station re-enables its transmitter, the mean output power shall be as specified in 2.1.2.4.1 of [2] for a step change in input power. If the mobile station re-enables its transmitter earlier than  $N_{3m} \times 20$  ms after it tunes to the Serving Frequency, the initial mean output power shall be as specified in 2.1.2.3.1 of [2], where the initial mean input power estimate is either:
  - o within 6 dB of the actual mean input power, or
  - o equal to the mean input power before the mobile station tuned to the Target Frequency.
- The mobile station shall enable the fade timer and the handoff drop timers corresponding to the pilots in its Active Set and Candidate Set. The mobile station shall resume incrementing TOT\_FRAMEs<sub>s</sub>, BAD\_FRAMEs<sub>s</sub>, DCCH\_TOT\_FRAMEs<sub>s</sub>, DCCH\_BAD\_FRAMEs<sub>s</sub>, SCH\_TOT\_FRAMEs<sub>s</sub>, and SCH\_BAD\_FRAMEs<sub>s</sub> if applicable as specified in 2.6.4.1.1.

#### 2.6.6.2.10.4 Aborting Analog Frequencies Periodic Search

When the mobile station aborts a periodic search, it shall do the following:

- The mobile station shall cancel any remaining visits away from the Serving Frequency in the current search period and shall not send a *Candidate Frequency Search Report Message* for the current search period.
- The mobile station shall disable the periodic search timer.

#### 2.6.6.2.11 Processing of Reverse Supplemental Code Channels and Reverse Supplemental Channels

If USE\_T\_ADD\_ABORT<sub>s</sub> is set to '1', and the strength of a Neighbor Set or Remaining Set pilot is found to be above T\_ADD<sub>s</sub>, then the mobile station shall terminate any active transmission on Reverse Supplemental Code Channels or Reverse Supplemental Channels at the end of the current 20 ms frame. The mobile station shall do the following:

- Any previously active Reverse Supplemental Code Channel or Reverse Supplemental Channel assignment shall be considered implicitly terminated.
- If active transmission on Reverse Supplemental Code Channels is terminated, the mobile station shall set NUM\_REV\_CODEs<sub>s</sub> to '000' and shall set IGNORE\_SCAM<sub>s</sub> to '1'.

- If active transmission on Reverse Supplemental Channels is terminated, the mobile station shall set IGNORE\_ESCAM<sub>S</sub> to '1'.
- The mobile station shall set SCRM\_SEQ\_NUM<sub>S</sub> to (SCRM\_SEQ\_NUM<sub>S</sub> + 1) mod 16.
- The mobile station shall transmit a *Supplemental Channel Request Message* with USE\_SCRM\_SEQ\_NUM set to '1', SCRM\_SEQ\_NUM set to SCRM\_SEQ\_NUM<sub>S</sub>, and SIZE\_OF\_REQ\_BLOB set to '0000'.

#### 2.6.6.2.12 Periodic Serving Frequency Pilot Report Procedure

While the mobile station is tuned to the Serving Frequency (specified by CDMACH<sub>S</sub> and CDMABAND<sub>S</sub>), the mobile station shall measure the total received power spectral density, in mW/1.23 MHz, on the Serving Frequency at least once every 20 ms frame. The mobile station shall maintain the average value of the total received power spectral density, *spec\_density*, over the last N<sub>12m</sub> frames. The mobile station shall maintain the PPSMM timer as follows:

- When the mobile station starts a Periodic Serving Frequency Pilot Report Procedure, it shall set the PPSMM timer to PPSMM\_PERIOD<sub>S</sub> × 0.08 seconds and shall enable the timer.
- When the PPSMM timer expires, the mobile station shall send a *Periodic Pilot Strength Measurement Message* (2.6.6.2.5.2) to the base station, reset the PPSMM timer to PPSMM\_PERIOD<sub>S</sub> × 0.08 seconds and shall re-enable the timer.
- When the mobile station receives an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message* directing the mobile station to perform a hard handoff (see 2.6.6.2.5.1), it shall abort the Periodic Serving Frequency Pilot Report Procedure and disable the PPSMM timer if it is enabled.
- If MIN\_PILOT\_PWR\_THRESH<sub>S</sub> is not equal to '11111' and MIN\_PILOT\_EC\_IO\_THRESH<sub>S</sub> is equal to '11111', the mobile station shall perform the following actions once per frame:
  - Disable the PPSMM timer if the received total energy per PN chip, E<sub>C</sub>, of the pilots in the Active Set is not less than (-120 + 2 × MIN\_PILOT\_PWR\_THRESH<sub>S</sub>), where the value of E<sub>C</sub> is computed as  $10 \times \log_{10} (\text{PS} \times \text{spec\_density})$  and PS is the total E<sub>C</sub>/I<sub>O</sub> of the pilots in the Active Set measured as specified in 2.6.6.2.2.
  - Reset the expiration time of the PPSMM timer to PPSMM\_PERIOD<sub>S</sub> × 0.08 seconds and re-enable the timer if the following conditions are true:
    - o the PPSMM timer is disabled, and
    - o the received total energy per PN chip, E<sub>C</sub>, of the pilots in the Active Set is less than (-120 + 2 × MIN\_PILOT\_PWR\_THRESH<sub>S</sub>).
- If MIN\_PILOT\_PWR\_THRESH<sub>S</sub> is equal to '11111' and MIN\_PILOT\_EC\_IO\_THRESH<sub>S</sub> is not equal to '11111', the mobile station shall perform the following actions once per frame:

- 1     – Disable the PPSMM timer if the total pilot strength of the pilots in the Active Set,  
2        PS, satisfies the condition that  $(-20 \times \log_{10}(PS))$  is not greater than  
3         $\text{MIN\_PILOT\_EC\_IO\_THRESH}_S$ .
- 4     – Reset the expiration time of the PPSMM timer to  $\text{PPSMM\_PERIOD}_S \times 0.08$   
5        seconds and re-enable the timer if the following conditions are true:  
6           o the PPSMM timer is disabled, and  
7           o the total pilot strength of the pilots in the Active Set, PS, satisfies the  
8              condition that  $(-20 \times \log_{10}(PS))$  is greater than  $\text{MIN\_PILOT\_EC\_IO\_THRESH}_S$ .
- 9     • If  $\text{MIN\_PILOT\_PWR\_THRESH}_S$  is not equal to ‘11111’ and  
10         $\text{MIN\_PILOT\_EC\_IO\_THRESH}_S$  is not equal to ‘11111’, the mobile station shall  
11        perform the following actions once per frame:  
12           – Disable the PPSMM timer if the following conditions are true:  
13              o the received total energy per PN chip,  $E_C$ , of the pilots in the Active Set is not  
14                less than  $(-120 + 2 \times \text{MIN\_PILOT\_PWR\_THRESH}_S)$ , and  
15              o the total pilot strength of the pilots in the Active Set, PS, satisfies the  
16                condition that  $(-20 \times \log_{10}(PS))$  is not greater than  
17                 $\text{MIN\_PILOT\_EC\_IO\_THRESH}_S$ .  
18           – Reset the expiration time of the PPSMM timer to  $\text{PPSMM\_PERIOD}_S \times 0.08$   
19        seconds and re-enable the timer if the following conditions are true:  
20              o the PPSMM timer is disabled, and  
21              o the received total energy per PN chip,  $E_C$ , of the pilots in the Active Set is less  
22                than  $(-120 + 2 \times \text{MIN\_PILOT\_PWR\_THRESH}_S)$ , or the total pilot strength of  
23                the pilots in the Active Set, PS, satisfies the condition that  $(-20 \times \log_{10}(PS))$  is  
24                greater than  $\text{MIN\_PILOT\_EC\_IO\_THRESH}_S$ .  
25     • If  $\text{MIN\_PILOT\_PWR\_THRESH}_S$  is equal to ‘11111’ and  $\text{MIN\_PILOT\_EC\_IO\_THRESH}_S$   
26        is equal to ‘11111’, the mobile station shall maintain the PPSMM timer independent  
27        of the received power and the total  $E_C/I_0$  of the pilots.

#### 28     2.6.6.3 Examples

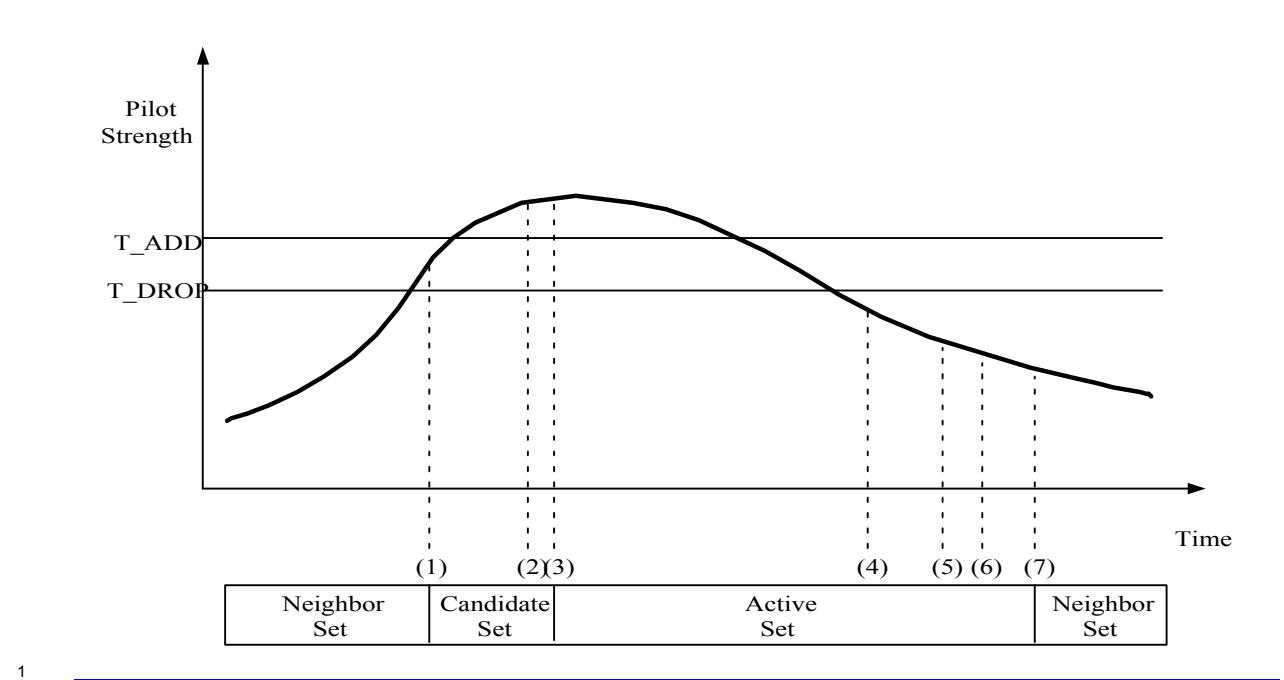

29     The following examples illustrate typical message exchanges between the mobile station and  
30        the base station during handoff. Refer to Annex B for examples of call processing during  
31        handoff.

32     Figure 2.6.6.3-1 shows an example of the messages exchanged between the mobile station and  
33        the base station during a typical handoff process if  $P_{REV\_IN\_USE}_S$  is less than or  
34        equal to three or  $SOFT\_SLOPE}_S$  is equal to ‘000000’.

35     Figure 2.6.6.3-2 shows an example of the messages exchanged between the mobile station and  
36        the base station during a typical handoff process if  $P_{REV\_IN\_USE}_S$  is greater than  
37        three and  $SOFT\_SLOPE}_S$  is not equal to ‘000000’.

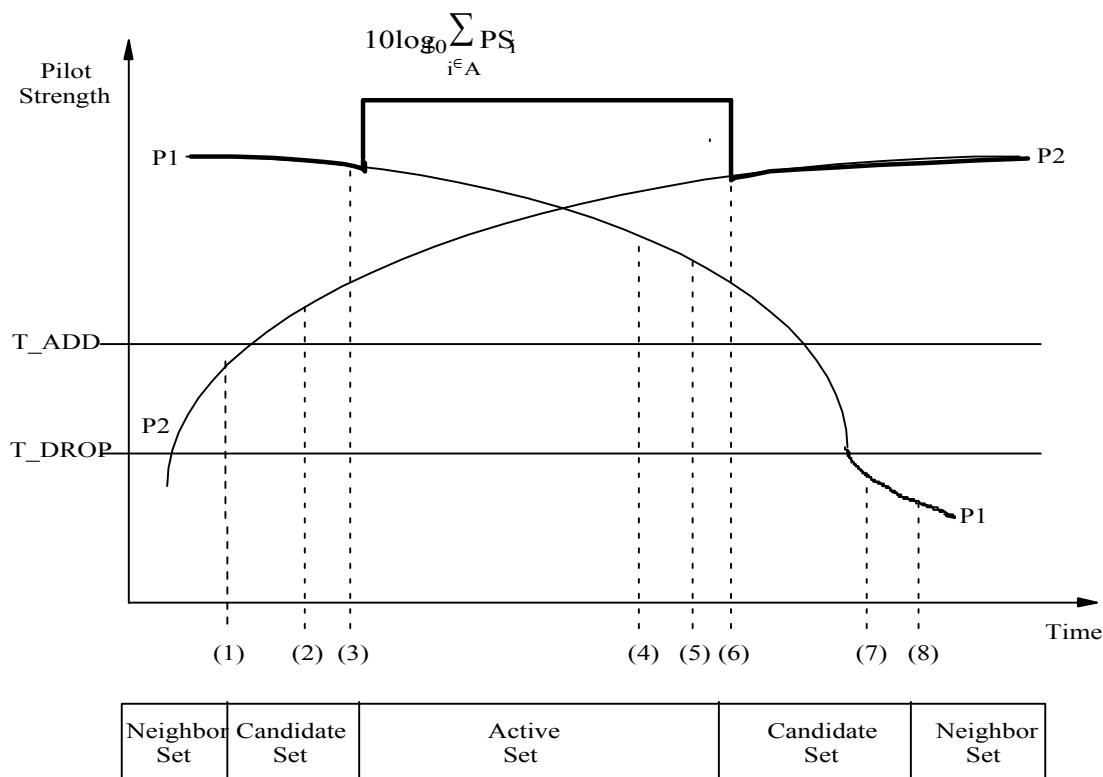

1 Figure 2.6.6.3-3 illustrates the messaging triggered by a pilot of the Candidate Set as its  
2 strength gradually rises above the strength of each pilot of the Active Set if P\_REV\_IN\_USE<sub>s</sub>  
3 is less than or equal to three, or SOFT\_SLOPE<sub>s</sub> is equal to '000000'. Note that the mobile  
4 station reports that a Candidate Set pilot is stronger than an Active Set pilot only if the  
5 difference between their respective strengths is at least T\_COMP × 0.5 dB.

6 Figure 2.6.6.3-4 illustrates the messaging triggered by a pilot of the Candidate Set as its  
7 strength gradually rises above the strength of each pilot of the Active Set if P\_REV\_IN\_USE<sub>s</sub>  
8 is greater than three and SOFT\_SLOPE<sub>s</sub> is not equal to '000000'. Note that the mobile  
9 station reports that a Candidate Set pilot is stronger than an Active Set pilot only if the  
10 difference between their respective strengths is at least T\_COMP × 0.5 dB and Pilot P<sub>0</sub>  
11 strength exceeds [(SOFT\_SLOPE/8) × 10 × log<sub>10</sub>(PS<sub>1</sub> + PS<sub>2</sub>) + ADD\_INTERCEPT/2].

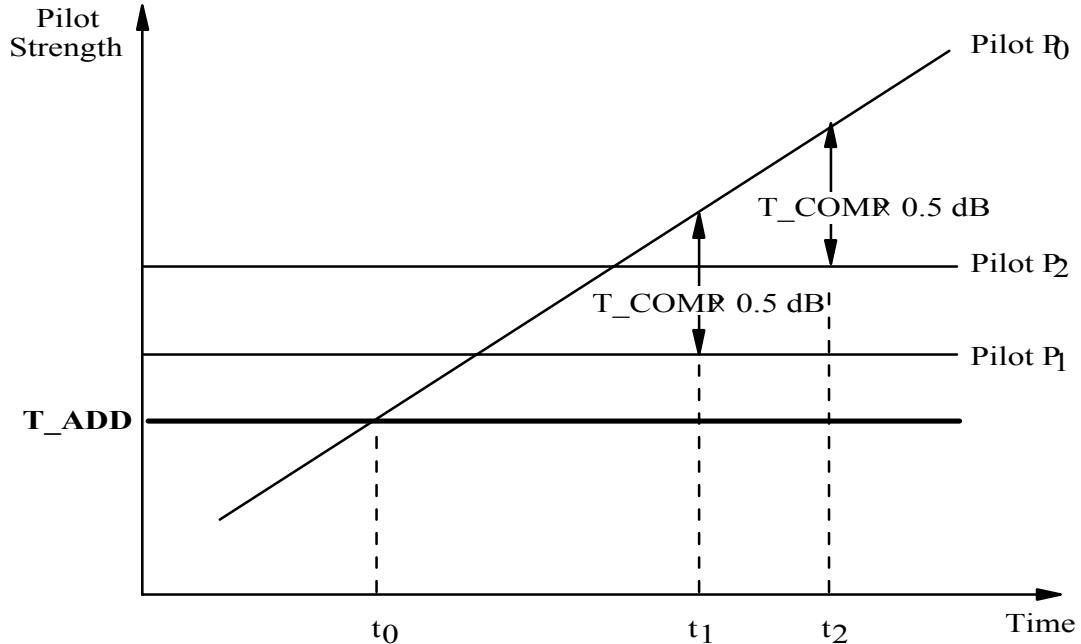

- (1) Pilot strength exceeds  $T_{ADD}$ . Mobile station sends a *Pilot Strength Measurement Message* and transfers pilot to the Candidate Set.
- (2) Base station sends an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message*.
- (3) Mobile station transfers pilot to the Active Set and sends a *Handoff Completion Message*.
- (4) Pilot strength drops below  $T_{DROP}$ . Mobile station starts the handoff drop timer.
- (5) Handoff drop timer expires. Mobile station sends a *Pilot Strength Measurement Message*.
- (6) Base station sends an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message*.
- (7) Mobile station moves pilot from the Active Set to the Neighbor Set and sends a *Handoff Completion Message*.

**Figure 2.6.6.3-1. Handoff Threshold Example if P\_REV\_IN\_USE<sub>s</sub> is Less Than or Equal to Three, or SOFT\_SLOPE<sub>s</sub> is Equal to '000000'**

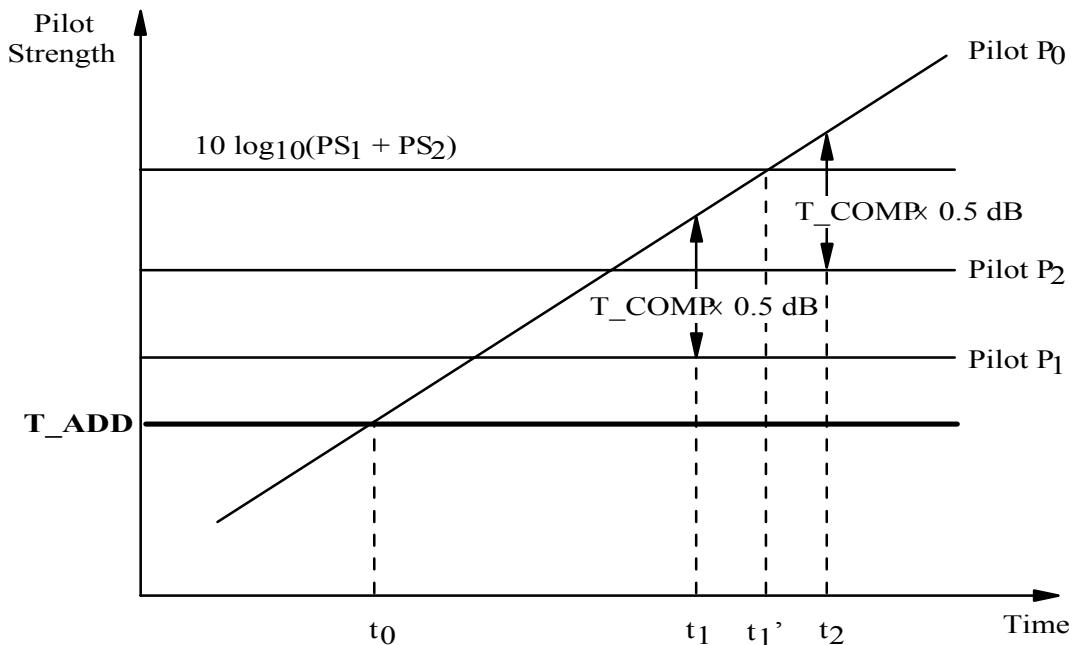

- (1) Pilot  $P_2$  strength exceeds  $T_{ADD}$ . Mobile station transfers the pilot to the Candidate Set.
- (2) Pilot  $P_2$  strength exceeds  $[(SOFT\_SLOPE/8) \times 10 \times \log_{10}(PS_1) + ADD\_INTERCEPT/2]$ . Mobile station sends a *Pilot Strength Measurement Message*.
- (3) Mobile station receives an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message*, transfers the pilot  $P_2$  to the Active Set, and sends a *Handoff Completion Message*.
- (4) Pilot  $P_1$  strength drops below  $[(SOFT\_SLOPE/8) \times 10 \times \log_{10}(PS_2) + DROP\_INTERCEPT/2]$ . Mobile station starts the handoff drop timer.
- (5) Handoff drop timer expires. Mobile station sends a *Pilot Strength Measurement Message*.
- (6) Mobile station receives an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a *Universal Handoff Direction Message*, transfers the pilot  $P_1$  to the Candidate Set and sends a *Handoff Completion Message*.
- (7) Pilot  $P_1$  strength drops below  $T_{DROP}$ . Mobile station starts the handoff drop timer.
- (8) Handoff drop timer expires. Mobile station moves the pilot  $P_1$  from the Candidate Set to the Neighbor Set.

**Figure 2.6.6.3-2. Handoff Threshold Example if  $P_{REV\_IN\_USE_s}$  is Greater Than Three, and  $SOFT\_SLOPE_s$  is Not Equal to '000000'**

- 1 Candidate Set: Pilot  $P_0$
  - 2 Active Set: Pilots  $P_1, P_2$
  - 3  $t_0$  – Pilot Strength Measurement Message sent,  $P_0 > T_{ADD}$
  - 4  $t_1$  – Pilot Strength Measurement Message sent,  $P_0 > P_1 + T_{COMP} \times 0.5 \text{ dB}$
  - 5  $t_2$  – Pilot Strength Measurement Message sent,  $P_0 > P_2 + T_{COMP} \times 0.5 \text{ dB}$
- Figure 2.6.6.3-3. Pilot Strength Measurements Triggered by a Candidate Pilot if  $P_{REV\_IN\_USE_s} = 3$  or  $SOFT\_SLOPE_s = '000000'$**

Candidate Set: Pilot  $P_0$

Active Set: Pilots  $P_1$ ,  $P_2$

$t_0$  – Pilot Strength Measurement Message not sent because

$$[10 \times \log_{10}(PS_0)] < [(SOFT\_SLOPE/8) \times 10 \times \log_{10}(PS_1 + PS_2) + ADD\_INTERCEPT/2]$$

$t_1$  – Pilot Strength Measurement Message not sent because

$$P_0 > [P_1 + T_{COMP} \times 0.5 \text{ dB}] \text{ but}$$

$$[10 \times \log_{10}(PS_0)] < [(SOFT\_SLOPE/8) \times 10 \times \log_{10}(PS_1 + PS_2) + ADD\_INTERCEPT/2]$$

$t_1'$  – Pilot Strength Measurement Message sent because

$$[10 \times \log_{10}(PS_0)] > [(SOFT\_SLOPE/8) \times 10 \times \log_{10}(PS_1 + PS_2) + ADD\_INTERCEPT/2]$$

$t_2$  – Pilot Strength Measurement Message sent because

$$P_0 > [P_2 + T_{COMP} \times 0.5 \text{ dB}] \text{ and}$$

$$[10 \times \log_{10}(PS_0)] > [(SOFT\_SLOPE/8) \times 10 \times \log_{10}(PS_1 + PS_2) + ADD\_INTERCEPT/2]$$

**Figure 2.6.6.3-4. Pilot Strength Measurements Triggered by a Candidate Pilot if  $P_{REV\_IN\_USE_s} > 3$  and  $SOFT\_SLOPE_s$  is Not Equal to '000000'**

## 1    2.6.7 Hash Functions and Randomization

## 2    2.6.7.1 Hash Function

3    Certain procedures require a uniform distribution of mobile stations among N resources.  
 4    The following function returns an integer, using as arguments the mobile station's IMSI, the  
 5    number of resources N, and a modifier DECORR. The modifier serves to decorrelate the  
 6    values obtained for the various applications from the same mobile station.

7    HASH\_KEY shall be equal to the 32 least significant bits of  $(\text{IMSI\_O\_S1} + 2^{24} \times \text{IMSI\_O\_S2})$ .

8    Define:

- 9       • Word L to be bits 0-15 of HASH\_KEY
- 10      • Word H to be bits 16-31 of HASH\_KEY

11   where bit 0 is the least significant bit of HASH\_KEY.

12   For determining CDMA Channel Number, Paging Channel Number, Forward Common  
 13   Control Channel Number, Quick Paging Channel Number, and Paging Slot Number, the  
 14   hash value is computed as follows:<sup>18</sup>

$$15   \quad R = \lfloor N \times ((40503 \times (L \oplus H \oplus \text{DECORR})) \bmod 2^{16}) / 2^{16} \rfloor.$$

16   For determining a mobile station's assigned paging indicator bit positions, the hash value is  
 17   computed as follows:

$$18   \quad R_1 = \lfloor N \times ((40503 \times (L \oplus H \oplus \text{DECORR}_1)) \bmod 2^{16}) / 2^{16} \rfloor,$$

19   and

$$20   \quad R_2 = \lfloor ( (1 - \lfloor (2 \times R_1) / (N+4) \rfloor) \times (N+4) / 2 + \lfloor (2 \times R_1) / (N+4) \rfloor \times ((N+4) / 2 - 4) ) \times ((40503 \times (L \oplus H \oplus \text{DECORR}_2)) \bmod 2^{16}) / 2^{16} \rfloor + N + 4 + \lfloor (2 \times R_1) / (N+4) \rfloor \times ((N+4) / 2) \text{ for Quick Paging Channel indicator rate of 4800 bps, or}$$

$$23   \quad R_2 = \lfloor ( (1 - \lfloor (2 \times R_1) / (N+8) \rfloor) \times (N+8) / 2 + \lfloor (2 \times R_1) / (N+8) \rfloor \times ((N+8) / 2 - 8) ) \times ((40503 \times (L \oplus H \oplus \text{DECORR}_2)) \bmod 2^{16}) / 2^{16} \rfloor + N + 8 + \lfloor (2 \times R_1) / (N+8) \rfloor \times ((N+8) / 2) \text{ for Quick Paging Channel indicator rate of 9600 bps.}$$

26   The mobile station shall choose the range N and the modifiers DECORR, DECORR<sub>1</sub>, and  
 27   DECORR<sub>2</sub> according to the application as shown in Table 2.6.7.1-1. In the table,  
 28   HASH\_KEY [0...11] denotes the 12 least significant bits of HASH\_KEY.

29

---

<sup>18</sup> This formula is adapted from Knuth, Donald N., *The Art of Computer Programming*, 2 volumes, (Reading, MA, Addison-Wesley, 1998).

**Table 2.6.7.1-1. Hash Function Modifier**

| <b>Application</b>                    | <b>N</b>                                                                                                                                              | <b>DECORR</b>                                                                                                                                                                                                                                    | <b>Return Value</b>               |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| CDMA Channel Number                   | Number of channels in last <i>CDMA Channel List Message</i> or the number of qualified channels in the last <i>Extended CDMA Channel List Message</i> | 0                                                                                                                                                                                                                                                | R + 1                             |
| Paging Channel Number                 | PAGE_CHAN <sub>s</sub> from <i>System Parameters Message</i> (up to 7)                                                                                | 2 × HASH_KEY [0...11]                                                                                                                                                                                                                            | R + 1                             |
| Quick Paging Channel Number           | NUM_QPCH <sub>s</sub> from <i>Extended System Parameters Message</i> or <i>MC-RR Parameters Message</i> (up to 3)                                     | 2 × HASH_KEY [0...11]                                                                                                                                                                                                                            | R + 1                             |
| Paging Slot Number                    | 2048                                                                                                                                                  | 6 × HASH_KEY[0...11]                                                                                                                                                                                                                             | R                                 |
| Paging Indicator Positions            | 376 (for 9600 bps), 188 (for 4800 bps)                                                                                                                | DECORR <sub>1</sub> = $\lfloor t / 64 \rfloor \bmod 2^{16}$ ,<br>DECORR <sub>2</sub> = $\lfloor t / 64 + 1 \rfloor \bmod 2^{16}$ ,<br>where t is the System Time in frames, relative to the beginning of the assigned Quick Paging Channel slot. | R <sub>1</sub> and R <sub>2</sub> |
| Forward Common Control Channel Number | NUM_FCCCH <sub>s</sub> from <i>MC-RR Parameters Message</i> (up to 7)                                                                                 | 2 × HASH_KEY [0...11]                                                                                                                                                                                                                            | R + 1                             |

2

## 3 2.6.7.2 Pseudorandom Number Generator

4 Where pseudorandom numbers are needed, a linear congruential generator shall be used.

5 The mobile station shall implement the linear congruential generator defined by:

6 
$$z_n = a \times z_{n-1} \bmod m$$

7 where  $a = 7^5 = 16807$  and  $m = 2^{31} - 1 = 2147483647$ .  $z_n$  is the output of the generator.<sup>19</sup>

<sup>19</sup> This generator has full period, ranging over all integers from 1 to m-1; the values 0 and m are never produced. Several suitable implementations can be found in Park, Stephen K. and Miller, Keith

(footnote continued on next page)

1 During the *Mobile Station Initialization State*, the mobile station shall seed its generator with

$$2 z_0 = (\text{ESN} \oplus \text{RANDOM\_TIME}) \bmod m$$

3 where RANDOM\_TIME shall be the least-significant 32-bits of SYS\_TIME<sub>S</sub> stored from the  
4 Sync Channel Message. If the initial value so produced is found to be zero, it shall be  
5 replaced with one. The mobile station shall compute a new  $z_n$  for each subsequent use.

6 The mobile station shall use the value  $u_n = z_n / m$  for those applications that require a  
7 binary fraction  $u_n$ ,  $0 < u_n < 1$ .

8 The mobile station shall use the value  $k_n = \lfloor N \times z_n / m \rfloor$  for those applications that require  
9 a small integer  $k_n$ ,  $0 \leq k_n \leq N - 1$ .

10 2.6.8 CODE\_CHAN\_LIST<sub>S</sub> Maintenance

11 The CODE\_CHAN\_LIST<sub>S</sub> is a descriptive structure used to manage the Forward  
12 Fundamental ~~Code~~-Channel and Forward Supplemental Code Channels, if any, associated  
13 with the mobile station's Active Set. Associated with each member of the mobile station's  
14 Active Set, there is an ordered array of code channels. The first entry of the ordered array  
15 specifies the Forward Fundamental ~~Code~~-Channel associated with the pilot and the  
16 subsequent entries, if any, specify the Forward Supplemental Code Channels associated  
17 with the pilot. The CODE\_CHAN\_LIST<sub>S</sub> is the collection of ordered arrays of code channels  
18 for each member of the mobile station's Active Set. The  $i^{\text{th}}$  entry in every array (of code  
19 channels associated with a member of the Active Set) corresponds to the  $i^{\text{th}}$  code channel.

20 The mobile station shall maintain the CODE\_CHAN\_LIST<sub>S</sub> as follows:

- 21 • When the mobile station is first assigned a Forward Fundamental ~~Code~~-Channel, it  
22 shall initialize the CODE\_CHAN\_LIST<sub>S</sub> to contain the Forward Fundamental ~~Code~~  
23 Channel for each member of the Active Set.
- 24 • When the mobile station processes the *Extended Handoff Direction Message*, the  
25 mobile station shall update the CODE\_CHAN\_LIST<sub>S</sub> as follows:
  - 26 – For each pilot listed in the *Extended Handoff Direction Message* which does not  
27 have a corresponding code channel in the CODE\_CHAN\_LIST<sub>S</sub>, the mobile  
28 station shall add the code channel, CODE\_CHAN, of that pilot to the  
29 CODE\_CHAN\_LIST<sub>S</sub>, as the Forward Fundamental ~~Code~~-Channel for the pilot.
  - 30 – The mobile station shall delete all information in the CODE\_CHAN\_LIST<sub>S</sub>  
31 associated with a pilot that is not included in the *Extended Handoff Direction  
32 Message*.

---

W., "Random Number Generators: Good Ones are Hard to Find," *Communications of the ACM*, vol. 31,  
no. 10, October 1988, pp. 1192-1201.

- When the mobile station processes the *General Handoff Direction Message*, the mobile station shall update the CODE\_CHAN\_LIST<sub>s</sub> to contain the Forward Fundamental Code-Channel associated with each pilot included in the *General Handoff Direction Message*. The first code channel occurrence associated with each pilot included in the *General Handoff Direction Message* corresponds to the Forward Fundamental Code-Channel. The mobile station shall do the following:
  - If FOR\_SUP\_CONFIG<sub>r</sub> is included and FOR\_SUP\_CONFIG<sub>r</sub> is equal to ‘10’ or ‘11’, the mobile station shall perform the following actions:
    - + For each pilot listed in the *General Handoff Direction Message*, the mobile station shall set the Forward Supplemental Code Channels (associated with the pilot) in the CODE\_CHAN\_LIST<sub>s</sub> to the Forward Supplemental Code Channels specified in the *General Handoff Direction Message*.
    - + The mobile station shall delete all information in the CODE\_CHAN\_LIST<sub>s</sub> associated with a pilot that is not included in the *General Handoff Direction Message*.
  - If FOR\_SUP\_CONFIG<sub>r</sub> is equal to ‘00’ or ‘01’ or if FOR\_SUP\_CONFIG<sub>r</sub> is not included in the *General Handoff Direction Message*, the mobile station shall not update Supplemental Code Channels associated with the pilots included in the *General Handoff Direction Message*. The mobile station shall perform the following actions:
    - + For each pilot listed in the *General Handoff Direction Message* which does not have a corresponding code channel in the CODE\_CHAN\_LIST<sub>s</sub>, the mobile station shall add the code channel, CODE\_CHAN, of that pilot to the CODE\_CHAN\_LIST<sub>s</sub>, as the Forward Fundamental Code-Channel for the pilot.
    - + The mobile station shall delete all information in the CODE\_CHAN\_LIST<sub>s</sub> associated with a pilot that is not included in the *General Handoff Direction Message*.
- When the mobile station processes the *Supplemental Channel Assignment Message* it shall follow the following rules:
  - If FOR\_SUP\_CONFIG<sub>r</sub> is equal to ‘10’ or ‘11’, the mobile station shall update the Forward Supplemental Code Channels for each pilot in the Active Set.
  - If the pilot is not listed in the *Supplemental Channel Assignment Message*, the mobile station shall delete all occurrences of Forward Supplemental Code Channels associated with the pilot from the Code Channel List.
  - If a pilot is listed in the *Supplemental Channel Assignment Message*, then the mobile station shall set the Forward Supplemental Code Channels (associated with the pilot) in the CODE\_CHAN\_LIST<sub>s</sub> to the Forward Supplemental Code Channels specified in the *Supplemental Channel Assignment Message*.

- 1        – If FOR\_SUP\_CONFIG<sub>r</sub> is equal to ‘00’ or ‘01’, the mobile station shall not update  
 2              Supplemental Code Channels associated with the pilots included in the  
 3              *Supplemental Channel Assignment Message.*

4        2.6.9 CDMA Tiered Services

5        This section presents an overview and mobile station requirements for the support of CDMA  
 6        Tiered services while the mobile station is in the *Mobile Station Idle State* and in the *Mobile*  
 7        *Station Control on the Traffic Channel State.*

8        2.6.9.1 Overview

9        2.6.9.1.1 Definition

10      The mobile station may support Tiered Services based upon User Zones. Tiered Services  
 11     provide the user custom services and special features based upon the mobile station  
 12     location. Tiered Services also provides private network support. Important to the operation  
 13     of CDMA Tiered Services is the concept of User Zones. It is via User Zones by which the  
 14     base station offers custom services based upon the mobile station location.

15      User Zones are associated with a set of features and services, plus a geographic area in  
 16     which the User Zone features/services are made available to the customers that have  
 17     subscribed to that User Zone. The boundary of the User Zone Geographic area may be  
 18     established based on the coverage area of a public or private base station or it may be  
 19     established independent of RF topology.

20      User Zones may be supported by the public system on the same frequency as the serving  
 21     base station, or they may be supported on a private system operating on a different  
 22     frequency.

23      2.6.9.1.2 Types of User Zones

24      User Zones may be of two basic types:

- 25        • *Broadcast User Zones:* Broadcast User Zones are identified to the mobile station using  
 26              the Paging Channel or the Primary Broadcast Control Channel. In this case, the base  
 27              station broadcasts on the Paging Channel or the Primary Broadcast Control Channel  
 28              messages identifying the User Zones that fall within the coverage area of the  
 29              particular cell/sector. Mobile stations, as part of their monitoring of the Paging  
 30              Channel or the Primary Broadcast Control Channel, will identify the presence of a  
 31              particular User Zone.
- 32        • *Mobile Specific User Zones:* Mobile Specific User Zones are not broadcast by the base  
 33              station. The mobile station may use other overhead message parameters and  
 34              compare them with internally stored User Zone parameters to identify the presence of  
 35              a particular User Zone. These parameters may include: SID, NID, BASE\_ID,  
 36              BASE\_LAT, and BASE\_LONG.

37      *Broadcast User Zones* allow for permanent as well as temporary subscription. Temporary  
 38      subscription provides User Zone features and capabilities to users who are not subscribed  
 39      to the User Zone. In this case, a mobile station, upon entering a new coverage area, may

1 detect the presence of a User Zone that it presently does not subscribe to, but one that  
2 supports temporary subscription. The mobile station then queries the network to obtain  
3 the User Zone parameters. Once these parameters are received, the mobile station offers to  
4 the user via the mobile station user interface, the option of subscribing to the particular  
5 User Zone.

6 Some User Zones may require active registration (Active User Zones) upon the mobile  
7 station's entry to immediately trigger a change in a feature(s). For others, the implicit  
8 registration at call setup is sufficient (Passive User Zones). Active User Zones are used  
9 where inbound features change as a result of being in the User Zone. During the *Mobile*  
10 *Station Idle State*, a mobile stations needs to register to update the User Zone ID whenever  
11 the User Zone that the mobile station is entering and/or leaving is of the Active type.

12 A mobile station that supports User Zone services may store a list of User Zones, where  
13 each User Zone is identified by a User Zone ID (UZID). Associated with each stored User  
14 Zone, the mobile station may also store a number of determinant parameters used for  
15 identifying User Zones.

16 **2.6.9.2 Requirements**

17 If the mobile station supports User Zone services, it shall maintain and update UZIDs  
18 according the following rule:

19 If the mobile station selects a User Zone supported by the base station, the mobile station  
20 shall set UZID<sub>S</sub> to the User Zone Identifier associated with the User Zone; otherwise, the  
21 mobile station shall set UZID<sub>S</sub> to '0000000000000000'. The precise process for determining  
22 how to select a User Zone that is supported by the base station is left to the mobile station  
23 manufacturer.

24 If the mobile station does not support User Zone services, the mobile station shall set  
25 UZID<sub>S</sub> to '0000000000000000'.

26 The mobile station may search pilots of private neighbor base stations on other frequencies  
27 and band classes as identified in the *Private Neighbor List Message*. Search performance  
28 criteria are defined [11].

29 **2.6.9.2.1 User Zone Operation in the Mobile Station Idle State:**

30 When a mobile station performs an idle handoff, it selects User Zones based on internally  
31 stored parameters and information broadcast on the Paging Channel or on the Primary  
32 Broadcast Control Channel as described in 2.6.9.1.

33 After the mobile station performs idle handoff, if the mobile station determines that a  
34 change from one Broadcast User Zone to another Broadcast User Zone is required, the  
35 mobile station shall not update UZID<sub>S</sub>, UZ\_EXIT\_IN\_USE<sub>S</sub> and shall not perform User Zone  
36 registration until the pilot strength of the currently serving base station exceeds that of the  
37 base station corresponding to the old User Zone by the value of UZ\_EXIT\_IN\_USE<sub>S</sub>.

1 If the mobile station determines that it needs to change User Zone, and if the difference  
 2 between the pilot strengths exceeds UZ\_EXIT\_IN\_USE<sub>S</sub>, then the mobile station shall do the  
 3 following:

- 4 • Perform User Zone registration.
- 5 • Update UZID<sub>S</sub>.
- 6 • Set UZ\_EXIT\_IN\_USE<sub>S</sub> to UZ\_EXIT\_RCVD<sub>S</sub>.

7 The mobile station may also implement other means to avoid the premature exiting of a  
 8 User Zone due to rapid changes in signal strength. The exact implementation of such  
 9 techniques is left to mobile station implementation.

10 If the mobile station is in the *Mobile Station Idle State* and it receives a *User Zone Reject*  
 11 *Message* the mobile station shall perform the following:

- 12 • Set REJECT\_ACTION\_IND<sub>I</sub><sub>S</sub> to REJECT\_ACTION\_IND<sub>I</sub><sub>r</sub>.
- 13 • If UZID\_ASSIGN\_INCL<sub>r</sub> = '0', the mobile station shall set UZID<sub>S</sub> to  
 14 '0000000000000000', otherwise; the mobile station shall set UZID<sub>S</sub> to  
 15 ASSIGN\_UZID<sub>r</sub>.

16 If the mobile station is in the *Mobile Station Idle State* and it selects an active User Zone,  
 17 then the mobile station shall perform User Zone registration (see 2.6.5.1.10) by entering the  
 18 *System Access State* with a registration indication.

19 The mobile station should provide the user with a User Zone indication corresponding to  
 20 the User Zone in service each time UZID<sub>S</sub> is updated.

#### 21 2.6.9.2.2 User Zone Operation in the Mobile Station Control on the Traffic Channel State

22 If the mobile station is in the *Traffic Channel Substate* of the *Mobile Station Control on the*  
 23 *Traffic Channel State* and if it determines that the User Zone has changed, it shall update  
 24 UZID<sub>S</sub> and send a *User Zone Update Request Message* to the base station.

25 If the mobile station is in the *Traffic Channel Substate or Release Substate* of the *Mobile*  
 26 *Station Control on the Traffic Channel State* and it receives a *User Zone Update Message*,  
 27 then the mobile station shall update UZID<sub>S</sub> and set it equal to UZID<sub>r</sub>.

28 If the mobile station is in the *Traffic Channel Substate or Release Substate* of the *Mobile*  
 29 *Station Control on the Traffic Channel State* and it receives a *User Zone Reject Message*, then  
 30 the mobile station shall do the following:

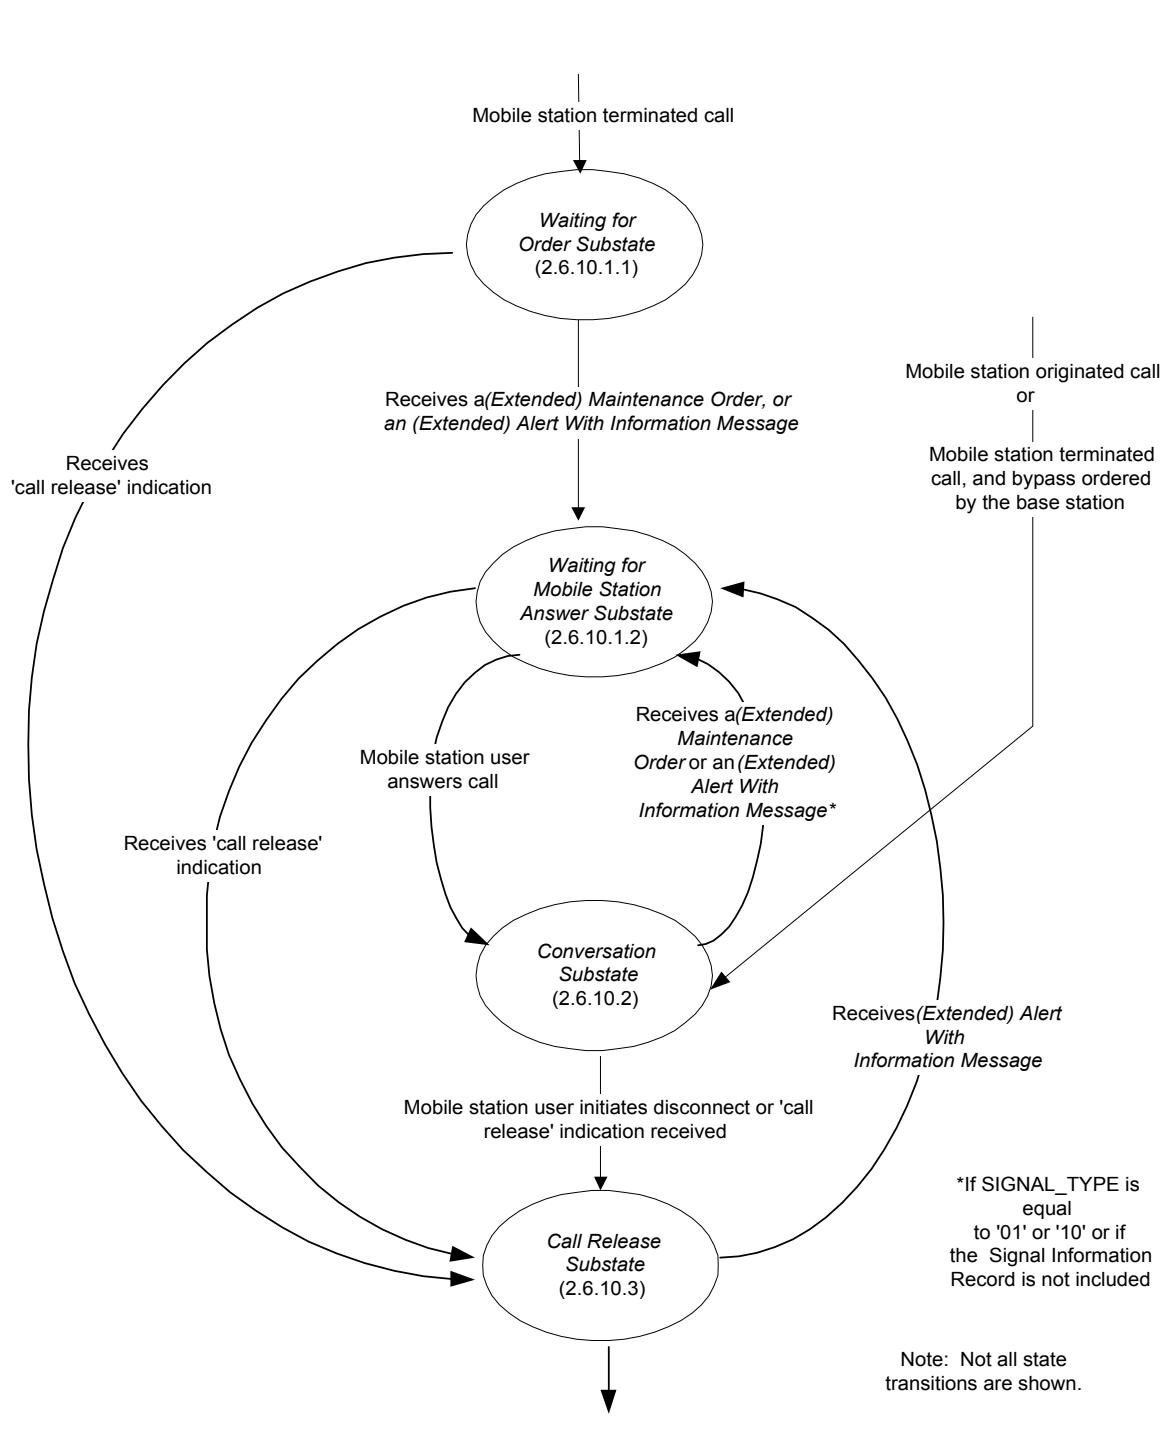

- 31 • Set REJECT\_ACTION\_IND<sub>I</sub><sub>S</sub> to REJECT\_ACTION\_IND<sub>I</sub><sub>r</sub>.
- 32 • If UZID\_ASSIGN\_INCL<sub>r</sub> = 0, the mobile station shall set UZID<sub>S</sub> to '0', otherwise; the  
 33 mobile station shall set UZID<sub>S</sub> to ASSIGN\_UZID<sub>r</sub>.

34 The mobile station should provide the user with a User Zone indication corresponding to  
 35 the User Zone in service each time UZID<sub>S</sub> is updated.

#### 36 2.6.10 Call Control Processing

37 As illustrated in Figure 2.6.10-1, the Call Control consists of the following states:

- 1     • *Waiting for Order Substate* - In this substate, the Call Control instance waits for an  
2        *Alert With Information Message* or an *Extended Alert With Information Message*.
- 3     • *Waiting for Mobile Station Answer Substate* - In this substate, the Call Control  
4        instance waits for the user to answer the call.
- 5     • *Conversation Substate* - In this substate, the parties involved in this call  
6        communicate.
- 7     • *Call Release Substate* - In this substate, the Call Control instance waits for the call  
8        to be disconnected.

1

2

3

**Figure 2.6.10-1. Call Control**

1 The following messages are processed by the Call Control:

2 - *Alert With Information Message*

3 - *Extended Alert with Information Message:*

4 - *Flash With Information Message*

5 - *Extended Flash With Information Message*

6 - *Send Burst DTMF Message*

7 - *Origination Continuation Message*

8 The following orders are processed by the Call Control:

9 - *Continuous DTMF Tone Order*

10 - *Maintenance Order*

11 - *Connect Order*

12 Upon instantiation, the Call Control instance shall perform the following:

- 13 • If this Call Control instance is instantiated with a ‘restore indication’, the Call  
14 Control instance shall enter the *Conversation Substate*.
- 15 • If the call is mobile station terminated, and BYPASS\_ALERT\_ANSWER<sub>s</sub> is ‘1’, the  
16 Call Control instance shall enter the *Conversation Substate*. If the call is mobile  
17 station terminated and BYPASS\_ALERT\_ANSWER<sub>s</sub> is ‘0’, the Call Control instance  
18 shall enter the *Waiting for Order Substate*.
- 19 • If the call is mobile station originated, the Call Control instance shall enter the  
20 *Conversation Substate*.

21 2.6.10.1 Alerting

22 2.6.10.1.1 Waiting for Order Substate

23 In this substate, the Call Control instance waits for an *Alert With Information Message* or an  
24 *Extended Alert With Information Message*.

25 Upon entering the *Waiting for Order Substate*, the Call Control instance shall set the  
26 substate timer for T52m seconds.

27 While in the *Waiting for Order Substate*, the Call Control instance shall perform the  
28 following:

- 1     • If the substate timer expires, the Call Control instance shall send a “substate timer  
2       expired indication” to the [layer 3](#)[Layer 3](#) and shall enter the *Call Release Substate*.
- 3     • If the Call Control instance receives a “reset waiting for order substate timer  
4       indication” from the [layer 3](#)[Layer 3](#), the Call Control instance shall reset the  
5       substate timer for T52m seconds.
- 6     • If the Call Control instance receives a “release indication” from the [layer 3](#)[Layer 3](#),  
7       the Call Control instance shall enter the *Call Release Substate*.
- 8     • If the Call Control instance receives an indication that the user has originated an  
9       emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*  
10      *Message* or an *Extended Flash With Information Message* in assured mode with a  
11      Global Emergency Call Information Record (see 2.7.4.31), as follows:
  - 12       - If this Call Control instance is identified by NULL, the mobile station shall send  
13           either a *Flash With Information Message* or an *Extended Flash With Information*  
14           *Message* (with either the CON\_REF\_INCL field of the message set to ‘0’ or the  
15           CON\_REF\_INCL field set to ‘1’ and the CON\_REF field set to the connection  
16           reference of the service option connection corresponding to this call); otherwise,  
17           the mobile station shall send an *Extended Flash With Information Message*, with  
18           the CON\_REF\_INCL field of the message set to ‘1’ and the CON\_REF field of the  
19           message set to the connection reference of the service option connection  
20           corresponding to this call.
- 21     • If the Call Control instance receives a message from the [layer 3](#)[Layer 3](#) which is  
22       included in the following list and every message field value is within its permissible  
23       range, the Call Control instance shall process the message as described below and  
24       in accordance with the message’s action time (see 2.6.4.1.5).
  - 25       1. *Alert With Information Message*: If the message contains a Signal information  
26           record, the mobile station should alert the user in accordance with the Signal  
27           information record; otherwise, the mobile station should use standard alert as  
28           defined in 3.7.5.5. The Call Control instance shall enter the *Waiting for Mobile*  
29           *Station Answer Substate* (see 2.6.10.1.2).
  - 30       2. *Extended Alert with Information Message*: If the message contains a Signal  
31           information record, the mobile station should alert the user in accordance with  
32           the Signal information record; otherwise, the mobile station should use  
33           standard alert as defined in 3.7.5.5. The Call Control instance shall enter the  
34           *Waiting for Mobile Station Answer Substate* (see 2.6.10.1.2).
  - 35       3. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Mobile*  
36           *Station Answer Substate*.

- 1     • If the Call Control instance receives a message that is not included in the above list,  
 2       cannot be processed, or requires a capability which is not supported, the Call  
 3       Control instance shall discard the message and send a ‘message rejected indication’  
 4       to the [layer 3](#)[Layer 3](#), with the reject reason indicated.

5     2.6.10.1.2 Waiting for Mobile Station Answer Substate

6     In this substate, the Call Control instance waits for the user to answer the mobile station  
 7       terminated call or to invoke special treatment.

8     Upon entering the *Waiting for Mobile Station Answer Substate*, the Call Control instance  
 9       shall set the substate timer for T<sub>53m</sub> seconds.

10    While in the *Waiting for Mobile Station Answer Substate*, the Call Control instance shall  
 11      perform the following:

- 12     • If the substate timer expires, the Call Control instance shall send a “substate timer  
 13       expired indication” to the [layer 3](#)[Layer 3](#) and shall enter the *Call Release Substate*.
- 14     • If the Call Control instance receives a “release indication” from the [layer 3](#)[Layer 3](#),  
 15       the Call Control instance shall enter the *Call Release Substate*.
- 16     • If the Call Control instance is directed by the user to answer the call, the mobile  
 17       station shall send a *Connect Order* in assured mode:
  - 18       - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the mobile station shall  
 19           perform the following: If this Call Control instance is identified by NULL, the  
 20           mobile station shall either set the CON\_REF\_INCL field of the message to ‘0’ or  
 21           set the CON\_REF\_INCL field to ‘1’ and set the CON\_REF field to the connection  
 22           reference of the service option connection corresponding to this call; otherwise,  
 23           the mobile station shall set the CON\_REF\_INCL field of the message to ‘1’ and  
 24           the CON\_REF field of the message to the connection reference of the service  
 25           option connection corresponding to this call.

26    The Call Control instance shall enter the *Conversation Substate*.

- 27     • If the Call Control instance is directed by the user to forward the incoming call, the  
 28       mobile station shall send a *Flash With Information Message* or an *Extended Flash  
 29       With Information Message* in assured mode with a *Keypad Facility* information record  
 30       (see 2.7.4.2) with the CHAR<sub>i</sub> field set to a pre-programmed feature code which  
 31       indicates User Selective Call Forwarding with a pre-registered number, as follows:
  - 32       - If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall send a *Flash With  
 33       Information Message*.

- 1     - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
 2       perform the following: if this Call Control instance is identified by NULL, the  
 3       mobile station shall send either a *Flash With Information Message* or an  
 4       *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of  
 5       the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF  
 6       field set to the connection reference of the service option connection  
 7       corresponding to this call); otherwise, the mobile station shall send an *Extended*  
 8       *Flash With Information Message*, with the CON\_REF\_INCL field of the message  
 9       set to '1' and the CON\_REF field of the message set to the connection reference  
 10      of the service option connection corresponding to this call.
- 11     • If the Call Control instance is directed by user to forward the incoming call to a  
 12       number stored in the mobile station, the mobile station shall send a *Flash With*  
 13       *Information Message* or an *Extended Flash With Information Message* in assured  
 14       mode with a *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set  
 15       to the following:
  - 16         - a pre-programmed feature code which indicates User Selective Call  
 17           Forwarding to a number stored in the mobile station as the first digits in  
 18           the field and
  - 19         - the forwarding to number immediately following the pre-programmed  
 20           feature code.

21      The mobile station shall send the message as follows:

- 22       - If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With*  
 23       *Information Message*.
- 24       - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
 25       perform the following: if this Call Control instance is identified by NULL, the  
 26       mobile station shall send either a *Flash With Information Message* or an  
 27       *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of  
 28       the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF  
 29       field set to the connection reference of the service option connection  
 30       corresponding to this call); otherwise, the mobile station shall send an *Extended*  
 31       *Flash With Information Message*, with the CON\_REF\_INCL field of the message  
 32       set to '1' and the CON\_REF field of the message set to the connection reference  
 33       of the service option connection corresponding to this call.
- 34     • If the Call Control instance is directed by the user to forward the incoming call to  
 35       network-based voice mail, the mobile station shall send a *Flash With Information*  
 36       *Message* or an *Extended Flash With Information Message* in assured mode with a  
 37       *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set to a pre-  
 38       programmed feature code which indicates User Selective Call Forwarding to voice  
 39       mail, as follows:

- If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With Information Message*.
- If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall perform the following: if this Call Control instance is identified by NULL, the mobile station shall send either a *Flash With Information Message* or an *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF field set to the connection reference of the service option connection corresponding to this call); otherwise, the mobile station shall send an *Extended Flash With Information Message*, with the CON\_REF\_INCL field of the message set to '1' and the CON\_REF field of the message set to the connection reference of the service option connection corresponding to this call.
- If the Call Control instance is directed by the user to activate answer holding, the mobile station shall send a *Flash With Information Message* or an *Extended Flash With Information Message* in assured mode requiring confirmation of delivery with a *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set to a pre-programmed feature code which indicates Answer Holding:
  - If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With Information Message*.
  - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall perform the following: if this Call Control instance is identified by NULL, the mobile station shall send either a *Flash With Information Message* or an *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF field set to the connection reference of the service option connection corresponding to this call); otherwise, the mobile station shall send an *Extended Flash With Information Message*, with the CON\_REF\_INCL field of the message set to '1' and the CON\_REF field of the message set to the connection reference of the service option connection corresponding to this call.

After receiving confirmation of delivery of the *Flash With Information Message* or the *Extended Flash With Information Message*, the mobile station shall send a *Connect Order* in assured mode:

- If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall perform the following: If this Call Control instance is identified by NULL, the mobile station shall either set the CON\_REF\_INCL field of the message to '0' or set the CON\_REF\_INCL field to '1' and set the CON\_REF field to the connection reference of the service option connection corresponding to this call; otherwise, the mobile station shall set the CON\_REF\_INCL field of the message to '1' and the CON\_REF field of the message to the connection reference of the service option connection corresponding to this call.

- 1       The Call Control instance shall enter the *Conversation Substate*.
- 2       • If the Call Control instance receives an indication that the user has originated an  
 3            emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*  
 4            *Message* or an *Extended Flash With Information Message* in assured mode with a  
 5            Global Emergency Call Information Record (see 2.7.4.31), as follows:
- 6            - If this Call Control instance is identified by NULL, the mobile station shall send  
 7              either a *Flash With Information Message* or an *Extended Flash With Information*  
 8              *Message* (with either the CON\_REF\_INCL field of the message set to '0' or the  
 9              CON\_REF\_INCL field set to '1' and the CON\_REF field set to the connection  
 10             reference of the service option connection corresponding to this call); otherwise,  
 11             the mobile station shall send an *Extended Flash With Information Message*, with  
 12             the CON\_REF\_INCL field of the message set to '1' and the CON\_REF field of the  
 13             message set to the connection reference of the service option connection  
 14             corresponding to this call.
- 15        • If the Call Control instance receives a message from [layer 3](#)  
 16            which is included in the following list and every message field value is within its permissible  
 17            range, the Call Control instance shall process the message as described below and  
 18            in accordance with the message's action time (see 2.6.4.1.5).
- 19            1. *Alert With Information Message*: The Call Control instance shall reset the  
 20              substate timer for T<sub>53m</sub> seconds. If this message does not contain a Signal  
 21              information record, the mobile station should use standard alert as defined in  
 22              3.7.5.5.
- 23            2. *Extended Alert With Information Message*: The Call Control instance shall reset  
 24              the substate timer for T<sub>53m</sub> seconds. If this message does not contain a Signal  
 25              information record, the mobile station should use standard alert as defined in  
 26              3.7.5.5.
- 27            3. *Maintenance Order*: The mobile station shall reset the substate timer for T<sub>53m</sub>  
 28              seconds.
- 29        • If the Call Control instance receives a message that is not included in the above list,  
 30            cannot be processed, or requires a capability which is not supported, the Call  
 31            Control instance shall discard the message and send a 'message rejected indication'  
 32            to the [layer 3](#), with the reject reason indicated.

### 33       2.6.10.2 Conversation Substate

34       While in the *Conversation Substate*, the Call Control instance shall perform the following:

- 35       • If the Call Control instance receives a "release indication" from the [layer 3](#),  
 36            the Call Control instance shall enter the *Call Release Substate*.

- 1     • The mobile station shall send an *Origination Continuation Message* in assured mode,  
 2       within T<sub>54m</sub> seconds after the Call Control instance entering *the Conversation*  
 3       Substate if any of the following conditions occur:

- 4       – The mobile station originated the call, and did not send all the dialed digits in  
 5        the *Origination Message*.
- 6       – There is more than one calling party number associated with the mobile station.
- 7       – A calling party subaddress is used in the call.
- 8       – A called party subaddress is used in the call.

9       If more than one calling party number is associated with the mobile station, the  
 10      mobile station shall include the calling party number being used in the calling party  
 11      number information record in the *Origination Continuation Message*. If only one  
 12      calling party number is associated with the mobile station, the mobile station shall  
 13      not include the calling party number information record in the *Origination*  
 14      *Continuation Message*. If a calling party subaddress is used, the mobile station shall  
 15      include the calling party subaddress information record in the *Origination*  
 16      *Continuation Message*; otherwise, the mobile station shall omit the calling party  
 17      subaddress information record. If a called party subaddress is used, the mobile  
 18      station shall include the called party subaddress information record in the  
 19      *Origination Continuation Message*; otherwise, the mobile station shall omit the calling  
 20      called party subaddress information record.

- 21     • If the Call Control instance is directed by the user to issue a flash, the mobile  
 22      station shall build a *Flash With Information Message* or an *Extended Flash With*  
 23      *Information Message* with the collected digits or characters contained in a *Keypad*  
 24      *Facility* information record, if needed, and shall send the message in assured mode,  
 25      as follows:
- 26       – If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With*  
 27       *Information Message*.
- 28       – If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
 29       perform the following: if this Call Control instance is identified by NULL, the  
 30       mobile station shall send either a *Flash With Information Message* or an  
 31       *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of  
 32       the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF  
 33       field set to the connection reference of the service option connection  
 34       corresponding to this call); otherwise, the mobile station shall send an *Extended*  
 35       *Flash With Information Message*, with the CON\_REF\_INCL field of the message  
 36       set to '1' and the CON\_REF field of the message set to the connection reference  
 37       of the service option connection corresponding to this call.

- 1     • If the Call Control instance is directed by the user to forward the incoming call, the  
 2       mobile station shall send a *Flash With Information Message* or an *Extended Flash*  
 3       *With Information Message* in assured mode with a *Keypad Facility* information record  
 4       (see 2.7.4.2) with the CHARi field set to a pre-programmed feature code which  
 5       indicates User Selective Call Forwarding with a pre-registered number, as follows:  
 6           - If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With*  
 7           *Information Message*.  
 8           - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
 9           perform the following: if this Call Control instance is identified by NULL, the  
 10          mobile station shall send either a *Flash With Information Message* or an  
 11          *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of  
 12          the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF  
 13          field set to the connection reference of the service option connection  
 14          corresponding to this call); otherwise, the mobile station shall send an *Extended*  
 15          *Flash With Information Message*, with the CON\_REF\_INCL field of the message  
 16          set to '1' and the CON\_REF field of the message set to the connection reference  
 17          of the service option connection corresponding to this call.  
 18     • If the Call Control instance is directed by the user to forward the incoming call to a  
 19       number stored in the mobile station, the mobile station shall send a *Flash With*  
 20       *Information Message* or an *Extended Flash With Information Message* in assured  
 21       mode with a *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set  
 22       to the following:  
 23           - a pre-programmed feature code which indicates User Selective Call  
 24           Forwarding to a number stored in the mobile station as the first digits in  
 25           the field and  
 26           - the forwarding to number immediately following the pre-programmed  
 27           feature code.

28       The mobile station shall send the message as follows:

- 29           - If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With*  
 30           *Information Message*.  
 31           - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven and if this Call Control  
 32           instance is identified by NULL, the mobile station shall send either a *Flash With*  
 33           *Information Message* or an *Extended Flash With Information Message* (with either  
 34           the CON\_REF\_INCL field of the message set to '0' or the CON\_REF\_INCL field set  
 35           to '1' and the CON\_REF field set to the connection reference of the service option  
 36           connection corresponding to this call). Otherwise, the mobile station shall send  
 37           an *Extended Flash With Information Message*, with the CON\_REF\_INCL field of  
 38           the message set to '1' and the CON\_REF field of the message set to the  
 39           connection reference of the service option connection corresponding to this call.

- If the Call Control instance is directed by the user to forward the incoming call to network-based voice mail, the mobile station shall send a *Flash With Information Message* or an *Extended Flash With Information Message* in assured mode with a *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set to a pre-programmed feature code which indicates User Selective Call Forwarding to voice mail, as follows:
  - If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall send a *Flash With Information Message*.
  - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven and if this Call Control instance is identified by NULL, the mobile station shall send either a *Flash With Information Message* or an *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF field set to the connection reference of the service option connection corresponding to this call). Otherwise, the mobile station shall send an *Extended Flash With Information Message*, with the CON\_REF\_INCL field of the message set to '1' and the CON\_REF field of the message set to the connection reference of the service option connection corresponding to this call.
- If the Call Control instance is directed by the user to activate answer holding, the mobile station shall send a *Flash With Information Message* or an *Extended Flash With Information Message* in assured mode requiring confirmation of delivery with a *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set to a pre-programmed feature code which indicates Answer Holding, as follows:
  - If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall send a *Flash With Information Message*.
  - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the mobile station shall perform the following: if this Call Control instance is identified by NULL, the mobile station shall send either a *Flash With Information Message* or an *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF field set to the connection reference of the service option connection corresponding to this call); otherwise, the mobile station shall send an *Extended Flash With Information Message*, with the CON\_REF\_INCL field of the message set to '1' and the CON\_REF field of the message set to the connection reference of the service option connection corresponding to this call.

- 1     • If answer holding is activated and the Call Control instance is directed by the user  
2       to deactivate answer holding, the mobile station shall send a *Flash With Information*  
3       *Message* or an *Extended Flash With Information Message* in assured mode with a  
4       *Keypad Facility* information record (see 2.7.4.2) with the CHARi field set to a pre-  
5       programmed feature code which indicates Answer Holding, as follows:  
6           - If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall send a *Flash With*  
7       *Information Message*.  
8           - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
9       perform the following: if this Call Control instance is identified by NULL, the  
10      mobile station shall send either a *Flash With Information Message* or an  
11      *Extended Flash With Information Message* (with either the CON\_REF\_INCL field of  
12      the message set to '0' or the CON\_REF\_INCL field set to '1' and the CON\_REF  
13      field set to the connection reference of the service option connection  
14      corresponding to this call); otherwise, the mobile station shall send an *Extended*  
15      *Flash With Information Message*, with the CON\_REF\_INCL field of the message  
16      set to '1' and the CON\_REF field of the message set to the connection reference  
17      of the service option connection corresponding to this call.  
18     • If the Call Control instance is directed by the user to send burst DTMF digits, the  
19      mobile station shall build the *Send Burst DTMF Message* with the dialed digits and  
20      shall send the message in assured mode requiring confirmation of delivery.  
21           - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
22       perform the following: If this Call Control instance is identified by NULL, the  
23       mobile station shall set the CON\_REF\_INCL field of the message to '0'; otherwise,  
24       the mobile station shall set the CON\_REF\_INCL field of the message to '1' and  
25       the CON\_REF field of the message to the connection reference of the service  
26       option connection corresponding to this call.

27     The mobile station sending multiple *Send Burst DTMF Messages* shall preserve  
28     relative ordering of these messages (see 1.6 of [4]). The mobile station should  
29     attempt to preserve the user timing as much as possible, using recommended values  
30     of DTMF\_ON\_LENGTH (see Table 2.7.2.3.2.7-1) and DTMF\_OFF\_LENGTH (see Table  
31     2.7.2.3.2.7-2).

- 32     • If the Call Control instance is directed by the user to send a continuous DTMF digit,  
33       the mobile station shall build the *Continuous DTMF Tone Order* with the dialed digit  
34       and shall send the order in assured mode requiring confirmation of delivery, as  
35       follows:

- 1        - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the mobile station shall  
 2              perform the following: If this Call Control instance is identified by NULL, the  
 3              mobile station shall either set the CON\_REF\_INCL field of the message to '0' or  
 4              set the CON\_REF\_INCL field to '1' and set the CON\_REF field to the connection  
 5              reference of the service option connection corresponding to this call; otherwise,  
 6              the mobile station shall set the CON\_REF\_INCL field of the message to '1' and  
 7              the CON\_REF field of the message to the connection reference of the service  
 8              option connection corresponding to this call.

9        When the Call Control instance is directed by the user to cease sending the  
 10      continuous DTMF digit, the mobile station shall send the *Continuous DTMF Tone  
             Order* (ORDQ = '11111111') in assured mode requiring confirmation of delivery, as  
 12      follows:

- 13        - If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the mobile station shall  
 14              perform the following: If this Call Control instance is identified by NULL, the  
 15              mobile station shall either set the CON\_REF\_INCL field of the message to '0' or  
 16              set the CON\_REF\_INCL field to '1' and set the CON\_REF field to the connection  
 17              reference of the service option connection corresponding to this call; otherwise,  
 18              the mobile station shall set the CON\_REF\_INCL field of the message to '1' and  
 19              the CON\_REF field of the message to the connection reference of the service  
 20              option connection corresponding to this call.

21        The mobile station sending multiple *Continuous DTMF Tone Orders* shall preserve  
 22      relative ordering of these messages (see [2]). The mobile station shall send the  
 23      *Continuous DTMF Tone Order* with the ORDQ set to '11111111' indicating the  
 24      completion of the current continuous DTMF digit before sending the *Continuous  
             DTMF Tone Order* for another digit or the *Send Burst DTMF Message*.

- 26        • If the Call Control instance is directed by the user to disconnect the call, the Call  
 27              Control instance shall send a 'call release request' to the [layer 3](#)  
 28              and shall enter the *Call Release Substate*.
- 29        • If the Call Control instance receives an indication that this packet data service  
 30              instance has been inactivated, the Call Control instance shall send a "call inactive  
 31              indication" to the [layer 3](#)  
 32              and shall enter the *Call Release Substate*.
- 33        • If the Call Control instance receives an indication that the user has originated an  
 34              emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information  
             Message* or an *Extended Flash With Information Message* in assured mode with a  
 35              Global Emergency Call Information Record (see 2.7.4.31), as follows:

- 1        – If this Call Control instance is identified by NULL, the mobile station shall send  
 2        either a *Flash With Information Message* or an *Extended Flash With Information*  
 3        *Message* (with either the CON\_REF\_INCL field of the message set to ‘0’ or the  
 4        CON\_REF\_INCL field set to ‘1’ and the CON\_REF field set to the connection  
 5        reference of the service option connection corresponding to this call); otherwise,  
 6        the mobile station shall send an *Extended Flash With Information Message*, with  
 7        the CON\_REF\_INCL field of the message set to ‘1’ and the CON\_REF field of the  
 8        message set to the connection reference of the service option connection  
 9        corresponding to this call.
- 10      • If the Call Control instance receives a message from the [layer 3](#) which is  
 11     included in the following list and every message field value is within its permissible  
 12     range, the Call Control instance shall process the message as described below and  
 13     in accordance with the message’s action time (see 2.6.4.1.5).
- 14      1. *Alert With Information Message*: If the message contains a Signal information  
 15     record with the SIGNAL\_TYPE field set to ‘01’ or ‘10’, or if the message does not  
 16     contain a Signal information record, the Call Control instance shall enter the  
 17     *Waiting For Mobile Station Answer Substate*. The mobile station should alert the  
 18     user in accordance with the Signal information record. If this message does not  
 19     contain a Signal information record, the mobile station should use standard  
 20     alert as defined in 3.7.5.5.
- 21      2. *Continuous DTMF Tone Order*
- 22      3. *Extended Alert With Information Message*: If the message contains a Signal  
 23     information record with the SIGNAL\_TYPE field set to ‘01’ or ‘10’, or if the  
 24     message does not contain a Signal information record, the Call Control instance  
 25     shall enter the *Waiting For Mobile Station Answer Substate*. The mobile station  
 26     should alert the user in accordance with the Signal information record. If this  
 27     message does not contain a Signal information record, the mobile station should  
 28     use standard alert as defined in 3.7.5.5.
- 29      4. *Flash With Information Message*
- 30      5. *Extended Flash With Information Message*
- 31      6. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Mobile*  
 32     *Station Answer Substate*.
- 33      7. *Send Burst DTMF Message*:
- 34      • If the Call Control instance receives a message that is not included in the above list,  
 35     cannot be processed, or requires a capability which is not supported, the Call  
 36     Control instance shall discard the message and send a ‘message rejected indication’  
 37     to the [layer 3](#), with the reject reason indicated.

## 1    2.6.10.3 Call Release Substate

2    In this substate, the Call Control instance waits for the call to be released.

3    While in the *Call Release Substate*, the Call Control instance shall perform the following:

- 4    • If the Call Control instance receives a message from the layer 3Layer 3 which is  
5    included in the following list and every message field value is within its permissible  
6    range, the Call Control instance shall process the message as described below and  
7    in accordance with the message's action time (see 2.6.4.1.5).

8       1. *Alert With Information Message*: The Call Control instance shall send an “enter  
9    traffic channel substate indication” to the layer 3Layer 3 and shall enter the  
10   *Waiting for Mobile Station Answer Substate*. If this message does not contain a  
11   Signal information record, the mobile station should use standard alert as  
12   defined in 3.7.5.5.

13      2. *Extended Alert With Information Message*: The Call Control instance shall send a  
14   “enter traffic channel substate indication” to layer 3Layer 3 and shall enter the  
15   *Waiting for Mobile Station Answer Substate*. If this message does not contain a  
16   Signal information record, the mobile station should use standard alert as  
17   defined in 3.7.5.5.

- 18   • If the Call Control instance receives a message that is not included in the above list,  
19   cannot be processed, or requires a capability which is not supported, the Call  
20   Control instance shall discard the message and send a ‘message rejected indication’  
21   to the layer 3Layer 3, with the reject reason indicated.

22   2.6.11 SYNC\_ID Computation

23   ~~The SYNC\_ID shall be calculated on all bits within the service configuration (that is, both  
24   the Service Configuration information record and the Non-negotiable Service Configuration  
25   information record).~~

26   ~~The generator polynomials for computation of the SYNC\_ID shall be as follows:~~

$$g(x) = x^{16} + x^{15} + x^{14} + x^{11} + x^6 + x^5 + x^2 + x + 1$$

28   ~~The SYNC\_ID shall be computed according to the following procedure as shown in Figures  
29   2.6.11.1:~~

- 30   • ~~Initially, all shift register elements shall be set to logical one and the switches  
31   shall be set in the up position.~~
- 32   • ~~The register shall be clocked a number of times equal to the number bits in the  
33   service configuration (that is, both the Service Configuration information record  
34   and the Non-negotiable Service Configuration information record) with  
35   those bits as input. The Service Configuration information record bits shall  
36   be input first (starting with the first field of the record) followed by the Non-  
37   negotiable Service Configuration information record bits (starting at the first  
38   field of the record).~~

- 1     • The switches shall be set in the down position so that the output is a modulo 2  
2       addition with a '0' and the successive shift register inputs are '0'.  
  
 3     • The register shall be clocked an additional 16 times.  
  
 4     • These additional bits shall be the SYNC\_ID.  
  
 5     • The first bit calculated shall be the most significant bit of SYNC\_ID.

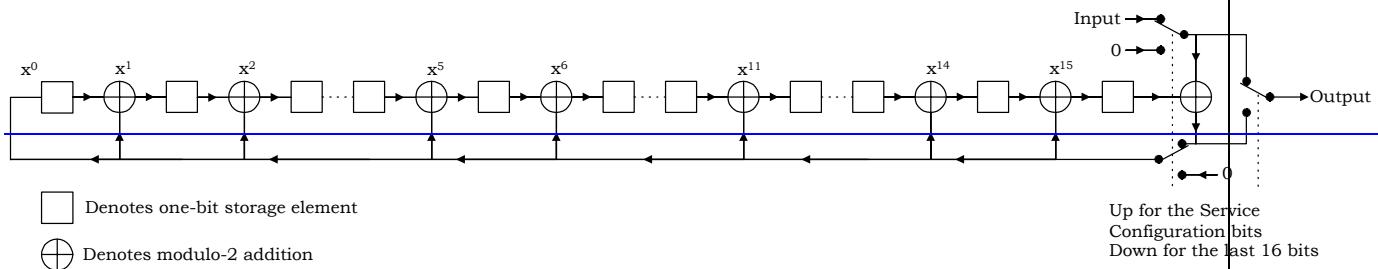

Figure 2.6.11-1. SYNC\_ID Calculation

1    2.7 PDU Formats for Mobile Stations

2    This section describes the formats of the PDUs corresponding to the messages sent by the  
3    mobile station.

4    In any multi-bit field in the following messages, the most significant bit (MSB) shall be  
5    transmitted first.

6    Some bits in the PDUs are marked as RESERVED. These bits allow extension of the PDUs  
7    for future features and capabilities. The mobile station sets all reserved bits to '0'.

- 1    2.7.1 r-csch
- 2    This section describes the messages and their PDU formats sent by the mobile station on  
3    the r-csch.
- 4    2.7.1.1 Reserved
- 5    2.7.1.2 Reserved
- 6    2.7.1.3 PDU Formats on r-csch
- 7    The messages sent on the r-csch are summarized in Table 2.7.1.3-1.
- 8

**Table 2.7.1.3-1. Messages on r-csch**

| <b>Message Name</b>                              | <b>MSG_TAG</b> | <b>Section Number</b> |
|--------------------------------------------------|----------------|-----------------------|
| <i>Registration Message</i>                      | RGM            | 2.7.1.3.2.1           |
| <i>Order Message</i>                             | ORDM           | 2.7.1.3.2.2           |
| <i>Data Burst Message</i>                        | DBM            | 2.7.1.3.2.3           |
| <i>Origination Message</i>                       | ORM            | 2.7.1.3.2.4           |

| ENHANCED_RC              | 0 or 1               |
| UZID_INCL                | 0 or 1               |
| UZID                     | 0 or 16              |
| GEO_LOC_INCL             | 0 or 1               |
| GEO_LOC_TYPE             | 0 or 3               |
| OTD_SUPPORTED            | 0 or 1               |
| STS_SUPPORTED            | 0 or 1               |
| 3X_CCH_SUPPORTED         | 0 or 1               |
| WLL_INCL                 | 0 or 1               |
| WLL_DEVICE_TYPE          | 0 or 3               |
| HOOK_STATUS              | 0 or 4               |
| ENC_INFO_INCL            | 0 or 1               |
| SIG_ENCRYPT_SUP          | 0 or 8               |
| <u>C_SIG_ENCRYPT_REQ</u> | 0 or 1               |
| <u>KEY_SEQ_NEW_INCL</u>  | <u>0 or 1</u>        |
| <u>KEY_SEQ_NEW</u>       | <u>0 or 4</u>        |
| ENC_SEQ_H                | 0 or 24              |
| ENC_SEQ_H_SIG            | 0 or 8               |
| UI_ENCRYPT_SUP           | 0 or 8               |

4

5    REG\_TYPE    -    Registration type.

6    This field indicates which type of event generated the  
7    registration attempt.8    The mobile station shall set this field to the REG\_TYPE value  
9    shown in Table 2.7.1.3.2.1-1 corresponding to the event that  
10   caused this registration to occur (see 2.6.5.1).

1

2

**Table 2.7.1.3.2.1-1. Registration Type (REG\_TYPE) Codes**

| <b>REG_TYPE<br/>(binary)</b>            | <b>Type of Registration</b>                         |
|-----------------------------------------|-----------------------------------------------------|
| 0000                                    | Timer-based (see 2.6.5.1.3)                         |
| 0001                                    | Power-up (see 2.6.5.1.1)                            |
| 0010                                    | Zone-based (see 2.6.5.1.5)                          |
| 0011                                    | Power-down (see 2.6.5.1.2)                          |
| 0100                                    | Parameter-change (see 2.6.5.1.6)                    |
| 0101                                    | Ordered (see 2.6.5.1.7)                             |
| 0110                                    | Distance-based (see 2.6.5.1.4)                      |
| 0111                                    | User Zone-based (see 2.6.5.1.10)                    |
| <u>1000</u>                             | <u>Encryption Re-sync required (see 2.6.5.1.11)</u> |
| All other REG_TYPE values are reserved. |                                                     |

3

- 4      SLOT\_CYCLE\_INDEX    - Slot cycle index.  
       If the mobile station is configured for slotted mode operation,  
       the mobile station shall set this field to the preferred slot cycle  
       index, SLOT\_CYCLE\_INDEX<sub>p</sub> (see 2.6.2.1.1). Otherwise, the  
       mobile station shall set this field to '000'.  
 5  
 6  
 7  
 8
- 9      MOB\_P\_REV    - Protocol revision of the mobile station.  
       The mobile station shall set this field to '00000111'.  
 10  
 11     SCM    - Station class mark.  
       The mobile station shall set this field to its station class mark.  
       See 2.3.3.  
 12  
 13
- 14     MOB\_TERM    - Mobile terminated calls accepted indicator.  
       If the mobile station is configured to accept mobile terminated  
       calls while operating with the current roaming status (see  
       2.6.5.3), the mobile station shall set this bit to '1'. Otherwise,  
       the mobile station shall set this bit to '0'.  
 15  
 16  
 17  
 18
- 19     RETURN\_CAUSE    - Reason of the mobile station registration or access.  
       The mobile station shall set this field to the RETURN\_CAUSE  
       value shown in Table 2.7.1.3.2.1-2 corresponding to the  
       service redirection failure condition (see 2.6.1.1).  
 20  
 21  
 22

23

**Table 2.7.1.3.2.1-2. RETURN\_CAUSE Codes**

| <b>RETURN_CAUSE<br/>(binary)</b>            | <b>Redirect Failure Condition</b>                                 |
|---------------------------------------------|-------------------------------------------------------------------|
| 0000                                        | Normal access.                                                    |
| 0001                                        | Service redirection failed as a result of system not found.       |
| 0010                                        | Service redirection failed as a result of protocol mismatch.      |
| 0011                                        | Service redirection failed as a result of registration rejection. |
| 0100                                        | Service redirection failed as a result of wrong SID.              |
| 0101                                        | Service redirection failed as a result of wrong NID.              |
| All other RETURN_CAUSE values are reserved. |                                                                   |

- QPCH\_SUPPORTED – Quick Paging Channel supported indicator.  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If the mobile station supports the Quick Paging Channel, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
- ENHANCED\_RC – Enhanced radio configuration supported indicator.  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If the mobile station supports any radio configuration in the Radio Configuration Class 2 (see 1.1.1), the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
- UZID\_INCL – User Zone Identifier included indicator.  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If the message is to contain the User Zone Identifier, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
- UZID – User Zone Identifier.

- If the UZID\_INCL is included in the message and is set to '1', the mobile station shall include this field and set it to UZID<sub>S</sub>; otherwise, the mobile station shall omit this field.
- GEO\_LOC\_INCL**
- Geo-location included indicator.
- If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
- If the message is to contain the GEO\_LOC\_TYPE field, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- GEO\_LOC\_TYPE**
- Geo-Location Type.
- If GEO\_LOC\_INCL is included in the message and is set to '1', the mobile station shall include this field and shall set it to the value shown in Table 2.7.1.3.2.4-7; otherwise, the mobile station shall omit this field.
- OTD\_SUPPORTED**
- Orthogonal Transmit Diversity supported.
- If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
- The mobile station shall set this field to '1' if Orthogonal Transmit Diversity is supported; otherwise, the mobile station shall set this field to '0'.
- STS\_SUPPORTED**
- Space Time Spreading Transmit Diversity supported.
- If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
- The mobile station shall set this field to '1', if Space Time Spreading Transmit Diversity is supported; otherwise, the mobile station shall set this field to '0'.
- 3X\_CCH\_SUPPORTED**
- 3X Common Channels supported.
- If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
- The mobile station shall set this field to '1' if the mobile station supports the Spreading Rate 3 common channels (3X BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile station shall set this field to '0'.
- WLL\_INCL**
- WLL information included indicator.
- If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
- If the mobile station is a Wireless Local Loop device, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

- 1        WLL\_DEVICE\_TYPE – WLL device type indicator.  
 2              If WLL\_INCL is not included, or if WLL\_INCL is included and is  
 3              set to '0', the mobile station shall omit this field; otherwise,  
 4              the mobile station shall set this field as follows.  
 5              The mobile station shall set this field to the  
 6              WLL\_DEVICE\_TYPE value shown in Table 2.7.1.3.2.1-3  
 7              corresponding to the mobile station device type.

8              **Table 2.7.1.3.2.1-3. WLL Device Types**

| <b>WLL_DEVICE_TYPE<br/>(binary)</b> | <b>Description</b>                                 |
|-------------------------------------|----------------------------------------------------|
| 000                                 | Wireless Local Loop terminal with no mobility      |
| 001                                 | Wireless Local Loop terminal with limited mobility |
| 010                                 | Wireless Local Loop terminal with full mobility    |
| 011 - 111                           | Reserved                                           |

- 9  
 10        HOOK\_STATUS – WLL terminal hook status.  
 11              If WLL\_INCL is not included, or if WLL\_INCL is included and is  
 12              set to '0', the mobile station shall omit this field; otherwise,  
 13              the mobile station shall set this field to the value shown in  
 14              Table 2.7.1.3.2.1-4 corresponding to the hook state.

**Table 2.7.1.3.2.1-4. Hook Status Values**

| <b>HOOK_STATUS<br/>(binary)</b> | <b>Description</b>                    |
|---------------------------------|---------------------------------------|
| 0000                            | Subscriber terminal is on-hook        |
| 0001                            | Subscriber terminal is off-hook       |
| 0010                            | Subscriber terminal is stuck off-hook |
| 0011 – 1111                     | Reserved                              |

- ENC\_INFO\_INCL – Encryption fields included.  
 If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
- The mobile station shall set this field to ‘1’ if the encryption related fields are included; otherwise the mobile station shall set this field to ‘0’. The mobile station shall set this field to ‘1’ if it is unable to determine the base station support for encryption. The mobile station shall set this field to ‘0’ if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.
- SIG\_ENCRYPT\_SUP – Signaling Encryption supported indicator.  
 If ENC\_INFO\_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate which signaling encryption algorithms are supported by the mobile station.

1 This field consists of the subfields shown in Table 2.7.1.3.2.1-  
 2 5.

3 **Table 2.7.1.3.2.1-5. Encoding of the SIG\_ENCRYPT\_SUP Field**

| Subfield            | Length (bits)      | Subfield Description                                         |  |
|---------------------|--------------------|--------------------------------------------------------------|--|
| CMEA                | 1                  | Support of Cellular Message Encryption Algorithm             |  |
| ECMEA               | 1                  | Support of Enhanced Cellular Message Encryption Algorithm    |  |
| <a href="#">REA</a> | <a href="#">1</a>  | <a href="#">Support of the Rijndael Encryption Algorithm</a> |  |
| RESERVED            | <a href="#">56</a> | Reserved bits                                                |  |

4 If this field is included, the mobile station shall set the  
 5 subfields as follows:

6 The mobile station shall set the CMEA subfield to ‘1’.

7 The mobile station shall set each other subfield to ‘1’ if the  
 8 corresponding signaling [encryption](#) algorithm is supported by  
 9 the mobile station; otherwise, the mobile station shall set the  
 10 subfield to ‘0’.

11 The mobile station shall set the RESERVED subfield to  
 12 ‘000000’.

13 [C\\_SIG\\_ENCRYPT\\_REQ](#) – [Common Channel sSignaling mMessage encryption](#)  
 14 request indicator.

15 If ENC\_INFO\_INCL is included and is set to ‘1’, the mobile  
 16 station shall include this field; otherwise, the mobile station  
 17 shall omit this field. If this field is included, the mobile  
 18 station shall set this field to ‘1’ to request signaling encryption  
 19 to be turned on for signaling messages sent on [f\\_dsch](#), [r\\_dsch](#),  
 20 [f-csch](#), and [r-csch](#), and to ‘0’ to request signaling encryption  
 21 to be turned off for signaling messages sent on [f\\_dsch](#), [r\\_dsch](#),  
 22 [f-csch](#), and [r-csch](#).

23 [KEY\\_SEQ\\_NEW\\_INCL](#) – [The new encryption key sequence number included indicator.](#)

24 [If ENC\\_INFO\\_INCL is included and is set to ‘1’, the mobile](#)  
 25 [station shall include this field; otherwise, the mobile station](#)  
 26 [shall omit this field. If this field is included, the mobile station](#)  
 27 [shall set this field as follows:](#)

28 [If STORE\\_KEYs is equal to ‘1’ and KEY\\_SEQ\\_NEW is included in](#)  
 29 [this message, the mobile station shall set this field to ‘1’;](#)  
 30 [otherwise, the mobile station shall set this field to ‘0’.](#)

31 [KEY\\_SEQ\\_NEW](#) – [The key sequence number corresponding to the new encryption](#)  
 32 [key generated by the mobile station.](#)

If KEY\_SEQ\_NEW\_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to KEY\_SEQ\_NEW<sub>s,p</sub>, the sequence number associated with the new encryption key generated by the mobile station.

- ENC\_SEQ\_H - The 24 MSB of the EXT\_ENC\_SEQ
- If ENC\_INFO\_INCL is included and is set to ‘1’, SIG\_ENCRYPT\_SUP is included and the ECMEA or REA subfield in SIG\_ENCRYPT\_SUP is set to ‘1’ and Enhanced Cellular Message Encryption Algorithm is supported by the mobile station, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the 24 most significant bits of the EXT\_ENC\_SEQ to be used as the initial value of crypto sync for both forward and reverse link encryptions.

- ENC\_SEQ\_H\_SIG - The signature of ENC\_SEQ\_H
- If ENC\_SEQ\_H is included, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the digital signature of the ENC\_SEQ\_H computed as described in 2.3.12.4.5.

- UI\_ENCRYPT\_SUP - User information eEncryption supported indicator.
- If ENC\_INFO\_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.

This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘000000’.

## 1    2.7.1.3.2.2 Order Message

2    MSG\_TAG: ORDM

3

| <b>Field</b>                    | <b>Length (bits)</b>               |
|---------------------------------|------------------------------------|
| ORDER                           | 6                                  |
| ADD_RECORD_LEN                  | 3                                  |
| Order-specific fields (if used) | $8 \times \text{ADD\_RECORD\_LEN}$ |

4

5    ORDER    – Order code.

6                 The mobile station shall set this field to the ORDER code  
7                 (see 2.7.3) for this type of *Order Message*.

8    ADD\_RECORD\_LEN    – Additional record length.

9                 The mobile station shall set this field to the number of octets  
10                in the order-specific fields included in this message.

11    order-specific fields    – Order-specific fields.

12                 The mobile station shall include order-specific fields as  
13                specified in 2.7.3.

## 1    2.7.1.3.2.3 Data Burst Message

2    MSG\_TAG: DBM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| MSG_NUMBER   | 8                    |
| BURST_TYPE   | 6                    |
| NUM_MSGS     | 8                    |
| NUM_FIELDS   | 8                    |

NUM\_FIELDS occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

4

- 5    MSG\_NUMBER    -    Message number within the data burst stream.  
 6                      The mobile station shall set this field to the number of this  
 7                      message within the data burst stream.
- 8    BURST\_TYPE    -    Data burst type.  
 9                      The mobile station shall set the value of this field for the type  
 10                     of this data burst as defined in [30]. If the mobile station sets  
 11                     this field equal to '111110', it shall set the first two CHARi  
 12                     fields of this message equal to EXTENDED\_BURST\_TYPE\_INTERNATIONAL as described in  
 13                     the definition of CHARi below. If the mobile station sets this  
 14                     field equal to '111111', it shall set the first two CHARi fields of  
 15                     this message equal to the EXTENDED\_BURST\_TYPE as  
 16                     described in the definition of CHARi below.
- 18    NUM\_MSGS    -    Number of messages in the data burst stream.  
 19                      The mobile station shall set this field to the number of  
 20                      messages within this data burst stream.
- 21    NUM\_FIELDS    -    Number of characters in this message.  
 22                      The mobile station shall set this field to the number of CHARi  
 23                      fields included in this message.
- 24    CHARi    -    Character.  
 25                      The mobile station shall include NUM\_FIELDS occurrences of  
 26                      this field. The mobile station shall set these fields to the  
 27                      corresponding octet of the data burst stream.

If the BURST\_TYPE field of this message is equal to '111110', the first two CHARi octets shall represent a 16 bit EXTENDED\_BURST\_TYPE\_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC). Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED\_BURST\_TYPE\_INTERNATIONAL field shall specify the COUNTRY\_BURST\_TYPE. The mobile station shall set the value of the COUNTRY\_BURST\_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

| <b>Field</b>           | <b>Length (bits)</b>               |
|------------------------|------------------------------------|
| Mobile Country Code    | 10                                 |
| COUNTRY_BURST_TYPE     | 6                                  |
| Remaining CHARi fields | $8 \times (\text{NUM_FIELDS} - 2)$ |

If the BURST\_TYPE field of this message is equal to '111111', the first two CHARi octets shall represent a single, 16 bit, EXTENDED\_BURST\_TYPE field, as shown below. The mobile station shall set the value of the EXTENDED\_BURST\_TYPE according to the type of this data burst as defined in [30].

| <b>Field</b>                                    | <b>Length (bits)</b>               |
|-------------------------------------------------|------------------------------------|
| EXTENDED_BURST_TYPE<br>(first two CHARi fields) | 16                                 |
| Remaining CHARi fields                          | $8 \times (\text{NUM_FIELDS} - 2)$ |

## 1 2.7.1.3.2.4 Origination Message

2 MSG\_TAG: ORM

3

| <b>Field</b>     | <b>Length (bits)</b> |

If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than 7, the mobile station shall include the following fields:

|               |                           |
|---------------|---------------------------|
| SO_BITMAP_IND | 0 or 2                    |
| SO_GROUP_NUM  | 0 or 5                    |
| SO_BITMAP     | 0 or 4 ×<br>SO_BITMAP_IND |

1

2

MOB\_TERM – Mobile terminated calls accepted indicator.

3

4

5

6

If the mobile station is configured to accept mobile terminated calls while operating with the current roaming status (see 2.6.5.3), the mobile station shall set this bit to '1'; otherwise, the mobile station shall set this bit to '0'.

- 1      SLOT\_CYCLE\_INDEX    – Slot cycle index.  
 2                             If the mobile station is configured for slotted mode operation,  
 3                             the mobile station shall set this field to the preferred slot cycle  
 4                             index, SLOT\_CYCLE\_INDEX<sub>p</sub> (see 2.6.2.1.1); otherwise, the  
 5                             mobile station shall set this field to ‘000’.
- 6      MOB\_P\_REV    – Protocol revision of the mobile station.  
 7                             The mobile station shall set this field to ‘00000111’.
- 8      SCM    – Station class mark.  
 9                             The mobile station shall set this field to the station class mark  
 10                            of the mobile station. See 2.3.3.
- 11     REQUEST\_MODE    – Requested mode code.  
 12                             The mobile station shall set this field to the value shown in  
 13                            Table 2.7.1.3.2.4-1 corresponding to its current configuration.

**Table 2.7.1.3.2.4-1. REQUEST\_MODE Codes**

| <b>Value (binary)</b> | <b>Requested Mode</b>                    |
|-----------------------|------------------------------------------|
| 000                   | Reserved                                 |
| 001                   | CDMA only                                |
| 010                   | Wide analog only                         |
| 011                   | Either wide analog or CDMA only          |
| 100                   | Narrow analog only                       |
| 101                   | Either narrow analog or CDMA only        |
| 110                   | Either narrow analog or wide analog only |
| 111                   | Narrow analog or wide analog or CDMA     |

- 16
- 17     SPECIAL\_SERVICE    – Special service option indicator.  
 18                             To request a special service option, the mobile station shall set  
 19                             this field to ‘1’. To request the default service option (Service  
 20                             Option 1), the mobile station shall set this field to ‘0’.
- 21     SERVICE\_OPTION    – Requested service option for this origination.  
 22                             If the SPECIAL\_SERVICE field is set to ‘1’, the mobile station  
 23                             shall set this field to the value specified in [30], corresponding  
 24                             to the requested service option. If the SPECIAL\_SERVICE  
 25                             field is set to ‘0’, the mobile station shall omit this field.
- 26     PM    – Privacy mode indicator.  
 27                             To request voice privacy, the mobile station shall set this field  
 28                             to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
- 29     DIGIT\_MODE    – Digit mode indicator.

This field indicates whether the dialed digits are 4-bit DTMF codes or 8-bit ASCII codes using a specified numbering plan.

To originate the call using the binary representation of DTMF digits, the mobile station shall set this field to '0'. To originate the call using ASCII characters, the mobile station shall set this field to '1'.

NUMBER\_TYPE - Type of number.

If the DIGIT\_MODE field is set to '1', the mobile station shall set this field to the NUMBER\_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the number as defined in [7], Section 4.5.9. If the DIGIT\_MODE field is set to '0', the mobile station shall omit this field.

**Table 2.7.1.3.2.4-2. Number Types**

| Description             | NUMBER_TYPE<br>(binary) |
|-------------------------|-------------------------|
| Unknown                 | 000                     |
| International number    | 001                     |
| National number         | 010                     |
| Network-specific number | 011                     |
| Subscriber number       | 100                     |
| Reserved                | 101                     |
| Abbreviated number      | 110                     |
| Reserved for extension  | 111                     |

NUMBER\_PLAN - Numbering plan.

If the DIGIT\_MODE field is set to '1', the mobile station shall set this field to the NUMBER\_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the requested numbering plan as defined in [7], Section 4.5.9. If the DIGIT\_MODE field is set to '0', the mobile station shall omit this field.

**Table 2.7.1.3.2.4-3. Numbering Plan Identification**

| <b>Description</b>                            | <b>NUMBER_PLAN<br/>(binary)</b> |
|-----------------------------------------------|---------------------------------|
| Unknown                                       | 0000                            |
| ISDN/Telephony numbering plan ([17] and [16]) | 0001                            |
| Data numbering plan ([20])                    | 0011                            |
| Telex numbering plan ([19])                   | 0100                            |
| Private numbering plan                        | 1001                            |
| Reserved for extension                        | 1111                            |
| All other NUMBER_PLAN codes are reserved.     |                                 |

2

3 MORE\_FIELDS

- More dialed digits indicator.

4

5

This field indicates whether additional dialed digits will be sent in a later *Origination Continuation Message*.

6

7

8

If all dialed digits will fit into this message, the mobile station shall set this field to '0'. If not, the mobile station shall set this field to '1'.

9

NUM\_FIELDS

- Number of dialed digits in this message.

10

11

The mobile station shall set this field to the number of dialed digits included in this message.

12

CHARi

- A dialed digit or character.

13

14

15

16

17

18

19

20

The mobile station shall include NUM\_FIELDS occurrences of this field. If the DIGIT\_MODE field is set to '0', the mobile station shall set each occurrence of this field to the code value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed digit. If the DIGIT\_MODE field is set to '1', the mobile station shall set each occurrence of this field to the ASCII representation corresponding to the dialed digit, as specified in [9], with the most significant bit set to '0'.

21

**Table 2.7.1.3.2.4-4. Representation of DTMF Digits**

| <b>Digit</b>                  | <b>Code (binary)</b> | <b>Digit</b> | <b>Code (binary)</b> |
|-------------------------------|----------------------|--------------|----------------------|
| 1                             | 0001                 | 7            | 0111                 |
| 2                             | 0010                 | 8            | 1000                 |
| 3                             | 0011                 | 9            | 1001                 |
| 4                             | 0100                 | 0            | 1010                 |
| 5                             | 0101                 | *            | 1011                 |
| 6                             | 0110                 | #            | 1100                 |
| All other codes are reserved. |                      |              |                      |

- NAR\_AN\_CAP – Narrow analog capability.  
If the mobile station is capable of narrow analog operation, the mobile station shall set this bit to ‘1’; otherwise, the mobile station shall set this bit to ‘0’.
- PACA\_REORIG – PACA re-origination.  
If this is a user directed origination, the mobile station shall set this field to ‘0’. If this is a PACA re-origination, the mobile station shall set this field to ‘1’.
- RETURN\_CAUSE – Reason for the mobile station registration or access.  
The mobile station shall set this field to the RETURN\_CAUSE value shown in Table 2.7.1.3.2.1-2 corresponding to the service redirection failure condition (see 2.6.1.1).
- MORE\_RECORDS – More records indicator.  
This field indicates whether information records will be sent in a later *Origination Continuation Message*. If information records will be sent, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
- ENCRYPTION-SUPPORTED – Encryption algorithms supported by the mobile station.  
If P\_REV\_IN\_USE is greater than or equal to 7 or AUTH\_MODE is equal to ‘00’, the mobile station shall omit the ENCRYPTION\_SUPPORTED field. If P\_REV\_IN\_USE is less than 7 and AUTH\_MODE is not equal to ‘00’, the mobile station shall set this field as specified in Table 2.7.1.3.2.4-5.

**Table 2.7.1.3.2.4-5. Encryption Algorithms Supported**

| <b>Description</b>                      | <b>ENCRYPTION_SUPPORTED<br/>(binary)</b> |
|-----------------------------------------|------------------------------------------|
| Basic encryption supported              | 0000                                     |
| Basic and Enhanced encryption supported | 0001                                     |
| Reserved                                | 0010 - 1111                              |

- PACA\_SUPPORTED – CDMA PACA support indication.  
This field identifies the mobile station's support for PACA in CDMA mode. The mobile station shall set this field to '1'.
- NUM\_ALT\_SO – Number of alternative service options.  
If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall set this field to the number of alternative service options it supports other than the one specified in the SERVICE\_OPTION field. The mobile station shall set this field to a value less than or equal to MAX\_NUM\_ALT\_SO<sub>s</sub>.  
If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall set this field to the number of alternate service options, which either have no service option group number assigned or do not belong to the same service option group whose bitmap is being included. The alternate service option numbers are other than the one specified in the SERVICE\_OPTION field. The mobile station shall set this field to a value less than or equal to MAX\_NUM\_ALT\_SO<sub>s</sub>.
- ALT\_SO – Alternative service option.  
If P\_REV\_IN\_USE<sub>s</sub> is less than 7, the mobile station shall include NUM\_ALT\_SO occurrences of this field. The mobile station shall set this field to the value specified in [30], corresponding to the alternative service option supported by the mobile station.  
If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall include NUM\_ALT\_SO occurrences of this field. The mobile station shall set this field to the service option number defined in TSB58-[30] corresponding to the alternate service options which either have no service option group number assigned or do not belong to the same service option group whose bitmap is included in this message.
- DRS – Data Ready to Send.  
If P\_REV\_IN\_USE<sub>s</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If there is data to send, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

- 3           UZID\_INCL   – User Zone Identifier included indicator.  
4           If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
5           omit this field; otherwise, the mobile station shall include this  
6           field and set it as follows.  
7           If the message is to contain the User Zone Identifier, the  
8           mobile station shall set this field to ‘1’; otherwise, the mobile  
9           station shall set this field to ‘0’.
- 10          UZID        – User Zone Identifier.  
11          If the UZID\_INCL field is included in the message and is set to  
12           ‘1’, the mobile station shall include this field and set it to  
13           UZID<sub>S</sub>; otherwise, the mobile station shall omit this field.
- 14          CH\_IND      – Channel indicator.  
15          If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
16           omit this field; otherwise, the mobile station shall include this  
17           field and set it, as shown in Table 2.7.1.3.2.4-6, to request  
18           physical resources.

**Table 2.7.1.3.2.4-6. Channel Indicator**

| <b>CH_IND<br/>(binary)</b> | <b>Channel(s) Requested</b>                          |
|----------------------------|------------------------------------------------------|
| 00                         | Reserved                                             |
| 01                         | Fundamental Channel                                  |
| 10                         | Dedicated Control Channel                            |
| 11                         | Fundamental Channel and Dedicated<br>Control Channel |

- 1                   SR\_ID     – Service reference identifier.  
 2                   If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 3                   omit this field; otherwise, the mobile station shall include this  
 4                   field and set it as follows:  
 5                   If the service instance provides a service reference identifier,  
 6                   the mobile station shall set this field to the service reference  
 7                   identifier specified by the service instance. If the service  
 8                   instance does not provide a service reference identifier, the  
 9                   mobile station shall set this field to the smallest unused  
 10                  service reference identifier value between 1 and 6 (inclusive).
- 11                  OTD\_SUPPORTED     – Orthogonal Transmit Diversity supported indicator.  
 12                  If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 13                  omit this field; otherwise, the mobile station shall include this  
 14                  field and set it as follows.  
 15                  If the mobile station supports orthogonal transmit diversity, it  
 16                  shall set this field to '1'; otherwise, the mobile station shall set  
 17                  this field to '0'.
- 18                  QPCH\_SUPPORTED     – Quick Paging Channel supported indicator.  
 19                  If P\_REV\_IN\_USE is less than six, the mobile station shall  
 20                  omit this field; otherwise, the mobile station shall include this  
 21                  field and set it as follows.  
 22                  If the mobile station supports the Quick Paging Channel, the  
 23                  mobile station shall set this field to '1'; otherwise, the mobile  
 24                  station shall set this field to '0'.
- 25                  ENHANCED\_RC     – Enhanced radio configuration supported indicator.  
 26                  If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 27                  omit this field; otherwise, the mobile station shall include this  
 28                  field and set it as follows.  
 29                  If the mobile station supports any radio configuration in the  
 30                  Radio Configuration Class 2 (see 1.1.1), the mobile station  
 31                  shall set this field to '1'; otherwise, the mobile station shall set  
 32                  this field to '0'.
- 33                  FOR\_RC\_PREF     – Forward Radio Configuration preference.  
 34                  If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 35                  omit this field; otherwise, the mobile station shall include this  
 36                  field and set this field as follows.  
 37                  The mobile station shall set this field to its preferred Radio  
 38                  Configuration for the Forward Traffic Channel.
- 39                  REV\_RC\_PREF     – Reverse FCH Radio Configuration Preference.  
 40                  If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 41                  omit this field; otherwise, the mobile station shall include this  
 42                  field and set it as follows.  
 43                  The mobile station shall set this field to its preferred Radio  
 44                  Configuration for the Reverse Traffic Channel.

- 1        FCH\_SUPPORTED    - Fundamental Channel supported indicator.  
 2  
 3  
 4  
 5        The mobile station shall set this field to ‘1’ if the mobile  
 6        station supports Fundamental Channel; otherwise, the mobile  
 7        station shall set this field to ‘0’.
- 8        FCH Capability  
 9        Type-specific fields    - Fundamental Channel capability information.  
 10      If the FCH\_SUPPORTED field is included and is set to ‘1’, the  
 11      mobile station shall include this field and set it as defined in  
 12      2.7.4.27.1; otherwise, the mobile station shall omit this field.
- 13      DCCH\_SUPPORTED    - Dedicated Control Channel supported indicator.  
 14      If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 15      omit this field; otherwise the mobile station shall include this  
 16      field and set it as follows.  
 17      The mobile station shall set this field to ‘1’ if the mobile  
 18      station supports Dedicated Control Channel; otherwise, the  
 19      mobile station shall set this field to ‘0’.
- 20      DCCH Capability  
 21      Type specific fields    - Dedicated Control Channel capability information.  
 22      If the DCCH\_SUPPORTED field is included and is set to ‘1’,  
 23      the mobile station shall include this field and set it as defined  
 24      in 2.7.4.27.2; otherwise, the mobile station shall omit this  
 25      field.
- 26      GEO\_LOC\_INCL    - Geo-location included indicator.  
 27      If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
 28      omit this field. If P\_REV\_IN\_USE<sub>S</sub> is equal to six, the mobile  
 29      station shall set this field to ‘0’. Otherwise, the mobile station  
 30      shall include this field and set it as follows.  
 31      If the message is to contain the GEO\_LOC\_TYPE field, the  
 32      mobile station shall set this field to ‘1’; otherwise, the mobile  
 33      station shall set this field to ‘0’.
- 34      GEO\_LOC\_TYPE    - Geo-Location Type.  
 35      If GEO\_LOC\_INCL is included in the message and is set to ‘1’,  
 36      the mobile station shall include this field and shall set it to  
 37      the value shown in Table 2.7.1.3.2.4-7; otherwise, the mobile  
 38      station shall omit this field.

**Table 2.7.1.3.2.4-7. Geo-location Types**

| <b>GEO_LOC_TYPE<br/>(binary)</b>            | <b>Type of Geo-location</b>                                                         |
|---------------------------------------------|-------------------------------------------------------------------------------------|
| 000                                         | No mobile station assisted geo-location capabilities                                |
| 001                                         | IS-801 capable (Advanced Forward Link Triangulation only (AFLT))                    |
| 010                                         | IS-801 capable (Advanced Forward Link Triangulation and Global Positioning Systems) |
| 011                                         | Global Positioning Systems only                                                     |
| All other GEO_LOC_TYPE values are reserved. |                                                                                     |

- 2           REV\_FCH-
- 3           \_GATING\_REQ    - Reverse Fundamental gating mode request indicator.  
 4                          If P\_REV\_IN\_USE is less than six, the mobile station shall  
 5                          omit this field; otherwise, the mobile station shall include this  
 6                          field and set it as follows:  
 7                          If the mobile station requests to turn on the reverse  
 8                          Fundamental Traffic Channel gating mode in Radio  
 9                          Configurations 3, 4, 5, and 6, the mobile station shall set this  
 10                         field to '1'; otherwise, the mobile station shall set this field to  
 11                         '0'.
- 12           ORIG\_REASON    - Re-Origination reason indicator.  
 13                          If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to six, the mobile  
 14                          station shall omit this field; otherwise, the mobile station shall  
 15                          include this field and set it as follows.  
 16                          The mobile station shall set this field to '1' if the mobile  
 17                          station initiates a silent-retry, i.e. an autonomous access re-  
 18                          attempt to re-originate this call without user interaction, after  
 19                          the mobile station received an access attempt failure from the  
 20                          ARQ Sublayer for a user initiated origination; otherwise, the  
 21                          mobile station shall set this field to '0'.
- 22           ORIG\_COUNT     - Re-Origination count.  
 23                          If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to six, the mobile  
 24                          station shall omit this field; otherwise, the mobile station shall  
 25                          include this field and set it as follows.  
 26                          If the ORIG\_REASON is set to '1', the mobile station shall set  
 27                          this field to the number of consecutive silent-retry, i.e. an  
 28                          autonomous access re-attempt that were made to re-originate  
 29                          the call, without user interaction, that were due to the mobile  
 30                          receiving an access attempt failure from the ARQ Sublayer. If  
 31                          the number of consecutive silent-retry is greater than three,  
 32                          the mobile station shall set this field to '11'.

If the ORIG\_REASON is set to '0', the mobile station shall set this field according to Table 2.7.1.3.2.4-8 depending on the number of autonomous re-connection attempts for the desired service (specified by SERVICE\_OPTION) that have failed since the last successful connection [of that desired service<sup>1</sup>](#). The count shall only include attempts since the last power-up.

**Table 2.7.1.3.2.4-8. ORIG\_COUNT field for ORIG\_REASON = '0'**

| <b>Number of autonomous re-origination attempts for the desired service that have failed since the last successful connection</b> | <b>ORIG_COUNT<br/>(binary)</b> |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| 0                                                                                                                                 | '00'                           |
| 1, 2, 3 or 4                                                                                                                      | '01'                           |
| 5, 6, 7 or 8                                                                                                                      | '10'                           |
| 9 or more                                                                                                                         | '11'                           |

- STS\_SUPPORTED – STS supported indicator.  
If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
The mobile station shall set this field to '1' if the mobile station supports Space Time Spreading Transmit Diversity; otherwise, the mobile station shall set this field to '0'.
- 3X\_CCH\_SUPPORTED – 3X Common Channels supported.  
If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
The mobile station shall set this field to '1' if the mobile station supports the Spreading Rate 3 common channels (3X BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile station shall set this field to '0'.
- WLL\_INCL – WLL information included indicator.  
If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

---

<sup>1</sup> For example, if the mobile station requests SO<sub>x</sub> in the Origination Message and SO<sub>y</sub> is granted by the base station, the counter associated with SO<sub>x</sub> is reset.

- 1                   If the mobile station is a Wireless Local Loop device, the  
 2                   mobile station shall set this field to '1'; otherwise, the mobile  
 3                   station shall set this field to '0'.
- 4     **WLL\_DEVICE\_TYPE** - WLL device type indicator.  
 5                   If WLL\_INCL is not included, or if WLL\_INCL is included and is  
 6                   set to '0', the mobile station shall omit this field; otherwise,  
 7                   the mobile station shall set this field as follows.  
 8                   The mobile station shall set this field to the  
 9                   **WLL\_DEVICE\_TYPE** value shown in Table 2.7.1.3.2.1-3  
 10                  corresponding to the mobile station device type.
- 11                  **GLOBAL-**  
 12     **\_EMERGENCY\_CALL** - Global Emergency Call indicator.  
 13                  If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall  
 14                  omit this field; otherwise, the mobile station shall include this  
 15                  field and shall set it as follows:  
 16                  The mobile station shall set this field to '1' if the mobile  
 17                  station recognizes that this is an emergency call; otherwise,  
 18                  the mobile station shall set this field to '0'.
- 19     **MS\_INIT\_POS\_LOC\_IND** - Mobile Initiated Position Location Session indicator.  
 20                  If the **GLOBAL\_EMERGENCY\_CALL** field is not included in  
 21                  this message or is included but is set to '0', the mobile station  
 22                  shall omit this field; otherwise, the mobile station shall  
 23                  include this field and shall set it as follows:  
 24                  The mobile station shall set this field to '1' if  
 25                  **MS INIT POS LOC SUP IND<sub>s</sub>** is equal to '1' and if the mobile  
 26                  station is to initiate a position location session associated with  
 27                  this emergency call; otherwise, the mobile station shall set  
 28                  this field to '0'.
- 29     **QOS\_PARMS\_INCL** - Presence indicator for the QoS parameters.  
 30                  If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the mobile station shall  
 31                  omit this field; otherwise the mobile station shall include this  
 32                  field and set it as follows.  
 33                  The mobile station shall set this field to '1', if QoS parameters  
 34                  are included in the message; otherwise the mobile station  
 35                  shall set this field to '0'. The mobile station shall not set this  
 36                  field to '1', if MOB\_QOS<sub>s</sub> is set to '0' or if the inclusion of the  
 37                  QoS parameters would prevent the inclusion of all the dialed  
 38                  digits in the message.
- 39     **QOS\_PARMS\_LEN** - Length of the block of QoS parameters.

If QOS\_PARMS\_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the combined length in octets, of the QOS\_PARMS field and the immediately following QOS\_RESERVED field; otherwise, the mobile station shall omit this field.

- QOS\_PARMS - QoS parameters block.  
 If QOS\_PARMS\_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set it to the set of QoS parameter values as defined in accordance with the requirements for the requested service option and/or for the user, per subscription.

- QOS\_RESERVED - QoS reserved bits.  
 If QOS\_PARMS\_INCL is included and is set to ‘1’, the mobile station shall include the minimum number of bits of ‘0’, such that the combined length of the QOS\_PARMS field and of this field is an integer number of octets; otherwise, the mobile station shall omit this field.

- ENC\_INFO\_INCL - Encryption fields included.  
 If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the encryption related fields are included; otherwise the mobile station shall set this field to ‘0’. The mobile station shall set this field to ‘1’ if it is unable to determine the base station support for encryption. The mobile station shall set this field to ‘0’ if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.

- SIG\_ENCRYPT\_SUP - Signaling eEncryption supported indicator.  
 If ENC\_INFO\_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, this field indicates which signaling encryption algorithms are supported by the mobile station.

1 This field consists of the subfields shown in Table 2.7.1.3.2.1-  
 2 5.

3 If this field is included, the mobile station shall set the  
 4 subfields as follows:

5 The mobile station shall set the CMEA subfield to '1'.

6 The mobile station shall set each other subfield to '1' if the  
 7 corresponding signaling encryption algorithm is supported by  
 8 the mobile station; otherwise, the mobile station shall set the  
 9 subfield to '0'.

10 The mobile station shall set the RESERVED subfield to  
 11 '000000'. |

12 D SIG\_ENCRYPT\_REQ - Dedicated channel sSignaling Message-encryption request  
 13 indicator.

14 If ENC\_INFO\_INCL is included and is set to '1', the mobile  
 15 station shall include this field; otherwise, the mobile station  
 16 shall omit this field. If this field is included, the mobile  
 17 station shall set this field to '1' to request signaling encryption  
 18 to be turned on for signaling messages sent on f-dsch;and r-  
 19 dsch,f esch, and r esch, and to '0' to request signaling  
 20 encryption to be turned off for signaling messages sent on f-  
 21 dsch and, r-dsch,f esch, and r esch.

22 KEY\_SEQ\_NEW\_INCL - The new encryption key sequence number included indicator.

23 ~~If ENC\_INFO\_INCL is included and is set to '1', the mobile~~  
 24 ~~station shall include this field; otherwise, the mobile station~~  
 25 ~~shall omit this field. If this field is included, the mobile station~~  
 26 ~~shall set this field as follows:~~

27 ~~If STORE\_KEYs is equal to '1' and KEY\_SEQ\_NEW is included in~~  
 28 ~~this message, the mobile station shall set this field to '1';~~  
 29 ~~otherwise, the mobile station shall set this field to '0'.~~

30 C SIG\_ENCRYPT\_REQ - Common channel signaling encryption request indicator.

31 ~~If ENC\_INFO\_INCL is included and is set to '1', the mobile~~  
 32 ~~station shall include this field; otherwise, the mobile station~~  
 33 ~~shall omit this field. If this field is included, the mobile~~  
 34 ~~station shall set this field to '1' to request signaling encryption~~  
 35 ~~to be turned on for signaling messages sent on f-csch and r-~~  
 36 ~~cscsch, and to '0' to request signaling encryption to be turned~~  
 37 ~~off for signaling messages sent on f-csch and r-csch.~~

38 KEY\_SEQ\_NEW - The key sequence number corresponding to the new encryption  
 39 key generated by the mobile station.

40 ~~If KEY\_SEQ\_NEW\_INCL is included and is set to '1', the mobile~~  
 41 ~~station shall include this field; otherwise, the mobile station shall~~  
 42 ~~omit this field. If this field is included, the mobile station shall~~  
 43 ~~set this field to KEY\_SEQ\_NEWS\_p, the sequence number~~  
 44 ~~associated with the new encryption key generated by the mobile~~  
 45 ~~station.~~

- 1           ENC\_SEQ\_H    - The 24 MSB of the EXT\_ENC\_SEQ  
2           If SIG\_ENCRYPT\_SUP is included and the ECMEA or REA  
3           subfield in SIG\_ENCRYPT\_SUP is set to '1', If ENC\_INFO\_INCL  
4           is included and is set to '1', and the Enhanced Cellular  
5           Message Encryption Algorithm is supported by the mobile  
6           station, the mobile station shall include this field; otherwise,  
7           the mobile station shall omit this field. If this field is  
8           included, the mobile station shall set this field to the 24 most  
9           significant bits of the EXT\_ENC\_SEQ to be used as the initial  
10          value of crypto sync for both forward and reverse link  
11          encryptions.
- 12          ENC\_SEQ\_H\_SIG - The signature of ENC\_SEQ\_H  
13          If ENC\_SEQ\_H is included, the mobile station shall include  
14          this field; otherwise, the mobile station shall omit this field. If  
15          this field is included, the mobile station shall set this field to  
16          the digital signature of the ENC\_SEQ\_H as described in  
17          2.3.12.4.5.
- 18          UI\_ENCRYPT\_REQ - Request for user information encryption on the traffic channel  
19          indicator.  
20          If ENC\_INFO\_INCL is included and is set to '1', the mobile  
21          station shall include this field; otherwise, the mobile station  
22          shall omit this field. If this field is included, the mobile  
23          station shall set this field to '1' to request user information  
24          encryption, and to '0' to request no user information  
25          encryption.
- 26          UI\_ENCRYPT\_SUP - User information eEncryption supported indicator.  
27          If ENC\_INFO\_INCL is included and is set to '1', the mobile  
28          station shall include this field; otherwise, the mobile station  
29          shall omit this field. If this field is included, the mobile  
30          station shall set this field to indicate the supported user  
31          information encryption algorithms.

1           This field consists of the subfields shown in Table 2.7.1.3.2.4-  
 2           9.

3           **Table 2.7.1.3.2.4-9. Encoding of the UI\_ENCRYPT\_SUP Field**

| <b>Subfield</b>     | <b>Length (bits)</b> | <b>Subfield Description</b>                                                               |
|---------------------|----------------------|-------------------------------------------------------------------------------------------|
| ORYX                | 1                    | Support for ORYX encryption algorithm                                                     |
| <a href="#">REA</a> | <a href="#">1</a>    | <a href="#">Support for the Rijndael encryption algorithm used in extended encryption</a> |
| RESERVED            | <a href="#">76</a>   | Reserved bits                                                                             |

4           The mobile station shall set each subfield to '1' if the  
 5           corresponding user information encryption algorithm is  
 6           supported by the mobile station; otherwise, the mobile station  
 7           shall set the subfield to '0'.

8           The mobile station shall set the RESERVED subfield to  
 9           '0000000'.  
 10          

11         SYNC\_ID\_INCL - [SCR-Service Configuration](#) synchronization identifier included indicator.  
 12          

13          [If P\\_REV\\_IN\\_USE<sub>s</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:](#)  
 14          

15          The mobile station shall set this field to '1' if the SYNC\_ID field  
 16           is included in this message; [otherwise, the mobile station shall set this field to '0'.](#)  
 17          

18         SYNC\_ID\_LEN - [Service Configuration synchronization identifier length indicator.](#)  
 19          

20          [If the SYNC\\_ID\\_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise the mobile station shall include this field and set it as follows:](#)  
 21          

22          [The mobile station shall set this field to the length of the SYNC\\_ID field included in this message.](#)  
 23          

24         SYNC\_ID - [SCR-Service Configuration](#) synchronization identifier.  
 25          

26          [If P\\_REV\\_IN\\_USE<sub>s</sub> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:](#)  
 27          

28          If the SYNC\_ID\_INCL field is not included, or is included but is set to '0', the mobile station shall omit this field; otherwise,  
 29

1           the mobile station shall include this field and set it as follows:

2           The mobile station shall set this field to the Service  
 3           Configuration synchronization identifier corresponding to the  
 4           stored service configuration.

5           to the 16 bit CRC computed over the entire stored service  
 6           configuration (that is, both the Service Configuration  
 7           information record and the Non-negotiable Service  
 8           Configuration information record) as specified in 2.6.11.

- 9       PREV\_SID\_INCL   - Previous System Identification (SID) included indicator.  
 10      If P\_REV\_IN\_USE is less than seven, the mobile station shall  
 11      omit this field; otherwise, the mobile station shall include this  
 12      field and set it as follows:  
 13      The mobile station shall set this field to '1' if the mobile  
 14      station determines that the SID has been changed after a  
 15      packet data dormant handoff and the PREV\_SID field is  
 16      included in this message; otherwise, the mobile station shall  
 17      set this field to '0'.
- 18       PREV\_SID   - Previous System Identification.  
 19      If PREV\_SID\_INCL is not included, or is included but is set to  
 20      '0', the mobile station shall omit this field; otherwise, the  
 21      mobile station shall include this field and set it as follows:  
 22      If the mobile station determines SID has been changed after a  
 23      packet data dormant handoff, the mobile station shall set this  
 24      field to the previous SID.
- 25       PREV\_NID\_INCL   - Previous Network Identification (NID) included indicator.  
 26      If P\_REV\_IN\_USE is less than seven, the mobile station shall  
 27      omit this field; otherwise, the mobile station shall include this  
 28      field and set it as follows:  
 29      The mobile station shall set this field to '1' if the mobile  
 30      station determines that NID has been changed after a packet  
 31      data dormant handoff and the PREV\_NID field is included in  
 32      this message; otherwise, the mobile station shall set this field  
 33      to '0'.
- 34       PREV\_NID   - Previous Network Identification.  
 35      If PREV\_NID\_INCL is not included, or is included but is set to  
 36      '0', the mobile station shall omit this field; otherwise, the  
 37      mobile station shall include this field and set it as follows:  
 38      If the mobile station determines NID has been changed after a  
 39      packet data dormant handoff, the mobile station shall set this  
 40      field to the previous NID.
- 41       PREV\_PZID\_INCL   - Previous Packet Zone ID (PZID) included indicator.  
 42      If P\_REV\_IN\_USE is less than seven, the mobile station shall  
 43      omit this field; otherwise, the mobile station shall include this  
 44      field and set it as follows:

The mobile station shall set this field to ‘1’ if the mobile station determines that the Packet Zone ID has been changed after a packet data dormant handoff and the PREV\_PZID field is included in this message; otherwise, the mobile station shall omit set this field to ‘0’.

- PREV\_PZID - Previous Packet Zone ID.
    - If PREV\_PZID\_INCL is not included, or is included but is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
      - If the mobile station determines PZID has been changed after a packet data dormant handoff, the mobile station shall set this field to the previous PZID.
  - BITMAP\_IND - Service option bitmap indicator.
    - If P\_REV\_IN\_USE<sub>s</sub> is less than 7, the mobile station shall omit this field; otherwise, the mobile station shall set this field as defined in Table 2.7.1.3.2.4-10.

**Table 2.7.1.3.2.4-10. Encoding of the SO\_BITMAP\_IND Field**

| <b>SO_BITMAP_IND</b> | <b>Size of bitmap (in bits) included</b> |
|----------------------|------------------------------------------|
| 00                   | 0 bit (i.e., No bitmap included)         |
| 01                   | 4 bits                                   |
| 10                   | 8 bits                                   |
| 11                   | Reserved                                 |

- |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SO_GROUP_NUM | - Service option group number.<br><br>If SO_BITMAP_IND is included and not set to '00', the mobile station shall include this field and set this field to service option group number defined in <a href="#">TSB58[30]</a> , of the bitmap to be included in this message; otherwise, the mobile station shall omit this field.                                                                                                                                                                                                                                                                             |
| SO_BITMAP    | - Service option bitmap.<br><br>If the field SO_BITMAP_IND is included and is not set to '00', the mobile station shall include the bitmap of the service option group (SO_GROUP_NUM); otherwise, the mobile station shall omit this field.<br><br>When the service option bitmap is included, if there are more than $(4 \times \text{SO_BITMAP_IND})$ service options defined in <a href="#">TSB58[30]</a> for the service option group [SO_GROUP_NUM], the mobile station shall include the bitmap containing the least significant bits $(4 \times \text{SO_BITMAP_IND})$ for the service option group. |

1           The mobile station shall set a bit in this bitmap to '1', if the  
2           mobile station is capable of supporting the service option for  
3           which the bit represents; otherwise, the mobile station shall  
4           set a bit in this bitmap to '0'.

## 1 2.7.1.3.2.5 Page Response Message

| <b>Field</b>                | <b>Length (bits)</b>                     |
|-----------------------------|------------------------------------------|
| SYNC_ID_INCL                | 0 or 1                                   |
| <a href="#">SYNC_ID_LEN</a> | <a href="#">0 or 4</a>                   |
| SYNC_ID                     | 0 or <a href="#">(8 x SYNC_ID_LEN)+6</a> |

If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than 7, the mobile station shall include the following fields:

|               |                        |
|---------------|------------------------|
| SO_BITMAP_IND | 0 or 2                 |
| SO_GROUP_NUM  | 0 or 5                 |
| SO_BITMAP     | 0 or 4 × SO_BITMAP_IND |

2

- 3           MOB\_TERM     – Mobile terminated calls accepted indicator.  
 4           If the mobile station is configured to accept mobile terminated  
 5           calls while operating with the current roaming status (see  
 6           2.6.5.3), the mobile station shall set this bit to '1'. Otherwise,  
 7           the mobile station shall set this bit to '0'.
- 8           SLOT\_CYCLE\_INDEX     – Slot cycle index.  
 9           If the mobile station is configured for slotted mode operation,  
 10          the mobile station shall set this field to the preferred slot cycle  
 11          index, SLOT\_CYCLE\_INDEX<sub>p</sub> (see 2.6.2.1.1). Otherwise, the  
 12          mobile station shall set this field to '000'.
- 13          MOB\_P\_REV     – Protocol revision of the mobile station.  
 14          The mobile station shall set this field to '00000111'.
- 15          SCM     – Station class mark.  
 16          The mobile station shall set this field to the station class mark  
 17          of the mobile station. See 2.3.3.
- 18          REQUEST\_MODE     – Requested mode code. The mobile station shall set this field  
 19          to the value shown in Table 2.7.1.3.2.4-1 corresponding to its  
 20          current configuration.
- 21          SERVICE\_OPTION     – Service option.  
 22          If the mobile station accepts the service option specified by the  
 23          mobile-station-addressed page, it shall set this field as follows:  
 24           • If the page record to which the mobile station is  
 25            responding contained a SERVICE OPTION field, the mobile  
 26            station shall set this field to the service option number  
 27            specified in the SERVICE OPTION field of the page record  
 28            to which the mobile station is responding.  
 29           • If the page record to which the mobile station is  
 30            responding did not contain a SERVICE OPTION field, the

1 mobile station shall set this field to the default option  
 2 number '00000000000000000000000000000000'.

3 If the mobile station does not accept the service option  
 4 specified by the mobile-station-addressed page to which the  
 5 mobile station is responding and the mobile station has an  
 6 alternative service option to request, the mobile station shall  
 7 set this field to the service option code specified in [30]  
 8 corresponding to the alternative service option.

9 If the mobile station does not accept the service option  
 10 specified by the mobile-station-addressed page to which the  
 11 mobile station is responding and the mobile station does not  
 12 have an alternative service option to request, the mobile  
 13 station shall set this field to '0000000000000000' to reject the  
 14 service option specified by the page record of the *General Page*  
 15 *Message* or *Universal Page Message* to which the mobile  
 16 station is responding.

17 PM - Privacy mode indicator.

18 To request voice privacy, the mobile station shall set this field  
 19 to '1'; otherwise, the mobile station shall set this field to '0'.

20 NAR\_AN\_CAP - Narrow analog capability.

21 If the mobile station is capable of narrow analog operation, the  
 22 mobile station shall set this bit to '1'; otherwise, the mobile  
 23 station shall set this bit to '0'.

24 ENCRYPTION- - Encryption algorithms supported by the mobile station.

25 \_SUPPORTED If P\_REV\_IN\_USE is greater than or equal to 7 or  
 26 AUTH\_MODE is equal to '00', the mobile station shall omit  
 27 this field. If P\_REV\_IN\_USE is less than 7 and AUTH\_MODE  
 28 is not equal to '00', then the mobile station shall set this field  
 29 as specified in table 2.7.1.3.2.4-5.

30 NUM\_ALT\_SO - Number of alternative service options.

31 If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall  
 32 set this field to the number of alternative service options it  
 33 supports other than the one specified in the  
 34 SERVICE\_OPTION field. The mobile station shall set this field  
 35 to a value less than or equal to MAX\_NUM\_ALT\_SO<sub>S</sub>.

36 If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the  
 37 mobile station shall set this field to the number of alternate  
 38 service options, which either have no service option group  
 39 number assigned or do not belong to the same service option  
 40 group whose bitmap is being included. The alternate service  
 41 option numbers are other than the one specified in the  
 42 SERVICE\_OPTION field. The mobile station shall set this field  
 43 to a value less than or equal to MAX\_NUM\_ALT\_SO<sub>S</sub>.

44 ALT\_SO - Alternative service option.

1           The mobile station shall include NUM\_ALT\_SO occurrences of  
 2           this field. The mobile station shall set this field to the value  
 3           specified in [30], corresponding to the alternative service  
 4           option supported by the mobile station.

5           If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven, the  
 6           mobile station shall include NUM\_ALT\_SO occurrences of in  
 7           this field. The mobile station shall set this field to the service  
 8           option number defined in [TSB58-\[30\]](#) corresponding to the  
 9           alternate service options which either have no service option  
 10          group number assigned or do not belong to the same service  
 11          option group whose bitmap is included in this message.

- 12           UZID\_INCL    – User Zone Identifier included indicator.  
                If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
                omit this field; otherwise, the mobile station shall include this  
                field and set it as follows.  
                If the message is to contain the User Zone Identifier, the  
                mobile station shall set this field to '1'; otherwise, the mobile  
                station shall set this field to '0'.
- 19           UZID        – User Zone Identifier.  
                If the UZID\_INCL field is included in the message and is set to  
                '1', the mobile station shall include this field and set it to  
                UZID<sub>S</sub>; otherwise, the mobile station shall omit this field.
- 23           CH\_IND      – Channel Indicator.  
                If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall  
                omit this field; otherwise, the mobile station shall include this  
                field and set it, as shown in Table 2.7.1.3.2.5-1, to request  
                physical resources.

**Table 2.7.1.3.2.5-1. Channel indicator**

| <b>CH_IND<br/>(binary)</b> | <b>Channel(s) Requested</b>                       |
|----------------------------|---------------------------------------------------|
| 00                         | Reserved                                          |
| 01                         | Fundamental Channel                               |
| 10                         | Dedicated Control Channel                         |
| 11                         | Fundamental Channel and Dedicated Control Channel |

- OTD\_SUPPORTED - Orthogonal transmit diversity supported indicator  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If the mobile station supports orthogonal transmit diversity, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- QPCH\_SUPPORTED - Quick Paging Channel supported indicator.  
If P\_REV\_IN\_USE is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If the mobile station supports the Quick Paging Channel, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- ENHANCED\_RC - Enhanced radio configuration supported indicator.  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If the mobile station supports any radio configuration in the Radio Configuration Class 2 (see 1.1.1), the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- FOR\_RC\_PREF - Forward Radio Configuration preference.  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
The mobile station shall set this field to its preferred Radio Configuration for the Forward Traffic Channel.
- REV\_RC\_PREF - Reverse Radio Configuration preference.  
If P\_REV\_IN\_USE<sub>S</sub> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

- |    |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                                      | The mobile station shall set this field to its preferred Radio Configuration for the Reverse Traffic Channel.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3  | FCH_SUPPORTED                        | <ul style="list-style-type: none"> <li>- Fundamental Channel supported indicator.</li> </ul> <p>If <math>P_{REV\_IN\_USE_S}</math> is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.</p> <p>The mobile station shall set this field to '1' if the mobile station supports Fundamental Channel; otherwise, the mobile station shall set this field to '0'.</p>                                                                                       |

| 38 | STS_SUPPORTED                        | <ul style="list-style-type: none"> <li>- STS supported indicator.</li> </ul> <p>If <math>P_{REV\_IN\_USE_S}</math> is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.</p> <p>The mobile station shall set this field to '1' if the mobile station supports Space Time Spreading Transmit Diversity; otherwise, the mobile station shall set this field to '0'.</p>                                                                                 |

- 1    3X\_CCH\_SUPPORTED    -    3X Common Channels supported.  
 2                         If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall  
 3                         omit this field; otherwise, the mobile station shall include this  
 4                         field and set it as follows.  
 5                         The mobile station shall set this field to '1' if the mobile  
 6                         station supports the Spreading Rate 3 common channels (3X  
 7                         BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile  
 8                         station shall set this field to '0'.  
 9    WLL\_INCL    -    WLL information included indicator.  
 10                       If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall  
 11                       omit this field; otherwise, the mobile station shall include this  
 12                       field and set it as follows.  
 13                       If the mobile station is a Wireless Local Loop device, the  
 14                       mobile station shall set this field to '1'; otherwise, the mobile  
 15                       station shall set this field to '0'.  
 16    WLL\_DEVICE\_TYPE    -    WLL device type indicator.  
 17                       If WLL\_INCL is not included, or if WLL\_INCL is included and is  
 18                       set to '0', the mobile station shall omit this field; otherwise,  
 19                       the mobile station shall set this field as follows.  
 20                       The mobile station shall set this field to the  
 21                       WLL\_DEVICE\_TYPE value shown in Table 2.7.1.3.2.1-3  
 22                       corresponding to the mobile station device type.  
 23    HOOK\_STATUS    -    WLL terminal hook status.  
 24                       If WLL\_INCL is not included, or if WLL\_INCL is included and is  
 25                       set to '0', the mobile station shall omit this field; otherwise,  
 26                       the mobile station shall set this field to the value shown in  
 27                       Table 2.7.1.3.2.1-4 corresponding to the hook state.  
 28    ENC\_INFO\_INCL    -    Encryption fields included.  
 29                       If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall  
 30                       omit this field; otherwise, the mobile station shall include this  
 31                       field and set it as follows:  
 32                       The mobile station shall set this field to '1' if the encryption  
 33                       related fields are included; otherwise the mobile station shall  
 34                       set this field to '0'. The mobile station shall set this field to '1'  
 35                       if it is unable to determine the base station support for  
 36                       encryption. The mobile station shall set this field to '0' if the  
 37                       base station does not support encryption or the mobile station  
 38                       does not support any of the encryption modes supported by  
 39                       the base station.  
 40    SIG\_ENCRYPT\_SUP    -    Signaling eEncryption supported indicator.  
 41                       If ENC\_INFO\_INCL is included and is set to '1', the mobile  
 42                       station shall include this field; otherwise, the mobile station  
 43                       shall omit this field. If this field is included, the mobile  
 44                       station shall set this field to indicate which signaling  
 45                       encryption algorithms are supported by the mobile station.

1           This field consists of the subfields shown in Table 2.7.1.3.2.1-  
 2           5.

3           If this field is included, the mobile station shall set the  
 4           subfields as follows:

5           The mobile station shall set the CMEA subfield to '1'.

6           The mobile station shall set each other subfield to '1' if the  
 7           corresponding signaling encryption algorithm is supported by  
 8           the mobile station; otherwise, the mobile station shall set the  
 9           subfield to '0'.

10          The mobile station shall set the RESERVED subfield to  
 11          '000000'. |

12          D SIG\_ENCRYPT\_REQ - Dedicated channel sSignaling Message-encryption request  
 13          indicator.

14          If ENC\_INFO\_INCL is included and is set to '1', the mobile  
 15          station shall include this field; otherwise, the mobile station  
 16          shall omit this field. If this field is included, the mobile  
 17          station shall set this field to '1' to request signaling encryption  
 18          to be turned on for signaling messages sent on f-dsch and, r-  
 19          dsch, f eseh, and r eseh, and to '0' to request signaling  
 20          encryption to be turned off for signaling messages sent on f-  
 21          dsch and, r-dsch, f eseh, and r eseh.

22          KEY\_SEQ\_NEW\_INCL - The new encryption key sequencee number included indicator.

23          If ENC\_INFO\_INCL is included and is set to '1', the mobile  
 24          station shall include this field; otherwise, the mobile station  
 25          shall omit this field. If this field is included, the mobile station  
 26          shall set this field as follow:

27          If STORE\_KEYs is equal to '1' and KEY\_SEQ\_NEW is included in  
 28          this message, the mobile station shall set this field to '1';  
 29          otherwise, the mobile station shall set this field to '0'.

30          C SIG ENCRYPT REQ - Common channel signaling encryption request indicator.

31          If ENC INFO INCL is included and is set to '1', the mobile  
 32          station shall include this field; otherwise, the mobile station  
 33          shall omit this field. If this field is included, the mobile  
 34          station shall set this field to '1' to request signaling encryption  
 35          to be turned on for signaling messages sent on f-csch and r-  
 36          csch, and to '0' to request signaling encryption to be turned  
 37          off for signaling messages sent on f-csch and r-csch.

38          KEY\_SEQ\_NEW - The key sequencee number corresponding to the new encryption  
 39          key generated by the mobile station.

40          If KEY\_SEQ\_NEW\_INCL is included and is set to '1', the mobile  
 41          station shall include this field; otherwise, the mobile station shall  
 42          omit this field. If this field is included, the mobile station shall set  
 43          this field to KEY\_SEQ\_NEWS\_p, the sequencee number associated  
 44          with the new encryption key generated by the mobile station.

45          ENC\_SEQ\_H - The 24 MSB of the EXT\_ENC\_SEQ

1           If SIG\_ENCRYPT\_SUP is included and the ECMEA or REA  
2           subfield in SIG\_ENCRYPT\_SUP is set to '1', If ENC\_INFO\_INCL  
3           is included and is equal to '1', and the Enhanced Cellular  
4           Message Encryption Algorithm is supported by the mobile  
5           station, the mobile station shall include this field; otherwise,  
6           the mobile station shall omit this field. If this field is  
7           included, the mobile station shall set this field to the 24 most  
8           significant bits of the EXT\_ENC\_SEQ to be used as the initial  
9           value of crypto sync for both forward and reverse link  
10          encryptions.

- 11          ENC\_SEQ\_H\_SIG    - The signature of ENC\_SEQ\_H  
12                 If the ENC\_SEQ\_H field is included in the message, the mobile  
13                 station shall set this field to the digital signature of the  
14                 ENC\_SEQ\_H as described in 2.3.12.4.5; otherwise, the mobile  
15                 station shall omit this field.
- 16          UI\_ENCRYPT\_REQ    - Request for user information encryption on the traffic channel  
17                 indicator.  
18                 If ENC\_INFO\_INCL is included and is set to '1', the mobile  
19                 station shall include this field; otherwise, the mobile station  
20                 shall omit this field. If this field is included, the mobile  
21                 station shall set this field to '1' to request user information  
22                 encryption, and to '0' to request no user information  
23                 encryption. UI\_ENCRYPT\_SUP- User information  
24                 Encryption supported indicator.  
25                 If ENC\_INFO\_INCL is included and is set to '1', the mobile  
26                 station shall include this field; otherwise, the mobile station  
27                 shall omit this field. If this field is included, the mobile  
28                 station shall set this field to indicate the supported user  
29                 information encryption algorithms.

1           This field consists of the subfields shown in Table 2.7.1.3.2.4-  
 2           9.

3           The mobile station shall set each subfield to '1' if the  
 4           corresponding user information encryption algorithm is  
 5           supported by the mobile station; otherwise, the mobile station  
 6           shall set the subfield to '0'.

7           The mobile station shall set the RESERVED subfield to  
 8           '0000000'. |

9           SYNC\_ID\_INCL - [SCR-Service Configuration](#) synchronization identifier included  
 10          indicator.

11          If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall  
 12          omit this field; otherwise, the mobile station shall include this  
 13          field and set it as follows.

14          The mobile station shall set this field to '1' if the SYNC\_ID  
 15          field is included in this message; [otherwise, the mobile](#)  
 16          [station shall set this field to '0'.](#)

17          [SYNC ID LEN](#) - [Service Configuration synchronization identifier length](#)  
 18          [indicator.](#)

19          [If the SYNC\\_ID\\_INCL field is not included or is included and is](#)  
 20          [set to '0', the mobile station shall omit this field; otherwise the](#)  
 21          [mobile station shall include this field and set it as follows:](#)

22          [The mobile station shall set this field to the length of the](#)  
 23          [SYNC\\_ID field included in this message.](#)

25          SYNC\_ID - [Service Configuration SCR](#)-synchronization identifier.

26          If the SYNC\_ID\_INCL field is not included, or is included and  
 27          is set to '0', the mobile station shall omit this field; otherwise,  
 28          the mobile station shall include this field and set it [as follows:](#)

29          [The mobile station shall set this field to the Service](#)  
 30          [Configuration synchronization identifier corresponding to the](#)  
 31          [stored service configuration.](#)

32          [to the 16 bit CRC computed over the entire stored service](#)  
 33          [configuration \(that is, both the Service Configuration](#)  
 34          [information record and the Non-negotiable Service](#)  
 35          [Configuration information record\) as specified in 2.6.11.](#)

36          SO\_BITMAP\_IND - SO bitmap indicator.

37          If P\_REV\_IN\_USE<sub>S</sub> is less than 7, the mobile station shall omit  
 38          this field; otherwise, the mobile station shall include this field  
 39          and set this field as defined in Table 2.7.1.3.2.4-10.

40          SO\_GROUP\_NUM - The service option group number.

If SO\_BITMAP\_IND is included and not set to '00', the mobile station shall include this field and set this field to service option group number of the bitmap to be included in this message; otherwise, the mobile station shall omit this field.

SO\_BITMAP - Service option bitmap.

If the field SO\_BITMAP\_IND field is included and is not set to '00', the mobile station shall include the bitmap of the service option group (SO\_GROUP\_NUM); otherwise, the mobile station shall omit this field.

When the service option bitmap is included, if there are more than  $(4 \times \text{SO_BITMAP_IND})$  service options defined for the service option group, the mobile station shall include the bitmap containing the least significant bits  $(4 \times \text{SO_BITMAP_IND})$  of the service option group.

The mobile station shall set a bit in this bitmap to '1', if the mobile station is capable of supporting the service option for which the bit represents; otherwise, the mobile station shall set a bit in this bitmap to '0'.

## 1    2.7.1.3.2.6 Authentication Challenge Response Message

2    MSG\_TAG: AUCRM

3

| Field | Length (bits) |
|-------|---------------|
| AUTHU | 18            |

4    AUTHU    –    Authentication challenge response.

5    The mobile station shall set this field as specified in  
6    2.3.12.1.4.

## 1    2.7.1.3.2.7 Status Response Message

2    MSG\_TAG: STRPM

3

| <b>Field</b>         | <b>Length (bits)</b>              |
|----------------------|-----------------------------------|
| QUAL_INFO_TYPE       | 8                                 |
| QUAL_INFO_LEN        | 3                                 |
| Type-specific fields | $8 \times \text{QUAL\_INFO\_LEN}$ |

One or more occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4    QUAL\_INFO\_TYPE    -    Qualification information type.

5                         The mobile station shall set this field to the QUAL\_INFO\_TYPE  
6                         field in the corresponding *Status Request Message*.

7    QUAL\_INFO\_LEN    -    Qualification information length.

8                         The mobile station shall set this field to the QUAL\_INFO\_LEN  
9                         field in the corresponding *Status Request Message*.

10   Type-specific fields    -    Type-specific fields.

11                         The mobile station shall set these fields to the qualification  
12                         information in the corresponding *Status Request Message*.13   The mobile station shall include all the records requested in the corresponding *Status  
14   Request Message*. The mobile station shall include one occurrence of the following fields for  
15   each information record to be included:

16   RECORD\_TYPE    -    Information record type.

17                         The mobile station shall set this field to the record type value  
18                         shown in Table 3.7.2.3.2.15-2 corresponding to the type of  
19                         this information record.

20   RECORD\_LEN    -    Information record length.

21                         The mobile station shall set this field to the number of octets  
22                         included in the type-specific fields of this information record.

23   Type-specific fields    -    Type-specific fields.

24                         The mobile station shall set these fields to the information as  
25                         specified in 2.7.4 for the specific type of records. The mobile  
26                         station shall only specify the information corresponding to the  
27                         included qualification information.

- 1    2.7.1.3.2.8 TMSI Assignment Completion Message

## 1    2.7.1.3.2.10 Extended Status Response Message

2    MSG\_TAG: ESTRPM

3

| <b>Field</b>         | <b>Length (bits)</b>              |
|----------------------|-----------------------------------|
| QUAL_INFO_TYPE       | 8                                 |
| QUAL_INFO_LEN        | 3                                 |
| Type-specific fields | $8 \times \text{QUAL\_INFO\_LEN}$ |
| NUM_INFO_RECORDS     | 4                                 |

NUM\_INFO\_RECORDS occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

- 5    QUAL\_INFO\_TYPE    – Qualification information type.  
 6                         The mobile station shall set this field to the QUAL\_INFO\_TYPE  
 7                         field in the corresponding *Status Request Message*.
- 8    QUAL\_INFO\_LEN    – Qualification information length.  
 9                         The mobile station shall set this field to the QUAL\_INFO\_LEN  
 10                        field in the corresponding *Status Request Message*.
- 11   Type-specific fields    – Type-specific fields.  
 12                         The mobile station shall set these fields to the qualification  
 13                         information in the corresponding *Status Request Message*.
- 14   NUM\_INFO\_RECORDS    – Number of information records included.  
 15                         The mobile station shall set this field to the number of  
 16                         information records which are included. The mobile station  
 17                         shall include all the records requested in the corresponding  
 18                         *Status Request Message*.

19   The mobile station shall include one occurrence of the following fields for each information  
 20   record which is included:

- 21       RECORD\_TYPE    – Information record type.  
 22                         The mobile station shall set this field to the record type value  
 23                         shown in Table 3.7.2.3.2.15-2 corresponding to the type of  
 24                         this information record.
- 25       RECORD\_LEN    – Information record length.  
 26                         The mobile station shall set this field to the number of octets  
 27                         included in the type-specific fields of this information record.

- 1      Type-specific fields – Type-specific fields.  
2  
3  
4  
5      The mobile station shall set these fields to the information as  
          specified in 2.7.4 for the specific type of records. The mobile  
          station shall only specify the information corresponding to the  
          included qualification information.

## 1    2.7.1.3.2.11 Device Information Message

2    MSG\_TAG: DIM

3

| <b>Field</b>     | <b>Length (bits)</b> |
|------------------|----------------------|
| WLL_DEVICE_TYPE  | 3                    |
| NUM_INFO_RECORDS | 5                    |

NUM\_INFO\_RECORDS occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

- 5    WLL\_DEVICE\_TYPE    –    WLL device type indicator.  
 6                         The mobile station shall set this field to the  
 7                         WLL\_DEVICE\_TYPE value shown in Table 2.7.1.3.2.1-3  
 8                         corresponding to the mobile station device type.
- 9    NUM\_INFO\_RECORDS    –    Number of information records included.  
 10                        The mobile station shall set this field to the number of  
 11                        information records which are included.

12    The mobile station shall include one occurrence of the following fields for each information  
 13    record which is included:

- 14                        RECORD\_TYPE    –    Information record type.  
 15                         The mobile station shall set this field to the record type code  
 16                         shown in Table 2.7.4-1 corresponding to the type of this  
 17                         information record.
- 18                        RECORD\_LEN    –    Information record length.  
 19                         The mobile station shall set this field to the number of octets  
 20                         in the type-specific fields of this record.
- 21                        Type-specific fields    –    Type-specific fields.  
 22                         The mobile station shall set these fields as specified in 2.7.4  
 23                         for this type of information record.

| Order-Specific Field     | Length (bits)  |
|--------------------------|----------------|
| UI_ENC_INCL              | 1              |
| UI_ENCRYPT_SUP           | 0 or 8         |
| SIG_ENC_INCL             | 1              |
| SIG_ENCRYPT_SUP          | 0 or 8         |
| <u>C_SIG_ENCRYPT_REQ</u> | 0 or 1         |
| <u>ENC_SEQ_H_INCL</u>    | <u>1</u>       |
| <u>ENC_SEQ_H</u>         | <u>0 or 24</u> |
| <u>ENC_SEQ_H_SIG</u>     | <u>0 or 8</u>  |

4

- 5    UI\_ENC\_INCL    -    User information encryption fields included.  
 6                  The mobile station shall set this field to '1' if the user  
 7                  information encryption related fields are included in this  
 8                  message; otherwise, the mobile station shall set this field to  
 9                  '0'.  
 10   |    UI\_ENCRYPT\_SUP    -    User information eEncryption supported indicator.  
 11                 If UI\_ENC\_INCL is equal to '1', the mobile station shall include  
 12                 this field; otherwise, the mobile station shall omit this field. If  
 13                 this field is included, the mobile station shall set this field to  
 14                 indicate the supported user information encryption  
 15                 algorithms.  
 16                 This field consists of the subfields shown in Table 2.7.1.3.2.4-  
 17                 9.  
 18                 The mobile station shall set each subfield to '1' if the  
 19                 corresponding user information encryption algorithm is  
 20                 supported by the mobile station; otherwise, the mobile station  
 21                 shall set the subfield to '0'.  
 22   |    SIG\_ENC\_INCL    -    Signaling encryption fields included.  
 23                 The mobile station shall set the RESERVED subfield to  
 24                 '0000000'.  
 25                 The mobile station shall set this field to '1' if the following two  
 26                 fields related to signaling encryption fields are included in this  
 27                 message; otherwise, the mobile station shall set this field to  
 28                 '0'.

|    |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | SIG_ENCRYPT_SUP       | - Signaling <u>e</u> ncryption supported indicator.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 1  |                       | If SIG_ENC_INCL is equal to '1', the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile shall set this field to indicate the supported signaling encryption algorithms supported by the mobile station.                                                                                                                                                                                                   |
| 2  |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3  |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4  |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 5  |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6  |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 7  |                       | This field consists of the subfields shown in Table 2.7.1.3.2.1-5.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 8  |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 9  |                       | If this field is included, the mobile station shall set the subfields as follows:                                                                                                                                                                                                                                                                                                                                                                                                          |
| 10 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 11 |                       | The mobile station shall set the CMEA subfield to '1'.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 1    2.7.2.3.2.1 Order Message

2    MSG\_TAG: ORDM

3

| <b>Field</b>                    | <b>Length (bits)</b>               |
|---------------------------------|------------------------------------|
| ORDER                           | 6                                  |
| ADD_RECORD_LEN                  | 3                                  |
| Order-specific fields (if used) | $8 \times \text{ADD\_RECORD\_LEN}$ |
| CON_REF_INCL                    | 0 or 1                             |
| CON_REF                         | 0 or 8                             |

4

5    ORDER    -    Order code.

6                 The mobile station shall set this field to the ORDER code.  
7                 See 2.7.3.

8    ADD\_RECORD\_LEN    -    Additional record length.

9                 The mobile station shall set this field to the number of octets  
10                in the order-specific fields included in this message.

11    Order-specific fields    -    Order-specific fields.

12                 The mobile station shall include order-specific fields as  
13                specified in 2.7.3.

14    CON\_REF\_INCL    -    Connection reference included indicator.

15                 If the order carried by this message is not a Call Control order  
16                (2.6.10), the mobile station shall omit this field; otherwise, the  
17                mobile station shall include this field and set it as follows:18                 The mobile station shall set this field to '1' if the connection  
19                reference field is included in this message; otherwise, it shall  
20                set this field to '0'.

21    CON\_REF    -    Connection reference.

22                 If the CON\_REF\_INCL field is not included, or is included but  
23                is set to '0', the mobile station shall omit this field; otherwise,  
24                the mobile station shall include this field and shall set it to  
25                the value of the connection reference assigned to the service  
26                option connection of the call, to which this message  
27                corresponds.

## 1    2.7.2.3.2.2 Authentication Challenge Response Message

2    MSG\_TAG: AUCRM

3

| Field | Length (bits) |
|-------|---------------|
| AUTHU | 18            |

4

5            AUTHU    -    Authentication challenge response.

6                         The mobile station shall set this field as specified in  
7                         2.3.12.1.4.

## 1    2.7.2.3.2.3 Flash With Information Message

2    MSG\_TAG: FWIM

3

| Field                                             | Length (bits)                 |
|---------------------------------------------------|-------------------------------|
| Zero or more occurrences of the following record: |                               |
| RECORD_TYPE                                       | 8                             |
| RECORD_LEN                                        | 8                             |
| Type-specific fields                              | $8 \times \text{RECORD\_LEN}$ |

4

5    The mobile station shall include one occurrence of the following record for each information  
6    record to be included:

- 7            RECORD\_TYPE    -    Information record type.  
                The mobile station shall set this field to the record type code  
                shown in Table 2.7.4-1 corresponding to the type of this  
                information record.
- 8            RECORD\_LEN    -    Information record length.  
                The mobile station shall set this field to the number of octets  
                in the type-specific fields of this record.
- 9            Type-specific fields    -    Type-specific fields.  
                The mobile station shall set these fields as specified in 2.7.4  
                for this type of information record.

## 1    2.7.2.3.2.4 Data Burst Message

2    MSG\_TAG: DBM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| MSG_NUMBER   | 8                    |
| BURST_TYPE   | 6                    |
| NUM_MSGS     | 8                    |
| NUM_FIELDS   | 8                    |

NUM\_FIELDS occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

4

- 5    MSG\_NUMBER    – Message number within the data burst stream.  
 6                  The mobile station shall set this field to the number of this  
 7                  message within the data burst stream.
- 8    BURST\_TYPE    – Data burst type.  
 9                  The mobile station shall set the value of this field for the type  
 10                 of this data burst as defined in [30]. If the mobile station sets  
 11                 this field equal to '111110', it shall set the first two CHARi  
 12                 fields of this message equal to EXTENDED\_BURST\_TYPE\_INTERNATIONAL as described in  
 13                 the definition of CHARi below. If the mobile station sets this  
 14                 field equal to '111111', it shall set the first two CHARi fields of  
 15                 this message equal to the EXTENDED BURST TYPE as  
 16                 described in the definition of CHARi below.
- 17                  NUM\_MSGS    – Number of messages in the data burst stream.  
 18                  The mobile station shall set this field to the number of  
 19                 messages within this data burst stream.
- 20                  NUM\_FIELDS    – Number of characters in this message.  
 21                  The mobile station shall set this field to the number of CHARi  
 22                 fields included in this message.
- 23                  CHARi    – Character.  
 24                  The mobile station shall include NUM\_FIELDS occurrences of  
 25                 this field. The mobile station shall set these fields to the  
 26                 corresponding octet of the data burst stream.
- 27

If the BURST\_TYPE field of this message is equal to '111110', the first two CHARi octets shall represent a 16 bit EXTENDED\_BURST\_TYPE\_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC) associated with the national standards organization administering the use of the remaining octets of the message. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED\_BURST\_TYPE\_INTERNATIONAL field shall specify the COUNTRY\_BURST\_TYPE. The mobile station shall set the value of the COUNTRY\_BURST\_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

| <b>Field</b>           | <b>Length (bits)</b>               |
|------------------------|------------------------------------|
| Mobile Country Code    | 10                                 |
| COUNTRY_BURST_TYPE     | 6                                  |
| Remaining CHARi fields | $8 \times (\text{NUM_FIELDS} - 2)$ |

If the BURST\_TYPE field of this message is equal to '111111', the first two CHARi octets shall represent a single, 16 bit, EXTENDED\_BURST\_TYPE field, as shown below. The mobile station shall set the value of the EXTENDED\_BURST\_TYPE according to the type of this data burst as defined in [30].

| <b>Field</b>                                    | <b>Length (bits)</b>               |
|-------------------------------------------------|------------------------------------|
| EXTENDED_BURST_TYPE<br>(first two CHARi fields) | 16                                 |
| Remaining CHARi fields                          | $8 \times (\text{NUM_FIELDS} - 2)$ |

## 1    2.7.2.3.2.5 Pilot Strength Measurement Message

2    MSG\_TAG: PSMM

3

| Field          | Length (bits) |
|----------------|---------------|
| REF_PN         | 9             |
| PILOT_STRENGTH | 6             |
| KEEP           | 1             |

Zero or more occurrences of the following record:

|                |    |
|----------------|----|
| PILOT_PN_PHASE | 15 |
| PILOT_STRENGTH | 6  |
| KEEP           | 1  |

4

5    REF\_PN    - Time reference PN sequence offset.

6                 The mobile station shall set this field to the PN sequence offset  
7                 of the pilot used by the mobile station to derive its time  
8                 reference, relative to the zero offset pilot PN sequence in units  
9                 of 64 PN chips.

10    PILOT\_STRENGTH    - Pilot strength.

11                 The mobile station shall set this field to

12                  $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ,

13                 where PS is the strength of the pilot used by the mobile  
14                 station to derive its time reference (see [2]), measured as  
15                 specified in 2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ) is less  
16                 than 0, the mobile station shall set this field to '000000'. If  
17                 this value is greater than '111111', the mobile station shall set  
18                 this field to '111111'.

19    KEEP    - Keep pilot indicator.

20                 If the handoff drop timer (see 2.6.6.2.3) corresponding to the  
21                 pilot used by the mobile station to derive its time reference  
22                 (see 2.1.5 of [2]) has expired, the mobile station shall set this  
23                 field to '0'; otherwise, the mobile station shall set this field to  
24                 '1'.

25

26    If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three, the mobile station shall include one  
27                 occurrence of the three-field record given below for each pilot in the Active Set and for each  
28                 Candidate Set pilot reported (the number of Candidate Set pilots reported shall not exceed  
29                 5), other than the pilot identified by the REF\_PN field. If P\_REV\_IN\_USE<sub>s</sub> is greater than  
30                 three and SOFT\_SLOPE<sub>s</sub> is equal to '000000', the mobile station shall include one  
31                 occurrence of the three-field record given below for each pilot in the Active Set and for each

1 pilot in the Candidate Set, other than the pilot identified by the REF\_PN field. If  
 2 P\_REV\_IN\_USE<sub>S</sub> is greater than three and SOFT\_SLOPE<sub>S</sub> is not equal to '000000', the  
 3 mobile station shall include one occurrence of the three-field record given below for each  
 4 pilot in the Active Set, for each pilot in the Candidate Set whose strength exceeds T\_ADD,  
 5 and shall also include one occurrence of the three-field record given below for each pilot in  
 6 the Candidate Set whose strength satisfies the following inequality:

$$7 \quad 10 \times \log_{10} PS > \frac{\text{SOFT\_SLOPE}_S}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD\_INTERCEPT}_S}{2}$$

8 where the summation is performed over all pilots currently in the Active Set. The mobile  
 9 station shall not include these fields for the pilot identified by the REF\_PN field.

10 The mobile station shall order any occurrences of the three-field record given below which  
 11 correspond to pilots in the Active Set such that they occur before any occurrences of the  
 12 three-field record given below which correspond to pilots in the Candidate Set.

13 PILOT\_PN\_PHASE - Pilot measured phase.

14 The mobile station shall set this field to the phase of the pilot  
 15 PN sequence relative to the zero offset pilot PN sequence of  
 16 this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

17 PILOT\_STRENGTH - Pilot strength.

18 The mobile station shall set this field to

$$19 \quad \lfloor -2 \times 10 \log_{10} PS \rfloor,$$

20 where PS is the strength of this pilot, measured as specified in  
 21 2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ) is less than 0, the  
 22 mobile station shall set this field to '000000'. If this value is  
 23 greater than '111111', the mobile station shall set this field to  
 24 '111111'.

25 KEEP - Keep pilot indicator.

26 If the handoff drop timer (see 2.6.6.2.3) corresponding to this  
 27 pilot has expired, the mobile station shall set this field to '0';  
 28 otherwise, the mobile station shall set this field to '1'.

## 1    2.7.2.3.2.6 Power Measurement Report Message

2    MSG\_TAG: PMRM

3

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| ERRORS_DETECTED | 5                    |
| PWR_MEAS_FRAMES | 10                   |
| LAST_HDM_SEQ    | 2                    |
| NUM_PILOTS      | 4                    |

NUM\_PILOTS occurrences of the following field:

|                |   |
|----------------|---|
| PILOT_STRENGTH | 6 |
|----------------|---|

|                      |         |
|----------------------|---------|
| DCCH_PWR_MEAS_INCL   | 1       |
| DCCH_PWR_MEAS_FRAMES | 0 or 10 |
| DCCH_ERRORS_DETECTED | 0 or 5  |
| SCH_PWR_MEAS_INCL    | 1       |
| SCH_ID               | 0 or 1  |
| SCH_PWR_MEAS_FRAMES  | 0 or 16 |
| SCH_ERRORS_DETECTED  | 0 or 10 |

4

5    ERRORS\_DETECTED    -    Number of detected bad frames.

6    When the Forward Fundamental Channel is assigned, the  
7    mobile station shall set this field to the number of bad frames  
8    detected (BAD\_FRAMES<sub>S</sub>, see 2.6.4.1.1] on the Forward  
9    Fundamental Channel.10    If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to six and only the  
11    Forward Dedicated Control Channel is assigned, the mobile  
12    station shall set this field to the number of bad frames  
13    detected on the Forward Dedicated Control Channel  
14    (DCCH\_BAD\_FRAMES<sub>S</sub>, see 2.6.4.1.1].15    If the number of bad frames received on this channel within  
16    the measurement period is less than or equal to 31, the  
17    mobile station shall set this field to that number. If that  
18    number exceeds 31, the mobile station shall set this field to  
19    '11111'.

- 1 PWR\_MEAS\_FRAMES - Number of power measurement frames.
- 2 When the Forward Fundamental Channel is assigned, the  
3 mobile station shall set this field to the number of frames  
4 received on the Forward Fundamental Channel within the  
5 measurement period ( $TOT\_FRAMES_S$ , see 2.6.4.1.1).
- 6 If  $P\_REV\_IN\_USE$  is greater than or equal to six and only the  
7 Dedicated Control Channel is assigned, the mobile station  
8 shall set this field to the number of frames received on the  
9 Dedicated Control Channel ( $DCCH\_TOT\_FRAMES_S$ , see  
10 2.6.4.1.1).
- 11 LAST\_HDM\_SEQ - *Extended Handoff Direction Message* or a *General Handoff*  
12 *Direction Message*, or *Universal Handoff Direction Message*  
13 sequence number.
- 14 If an *Extended Handoff Direction Message*, a *General Handoff*  
15 *Direction Message*, or *Universal Handoff Direction Message* has  
16 been received during this call, the mobile station shall set this  
17 field to the value of the HDM\_SEQ field from the *Extended*  
18 *Handoff Direction Message*, the *General Handoff Direction*  
19 *Message* or the *Universal Handoff Direction Message* that  
20 determined the current Active Set. If no *Extended Handoff*  
21 *Direction Message*, *General Handoff Direction Message*, or  
22 *Universal Handoff Direction Message* has been received during  
23 this call, the mobile station shall set this field to '11'.
- 24 NUM\_PILOTS - Number of pilots reported.  
25 The mobile station shall set this field to the number of pilots  
26 in the current Active Set.
- 27 PILOT\_STRENGTH - Pilot strength.  
28 The mobile station shall include one occurrence of this field  
29 for each pilot in the Active Set. If the Active Set contains more  
30 than one pilot, the mobile station shall include the pilot  
31 strengths in the same order as in the *Extended Channel*  
32 *Assignment Message*, *Extended Handoff Direction Message*,  
33 *General Handoff Direction Message* or the *Universal Handoff*  
34 *Direction Message* that determined the current Active Set.  
35 The mobile station shall set each occurrence of this field to  
36  $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ,
- 37 where PS is the strength of the pilot, measured as specified in  
38 2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ) is less than 0, the  
39 mobile station shall set this field to '000000'. If this value is  
40 greater than '111111', the mobile station shall set this field to  
41 '111111'.
- 42 DCCH\_PWR\_MEAS\_INCL - Forward Dedicated Control Channel power measurement  
43 included.

If both Forward Fundamental Channel and Forward Dedicated Control Channel are assigned, the mobile station shall set this field equal to '1'; otherwise, the mobile shall set this field to '0'.

## DCCH\_PWR-

- Number of received Dedicated Control Channel frames.  
If DCCH\_PWR\_MEAS\_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of frames received on the Dedicated Control Channel within the measurement period (DCCH\_TOT\_FRAMESS, see 2.6.4.1.1).

## DCCH\_ERRORS-

- Number of detected bad Dedicated Control Channel frames.
    - If DCCH\_PWR\_MEAS\_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of bad frames (DCCH\_BAD\_FRAMES<sub>S</sub>) detected on the Forward Dedicated Control Channel.
    - If DCCH\_BAD\_FRAMES<sub>S</sub> exceeds 31, the mobile station shall set this field to '11111'; otherwise, the mobile station shall set this field to DCCH\_BAD\_FRAMES<sub>S</sub> [see 2.6.4.1.1].

## SCH\_PWR\_MEAS\_INCL

- Supplemental Channel power measurement included indicator.  
If FOR\_SCH\_FER\_REPs is set to '1' and this message is to report the frame counts at the end of the burst on an assigned Supplemental Channel, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to

SCH ID

- Forward Supplemental Channel identifier.  
If the SCH\_PWR\_MEAS\_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile shall set this field to the Identifier of the Forward Supplemental Channel of which the frame counts are being reported in this message.

SCH\_PWR-

- Number of received Supplemental Channel frames.  
If SCH\_PWR\_MEAS\_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the total number of frames [SCH\_TOT\_FRAMES<sub>s</sub>] received during the burst duration on the Supplemental Channel specified by SCH\_ID. If this measurement is greater than or equal to  $2^{16} - 1$ , the mobile station shall set this field to '1111111111111111'.

## SCH ERRORS-

- Number of detected bad Supplemental Channel frames

1           If SCH\_PWR\_MEAS\_INCL is set to '0', the mobile station shall  
2           omit this field; otherwise, the mobile station shall set this field  
3           to the number of bad frame detected on the Forward  
4           Supplemental Channel of the SCH\_ID for the duration of the  
5           forward burst on this channel.

6           If the number of bad frames (SCH\_BAD\_FRAME<sub>S</sub>) detected  
7           on the SCH\_ID Supplemental Channel during the burst is  
8           greater than 1023, the mobile station shall set this field to  
9           '1111111111'.

1      2.7.2.3.2.7 Send Burst DTMF Message

2      MSG\_TAG: BDTMFM

3

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| NUM_DIGITS      | 8                    |
| DTMF_ON_LENGTH  | 3                    |
| DTMF_OFF_LENGTH | 3                    |

NUM\_DIGITS occurrences of the following field:

|                    |   |
|--------------------|---|
| DIGIT <sub>i</sub> | 4 |
|--------------------|---|

|              |        |
|--------------|--------|
| CON_REF_INCL | 1      |
| CON_REF      | 0 or 8 |

4

- 5      NUM\_DIGITS    - Number of DTMF digits.  
 6                  The mobile station shall set this field to the number of DTMF  
 7                  digits included in this message.
- 8      DTMF\_ON\_LENGTH    - DTMF pulse width code.  
 9                  The mobile station shall set this field to the DTMF\_ON\_LENGTH  
 10                 value shown in Table 2.7.2.3.2.7-1 corresponding to the  
 11                 requested width of DTMF pulses to be generated by the base  
 12                 station.

13

**Table 2.7.2.3.2.7-1. Recommended DTMF Pulse Width**

| <b>DTMF_ON_LENGTH<br/>Field (binary)</b>     | <b>Recommended Pulse Width</b> |
|----------------------------------------------|--------------------------------|
| 000                                          | 95 ms                          |
| 001                                          | 150 ms                         |
| 010                                          | 200 ms                         |
| 011                                          | 250 ms                         |
| 100                                          | 300 ms                         |
| 101                                          | 350 ms                         |
| All other DTMF_ON_LENGTH codes are reserved. |                                |

14

- 1      DTMF\_OFF\_LENGTH    -    DTMF inter-digit interval code.  
 2      The mobile station shall set this field to the  
 3      DTMF\_OFF\_LENGTH value shown in Table 2.7.2.3.2.7-2  
 4      corresponding to the requested minimum interval between  
 5      DTMF pulses to be generated by the base station.

6

7      **Table 2.7.2.3.2.7-2. Recommended Minimum Inter-digit**  
 8      **Interval**

| DTMF_OFF_LENGTH<br>Field (binary)             | Recommended Minimum<br>Inter-digit Interval |
|-----------------------------------------------|---------------------------------------------|
| 000                                           | 60 ms                                       |
| 001                                           | 100 ms                                      |
| 010                                           | 150 ms                                      |
| 011                                           | 200 ms                                      |
| All other DTMF_OFF_LENGTH codes are reserved. |                                             |

- 9
- 10     DIGIT<sub>i</sub>    -    DTMF digit.  
 11    The mobile station shall include one occurrence of this field  
 12    for each DTMF digit to be generated by the base station. The  
 13    mobile station shall set each occurrence of this field to the  
 14    code value shown in Table 2.7.1.3.2.4-4 corresponding to the  
 15    dialed digit.
- 16     CON\_REF\_INCL    -    Connection reference included indicator.  
 17    The mobile station shall set this field to '1' if the connection  
 18    reference field is included in this message; otherwise, it shall  
 19    set this field to '0'.
- 20     CON\_REF    -    Connection reference.  
 21    If the CON\_REF\_INCL field is set to '0', the mobile station  
 22    shall omit this field; otherwise, the mobile station shall  
 23    include this field and shall set it to the value of the connection  
 24    reference assigned to the service option connection of the call,  
 25    to which this message corresponds.

## 1    2.7.2.3.2.8 Status Message

2    MSG\_TAG: STM

3

| <b>Field</b>         | <b>Length (bits)</b>          |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    RECORD\_TYPE    – Information record type.

6                    The mobile station shall set this field to the record type value  
7                    shown in Table 2.7.4-1 corresponding to the type of this  
8                    information record.

9    RECORD\_LEN    – Information record length.

10                  The mobile station shall set this field to the number of octets  
11                  included in the type-specific fields of this information record.

12   Type-specific fields    – Type-specific fields.

13                  The mobile station shall set these fields as specified in 2.7.4  
14                  for this type of record.

## 1    2.7.2.3.2.9 Origination Continuation Message

2    MSG\_TAG: ORCM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| DIGIT_MODE   | 1                    |
| NUM_FIELDS   | 8                    |

NUM\_FIELDS occurrences of the following field:

|       |        |
|-------|--------|
| CHARi | 4 or 8 |
|-------|--------|

Zero or more occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

- 5    DIGIT\_MODE    -    Digit mode indicator.  
 6         The mobile station shall set this field to the DIGIT\_MODE  
 7         value from the *Origination Message* for which this message is  
 8         a continuation.
- 9    NUM\_FIELDS    -    Number of dialed digits in this message.  
 10      The mobile station shall set this field to the number of dialed  
 11      digits included in this message.
- 12    CHARi    -    A dialed digit or character.  
 13      The mobile station shall include NUM\_FIELDS occurrences of  
 14      this field. The mobile station shall include occurrences of this  
 15      field for all dialed digits after those sent in the *Origination*  
 16      *Message* of which this message is a continuation. If the  
 17      DIGIT\_MODE field is set to '0', the mobile station shall set  
 18      each occurrence of this field to the code value shown in Table  
 19      2.7.1.3.2.4-4 corresponding to the dialed digit. If the  
 20      DIGIT\_MODE field is set to '1', the mobile station shall set  
 21      each occurrence of this field to the ASCII representation  
 22      corresponding to the dialed digit, as specified in [9], with the  
 23      most significant bit set to '0'.
- 24      If the MORE\_RECORDS field in the last *Origination Message*, of which this message is a  
 25      continuation, is set to '1', the mobile station shall include one or more occurrences of the  
 26      following three-field record; otherwise, the mobile station shall not include the following  
 27      record.
- 28    RECORD\_TYPE    -    Information record type.  
 29      The mobile station shall set this field to the record type value  
 30      shown in Table 2.7.4-1.

1                   The mobile station shall not include the record type for QoS  
2                   Parameters information record if MOB\_QOS<sub>S</sub> is equal to '0'.

- 3           RECORD\_LEN    – Information record length.  
4                         The mobile station shall set this field to the number of octets  
5                         in the type-specific fields included in this record.
- 6           Type-specific fields    – Type-specific fields.  
7                         The mobile station shall include type-specific fields as  
8                         specified in 2.7.4.

## 1    2.7.2.3.2.10 Handoff Completion Message

2    MSG\_TAG: HOCM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| LAST_HDM_SEQ | 2                    |

One or more occurrences of the following field:

|          |   |
|----------|---|
| PILOT_PN | 9 |
|----------|---|

4

- 5    LAST\_HDM\_SEQ    -    *Extended Handoff Direction Message, General Handoff  
6    Direction Message, or Universal Handoff Direction Message*  
7    sequence number.

8                         The mobile station shall set this field to the value of the  
9                         HDM\_SEQ field from the *Extended Handoff Direction Message,*  
10                        *General Handoff Direction Message,* or the *Universal Handoff  
11                        Direction Message* that determined the current Active Set.

- 12                       PILOT\_PN    -    Pilot PN sequence offset.

13                         The mobile station shall include one occurrence of this field  
14                         for each pilot in the current Active Set. The mobile station  
15                         shall set this field to the pilot PN sequence offset, relative to  
16                         the zero offset pilot PN sequence in units of 64 PN chips, for  
17                         this pilot. If the Active Set contains more than one pilot, the  
18                         mobile station shall include the pilot offsets in the same order  
19                         as in the *Extended Handoff Direction Message, the General  
20                        Handoff Direction Message, or the Universal Handoff Direction  
21                        Message* that determined the current Active Set.

## 1    2.7.2.3.2.11 Parameters Response Message

2    MSG\_TAG: PRSM

3

| Field                                            | Length (bits)             |
|--------------------------------------------------|---------------------------|
| One or more occurrences of the following record: |                           |
| PARAMETER_ID                                     | 16                        |
| PARAMETER_LEN                                    | 10                        |
| PARAMETER                                        | 0 or<br>PARAMETER_LEN + 1 |

4

5    The mobile station shall include one occurrence of the following three-field record for each  
6    occurrence of the PARAMETER\_ID field in the Forward Traffic Channel *Retrieve Parameters*  
7    *Message* to which this message is a response. See Annex E.

8    PARAMETER\_ID – Parameter identification.

9                 The mobile station shall set this field to the value of the  
10                PARAMETER\_ID field for this parameter from the *Retrieve*  
11                *Parameters Message* to which this message is a response.

12                PARAMETER\_LEN – Parameter length.

13                 The mobile station shall set this field to the length shown in  
14                Table E-1 corresponding to this PARAMETER\_ID.15                 If the mobile station is unable to return the value of this  
16                parameter, or if the parameter identification is unknown, the  
17                mobile station shall set this field to '1111111111'.

18                PARAMETER – Parameter value.

19                 The mobile station shall set this field equal to the value of the  
20                parameter shown in Table E-1 corresponding to the  
21                PARAMETER\_ID field of the record.22                 If the mobile station is unable to return the value of this  
23                parameter, or if the parameter identification is unknown, the  
24                mobile station shall omit this field.

1    2.7.2.3.2.12 Service Request Message

2    MSG\_TAG: SRQM

3

| Field        | Length (bits) |
|--------------|---------------|
| SERV_REQ_SEQ | 3             |
| REQ_PURPOSE  | 4             |

Zero or one occurrence of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    SERV\_REQ\_SEQ    -    Service request sequence number.

6                      The mobile station shall set this field to the service request  
7                      sequence number pertaining to this request message as  
8                      specified in 2.6.4.1.2.1.1.

9    REQ\_PURPOSE    -    Request purpose.

10                     The mobile station shall set this field to the appropriate  
11                     REQ\_PURPOSE code from Table 2.7.2.3.2.12-1 to indicate the  
12                     purpose of the message.

13                     **Table 2.7.2.3.2.12-1. REQ\_PURPOSE Codes**

| REQ_PURPOSE<br>(binary)                   | Meaning                                                                                  |
|-------------------------------------------|------------------------------------------------------------------------------------------|
| 0000                                      | Indicates that the purpose of the message is to accept a proposed service configuration. |
| 0001                                      | Indicates that the purpose of the message is to reject a proposed service configuration. |
| 0010                                      | Indicates that the purpose of the message is to propose a service configuration.         |
| All other REQ_PURPOSE codes are reserved. |                                                                                          |

14

15    If the REQ\_PURPOSE code is set to '0010', the mobile station shall include one occurrence  
16                      of the following three-field record to specify the proposed service configuration; otherwise,  
17                      the mobile station shall not include the following record:

18    RECORD\_TYPE    -    Information record type.

1                   The mobile station shall set this field to the record type value  
2                   shown in Table 2.7.4-1 corresponding to the Service  
3                   Configuration information record.

- 4           RECORD\_LEN     – Information record length.  
5                   The mobile station shall set this field to the number of octets  
6                   included in the type-specific fields of the Service Configuration  
7                   information record.
- 8           Type-specific fields     – Type-specific fields.  
9                   The mobile station shall set these fields as specified in 3.7.5.7  
10                  for the Service Configuration information record.

1    2.7.2.3.2.13 Service Response Message

2    MSG\_TAG: SRPM

3

| Field        | Length (bits) |
|--------------|---------------|
| SERV_REQ_SEQ | 3             |
| RESP_PURPOSE | 4             |

Zero or one occurrence of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    SERV\_REQ\_SEQ    -    Service request sequence number.

6                     The mobile station shall set this field to the value of the  
7                     SERV\_REQ\_SEQ field of the *Service Request Message* to which  
8                     it is responding.

9    RESP\_PURPOSE    -    Response purpose.

10                    The mobile station shall set this field to the appropriate  
11                    RESP\_PURPOSE code from Table 2.7.2.3.2.13-1 to indicate  
12                    the purpose of the message.

13

14

**Table 2.7.2.3.2.13-1. RESP\_PURPOSE Codes**

| RESP_PURPOSE<br>(binary)                   | Meaning                                                                                  |
|--------------------------------------------|------------------------------------------------------------------------------------------|
| 0000                                       | Indicates that the purpose of the message is to accept a proposed service configuration. |
| 0001                                       | Indicates that the purpose of the message is to reject a proposed service configuration. |
| 0010                                       | Indicates that the purpose of the message is to propose a service configuration.         |
| All other RESP_PURPOSE codes are reserved. |                                                                                          |

15

16    If the RESP\_PURPOSE field is set to '0010', the mobile station shall include one occurrence  
17    of the following record to specify the proposed service configuration; otherwise, the mobile  
18    station shall not include the following record:

- 1            RECORD\_TYPE    – Information record type.  
2                          The mobile station shall set this field to the record type value  
3                          shown in Table 2.7.4-1 corresponding to the Service  
4                          Configuration information record.
- 5            RECORD\_LEN    – Information record length.  
6                          The mobile station shall set this field to the number of octets  
7                          included in the type-specific fields of the Service Configuration  
8                          information record.
- 9            Type-specific fields    – Type-specific fields.  
10                          The mobile station shall set these fields as specified in 3.7.5.7  
11                          for the Service Configuration information record.

## 1    2.7.2.3.2.14 Service Connect Completion Message

2    MSG\_TAG: SCCM

3

| Field        | Length (bits) |
|--------------|---------------|
| RESERVED     | 1             |
| SERV_CON_SEQ | 3             |

4

5            RESERVED        Reserved bit.

6                              The mobile station shall set this field to '0'.

7            SERV\_CON\_SEQ    -    Service connect sequence number.

8                              The mobile station shall set this field to the value of the  
9                              SERV\_CON\_SEQ field of the *Service Connect Message* to which  
10                             it is responding.

## 1    2.7.2.3.2.15 Service Option Control Message

2    MSG\_TAG: SOCM

3

| <b>Field</b>         | <b>Length (bits)</b>            |
|----------------------|---------------------------------|
| CON_REF              | 8                               |
| SERVICE_OPTION       | 16                              |
| RESERVED             | 7                               |
| CTL_REC_LEN          | 8                               |
| Type-specific fields | $8 \times \text{CTL\_REC\_LEN}$ |

4

- 5            CON\_REF    - Service option connection reference.  
 6                         The mobile station shall set this field to the reference for the  
 7                         target service option (see 2.6.4.1.2).
- 8            SERVICE\_OPTION    - Service option.  
 9                         The mobile station shall set this field to the service option in  
 10                  use with the service option connection.
- 11            RESERVED    - Reserved bits.  
 12                         The mobile station shall set this field to '0000000'.
- 13            CTL\_REC\_LEN    - Control record length.  
 14                         The mobile station shall set this field to the number of octets  
 15                         included in the type-specific fields of this service option  
 16                         control record.
- 17            Type-specific fields    - Type-specific fields.  
 18                         The mobile station shall set these fields as specified by the  
 19                         requirements for the service option.

## 1    2.7.2.3.2.16 Status Response Message

2    MSG\_TAG: STRPM

3

| <b>Field</b>          | <b>Length (bits)</b>              |
|-----------------------|-----------------------------------|
| QUAL_INFO_TYPE        | 8                                 |
| QUAL_INFO_LEN         | 3                                 |
| Type-specific fields. | $8 \times \text{QUAL\_INFO\_LEN}$ |

One or more occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    QUAL\_INFO\_TYPE    – Qualification information type.  
6                         The mobile station shall set this field to the QUAL\_INFO\_TYPE  
7                         field in the corresponding *Status Request Message*.8    QUAL\_INFO\_LEN    – Qualification information length.  
9                         The mobile station shall set this field to the QUAL\_INFO\_LEN  
10                        field in the corresponding *Status Request Message*.11   Type-specific fields    – Type-specific fields.  
12                         The mobile station shall set these fields to the qualification  
13                         information in the corresponding *Status Request Message*.14   The mobile station shall include all the records requested in the corresponding *Status  
15   Request Message*. The mobile station shall include one occurrence of the following fields for  
16   each information record that is included:17      RECORD\_TYPE    – Information record type.  
18                         The mobile station shall set this field to the record type value  
19                         shown in Table 3.7.2.3.2.15-2 corresponding to the type of  
20                         this information record.21      RECORD\_LEN    – Information record length.  
22                         The mobile station shall set this field to the number of octets  
23                         included in the type-specific fields of this information record.24   Type-specific fields    – Type-specific fields.  
25                         The mobile station shall set these fields as specified in 2.7.4  
26                         for this type of record, according to the mobile station's  
27                         capabilities under the qualification information included in  
28                         this message.

- 1    2.7.2.3.2.17 TMSI Assignment Completion Message
- 2    MSG\_TAG: TACM
- 3    There are no Layer 3 fields associated with this message.

## 1 2.7.2.3.2.18 Supplemental Channel Request Message

2 MSG\_TAG: SCRM

3

| <b>Field</b>     | <b>Length (bits)</b>                  |
|------------------|---------------------------------------|
| SIZE_OF_REQ_BLOB | 4                                     |
| REQ_BLOB         | $8 \times \text{SIZE\_OF\_REQ\_BLOB}$ |
| USE_SCRM_SEQ_NUM | 1                                     |
| SCRM_SEQ_NUM     | 0 or 4                                |
| REF_PN           | 0 or 9                                |
| PILOT_STRENGTH   | 0 or 6                                |
| NUM_ACT_PN       | 0 or 3                                |

If NUM\_ACT\_PN is included, the mobile station shall include NUM\_ACT\_PN occurrences of the following record:

|                    |    |
|--------------------|----|
| ACT_PN_PHASE       | 15 |
| ACT_PILOT_STRENGTH | 6  |

|              |        |
|--------------|--------|
| NUM_NGHBR_PN | 0 or 3 |
|--------------|--------|

If NUM\_NGHBR\_PN is included, the mobile station shall include NUM\_NGHBR\_PN occurrences of the following record:

|                      |    |
|----------------------|----|
| NGHBR_PN_PHASE       | 15 |
| NGHBR_PILOT_STRENGTH | 6  |

|                    |        |
|--------------------|--------|
| REF_PILOT_REC_INCL | 0 or 1 |
| REF_PILOT_REC_TYPE | 0 or 3 |

(continues on next page)

1

| Field                | Length (bits)                      |
|----------------------|------------------------------------|
| REF_RECORD_LEN       | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

If NUM\_ACT\_PN is included, the mobile station shall include NUM\_ACT\_PN occurrences of the following record:

|                      |                                    |
|----------------------|------------------------------------|
| PILOT_REC_INCL       | 1                                  |
| PILOT_REC_TYPE       | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

If NUM\_NGHBR\_PN is included, the mobile station shall include NUM\_NGHBR\_PN occurrences of the following record:

|                      |                                    |
|----------------------|------------------------------------|
| PILOT_REC_INCL       | 1                                  |
| PILOT_REC_TYPE       | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

2

- 3      SIZE\_OF\_REQ\_BLOB    -    Size of the request information block of bytes (REQ\_BLOB).  
4                          The mobile station shall set this field to the number of bytes  
5                          in the Reverse Supplemental Code Channel or the Reverse  
6                          Supplemental Channel request block of bytes (REQ\_BLOB).
- 7      REQ\_BLOB    -    Reverse Supplemental Code Channel request block of bytes.  
8                          The mobile station shall include information in this field  
9                          containing the parameters that specify the characteristics of  
10                         the Reverse Supplemental Code Channels or the Reverse  
11                         Supplemental Channel request. The mobile station shall set  
12                         this field in accordance with the connected Service Option.
- 13     USE\_SCRM\_SEQ\_NUM    -    Use *Supplemental Channel Request Message* sequence number  
14                         indicator.  
15                          The mobile station shall set this field to '1' if the *Supplemental*  
16                         *Channel Request Message* sequence number is included in  
17                         this message; otherwise, the mobile station shall set this field  
18                         to '0'.
- 19     SCRM\_SEQ\_NUM    -    *Supplemental Channel Request Message* sequence number.

If USE\_SCRM\_SEQ\_NUM is set to '1', the mobile station shall set this field to the *Supplemental Channel Request Message* sequence number that the base station is to include in a *Supplemental Channel Assignment Message* or *Extended Supplemental Channel Assignment Message* which is in response to this message; otherwise, the mobile station shall omit this field.

REF\_PN - Time reference PN sequence offset.  
 If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PN sequence offset of the pilot used by the mobile station to derive its time reference, relative to the zero offset pilot PN sequence in units of 64 PN chips.

PILOT\_STRENGTH - Reference pilot strength.  
 If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

where PS is the strength of the pilot used by the mobile station to derive its time reference (see 2.1.5 of [2]), measured as specified in 2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ) is less than 0, the mobile station shall set this field to '000000'. If this value is greater than '111111', the mobile station shall set this field to '111111'.

NUM\_ACT\_PN - Number of reported pilots in the Active Set.  
 If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of reported pilots in the Active Set other than the pilot identified by the REF\_PN field.

If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following two-field record for each pilot in the Active Set other than the pilot identified by the REF\_PN field:

ACT\_PN\_PHASE - Active pilot measured phase.  
 The mobile station shall set this field to the phase of this pilot PN sequence relative to the zero offset pilot PN sequence, in units of one PN chip, as specified in 2.6.6.2.4.

ACT\_PILOT\_STRENGTH - Active pilot strength.  
 The mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

where PS is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ) is less than 0, the mobile station shall set this field to '000000'. If this value is greater than 63, the mobile station shall set this field to '111111'.

- NUM\_NGHBR\_PN** – Number of reported neighbor pilots in the Candidate Set and the Neighbor Set.

If SIZE\_OF\_REQ\_BLOB is set to '0000', the mobile station shall omit this field; otherwise, the mobile station shall set this field as follows:

The mobile station shall set this field to the number of reported pilots which are not in the Active Set and have measurable strength that exceeds ( $T_{ADD_s} - T_{MULCHAN_s}$ ). ( $NUM_{ACT\_PN} + NUM_{NGHBR\_PN}$ ) shall not exceed 8. If there are more than ( $8 - NUM_{ACT\_PN}$ ) pilots not in the Active Set with strength exceeding ( $T_{ADD_s} - T_{MULCHAN_s}$ ), the mobile station shall set  $NUM_{NGHBR\_PN}$  to ( $8 - NUM_{ACT\_PN}$ ) and report the  $NUM_{NGHBR\_PN}$  strongest pilots not in the Active Set.

If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following two-field record for each of the NUM\_NGHBR\_PN reported pilots.

- NGHBR\_PN\_PHASE – Neighbor pilot measured phase.

The mobile station shall set this field to the phase of this pilot PN sequence relative to the zero offset pilot PN sequence, in units of one PN chip, as specified in 2.6.6.2.4.

- NGHBR\_PILOT-

- \_STRENGTH – Neighbor pilot strength.

The mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

where PS is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value ( $-2 \times 10 \log_{10} PS$ ) is less than 0, the mobile station shall set this field to '000000'. If this value is greater than 63, the mobile station shall set this field to '111111'.

- REF\_PILOT\_REC\_INCL** – Additional pilot information included indicator.

If SIZE\_OF\_REQ\_BLOB is set to '0000', the mobile station shall omit this field; otherwise, the mobile station shall set include this field and set it as follows:

The mobile station shall set this field to '1' if additional reference pilot information listed in the REF\_PILOT\_REC\_TYPE and REF\_RECORD\_LEN fields are included. The mobile station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

- 1 REF\_PILOT\_REC\_TYPE – Reference pilot record type.  
 2 If REF\_PILOT\_REC\_INCL is included and set to ‘0’, the mobile  
 3 station shall omit this field. If REF\_PILOT\_REC\_INCL is  
 4 included and set to ‘1’, the mobile station shall set this field to  
 5 the REF\_PILOT\_REC\_TYPE value shown in Table 2.7.2.3.2.  
 6 3334-1 corresponding to the type of Pilot Record specified by  
 7 this record.
- 8 REF\_RECORD\_LEN – Pilot record length for the reference pilot.  
 9 If REF\_PILOT\_REC\_INCL is included and set to ‘0’, the mobile  
 10 station shall omit this field. If REF\_PILOT\_REC\_INCL is  
 11 included and set to ‘1’, the mobile station shall set this field to  
 12 the number of octets in the type-specific fields of this pilot  
 13 record.
- 14 Type-specific fields – Pilot record type-specific fields for the reference pilot.  
 15 If REF\_PILOT\_REC\_INCL is included and set to ‘0’, the mobile  
 16 station shall omit this field. If REF\_PILOT\_REC\_INCL is  
 17 included and set to ‘1’, the mobile station shall include type-  
 18 specific fields based on the REF\_PILOT\_REC\_TYPE of this pilot  
 19 record.

20  
 21 If REF\_PILOT\_REC\_TYPE is equal to ‘000’, the mobile station shall include the following  
 22 fields:

| Field        | Length (bits)         |
|--------------|-----------------------|
| QOF          | 2                     |
| WALSH_LENGTH | 3                     |
| PILOT_WALSH  | (WALSH_LENGTH +<br>6) |
| RESERVED     | 0 to 7 (as needed)    |

- 24  
 25 QOF – Quasi-orthogonal function index.  
 26 The mobile station shall set this field to the index of the  
 27 Quasi-orthogonal function of the corresponding Auxiliary  
 28 Pilot.  
 29 WALSH\_LENGTH – Length of the Walsh code for the reference pilot.  
 30 The mobile station shall set this field to the WALSH\_LENGTH  
 31 value shown in Table 2.7.2.3.2.343-2 corresponding to the  
 32 length of the Walsh code for the pilot that is used as the  
 33 Auxiliary Pilot.  
 34 PILOT\_WALSH – Walsh code for the Auxiliary Pilot used by the mobile station  
 35 to derive its time reference.

The mobile station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

- RESERVED** – Reserved bits.

The base station shall set all the bits of this field to '0' to make the entire record octet-aligned.

If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following record for each pilot in the Active Set other than the pilot identified by the REF\_PN field:

- PILOT\_REC\_INCL** – Additional pilot information included indicator.

The mobile station shall set this field to '1' if additional pilot information listed in the PILOT\_REC\_TYPE and RECORD\_LEN fields are included. The mobile station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

- PILOT\_REC\_TYPE** – Reference pilot record type.

If PILOT\_REC\_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PILOT\_REC\_TYPE value shown in Table-32.7.2.3.2.\_3334-1 corresponding to the type of Pilot Record specified by this record.

- RECORD\_LEN** – Pilot record length.

If PILOT\_REC\_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

- Type-specific fields – Pilot record type-specific fields.

If PILOT\_REC\_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include type-specific fields based on the PILOT\_REC\_TYPE of this pilot record as described in 3.7.6.1.

If SIZE\_OF\_REQ\_BLOB is set to '0000' and USE\_SCRM\_SEQ\_NUM is set to '0', the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following record for each of the NUM\_NGHR\_PN reported pilots.

- PILOT REC INCL – Additional pilot information included indicator.

The mobile station shall set this field to '1' if additional pilot information listed in the PILOT\_REC\_TYPE and RECORD\_LEN fields are included. The mobile station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

- PILOT\_REC\_TYPE** – Reference pilot record type.

1                   If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
2                   this field; otherwise, the mobile station shall set this field to  
3                   the PILOT\_REC\_TYPE value shown in Table 3.7.2.3.2.33-1  
4                   corresponding to the type of Pilot Record specified by this  
5                   record.

6           RECORD\_LEN    - Pilot record length.

7                   If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
8                   this field; otherwise, the mobile station shall set this field to  
9                   the number of octets in the type-specific fields of this pilot  
10                  record.

11           Type-specific fields    - Pilot record type-specific fields.

12                   If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
13                   this field; otherwise, the mobile station shall include type-  
14                   specific fields based on the PILOT\_REC\_TYPE of this pilot  
15                  record as described in 3.7.6.1.

16

## 1    2.7.2.3.2.19 Candidate Frequency Search Response Message

2    MSG\_TAG: CFSRSM

3

| <b>Field</b>       | <b>Length (bits)</b> |

| TOTAL_OFF_TIME_REV | 6                    |
| MAX_OFF_TIME_REV   | 6                    |
| PCG_OFF_TIMES      | 1                    |
| ALIGN_TIMING_USED  | 1                    |
| MAX_NUM_VISITS     | 0 or 5               |
| INTER_VISIT_TIME   | 0 or 6               |

4

5    LAST\_CFSRM\_SEQ   -   Candidate Frequency Search Request Message sequence  
6    number.7                         The mobile station shall set this field to the value of the  
8                         CFSRM\_SEQ field from the Candidate Frequency Search  
9                         Request Message to which this message is a response.10   TOTAL\_OFF\_TIME\_FWD   -   Total time that the mobile station is off the Forward Traffic  
11   Channel.12                         The mobile station shall set this field to the mobile station's  
13                         estimate of the total number of frames or power control  
14                         groups for which the mobile station will need to suspend its  
15                         current Forward Traffic Channel processing in order to tune to  
16                         the Candidate Frequency, to perform the requested search,  
17                         and to re-tune to the Serving Frequency. If the mobile station  
18                         requires multiple visits to the Candidate Frequency to  
19                         complete the requested search, the mobile station shall set  
20                         this field to the total number of frames (if PCG\_OFF\_TIME is  
21                         set to '0') or power control groups (if PCG\_OFF\_TIME is set to  
22                         '1') for all visits to the Candidate Frequency in a search  
23                         period.24   MAX\_OFF\_TIME\_FWD   -   Maximum time the mobile station is away from the Forward  
25                         Traffic Channel.

The mobile station shall set this field to the mobile station's estimate of the maximum number of frames (if PCG\_OFF\_TIME is set to '0') or power control groups (if PCG\_OFF\_TIME is set to '1') for which the mobile station will need to suspend its current Forward Traffic Channel processing during a visit to the Candidate Frequency, to perform a part of the requested search, and to re-tune to the Serving Frequency.

- TOTAL\_OFF\_TIME\_REV** – Total time that the mobile station is away from the Reverse Traffic Channel.

The mobile station shall set this field to the mobile station's estimate of the total number of frames or power control groups for which the mobile station will need to suspend its current Reverse Traffic Channel processing in order to tune to the Candidate Frequency, to perform the requested search, and to re-tune to the Serving Frequency. If the mobile station requires multiple visits to the Candidate Frequency to complete the requested search, the mobile station shall set this field to the total number of frames or power control groups for all visits to the Candidate Frequency in a search period.

- MAX\_OFF\_TIME\_REV** – Maximum time the mobile station is away from the Reverse Traffic Channel.

The mobile station shall set this field to the mobile station's estimate of the maximum number of frames or power control groups for which the mobile station will need to suspend its current Forward Traffic Channel processing during a visit to the Candidate Frequency, to perform a part of the requested search, and to re-tune to the Serving Frequency.

- PCG\_OFF\_TIMES** – Indicator if off times are expressed in units of power control groups.

If P\_REV\_IN\_USE<sub>s</sub> is less than six, the mobile station shall set this field to '0'; otherwise, the mobile station shall set this field as follows:

The mobile station shall set this field to '1' if it expresses TOTAL\_OFF\_TIME\_FWD, MAX\_OFF\_TIME\_FWD, TOTAL\_OFF\_TIME\_REV, and MAX\_OFF\_TIME\_REV in units of power control groups; otherwise, the mobile station shall set this field to '0' so that TOTAL\_OFF\_TIME\_FWD, MAX\_OFF\_TIME\_FWD, TOTAL\_OFF\_TIME\_REV, and MAX\_OFF\_TIME\_REV are expressed in units of frames.

- ALIGN\_TIMING\_USED** – Alignment timing used indicator.

The mobile station shall set this field to '1' if it will align the times of its visits away from the Serving Frequency, as requested by the base station; otherwise, the mobile station shall set this field to '0'.

- `MAX_NUM_VISITS` – Maximum number of visits per search period.

1           If the ALIGN\_TIMING\_USED field is set to '0', the mobile  
2           station shall omit this field; otherwise, the mobile station shall  
3           include this field and set it to the maximum number of visits  
4           per search period minus one.

- 5           INTER\_VISIT\_TIME   – Inter-visit time.  
6           If the mobile station includes the MAX\_NUM\_VISITS field and  
7           sets it to a value other than 0, the mobile station shall include  
8           this field and set it as described below; otherwise, the mobile  
9           station shall omit this field.

10          The mobile station shall set INTER\_VISIT\_TIME to

$$11 \quad \min ( 63, \lceil inter\_visit\_time / search\_time\_resolution \rceil )$$

12          where

13          *search\_time\_resolution* is equal to 0.02 if the mobile  
14          station sets PCG\_OFF\_TIMES to '0'; otherwise,  
15          *search\_time\_resolution* is equal to 0.00125,

16          and

17          *inter\_visit\_time* is the mobile station's estimate of the  
18          time, in seconds, between the beginning of consecutive  
19          visits away from the Serving Frequency.

## 1    2.7.2.3.2.20 Candidate Frequency Search Report Message

2    MSG\_TAG: CFSRPM

3

| <b>Field</b>         | <b>Length (bits)</b>     |
|----------------------|--------------------------|
| LAST_SRCH_MSG        | 1                        |
| LAST_SRCH_MSG_SEQ    | 2                        |
| SEARCH_MODE          | 4                        |
| MODE_SPECIFIC_LEN    | 8                        |
| Mode-specific fields | 8 ×<br>MODE_SPECIFIC_LEN |

4

5    LAST\_SRCH\_MSG    -    Indicator for the type of message that started the search being  
6    reported.7                         If this message is being sent to report the results of a single  
8                         search or a periodic search started by a *Candidate Frequency*  
9                         *Search Control Message* or by a *Candidate Frequency Search*  
10                       *Request Message*, the mobile station shall set this field to '0';  
11                       otherwise, the mobile station shall set this field to '1'.12    LAST\_SRCH\_MSG\_SEQ    -    Sequence number received in the message that started the  
13    search being reported.14                         If this message is being sent in response to a *Candidate*  
15                       *Frequency Search Control Message*, the mobile station shall set  
16                       this field to the value of the CFSCM\_SEQ field from the  
17                       *Candidate Frequency Search Control Message*.18                         If this message is being sent in response to a *Candidate*  
19                       *Frequency Search Request Message*, the mobile station shall  
20                       set this field to the value of the CFSRM\_SEQ field from the  
21                       *Candidate Frequency Search Request Message*.22                         If this message is being sent in response to a *General Handoff*  
23                       *Direction Message* or a *Universal Handoff Direction Message*,  
24                       the mobile station shall set this field to the value of the  
25                       HDM\_SEQ field from the *General Handoff Direction Message* or  
26                       the *Universal Handoff Direction Message*.

27    SEARCH\_MODE    -    Search mode.

28                         The mobile station shall set this field to the SEARCH\_MODE  
29                       value shown in Table 3.7.3.3.2.27-2 corresponding to the type  
30                       of search specified by the *Candidate Frequency Search Request*  
31                       *Message* that specified the search parameters.

32    MODE\_SPECIFIC\_LEN    -    Length of mode-specific fields included in this message.

33    Mode-specific fields    -    Search mode-specific fields.

1           The mobile station shall include mode-specific fields based on  
 2           the SEARCH\_MODE of this message.

3       If SEARCH\_MODE is equal to '0000', the mobile station shall include the following fields:

4

| Field           | Length (bits) |
|-----------------|---------------|
| BAND_CLASS      | 5             |
| CDMA_FREQ       | 11            |
| SF_TOTAL_RX_PWR | 5             |
| CF_TOTAL_RX_PWR | 5             |
| NUM_PILOTS      | 6             |

NUM\_PILOTS occurrences of the following record:

|                |    |
|----------------|----|
| PILOT_PN_PHASE | 15 |
| PILOT_STRENGTH | 6  |
| RESERVED_1     | 3  |

NUM\_PILOTS occurrences of the following record:

|                      |                                    |
|----------------------|------------------------------------|
| PILOT_REC_INCL       | 1                                  |
| PILOT_REC_TYPE       | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

5

6

BAND\_CLASS - Band class.

7

8

9

10

11

12

13

14

If this message is being sent to report an unsuccessful hard handoff attempt, the mobile station shall set this field to the CDMA band class corresponding to the CDMA Frequency Assignment for the Target Frequency, as specified in [30]. If this message is being sent to report measurements on a Candidate Frequency, the mobile station shall set this field to the CDMA band class corresponding to the CDMA Frequency Assignment for the Candidate Frequency, as specified in [30].

15

CDMA\_FREQ - Frequency assignment.

16

17

18

19

20

21

22

23

24

25

If this message is being sent to report an unsuccessful hard handoff attempt, the mobile station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA Frequency Assignment for the Target Frequency, as specified in 3.1.1.1 of [2]. If this message is being sent to report measurements on a Candidate Frequency, the mobile station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA Frequency Assignment for the Candidate Frequency, as specified in 3.1.1.1 of [2].

- 1 SF\_TOTAL\_RX\_PWR – Total received power on the Serving Frequency.  
 2 The mobile station shall set this field to  
 3  $\min(31, \lceil (10 \times \log_{10}(\text{total\_received\_power}) + 110) / 2 \rceil)$   
 4 where *total\_received\_power* is the mean input power received  
 5 by the mobile station on the Serving Frequency, in mW/1.23  
 6 MHz.

- 7 CF\_TOTAL\_RX\_PWR – Indicates the total received power on the Target Frequency or  
 8 the Candidate Frequency.  
 9 If this message is being sent to report an unsuccessful hard  
 10 handoff attempt, the mobile station shall include the total  
 11 received power on the Target Frequency; if this message is  
 12 being sent to report measurements on a Candidate Frequency,  
 13 the mobile station shall include the total received power on  
 14 the Candidate Frequency.

15 The mobile station shall set this field to

$$16 \min(31, \lceil (10 \times \log_{10}(\text{total\_received\_power}) + 110) / 2 \rceil)$$

17 where *total\_received\_power* is the mean input power received  
 18 by the mobile station on the Target Frequency or the  
 19 Candidate Frequency, in mW/1.23 MHz.

- 20 NUM\_PILOTS – Number of pilots.

21 The mobile station shall set this field to the number of pilots  
 22 included in this message. The mobile station shall set this  
 23 field to a value from 0 to N<sub>8m</sub>, inclusive.

24  
 25 The mobile station shall include NUM\_PILOTS occurrences of the following three-field  
 26 record:

- 27 PILOT\_PN\_PHASE – Pilot measured phase.

28 The mobile station shall set this field to the phase of the pilot  
 29 PN sequence relative to the zero offset pilot PN sequence of  
 30 this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

- 31 PILOT\_STRENGTH – Pilot strength.

32 The mobile station shall set this field to

$$33 \lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

34 where PS is the strength of this pilot, measured as specified in  
 35 2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} PS \rfloor$ ) is less than 0, the  
 36 mobile station shall set this field to '000000'. If this value is  
 37 greater than 63, the mobile station shall set this field to  
 38 '111111'.

- 39 RESERVED\_1 – Reserved bits.

40 The mobile station shall set this field to '000'.

1 The mobile station shall include NUM\_PILOTS occurrences of the following record in the  
 2 same order as the pilots listed above.

3 PILOT\_REC\_INCL – Additional pilot information included indicator.

4 The mobile station shall set this field to ‘1’ if additional pilot  
 5 information listed in the PILOT\_REC\_TYPE and RECORD\_LEN  
 6 fields are included. The mobile station shall set this field to ‘0’  
 7 if the corresponding pilot is the common pilot and there is no  
 8 additional pilot information included.

9 PILOT\_REC\_TYPE – Reference Pilot record type

10 If PILOT\_REC\_INCL is set to ‘0’, the mobile station shall omit  
 11 this field; otherwise, the mobile station shall set this field to  
 12 the PILOT\_REC\_TYPE value shown in Table 2.7.2.3.2.3.43-1  
 13 corresponding to the type of Pilot Record specified by this  
 14 record.

15 RECORD\_LEN – Pilot record length.

16 If PILOT\_REC\_INCL is set to ‘0’, the mobile station shall omit  
 17 this field; otherwise, the mobile station shall set this field to  
 18 the number of octets in the type-specific fields of this pilot  
 19 record.

20 Type-specific fields – Pilot record type-specific fields.

21 If PILOT\_REC\_INCL is set to ‘0’, the mobile station shall omit  
 22 this field; otherwise, the mobile station shall include type-  
 23 specific fields based on the PILOT\_REC\_TYPE of this pilot  
 24 record as described in 3.7.6.1.

25 If SEARCH\_MODE is equal to ‘0001’, the mobile station shall include the following fields:

| Field            | Length (bits) |
|------------------|---------------|
| BAND_CLASS       | 5             |
| SF_TOTAL_RX_PWR  | 5             |
| NUM_ANALOG_FREQS | 3             |
| RESERVED_2       | 5             |

26 NUM\_ANALOG\_FREQS occurrences of the following record:

|                 |    |
|-----------------|----|
| ANALOG_FREQ     | 11 |
| SIGNAL_STRENGTH | 6  |

|            |                   |
|------------|-------------------|
| RESERVED_3 | 0 - 7 (as needed) |
|------------|-------------------|

27 BAND\_CLASS – Band class.

28 The mobile station shall set this field to the CDMA band class  
 29 corresponding to the analog frequencies that are being  
 30 reported in this message, as specified in [30].  
 31  
 32

- 1 SF\_TOTAL\_RX\_PWR – Indicates the total received power on the Serving Frequency.  
 2 The mobile station shall set this field to  
 3  $\min(31, \lceil (10 \times \log_{10}(\text{total\_received\_power}) + 110) / 2 \rceil)$   
 4 where *total\_received\_power* is the mean input power received  
 5 by the mobile station on the Serving Frequency, in mW/1.23  
 6 MHz.
- 7 NUM\_ANALOG\_FREQS – Number of analog frequencies.  
 8 The base station shall set this field to the number of analog  
 9 frequencies included in this message.
- 10 RESERVED\_2 – Reserved bits.  
 11 The mobile station shall set this field to '00000'.
- 12 |  
 13 The message will include NUM\_ANALOG\_FREQS occurrences of the following [three](#)[two](#)-field  
 14 record, one for each neighbor on the candidate frequency.
- 15 | ANALOG\_FREQ – Analog frequency channel number.  
 16 | The base station shall set this field analog frequency channel  
 17 | number to search.
- 18 | SIGNAL\_STRENGTH – Signal strength.  
 19 | The mobile station shall set this field to  
 20 |  $\lfloor -0.5 \times SS \rfloor$ ,  
 21 | where SS is the strength of this signal, measured in dBm as  
 22 | specified in 2.6.6.2.10.3. If this value ( $\lfloor -0.5 \times SS \rfloor$ ) is less  
 23 | than 0, the mobile station shall set this field to '000000'. If  
 24 | this value is greater than 63, the mobile station shall set this  
 25 | field to '111111'.
- 26 |  
 27 | RESERVED\_3 – The mobile station shall add reserved bits as needed in order  
 28 | to make the length of the entire [message-record](#) equal to an  
 29 | integer number of octets. The mobile station shall set each of  
 30 | these bits to '0'.

## 1 2.7.2.3.2.21 Periodic Pilot Strength Measurement Message

2 MSG\_TAG: PPSMM

3

| Field          | Length (bits) |
|----------------|---------------|
| REF_PN         | 9             |
| PILOT_STRENGTH | 6             |
| KEEP           | 1             |
| SF_RX_PWR      | 5             |
| NUM_PILOT      | 4             |

NUM\_PILOT occurrences of the following record:

|                |    |
|----------------|----|
| PILOT_PN_PHASE | 15 |
| PILOT_STRENGTH | 6  |
| KEEP           | 1  |

NUM\_PIOT\$ occurrences of the following record:

|                      |                                    |
|----------------------|------------------------------------|
| PILOT_REC_INCL       | 1                                  |
| PILOT_REC_TYPE       | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

|                     |        |
|---------------------|--------|
| SETPT_INCL          | 1      |
| FCH_INCL            | 0 or 1 |
| FPC_FCH_CURR_SETPT  | 0 or 8 |
| DCCH_INCL           | 0 or 1 |
| FPC_DCCH_CURR_SETPT | 0 or 8 |
| NUM_SUP             | 0 or 2 |

If NUM\_SUP is included, include NUM\_SUP occurrences of the following fields:

|                    |   |
|--------------------|---|
| SCH_ID             | 1 |
| FPC_SCH_CURR_SETPT | 8 |

4

5

REF\_PN - Time reference PN sequence offset.

1                   The mobile station shall set this field to the PN sequence offset  
 2                   of the pilot used by the mobile station to derive its time  
 3                   reference, relative to the zero offset pilot PN sequence in units  
 4                   of 64 PN chips.

5           PILOT\_STRENGTH - Pilot strength.

6                   The mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

8                   where PS is the strength of the pilot used by the mobile  
 9                   station to derive its time reference (see [2]), measured as  
 10                  specified in 2.6.6.2.2. If this value is less than 0, the mobile  
 11                  station shall set this field to '000000'. If this value is greater  
 12                  than '111111', the mobile station shall set this field to  
 13                  '111111'.

14           KEEP - Keep pilot indicator.

15                   If the handoff drop timer (see 2.6.6.2.3) corresponding to the  
 16                   pilot used by the mobile station to derive its time reference  
 17                   (see [2]) has expired, the mobile station shall set this field to  
 18                   '0'; otherwise, the mobile station shall set this field to '1'.

19           SF\_RX\_PWR - The received power spectral density of the Serving Frequency.

20                   The mobile station shall set this field to

$$\min (31, \lceil (10 \times \log_{10}(spec\_density) + 120) / 2 \rceil)$$

22                   where *spec\_density* is the mobile station received power  
 23                   spectral density of the Serving Frequency, in mW/1.23MHz.

24                   If this value is less than 0, the mobile station shall set this  
 25                   field to '00000'.

26           NUM\_PILOT - Number of Pilots.

27                   The mobile station shall set this field to the number of other  
 28                   reported pilots of the Active Set and the Candidate Set.

30                   The mobile station shall include NUM\_PILOT occurrences of the following three-field record,  
 31                   one for each pilot in the Active Set and one for each pilot in the Candidate Set, other than  
 32                   the pilot identified by the REF\_PN field.

33           PILOT\_PN\_PHASE - Pilot measured phase.

34                   The mobile station shall set this field to the phase of the pilot  
 35                   PN sequence relative to the zero offset pilot PN sequence of  
 36                   this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

37           PILOT\_STRENGTH - Pilot strength.

38                   The mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

1 where PS is the strength of this pilot, measured as specified in  
 2 2.6.6.2.2. If this value is less than 0, the mobile station shall  
 3 set this field to '000000'. If this value is greater than  
 4 '111111', the mobile station shall set this field to '111111'.

- 5           KEEP    - Keep pilot indicator.  
 6                 If the handoff drop timer (see 2.6.6.2.3) corresponding to this  
 7 pilot has expired, the mobile station shall set this field to '0';  
 8 otherwise, the mobile station shall set this field to '1'.

9 The mobile station shall include NUM\_PILOTS occurrences of the following record in the  
 10 same order as the pilots listed above.

- 11          PILOT\_REC\_INCL - Additional pilot information included indicator.  
 12                 The mobile station shall set this field to '1' if additional pilot  
 13 information listed in the PILOT\_REC\_TYPE and RECORD\_LEN  
 14 fields are included. The mobile station shall set this field to '0'  
 15 if the corresponding pilot is the common pilot and there is no  
 16 additional pilot information included.
- 17          PILOT\_REC\_TYPE - Reference Pilot record type  
 18                 If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
 19 this field; otherwise, the mobile station shall set this field to  
 20 the PILOT\_REC\_TYPE value shown in Table 2.7.2.3.2.34-1  
 21 corresponding to the type of Pilot Record specified by this  
 22 record.
- 23          RECORD\_LEN - Pilot record length.  
 24                 If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
 25 this field; otherwise, the mobile station shall set this field to  
 26 the number of octets in the type-specific fields of this pilot  
 27 record.
- 28          Type-specific fields - Pilot record type-specific fields.  
 29                 If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
 30 this field; otherwise, the mobile station shall include type-  
 31 specific fields based on the PILOT\_REC\_TYPE of this pilot  
 32 record as described in 2.7.2.3.2.34.
- 33          SETPT\_INCL - Setpoint information included indicator.  
 34                 The mobile station shall set this field to '1' if setpoint  
 35 information is included in this message; otherwise, the mobile  
 36 station shall set this field to '0'.
- 37          FCH\_INCL - Fundamental Channel included indicator.  
 38                 If SETPT\_INCL is equal to '1', the mobile station shall include  
 39 this field and set it as follows; otherwise, the mobile station  
 40 shall omit this field.  
 41                 The mobile station shall set this field to '1' if FPC\_PRI\_CHAN<sub>s</sub>  
 42 is equal to '0'; otherwise, the mobile station shall set this field  
 43 to '0'.

- 1                   FPC\_FCH-
- 2                \_CURR\_SETPT - The outer loop  $E_b/N_t$  setpoint of the Fundamental Channel.
- 3                   If SETPT\_INCL is equal to '1' and if FCH\_INCL is set to '1', the  
4                   mobile station shall set this field to the value of the  $E_b/N_t$   
5                   setpoint, in units of 0.125 dB, currently in use in the  
6                   Fundamental Channel power control outer loop estimation;  
7                   otherwise, the mobile station shall omit this field.
- 8                DCCH\_INCL - Dedicated Control Channel included indicator.
- 9                   If SETPT\_INCL is equal to '1', the mobile station shall include  
10                  this field and set it as follows; otherwise, the mobile station  
11                  shall omit this field.
- 12                  The mobile station shall set this field to '1' if FPC\_PRI\_CHANs  
13                  is equal to '1'; otherwise, the mobile station shall set this field  
14                  to '0'.
- 15                   FPC\_DCCH-
- 16                \_CURR\_SETPT - The outer loop  $E_b/N_t$  setpoint of the Forward Dedicated  
17                  Channel.
- 18                   If SETPT\_INCL is equal to '1', and if DCCH\_INCL is set to '1',  
19                  the mobile station shall set this field to the value of the  $E_b/N_t$   
20                  setpoint, in units of 0.125 dB, currently in use in the  
21                  Dedicated Channel power control outer loop estimation;  
22                  otherwise, the mobile station shall omit this field.
- 23                NUM\_SUP - The number of Supplemental Channels.
- 24                   If SETPT\_INCL is equal to '1', the mobile station shall include  
25                  this field and set it as follows; otherwise, the mobile station  
26                  shall omit this field.
- 27                  The mobile station shall set this field to the total number of  
28                  the Supplemental Channels reported by this message.
- 29                  The mobile station shall include NUM\_SUP occurrences of the following two fields:
- 30                SCH\_ID - The Supplemental Channel index.
- 31                   The mobile station shall set this field to the Supplemental  
32                  Channel index to indicate the Forward Supplemental Channel  
33                  that is to be reported.
- 34                   FPC\_SCH-
- 35                \_CURR\_SETPT - The supplemental channel outer loop  $E_b/N_t$  setpoint.
- 36                   The mobile station shall set this field to the value of the power  
37                  control outer loop  $E_b/N_t$  setpoint, in units of 0.125 dB,  
38                  currently in use in the Channel specified by SCH\_ID.

## 1    2.7.2.3.2.22 Outer Loop Report Message

2    MSG\_TAG: OLRM

3

| <b>Field</b>        | <b>Length (bits)</b> |
|---------------------|----------------------|
| FCH_INCL            | 1                    |
| FPC_FCH_CURR_SETPT  | 0 or 8               |
| DCCH_INCL           | 1                    |
| FPC_DCCH_CURR_SETPT | 0 or 8               |
| NUM_SUP             | 2                    |

Include NUM\_SUP occurrences of the following fields:

|                    |   |
|--------------------|---|
| SCH_ID             | 1 |
| FPC_SCH_CURR_SETPT | 8 |

4

5    FCH\_INCL

- Fundamental Channel included indicator.

6    The mobile station shall set this field to '1' if  
 7    CURR\_FCH\_SETPT—FPC\_FCH\_CURR\_SETPT is included; |  
 8    otherwise the mobile station shall set this field to '0'. |

9    FPC\_FCH-  
 10   \_CURR\_SETPT

- The outer loop  $E_b/N_t$  setpoint of the Fundamental Channel.

11   If FCH\_INCL is set to '1', the mobile station shall set this field to the value of the  $E_b/N_t$  setpoint, in units of 0.125 dB,  
 12   currently in use in the Fundamental Channel power control  
 13   outer loop estimation; otherwise, the mobile station shall omit  
 14   this field.  
 15

16   DCCH\_INCL

- Dedicated Control Channel included indicator.

17   The mobile station shall set this field to '1' if the  
 18   CURR\_DCCH\_SETPT—FPC\_DCCH\_CURR\_SETPT field is |  
 19   included; otherwise the mobile station shall set this field to '0'. |

20   FPC\_DCCH-  
 21   \_CURR\_SETPT

- The outer loop  $E_b/N_t$  setpoint of the Forward Dedicated Channel.

23   If DCCH\_INCL is set to '1', the mobile station shall set this  
 24   field to the value of the  $E_b/N_t$  setpoint, in units of 0.125 dB,  
 25   currently in use in the Dedicated Channel power control outer  
 26   loop estimation; otherwise, the mobile station shall omit this  
 27   field.  
 27

1           NUM\_SUP    – The number of Supplemental Channels.  
2                         The mobile station shall set this field to the total number of  
3                         the Supplemental Channels reported by this message.

4     The mobile station shall in NUM\_SUP occurrences of the following two fields:

5           SCH\_ID    – The Supplemental Channel index.

6                         The mobile station shall set this field to the Supplemental  
7                         Channel index to indicate the Forward Supplemental Channel  
8                         that to be reported

9           FPC\_SCH-

10          \_CURR\_SETPT – The supplemental outer loop  $E_b/N_t$  setpoint.

11                         The mobile station shall set this field to the value of the power  
12                         control outer loop  $E_b/N_t$  setpoint, in units of 0.125 dB,  
13                         currently in use in the Channel specified by SCH\_ID.

1    2.7.2.3.2.27 Pilot Strength Measurement Mini Message

2    MSG\_TAG: PSMMM

3

| Field          | Length (bits) |
|----------------|---------------|
| PSMM_POS       | 3             |
| PILOT_STRENGTH | 6             |
| RANK           | 3             |

4

5    PSMM\_POS    - *Pilot Strength Measurement Message position.*

6                 The mobile station shall set this field to an index  
 7                 corresponding to the position, within the last sent *Pilot*  
 8                 *Strength Measurement Message* (see 2.7.2.3.2.5) or *Extended*  
 9                 *Pilot Strength Measurement Message* (see 2.7.2.3.2.3<sup>43</sup>), of the  
 10               Active-Set pilot whose strength is being reported. The mobile  
 11               station shall use a value of 0 to report the pilot represented by  
 12               the REF\_PN field in the last sent *Pilot Strength Measurement*  
 13               *Message* or *Extended Pilot Strength Measurement Message*.  
 14               The mobile station shall use a value of n, where n is an  
 15               integer greater than 0, to report the pilot represented by the  
 16               n<sup>th</sup> occurrence of the PILOT\_PN\_PHASE field in the last sent  
 17               *Pilot Strength Measurement Message* or *Extended Pilot Strength*  
 18               *Measurement Message*.

19    PILOT\_STRENGTH    - Pilot strength.

20                 The mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

22                 where PS is the strength of this Active-Set pilot, measured as  
 23                 specified in [2]. If this value is less than 0, the mobile station  
 24               shall set this field to '000000'. If this value is greater than  
 25               '111111', the mobile station shall set this field to '111111'.

26    RANK    - Rank order.

27                 The mobile station shall set this field to the rank order of the  
 28               pilot whose strength is being reported, relative to all other  
 29               pilots in the current Active Set. The mobile station shall use a  
 30               value of 0 to report the strongest pilot in the current Active  
 31               Set.

1    2.7.2.3.2.28 Supplemental Channel Request Mini Message

2    MSG\_TAG: SCRMM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| REQ_BLOB     | 16                   |

4

5    REQ\_BLOB    -    Reverse Supplemental Channel request block of bytes.

6                 The mobile station shall include information in this field  
7                 containing the parameters that specify the characteristics of  
8                 the Reverse Supplemental Channels request. The mobile  
9                 station shall set this field in accordance with the connected  
10          Service Options.

## 1    2.7.2.3.2.29 Resource Release Request Message

2    MSG\_TAG: RRRM

3

| <b>Order-Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| GATING_DISCONNECT_IND       | 1                    |
| CON_REF                     | 0 or 8               |
| PURGE_SERVICE               | 0 or 1               |

4

5

GATING-

6

\_DISCONNECT\_IND

- Reverse pilot gating or service disconnect indicator.  
If the mobile station requests that reverse pilot gating operation to be performed, the mobile station shall set this field to '1'; otherwise (if the mobile station requests that the service option connection specified by CON\_REF to be released), the mobile station shall set this field to '0'.

12

CON\_REF

- Connection reference.  
If the GATING\_DISCONNECT\_IND field is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

16

17

18

The mobile station shall set this field to the connection reference corresponding to the service option connection that is requested to be released.

19

PURGE\_SERVICE

- Purge service instance indicator.  
If the GATING\_DISCONNECT\_IND field is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:  
If the packet data service instance identified by CON\_REF has been inactivated, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

## 1    2.7.2.3.2.30 Resource Release Request Mini Message

2    MSG\_TAG: RRRMM

3

| <b>Order-Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| GATING_DISCONNECT_IND       | 1                    |
| CON_REF                     | 0 or 8               |
| PURGE_SERVICE               | 0 or 1               |

4

- 5                    GATING-
- 6    \_DISCONNECT\_IND   - Reverse pilot gating or service disconnect indicator.  
 7                    If the mobile station requests that reverse pilot gating  
 8                    operation to be performed, the mobile station shall set this  
 9                    field to '1'; otherwise (if the mobile station requests that the  
 10                  service option connection specified by CON\_REF to be  
 11                  released), the mobile station shall set this field to '0'.
- 12                  CON\_REF   - Connection reference.  
 13                  If the GATING\_DISCONNECT\_IND field is set to '1', the mobile  
 14                  station shall omit this field; otherwise, the mobile station shall  
 15                  include this field and set it as follows:  
 16                  The mobile station shall set this field to the connection  
 17                  reference corresponding to the service option connection that  
 18                  is requested to be released.
- 19                  PURGE\_SERVICE   - Purge service instance indicator.  
 20                  If the GATING\_DISCONNECT\_IND field is set to '1', the mobile  
 21                  station shall omit this field; otherwise, the mobile station shall  
 22                  include this field and set it as follows:  
 23                  If the packet data service instance identified by CON\_REF has  
 24                  been inactivated, the mobile station shall set this field to '1';  
 25                  otherwise, the mobile station shall set this field to '0'.

1    2.7.2.3.2.31 User Zone Update Request Message

2    MSG\_TAG: UZURM

3

| Field | Length (bits) |
|-------|---------------|
| UZID  | 16            |

4

5    UZID    -    User Zone identifiers.

6                 The mobile station shall set this field to the UZID<sub>S</sub>.

7

## 1 2.7.2.3.2.32 Enhanced Origination Message

## 2 MSG\_TAG: EOM

|-------------|--------|
| DIGIT_MODE  | 0 or 1 |
| NUMBER_TYPE | 0 or 3 |
| NUMBER_PLAN | 0 or 4 |
| NUM_FIELDS  | 0 or 8 |

NUM\_FIELDS occurrences of the following field:

|       |        |
|-------|--------|
| CHARi | 4 or 8 |
|-------|--------|

|          |   |
|----------|---|
| NUM_RECS | 5 |
|----------|---|

NUM\_RECS occurrences of the following three-field records:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

2

3 TAG – Transaction identifier.

4 The mobile station shall set this field to the identifier for this  
5 transaction.

6 CH\_IND – Channel indicator.

7 The mobile station shall set this field as shown in Table  
8 2.7.2.3.2.32-1, to request physical resources.

1

**Table 2.7.2.3.2.32-1. Channel Indicator**

| <b>CH_IND<br/>(binary)</b> | <b>Channel(s) Requested</b>                               |
|----------------------------|-----------------------------------------------------------|
| 000                        | No additional channels requested.                         |
| 001                        | Fundamental Channel.                                      |
| 010                        | Dedicated Control Channel.                                |
| 011                        | Reserved.                                                 |
| 100                        | Continuous Reverse Pilot Channel.                         |
| 101                        | Fundamental Channel and Continuous Reverse Pilot Channel. |
| 110                        | Reserved.                                                 |
| 111                        | Reserved.                                                 |

2

- 3           SR\_ID    – Service reference identifier.  
 4           If the service instance provides a service reference identifier,  
 5           the mobile station shall set this field to the service reference  
 6           identifier specified by the service instance. If the service  
 7           instance does not provide a service reference identifier, the  
 8           mobile station shall set this field to the smallest unused  
 9           service reference identifier value between 1 and 6 (inclusive).

10           GLOBAL-

- 11           \_EMERGENCY\_CALL – Global emergency call indicator.  
 12           The mobile station shall set this field to ‘1’, if the mobile  
 13           station recognizes that this is an emergency call; otherwise,  
 14           the mobile station shall set this field to ‘0’.

15           MS\_INIT\_POS\_LOC\_IND – Mobile Initiated Position Location Session indicator.

16           If the GLOBAL\_EMERGENCY\_CALL field is set to ‘0’, the  
 17           mobile station shall omit this field; otherwise, the mobile  
 18           station shall include this field and shall set it as follows:

19           The mobile station shall set this field to ‘1’ if MS\_INIT\_POS\_LOC\_SUP\_IND<sub>S</sub> is equal to ‘1’ and if the mobile  
 20           station is to initiate a position location session associated with  
 21           this emergency call; otherwise, the mobile station shall set  
 22           this field to ‘0’.

23

- 1           ENC\_INFO\_INCL   – Encryption fields included.  
 2  
 3  
 4  
 5  
 6  
 7  
 8  
 9
- 10          UI\_ENCRYPT\_REQ   – Request for user information encryption on the traffic channel indicator.  
 11  
 12  
 13  
 14  
 15  
 16
- 17          UI\_ENCRYPT\_SUP   – User information Encryption supported indicator.  
 18  
 19  
 20  
 21  
 22
- 23  
 24
- 25  
 26  
 27  
 28
- 29  
 30
- 31          SERVICE\_OPTION   – Requested service option for this origination.  
 32  
 33
- 34          MORE\_SO\_INFO\_INCL   – More service option information included.  
 35  
 36  
 37
- 38  
 39  
 40  
 41  
 42  
 43
- The mobile station shall set this field to ‘1’ if the encryption related fields are included; otherwise the mobile station shall set this field to ‘0’. The mobile station shall set this field to ‘1’ if it is unable to determine the base station support for encryption. The mobile station shall set this field to ‘0’ if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.
- If ENC\_INFO\_INCL is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request user information encryption, and to ‘0’ to request no user information encryption.
- If ENC\_INFO\_INCL is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.
- This field consists of the subfields shown in Table 2.7.1.3.2.4-9.
- The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.
- The mobile station shall set the RESERVED subfield to ‘0000000’.
- The mobile station shall set this field to the value specified in [30], corresponding to the requested service option.
- If MAX\_NUM\_ALT\_SO<sub>s</sub> is equal to ‘000’, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field as follows:
- If any alternate service option number or/and service option bitmap is to be included in this message, the mobile station shall set this field to ‘1’, otherwise, the mobile station shall set this field to ‘0’. In other words, MORE\_SO\_INFO\_INCL is set to ‘1’, if NUM\_ALT\_SO is included and not set to ‘000’ or/and SO\_BITAMP\_IND is included and not set to ‘00’.

1           NUM\_ALT\_SO   – Number of alternative service options.

2                             If MORE\_SO\_INFO\_INCL is set to ‘0’, the mobile station shall  
 3                             omit this field; otherwise, the mobile station shall set this field  
 4                             to the number of supported alternative service options which  
 5                             either have no service option group number assigned or do not  
 6                             belong to the same service option group whose bitmap is  
 7                             include in the message.

8           The mobile station shall include NUM\_ALT\_SO occurrences of the following field:

9           ALT\_SO   – Alternative service option.

10                             The mobile station shall set this field to the value specified in  
 11                             [30], corresponding to the alternative service option supported  
 12                             by the mobile station. These alternate service options are  
 13                             either have not service option group number assigned or do  
 14                             not belong to the same service option group whose bitmap is  
 15                             included in this message.

16           SO\_BITMAP\_IND   – SO bitmap indicator.

17                             If MORE\_SO\_INFO\_INCL is set to ‘0’, the mobile station shall  
 18                             omit this field; otherwise, the mobile station shall include this  
 19                             field and set it as defined in Table 2.7.1.3.2.4-10.

20           SO\_GROUP\_NUM   – Service option group number.

21                             If the field SO\_BITMAP\_IND is included and not set to ‘00’, the  
 22                             mobile station shall include this field and set this field to the  
 23                             service option group number of which the bitmap is to be  
 24                             included; otherwise, the mobile station shall omit this field.

25           SO\_BITMAP   – Service option bitmap.

26                             If the field SO\_BITMAP\_IND is included and not set to ‘00’, the  
 27                             mobile station shall include the bitmap of size  $4 \times$   
 28                             SO\_BITMAP\_IND bits of the service option group number  
 29                             (SO\_GROUP\_NUM); otherwise, the mobile station shall omit  
 30                             this field;

31                             When the service option bitmap is included, if there are more  
 32                             than  $(4 \times \text{SO_BITMAP\_IND})$  service options defined for the  
 33                             service option group, the mobile station shall include the  
 34                             bitmap containing the least significant bits  $(4 \times$   
 35                             SO\_BITMAP\_IND) of the service option group.

36                             The mobile station shall set abit in this bitmap to ‘1’, if the  
 37                             mobile station is capable of supporting the SO for which this  
 38                             bit represents; otherwise, the mobile station shall set a bit in  
 39                             this bitmap to ‘0’.

40           DRS   – Data ready to send indicator.

The mobile station shall set this field to '1' if it is requesting a packet data service option and it has data to send; otherwise, the mobile station shall set this field to '0'.

- 4 PREV\_SID\_INCL - Previous System Identification (SID) included indicator.  
5  
6 The mobile station shall set this field to '1' if the mobile  
7 station determines that the SID has been changed after a  
8 packet data dormant handoff and the PREV\_SID field is  
9 included in this message; otherwise, the mobile station shall  
set this field to '0'.  
10 PREV\_SID - Previous System Identification.  
11 If PREV\_SID\_INCL is set to '0', the mobile station shall omit  
12 this field; otherwise, the mobile station shall include this field  
13 and set it as follows:  
14 If the mobile station determines SID has been changed after a  
15 packet data dormant handoff, the mobile station shall set this  
16 field to the previous SID.  
17 PREV\_NID\_INCL - Previous Network Identification (NID) included indicator.  
18 The mobile station shall set this field to '1' if the mobile  
19 station determines that NID has been changed after a packet  
20 data dormant handoff and the PREV\_NID field is included in  
21 this message; otherwise, the mobile station shall set this field  
22 to '0'.  
23 PREV\_NID - Previous Network Identification.  
24 If PREV\_NID\_INCL is set to '0', the mobile station shall omit  
25 this field; otherwise, the mobile station shall include this field  
26 and set it as follows:  
27 If the mobile station determines NID has been changed after a  
28 packet data dormant handoff, the mobile station shall set this  
29 field to the previous NID.  
30 PREV\_PZID\_INCL - Previous Packet Zone ID (PZID) included indicator.  
31 The mobile station shall set this field to '1' if the mobile  
32 station determines that the Packet Zone ID has been changed  
33 after a packet data dormant handoff and the PREV\_PZID field  
34 is included in this message; otherwise, the mobile station shall  
35 omit this field.  
36 PREV\_PZID - Previous Packet Zone ID.  
37 If PREV\_PZID\_INCL is set to '0', the mobile station shall omit  
38 this field; otherwise, the mobile station shall include this field  
39 and set it as follows:  
40 If the mobile station determines PZID has been changed after  
41 a packet data dormant handoff, the mobile station shall set  
42 this field to the previous PZID.  
43 DIALED\_DIGS\_INCL - Dialed digits included indicator.

1                   The mobile station shall set this field to ‘1’ if the dialed digits  
 2                   related fields are included in this message; otherwise, the  
 3                   mobile station shall set this field to ‘0’.

4           DIGIT\_MODE – Digit mode indicator.

5                   If the DIALED\_DIGS\_INCL field is set to ‘0’, the mobile station  
 6                   shall omit this field; otherwise, the mobile station shall  
 7                   include this field and shall set it as follows:

8                   This field indicates whether the dialed digits are 4-bit DTMF  
 9                   codes or 8-bit ASCII codes using a specified numbering plan.

10                  To originate the call using the binary representation of DTMF  
 11                  digits, the mobile station shall set this field to ‘0’. To originate  
 12                  the call using ASCII characters, the mobile station shall set  
 13                  this field to ‘1’.

14           NUMBER\_TYPE – Type of number.

15                  If the DIALED\_DIGS\_INCL field is set to ‘0’ or if the  
 16                  DIGIT\_MODE field is set to ‘0’, the mobile station shall omit  
 17                  this field; otherwise, the mobile station shall include this field  
 18                  and shall set it as follows:

19                  The mobile station shall set this field to the NUMBER\_TYPE  
 20                  value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
 21                  of the number as defined in [7], Section 4.5.9.

22           NUMBER\_PLAN – Numbering plan.

23                  If the DIALED\_DIGS\_INCL field is set to ‘0’ or if the  
 24                  DIGIT\_MODE field is set to ‘0’, the mobile station shall omit  
 25                  this field; otherwise, the mobile station shall include this field  
 26                  and shall set it as follows:

27                  The mobile station shall set this field to the NUMBER\_PLAN  
 28                  value shown in Table 2.7.1.3.2.4-3 corresponding to the  
 29                  requested numbering plan as defined in [7], Section 4.5.9.

30           NUM\_FIELDS – Number of dialed digits in this message.

31                  If the DIALED\_DIGS\_INCL field is set to ‘0’, the mobile station  
 32                  shall omit this field; otherwise, the mobile station shall  
 33                  include this field and shall set it as follows:

34                  The mobile station shall set this field to the number of dialed  
 35                  digits included in this message.

1    The mobile station shall include NUM\_FIELDS occurrences of the following field:

2              CHARi    – A dialed digit or character.

3              If the DIGIT\_MODE field is set to '0', the mobile station shall  
 4              set each occurrence of this field to the code value shown in  
 5              Table 2.7.1.3.2.4-4 corresponding to the dialed digit. If the  
 6              DIGIT\_MODE field is set to '1', the mobile station shall set  
 7              each occurrence of this field to the ASCII representation  
 8              corresponding to the dialed digit, as specified in [9], with the  
 9              most significant bit set to '0'.

10          NUM\_RECS    – Number of records.

11          The mobile station shall set this field to the number of  
 12              information records included with this message.

13

14          The mobile station shall include NUM\_RECS occurrences of the following three-field record.

15              RECORD\_TYPE    – Information record type.

16              The mobile station shall set this field to the record type value  
 17              shown in Table 2.7.4-1.

18              The mobile station shall not include the record type for QoS  
 19              Parameters information record if MOB\_QOS<sub>S</sub> is equal to '0'.

20              RECORD\_LEN    – Information record length.

21              The mobile station shall set this field to the number of octets  
 22              in the type-specific fields included in this record.

23          Type-specific fields    – Type-specific fields.

24          The mobile station shall include type-specific fields as  
 25              specified in 2.7.4.

1    2.7.2.3.2.33 Extended Flash With Information Message

2    MSG\_TAG: EFWIM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| CON_REF_INCL | 1                    |
| CON_REF      | 0 or 8               |
| NUM_REC      | 4                    |

NUM\_REC occurrences of the following three-field record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    CON\_REF\_INCL    – Connection reference included indicator.

6                     The mobile station shall set this field to '1' if the connection  
7                     reference field is included in this message; otherwise, it shall  
8                     set this field to '0'.

9    CON\_REF    – Connection reference.

10                   If the CON\_REF\_INCL field is set to '0', the mobile station  
11                   shall omit this field; otherwise, the mobile station shall  
12                   include this field and shall set it to the value of the connection  
13                   reference assigned to the service option connection of the call,  
14                   to which this message corresponds.

15    NUM\_REC    – Number of records.

16                   The mobile station shall set this field to the number of  
17                   information records included with this message.

18    The mobile station shall include NUM\_REC occurrence of the following three-field record:

- 1            RECORD\_TYPE    – Information record type.
- 2                         The mobile station shall set this field to the record type code  
3                         shown in Table 2.7.4-1 corresponding to the type of this  
4                         information record.
- 5            RECORD\_LEN    – Information record length.
- 6                         The mobile station shall set this field to the number of octets  
7                         in the type-specific fields of this record.
- 8        Type-specific fields    – Type-specific fields.  
9                         The mobile station shall set these fields as specified in 2.7.4  
10                         for this type of information record.

## 1    2.7.2.3.2.34 Extended Pilot Strength Measurement Message

2    MSG\_TAG: EPSMM

3

| <b>Field</b>         | <b>Length (bits)</b>              |
|----------------------|-----------------------------------|
| REF_PN               | 9                                 |
| PILOT_STRENGTH       | 6                                 |
| KEEP                 | 1                                 |
| REF_PILOT_REC_INCL   | 1                                 |
| REF_PILOT_REC_TYPE   | 0 or 3                            |
| REF_RECORD_LEN       | 0 or 3                            |
| Type-specific fields | 0 or $8 \times$<br>REF_RECORD_LEN |
| SF_RX_PWR            | 5                                 |
| NUM_PILOTS           | 4                                 |

NUM\_PILOTS occurrences of the following record:

|                      |                            |
|----------------------|----------------------------|
| PILOT_PN_PHASE       | 15                         |
| PILOT_STRENGTH       | 6                          |
| KEEP                 | 1                          |
| PILOT_REC_INCL       | 1                          |
| PILOT_REC_TYPE       | 0 or 3                     |
| RECORD_LEN           | 0 or 3                     |
| Type-specific fields | 0 or $8 \times$ RECORD_LEN |

4

5    REF\_PN    -    Time reference PN sequence offset.

6    The mobile station shall set this field to the PN sequence offset  
7    of the pilot used by the mobile station to derive its time  
8    reference, relative to the zero offset pilot PN sequence in units  
9    of 64 PN chips.

10    PILOT\_STRENGTH    -    Pilot strength.

11    The mobile station shall set this field to

12     $\lfloor -2 \times 10 \log_{10} PS \rfloor,$

1 where PS is the strength of the pilot used by the mobile  
 2 station to derive its time reference (see [2]), measured as  
 3 specified in 2.6.6.2.2. If this value ( $-2 \times 10 \log_{10} PS$ ) is less  
 4 than 0, the mobile station shall set this field to '000000'. If  
 5 this value is greater than '111111', the mobile station shall set  
 6 this field to '111111'.

- 7           KEEP    - Keep pilot indicator.  
 8                   If the handoff drop timer (see 2.6.6.2.3) corresponding to the  
 9                   pilot used by the mobile station to derive its time reference  
 10                  (see 2.1.5 of [2]) has expired, the mobile station shall set this  
 11                 field to '0'; otherwise, the mobile station shall set this field to  
 12                 '1'.  
 13           REF\_PILOT\_REC\_INCL - Reference pilot information included indicator.  
 14                   The mobile station shall set this field to '1' if additional  
 15                   reference pilot information listed in the  
 16                   REF\_PILOT\_REC\_TYPE and REF\_RECORD\_LEN fields are  
 17                   included. The mobile station shall set this field to '0' if the  
 18                   corresponding pilot is the common pilot and there is no  
 19                   additional pilot information included.  
 20           REF\_PILOT\_REC\_TYPE - Reference pilot record type.  
 21                   If REF\_PILOT\_REC\_INCL is set to '1', the mobile station shall  
 22                   set this field to the REF\_PILOT\_REC\_TYPE value shown in  
 23                   Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record  
 24                   specified by this record.

26                   **Table 2.7.2.3.2.34-1. Pilot Record Types**

| Description                                                        | <b>REF_PILOT_REC_TYPE<br/>PILOT_REC_TYPE<br/>(binary)</b> |
|--------------------------------------------------------------------|-----------------------------------------------------------|
| Auxiliary Pilot                                                    | 000                                                       |
| All other REF_PILOT_REC_TYPE or PILOT_REC_TYPE values are reserved |                                                           |

27  
 28                   If REF\_PILOT\_REC\_INCL is set to '0', the mobile station shall  
 29                   omit this field.

- 30           REF\_RECORD\_LEN - Reference pilot record length.  
 31                   If REF\_PILOT\_REC\_INCL is set to '1', the mobile station shall  
 32                   set this field to the number of octets in the type-specific fields  
 33                   of this pilot record.  
 34                   If REF\_PILOT\_REC\_INCL is set to '0', the mobile station shall  
 35                   omit this field.  
 36           Type-specific fields - Pilot record type-specific fields.

If REF\_PILOT\_REC\_INCL is set to ‘1’, the mobile station shall include type-specific fields based on the REF\_PILOT\_REC\_TYPE of this pilot record.

If REF\_PILOT\_REC\_INCL is set to ‘0’, the mobile station shall omit this field.

If REF\_PILOT\_REC\_TYPE is equal to ‘000’, the mobile station shall include the following fields:

| Field        | Length (bits)      |
|--------------|--------------------|
| QOF          | 2                  |
| WALSH_LENGTH | 3                  |
| PILOT_WALSH  | (WALSH_LENGTH + 6) |
| RESERVED     | 0 to 7 (as needed) |

QOF - Quasi-orthogonal function index.

The mobile station shall set this field to the index of the Quasi-orthogonal function of the corresponding Auxiliary Pilot.

WALSH\_LENGTH - Length of the Walsh code for the reference pilot.

The mobile station shall set this field to the WALSH\_LENGTH value shown in Table 2.7.2.3.2.34-2 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary Pilot.

**Table 2.7.2.3.2.34-2. Walsh Code Length**

| Length of the WALSH_LENGTH | Walsh Code (binary) |
|----------------------------|---------------------|
| 64                         | ‘000’               |
| 128                        | ‘001’               |
| 256                        | ‘010’               |
| 512                        | ‘011’               |
| Reserved                   | ‘100’ – ‘111’       |

PILOT\_WALSH - Walsh code for the Auxiliary Pilot used by the mobile station to derive its time reference.

The mobile station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

- 1           RESERVED    -    Reserved bits.  
 2                         The base station shall set all the bits of this field to '0' to make  
 3                         the entire record octet-aligned.
- 4  
 5           SF\_RX\_PWR    -    The received power spectral density of the Serving Frequency.  
 6                         The mobile station shall set this field to  
 7                          $\lceil (10 \times \log_{10}(\text{spec\_density}) + 120) / 2 \rceil$   
 8                         where *spec\_density* is the mobile station received power  
 9                         spectral density of the Serving Frequency, in mW/1.23MHz,  
 10                        averaged over the last N<sub>12m</sub> frames (see 2.6.6.2.5.1).  
 11                        If this value is less than 0, the mobile station shall set this  
 12                        field to '00000'.  
 13           NUM\_PILOTS    -    Number of pilots reported.  
 14                         The mobile station shall set this field to the number of pilots  
 15                         being reported other than the reference pilot.
- 16           The mobile station shall include NUM\_PILOTS occurrences of the following record: one  
 17           occurrence for each pilot in the Active Set, for each pilot in the Candidate Set whose  
 18           strength exceeds T\_ADD, and for each pilot in the Candidate Set whose strength satisfies  
 19           the following inequality:

$$10 \times \log_{10} \text{PS} > \frac{\text{SOFT\_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} \text{PS}_i + \frac{\text{ADD\_INTERCEPT}_s}{2}$$

- 21           where the summation is performed over all pilots currently in the Active Set. The mobile  
 22           station shall not include these fields for the pilot identified by the REF\_PN field.  
 23           The mobile station shall order any occurrences of the following record which correspond to  
 24           pilots in the Active Set such that they occur before any occurrences of the following record  
 25           which correspond to pilots in the Candidate Set.

- 26           PILOT\_PN\_PHASE    -    Pilot measured phase.  
 27                         The mobile station shall set this field to the phase of the pilot  
 28                         PN sequence relative to the zero offset pilot PN sequence of  
 29                         this pilot, in units of one PN chip, as specified in 2.6.6.2.4.  
 30           PILOT\_STRENGTH    -    Pilot strength.  
 31                         The mobile station shall set this field to  
 32                          $\lfloor -2 \times 10 \log_{10} \text{PS} \rfloor$ ,  
 33                         where PS is the strength of this pilot, measured as specified in  
 34                         2.6.6.2.2. If this value ( $\lfloor -2 \times 10 \log_{10} \text{PS} \rfloor$ ) is less than 0, the  
 35                         mobile station shall set this field to '000000'. If this value is  
 36                         greater than '111111', the mobile station shall set this field to  
 37                         '111111'.

- 1                   KEEP     -     Keep pilot indicator.  
 2                   If the handoff drop timer (see 2.6.6.2.3) corresponding to this  
 3                   pilot has expired, the mobile station shall set this field to '0';  
 4                   otherwise, the mobile station shall set this field to '1'.  
 5       PILOT\_REC\_INCL     -     Additional pilot information included indicator.  
 6                   The mobile station shall set this field to '1' if additional pilot  
 7                   information listed in the PILOT\_REC\_TYPE and RECORD\_LEN  
 8                   fields are included. The mobile station shall set this field to '0'  
 9                   if the corresponding pilot is the common pilot and there is no  
 10                  additional pilot information included.  
 11      PILOT\_REC\_TYPE -     Reference pilot record type.  
 12                   If PILOT\_REC\_INCL is set to '1', the mobile station shall set  
 13                   this field to the PILOT\_REC\_TYPE value shown in Table  
 14                  2.7.2.3.2.3~~43~~-1 corresponding to the type of Pilot Record  
 15                  specified by this record.  
 16                   If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
 17                  this field.  
 18      RECORD\_LEN     -     Pilot record length.  
 19                   If PILOT\_REC\_INCL is set to '1', the mobile station shall set  
 20                   this field to the number of octets in the type-specific fields of  
 21                  this pilot record.  
 22                   If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
 23                  this field.  
 24      Type-specific fields     -     Pilot record type-specific fields.  
 25                   If PILOT\_REC\_INCL is set to '1', the mobile station shall  
 26                   include type-specific fields based on the PILOT\_REC\_TYPE of  
 27                  this pilot record as described in 3.7.6.1.  
 28                   If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
 29                  this field.

## 1    2.7.2.3.2.35 Extended Handoff Completion Message

2    MSG\_TAG: EHOCM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| LAST_HDM_SEQ | 2                    |
| NUM_PILOTS   | 4                    |

NUM\_PILOTS occurrences of the following record:

|                      |                                    |
|----------------------|------------------------------------|
| PILOT_PN             | 9                                  |
| PILOT_REC_INCL       | 1                                  |
| PILOT_REC_TYPE       | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

4

5    LAST\_HDM\_SEQ    -    *Extended Handoff Direction Message, General Handoff  
6    Direction Message, or Universal Handoff Direction Message  
7    sequence number.*8    The mobile station shall set this field to the value of the  
9    HDM\_SEQ field from the *Extended Handoff Direction Message,*  
10   *General Handoff Direction Message,* or the *Universal Handoff  
11   Direction Message* that determined the current Active Set.

12   NUM\_PILOTS    -    Number of pilots reported.

13   The mobile station shall set this field to the number of pilots  
14   in the current Active Set.15   The mobile station shall include NUM\_PILOTS occurrences of the following record: one  
16   occurrence for each pilot in the Active Set. If the Active Set contains more than one pilot,  
17   the mobile station shall include the pilot information in the same order as in the *Extended  
18   Handoff Direction Message, the General Handoff Direction Message, or the Universal Handoff  
19   Direction Message* that determined the current Active Set.

20   PILOT\_PN    -    Pilot PN sequence offset.

21   The mobile station shall set this field to the pilot PN sequence  
22   offset, relative to the zero offset pilot PN sequence in units of  
23   64 PN chips, for this pilot.

24   PILOT\_REC\_INCL    -    Additional pilot information included indicator.

25   The mobile station shall set this field to '1' if additional pilot  
26   information listed in the PILOT\_REC\_TYPE and RECORD\_LEN  
27   fields are included. The mobile station shall set this field to '0'  
28   if the corresponding pilot is the common pilot and there is no  
29   additional pilot information included.

30   PILOT\_REC\_TYPE    -    Reference pilot record type.

1           If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
2           this field; otherwise, the mobile station shall set this field to  
3           the PILOT\_REC\_TYPE value shown in Table 2.7.2.3.2.34-1  
4           corresponding to the type of Pilot Record specified by this  
5           record.

6       RECORD\_LEN   - Pilot record length.  
7           If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
8           this field; otherwise, the mobile station shall set this field to  
9           the number of octets in the type-specific fields of this pilot  
10          record.

11      Type-specific fields   - Pilot record type-specific fields.  
12           If PILOT\_REC\_INCL is set to '0', the mobile station shall omit  
13           this field; otherwise, the mobile station shall include type-  
14           specific fields based on the PILOT\_REC\_TYPE of this pilot  
15           record as described in 2.7.2.3.2.34.

## 1 2.7.2.3.2.36 Security Mode Request Message

2 MSG\_TAG: SMRM

3

| Order-Specific Field | Length (bits) |
|----------------------|---------------|
| UI_ENC_INCL          | 1             |
| UI_ENCRYPT_SUP       | 0 or 8        |
| NUM_RECS             | 0 or 3        |

NUM\_RECS + 1 occurrences of the following two field record

|                |        |
|----------------|--------|
| CON_REF        | 0 or 8 |
| UI_ENCRYPT_REQ | 0 or 1 |

|                          |                |
|--------------------------|----------------|
| SIG_ENC_INCL             | 1              |
| SIG_ENCRYPT_SUP          | 0 or 8         |
| <u>D_SIG_ENCRYPT_REQ</u> | 0 or 1         |
| <u>ENC SEQ H INCL</u>    | <u>1</u>       |
| <u>ENC SEQ H</u>         | <u>0 or 24</u> |
| <u>ENC SEQ H SIG</u>     | <u>0 or 8</u>  |

4

5

- UI\_ENC\_INCL - User information encryption fields included.

6

7

8

9

The mobile station shall set this field to '1' if the user information encryption related fields are included in this message; otherwise, the mobile station shall set this field to '0'.

10

- UI\_ENCRYPT\_SUP - User information
- eE
- ncryption supported indicator.

11

12

13

14

15

If UI\_ENC\_INCL is equal to '1', the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.

1           This field consists of the subfields shown in Table 2.7.1.3.2.4-  
 2           9.

3           The mobile station shall set each subfield to ‘1’ if the  
 4           corresponding user information encryption algorithm is  
 5           supported by the mobile station; otherwise, the mobile station  
 6           shall set the subfield to ‘0’.

7           The mobile station shall set the RESERVED subfield to  
 8           ‘00000000’

9           NUM\_REC    – Number of user information encryption records.

10          If UI\_ENC\_INCL is equal to ‘1’, the mobile station shall include  
 11           this field; otherwise, the mobile station shall omit this field. If  
 12           this field is included, the mobile station shall set this field to  
 13           number of user information encryption records included in  
 14           this message minus 1.

15          The mobile station shall include NUM\_REC + 1 occurrences of the following two field record

16           CON\_REF    – Connection reference corresponding to the service instance  
 17           requesting for encryption.

18          If UI\_ENC\_INCL is equal to ‘1’, the mobile station shall include  
 19           this field; otherwise, the mobile station shall omit this field. If  
 20           this field is included, the mobile station shall set this field to  
 21           the connection reference of the service option connection  
 22           corresponding to this user information encryption request  
 23           record.

24           UI\_ENCRYPT\_REQ    – Request for user information encryption on the traffic channel  
 25           indicator.

26          The mobile station shall set this field to ‘1’ to request user  
 27           information encryption for the user information corresponding  
 28           to the service option connection identified by CON\_REF;  
 29           otherwise, the mobile station shall set this field to ‘0’.

30           SIG\_ENC\_INCL    – Signaling encryption fields included.

31          The mobile station shall set this field to ‘1’ if the following two  
 32           fields related to signaling encryption fields are included in this  
 33           message. Otherwise, the mobile station shall set this field to  
 34           ‘0’.

35           SIG\_ENCRYPT\_SUP    – Signaling eEncryption supported indicator.

36          If SIG\_ENC\_INCL is equal to ‘1’, the mobile station shall  
 37           include this field; otherwise, the mobile station shall omit this  
 38           field. If this field is included, the mobile shall set this field to  
 39           indicate the supported signaling encryption algorithms  
 40           supported by the mobile station.

1           This field consists of the subfields shown in Table 2.7.1.3.2.1-  
 2           5.

3           If this field is included, the mobile station shall set the  
 4           subfields as follows:

5           The mobile station shall set the CMEA subfield to '1'.

6           The mobile station shall set each other subfield to '1' if the  
 7           corresponding signaling encryption algorithm is supported by  
 8           the mobile station; otherwise, the mobile station shall set the  
 9           subfield to '0'.

10          The mobile station shall set the RESERVED subfield to  
 11          '000000'. |

12          D\_SIG\_ENCRYPT\_REQ - Dedicated channel sSignaling Message-encryption request  
 13          indicator.

14          If SIG\_ENC\_INCL is equal to '1', the mobile station shall  
 15          include this field; otherwise, the mobile station shall omit this  
 16          field. If included the mobile station shall set this field to '1' to  
 17          request signaling encryption to be turned on for signaling  
 18          messages sent on f-dsch,and r-dsch,f esch,and r esch, and  
 19          to '0' to request signaling encryption to be turned off for  
 20          signaling messages sent on f-dsch,and r-dsch,f esch,and r  
 21          esch.

22          ENC SEQ H INCL - The 24 MSB of the EXT ENC SEQ included.

23          The mobile station shall set this field to '1' if ENC SEQ H is  
 24          included in this message; otherwise, the mobile station shall  
 25          set this field to '0'.

26          ENC SEQ H - The 24 MSB of the EXT ENC SEQ

27          If ENC SEQ H INCL is set to '1', the mobile station shall  
 28          include this field; otherwise, the mobile station shall omit this  
 29          field. If this field is included, the mobile station shall set this  
 30          field to the 24 most significant bits of the EXT ENC SEQ to be  
 31          used as the initial value of crypto sync for both forward and  
 32          reverse link encryptions.

33          ENC SEQ H SIG - The signature of ENC SEQ H

34          If ENC SEQ H is included, the mobile station shall include  
 35          this field; otherwise, the mobile station shall omit this field. If  
 36          this field is included, the mobile station shall set this field to  
 37          the digital signature of the ENC SEQ H computed as  
 38          described in 2.3.12.4.5.

39

40

## 1    2.7.2.3.2.37 Call Cancel Message

2    MSG\_TAG: CLCM

3

| Order-Specific Field | Length (bits) |
|----------------------|---------------|
| TAG                  | 4             |

4

5    TAG    -    Transaction identifier.

6    The mobile station shall set this field to the TAG value in the  
7    *Enhanced Origination Message* sent to originate this call.

## 1    2.7.2.3.2.38 Device Information Message

2    MSG\_TAG: DIM

3

| <b>Field</b>     | <b>Length (bits)</b> |
|------------------|----------------------|
| WLL_DEVICE_TYPE  | 3                    |
| NUM_INFO_RECORDS | 5                    |

NUM\_INFO\_RECORDS occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

- 5    WLL\_DEVICE\_TYPE    –    WLL device type indicator.  
 6                         The mobile station shall set this field to the  
 7                         WLL\_DEVICE\_TYPE value shown in Table 2.7.1.3.2.1-3  
 8                         corresponding to the mobile station device type.
- 9    NUM\_INFO\_RECORDS    –    Number of information records included.  
 10                        The mobile station shall set this field to the number of  
 11                        information records which are included.

12    The mobile station shall include one occurrence of the following fields for each information  
 13    record which is included:

- 14    RECORD\_TYPE    –    Information record type.  
 15                        The mobile station shall set this field to the record type code  
 16                        shown in Table 2.7.4-1 corresponding to the type of this  
 17                        information record.
- 18    RECORD\_LEN    –    Information record length.  
 19                        The mobile station shall set this field to the number of octets  
 20                        in the type-specific fields of this record.
- 21    Type-specific fields    –    Type-specific fields.  
 22                        The mobile station shall set these fields as specified in 2.7.4  
 23                        for this type of information record.

1      [2.7.2.3.2.39 Base Station Status Request Message](#)

2      [MSG TAG: BSSREQM](#)

| <u>Field</u>                         | <u>Length (bits)</u>     |

3      [QUAL\\_INFO\\_TYPE](#) - Qualification information type.

4      The mobile station shall set this field to the value shown in  
 5      Table 3.7.2.3.2.15-1 to show the inclusion of qualification  
 6      information in the type-specific fields.

7      [QUAL\\_INFO\\_LEN](#) - Qualification information length.

8      The mobile station shall set this field to the number of octets  
 9      included in the type-specific fields of the qualification  
 10     information.

11     [Type-specific fields](#) - Type-specific fields.

12     The mobile station shall set these fields to the qualification  
 13     information according to the QUAL\_INFO\_TYPE field.

14     If QUAL\_INFO\_TYPE is equal to '00000000', the type-specific  
 15     fields are omitted.

16     If QUAL\_INFO\_TYPE is equal to '00000001', the mobile station  
 17     shall use the following fixed-length format for the type-specific  
 18     fields:

| <u>Type-specific Field</u> | <u>Length (bits)</u> |
|----------------------------|----------------------|
| <a href="#">BAND_CLASS</a> | <u>5</u>             |
| <a href="#">RESERVED</a>   | <u>3</u>             |

19  
 20     If QUAL\_INFO\_TYPE is equal to '00000010', the mobile station  
 21     shall use the following fixed-length format for the type-specific  
 22     fields:

| Type-specific Field | Length (bits) |
|---------------------|---------------|
| BAND CLASS          | 5             |
| OP MODE             | 8             |
| RESERVED            | 3             |

- 1  
2     BAND CLASS - Band class.  
3                 The mobile station shall set this field to the CDMA band class,  
4                 as specified in [30].  
5     OP MODE - Operating mode.  
6                 The mobile station shall set this field as shown in  
7                 Table 3.7.2.3.2.15-3 to specify the operating mode  
8                 qualification information.  
9     RESERVED - Reserved bits.  
10                The mobile station shall set this field to '000'.  
11     NUM RECORD - Number of requested record fields in this message.  
12                The mobile station shall set this field to the number of  
13                occurrences of RECORD TYPE field in this message.  
14     The mobile station shall include NUM RECORD occurrences of the following variable-length  
15     record, one for each information record that is requested:  
16     RECORD TYPE - Information record type.  
17                The mobile station shall set this field to the record type value  
18                shown in Table 2.7.2.3.2.39-1 corresponding to the  
19                information record requested.
- 20     **Table 2.7.2.3.2.39-1. Base Station Status Request Information Record Types**
- | Information Record Requested | Record Type           |
|------------------------------|-----------------------|
| Pilot Information            | 00000000              |
| Reserved                     | 00000001-<br>11111111 |
- 21     RECORD LENGTH - Information record length.  
22                The mobile station shall set this field to the length, in octets,  
23                of the record type specific fields included in this record.  
24     Record type specific  
25     fields - Record type specific fields  
26                The mobile station shall set this field to the type specific fields  
27                corresponding to this record type.  
28                If the RECORD TYPE field is set to '00000000', the mobile

1                   station shall set the record type specific field as follows:

| <u>Field</u>       | <u>Length (bits)</u> |
|--------------------|----------------------|
| <u>NUM_PILOTS</u>  | <u>4</u>             |
| <u>SID_NID_REQ</u> | <u>1</u>             |

NUM\_PILOTS occurrences of the following one field record

|                 |          |
|-----------------|----------|
| <u>PILOT_PN</u> | <u>9</u> |
|-----------------|----------|

2                   NUM\_PILOTS - Number of Pilots reported.

3                   The mobile station shall set this field to the number of pilots  
 4                   whose information is requested in this message.

5                   The mobile station shall set this field to a number equal or  
 6                   greater than one.

7                   SID\_NID\_REQ - SID, NID information requested indicator.

8                   The mobile station shall set this field to '1' if it also requests  
 9                   the SID and NID information for these pilots; otherwise, the  
 10                  mobile station shall set this field to '0'.

11                  The mobile station shall include NUM\_PILOTS occurrences of the following one-field  
 12                  record:

13                  PILOT\_PN - Pilot PN sequence offset index.

14                  The mobile station shall set this field to the pilot PN sequence  
 15                  offset for the base station, in units of 64 PN chips, whose Base  
 16                  Station identification number information is being requested.

17                  RESERVED - Reserved bits.

18                  The mobile station shall add reserved bits as needed in order  
 19                  to make the length of the record equal to an integer number of  
 20                  octets. The mobile station shall set these bits to '0'.

1    2.7.3 Orders

2    *Order Messages* are sent by the mobile station on the r-csch and on the r-dsch. The  
3    general PDU format used on the r-csch is defined in 2.7.1.3.2.2, and the general PDU  
4    format used on the r-dsch is defined in 2.7.2.3.2.1. There are many specific types of *Order*  
5    *Messages*, as shown in Table 2.7.3-1.

6    The mobile station may send on the r-csch any type of order shown in Table 2.7.3-1 with a  
7    'Y' in the first column, but shall not send on the r-csch any type of order with an 'N' in the  
8    first column. The mobile station may send on the r-dsch any type of order shown in  
9    Table 2.7.3-1 with a 'Y' in the second column, but shall not send on the r-dsch any type of  
10   order with an 'N' in the second column. The mobile station shall be capable of sending all  
11   types of orders shown in Table 2.7.3-1 with a 'Y' in the sixth column.

12   An order consists of a 6-bit order code and zero or more order-specific fields. The mobile  
13   station shall set the ORDER field in the *Order Message* to the order code shown in Table  
14   2.7.3-1 corresponding to the type of order being sent.

15   If the order qualification code in the fourth column of Table 2.7.3-1 is '00000000' and there  
16   are no other additional fields as shown by an 'N' in the fifth column, the mobile station  
17   shall include no order qualification code or other order-specific fields in the *Order Message*.  
18   The order qualification code of such a message is implicitly '00000000'.

19   If the order qualification code is not '00000000' and there are no other additional fields as  
20   shown in Table 2.7.3-1 by an 'N' in the fifth column, the mobile station shall include the  
21   order qualification code as the only order-specific field in the *Order Message*.

22   If there are other additional fields as shown in Table 2.7.3-1 by a 'Y' in the fifth column, the  
23   mobile station shall include order-specific fields as specified in the corresponding  
24   subsection of this section.

**Table 2.7.3-1. Order and Order Qualification Codes Used on the r-dsch and the r-csch  
(Part 1 of 4)**

| r-csch Order | r-dsch Order | Order Code, ORDER (binary) | Order Qualification Code, ORDQ (binary) | More Fields other than ORDQ | Support Req'd | Name/Function                                                            |
|--------------|--------------|----------------------------|-----------------------------------------|-----------------------------|---------------|--------------------------------------------------------------------------|
| Y            | Y            | 000010                     | 00000000                                | Y                           | Y             | Base Station Challenge Order (see 2.7.3.1)                               |
| Y            | Y            | 000011                     | 00000000                                | N                           | Y             | SSD Update Confirmation Order                                            |
| Y            | Y            | 000011                     | 00000001                                | N                           | Y             | SSD Update Rejection Order                                               |
| N            | Y            | 000101                     | 0000nnnn                                | N                           | Y             | Parameter Update Confirmation Order (where 'nnnn' is the Request Number) |
| N            | Y            | 001011                     | 00000000                                | N                           | N             | Request Wide Analog Service Order                                        |
| N            | Y            | 001011                     | 00000001                                | N                           | N             | Request Narrow Analog Service Order                                      |
| N            | Y            | 001011                     | 00000010                                | N                           | N             | Request Analog Service Order                                             |
| Y            | Y            | 010000                     | 00000000                                | N                           | Y             | Mobile Station Acknowledgment Order (see [4])                            |
| N            | Y            | 010011                     | 00000000                                | Y                           | N             | Service Option Request Order (Band Class 0 only) (see 2.7.3.2)           |
| N            | Y            | 010100                     | 00000000                                | Y                           | Y             | Service Option Response Order (Band Class 0 only) (see 2.7.3.3)          |
| Y            | Y            | 010101                     | 00000000                                | N                           | Y             | Release Order (normal release)                                           |
| Y            | Y            | 010101                     | 00000001                                | N                           | Y             | Release Order (with power-down indication)                               |
| N            | Y            | 010101                     | 00000010                                | N                           | Y             | Release Order (with service inactive indication)                         |
| N            | Y            | 010111                     | 00000000                                | N                           | N             | Long Code Transition Request Order (request public)                      |
| N            | Y            | 010111                     | 00000001                                | N                           | N             | Long Code Transition Request Order (request private)                     |

1   **Table 2.7.3-1. Order and Order Qualification Codes Used on the r-dsch and the r-csch**  
 2   **(Part 2 of 4)**

| r-csch Order | r-dsch Order | Order Code, ORDER (binary) | Order Qualification Code, ORDQ (binary) | More Fields other than ORDQ | Support Req'd | Name/Function                                                                                                                                   |

| All other codes are reserved. |                 |                                     |                                                  |                                         |                  |                                                                                                                               |

## 1    2.7.3.1 Base Station Challenge Order

2

| Order-Specific Field | Length (bits) |
|----------------------|---------------|
| ORDQ                 | 8             |
| RANDBS               | 32            |

3

4            ORDQ – Order qualification code.

5            The mobile station shall set this field to '00000000'.

6            RANDBS – Random challenge data.

7            The mobile station shall set this field as specified in  
8            2.3.12.1.5.

## 1    2.7.3.2 Service Option Request Order

2

| <b>Order-Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| SERVICE_OPTION              | 16                   |

3

4            ORDQ    – Order qualification code.

5                         The mobile station shall set this field to '00000000'.

6            SERVICE\_OPTION    – Service option.

7                         The mobile station shall set this field to the service option  
8                         code specified in [30], corresponding to the requested or  
9                         alternative service option.

## 1    2.7.3.3 Service Option Response Order

2

| Order-Specific Field | Length (bits) |
|----------------------|---------------|
| ORDQ                 | 8             |
| SERVICE_OPTION       | 16            |

3

4              ORDQ    -    Order qualification code.

5              The mobile station shall set this field to '00000000'.

6              SERVICE\_OPTION    -    Service option.

7              The mobile station shall set this field to the service option  
8              code specified in [30], corresponding to the accepted service  
9              option, or to '0000000000000000' to reject the proposed  
10             service option. See 2.6.4.1.2.2.1.

1      2.7.3.4 Mobile Station Reject Order

2

3

| <b>Order-Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| REJECTED_TYPE               | 8                    |

If the order is sent on the Access Channel or Enhanced Access Channel and

REJECTED\_TYPE is '00000111',  
or if the order is sent on the Reverse Traffic Channel and  
REJECTED\_TYPE is '00000001',  
the order-specific fields also include the following two fields:

|                   |           |
|-------------------|-----------|
| <u>RESERVED_1</u> | <u>2</u>  |
| REJECTED_ORDER    | <u>68</u> |
| REJECTED_ORDQ     | 8         |

If the order is sent on the Reverse Traffic Channel and  
REJECTED\_TYPE is '00001100',  
the order-specific fields also include the following field:

|                   |    |
|-------------------|----|
| REJECTED_PARAM_ID | 16 |
|-------------------|----|

If the order is sent on the Access Channel or Enhanced Access Channel and

REJECTED\_TYPE is '00001100',  
or if the order is sent on the Reverse Traffic Channel and  
REJECTED\_TYPE is '00000011' '00101000', or  
REJECTED\_TYPE is '00001110', or '00101010',  
the order-specific fields also include the following field:

|                 |   |
|-----------------|---|
| REJECTED_RECORD | 8 |
|-----------------|---|

If the ORDQ is '00010000', '00010001', or '00010010', the order-specific fields also include the following fields:

|         |   |
|---------|---|
| CON_REF | 8 |
|---------|---|

If the ORDQ is '00010011', the order-specific fields also include the following fields:

|         |   |
|---------|---|
| CON_REF | 8 |
| TAG     | 4 |

|                   |                          |
|-------------------|--------------------------|
| REJECTED_PDU_TYPE | 0 or 2                   |
| <u>RESERVED_2</u> | <u>0 - 7 (as needed)</u> |

<sup>1</sup><sup>2</sup>

ORDQ – Order qualification code.

|    |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  |                   | The mobile station shall set this field to the ORDQ value shown in Table 2.7.3-1 corresponding to the reason for rejecting the message.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2  |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3  |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 4  | REJECTED_TYPE     | <ul style="list-style-type: none"> <li>- Message type of rejected message.</li> </ul> <p>The mobile station shall set this field to the value of the MSG_TYPE field of the message being rejected.</p> <p>If the MSG_TYPE field is not 8 bits, the mobile station shall set the least significant bits of this field to the value of the MSG_TYPE field and set all the remaining bits to '0'.</p>                                                                                                                                                           |
| 5  |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 42 | TAG               | <ul style="list-style-type: none"> <li>- Transaction identifier.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

1                   The mobile station shall set this field to the transaction  
 2                   identifier (received from the base station) of the call  
 3                   assignment being rejected.

4                   **CON\_REF** Connection reference.

5                   The mobile station shall set this field to the value of the  
 6                   connection reference of the service option connection  
 7                   corresponding to the call.

8           **REJECTED\_PDU\_TYPE** - PDU type of the rejected message.

9                   If  $P_{REV\_IN\_USE_S}$  is less than six, the mobile station shall  
 10                  omit this field; otherwise, the mobile station shall set this field  
 11                  to the REJECTED\_PDU\_TYPE code shown in Table 2.7.3.4-1  
 12                  corresponding to the PDU type of the message being rejected.

13  
 14                  **Table 2.7.3.4-1. REJECTED\_PDU\_TYPE codes**

| <b>REJECTED_PDU_TYPE (binary)</b> | <b>Description</b>    |
|-----------------------------------|-----------------------|
| 00                                | 20 ms regular message |
| 01                                | 5 ms mini message     |
| 01                                | Reserved              |
| 11                                | Reserved              |

15                  **RESERVED\_2** - Reserved bits.

16                   The mobile station shall add reserved bits as needed in order  
 17                  to make the total length of this record containing order-  
 18                  specific fields equal to an integer number of octets. The  
 19                  mobile station shall set these bits to '0'.

## 1    2.7.4 Information Records

2    On the r-csch, information records may be included in the *Status Response Message*, the  
 3    *Extended Status Response Message*, the *Origination Message*, and the *Device Information*  
 4    *Message*. On the r-dsch, information records may be included in the *Origination*  
 5    *Continuation Message*, the *Enhanced Origination Message*, the *Flash With Information*  
 6    *Message*, the *Extended Flash With Information Message*, the *Service Request Message*, the  
 7    *Service Response Message*, the *Status Message*, and the *Status Response Message*. Table  
 8    2.7.4-1 lists the information record type values that may be used with each message type.  
 9    The following sections describe the contents of each of the record types in detail.

10

11    **Table 2.7.4-1. Information Record Types (Part 1 of 2)**

| Information Record                   | Record Type (binary) | Message Type             | r-csch | r-dsch |
|--------------------------------------|----------------------|--------------------------|--------|--------|
| Reserved                             | 00000001             | None                     | -      | -      |

1      2.7.4.1 Reserved

## 1    2.7.4.2 Keypad Facility

2    This information record can be included in a *Flash With Information Message* and allows the  
3    user to send characters entered via a keyboard or other such terminal.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
|---------------------|---------------|

One or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

5

6    CHARi – Character.

7    The mobile station shall include one occurrence of this field  
8    for each character entered. The mobile station shall set each  
9    occurrence of this field to the ASCII representation  
10   corresponding to the character entered, as specified in [9],  
11   with the most significant bit set to '0'.

## 1    2.7.4.3 Called Party Number

2    This information record identifies the called party's number.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

|          |   |
|----------|---|
| RESERVED | 1 |
|----------|---|

3

4    NUMBER\_TYPE    -    Type of number.

5                     The mobile station shall set this field to the NUMBER\_TYPE  
6                     value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
7                     of the called number, as defined in [7], Section 4.5.9.

8    NUMBER\_PLAN    -    Numbering plan.

9                     The mobile station shall set this field to the NUMBER\_PLAN  
10                    value shown in Table 2.7.1.3.2.4-3 corresponding to the  
11                    numbering plan used for the called number, as defined in [7],  
12                    Section 4.5.9.

13                    CHARi    -    Character.

14                    The mobile stations shall include one occurrence of this field  
15                    for each character in the called number. The mobile station  
16                    shall set each occurrence of this field to the ASCII  
17                    representation corresponding to the character, as specified in  
18                    [9], with the most significant bit set to '0'.

19    RESERVED    -    Reserved bit.

20                    The mobile station shall set this field to '0'.

## 1    2.7.4.4 Calling Party Number

2    This information record can be included in a *Flash With Information Message* and identifies  
 3    the calling party's number.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |
| PI                  | 2             |
| SI                  | 2             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

|          |   |
|----------|---|
| RESERVED | 5 |
|----------|---|

- 4
- 5    NUMBER\_TYPE    -    Type of number.  
 6                  The mobile station shall set this field to the NUMBER\_TYPE  
 7                  value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
 8                  of the calling number, as defined in [7], Section 4.5.9.
- 9    NUMBER\_PLAN    -    Numbering plan.  
 10                 The mobile station shall set this field to the NUMBER\_PLAN  
 11                 value shown in Table 2.7.1.3.2.4-3 corresponding to the  
 12                 numbering plan used for the calling number, as defined in [7],  
 13                 Section 4.5.9.
- 14    PI    -    Presentation indicator.  
 15                 This field indicates whether or not the calling number should  
 16                 be displayed.  
 17                 The mobile station shall set this field to the PI value shown in  
 18                 Table 2.7.4.4-1 corresponding to the presentation indicator,  
 19                 as defined in [7], Section 4.5.9.
- 20

21    **Table 2.7.4.4-1. Presentation Indicators**

| Description             | PI (binary) |
|-------------------------|-------------|
| Presentation allowed    | 00          |
| Presentation restricted | 01          |
| Number not available    | 10          |
| Reserved                | 11          |

- 1           SI     – Screening indicator.  
 2                 This field indicates how the calling number was screened.  
 3                 The mobile station shall set this field to the SI value shown in  
 4                 Table 2.7.4.4-2 corresponding to the screening indicator  
 5                 value, as defined in [7], Section 4.5.9.

6

7           **Table 2.7.4.4-2. Screening Indicators**

| Description                        | SI (binary) |
|------------------------------------|-------------|
| User-provided, not screened        | 00          |
| User-provided, verified and passed | 01          |
| User-provided, verified and failed | 10          |
| Network-provided                   | 11          |

8

- 9           CHARi     – Character.  
 10                 The mobile stations shall include one occurrence of this field  
 11                 for each character in the calling number. The mobile station  
 12                 shall set each occurrence of this field to the ASCII  
 13                 representation corresponding to the character, as specified in  
 14                 [9], with the most significant bit set to '0'.  
 15           RESERVED     – Reserved bits.  
 16                 The mobile station shall set this field to '00000'.

1      2.7.4.5 Reserved

2

## 1    2.7.4.6 Call Mode

2    This information record can be included in a *Status Message* or a *Status Response Message*  
 3    to return the mobile station's preferred call mode and call-related information.

4    If P REV IN USE<sub>S</sub> is equal to or greater than seven, this information record will not be  
 5    requested by the base station (see 3.7.2.3.2.15 & 3.7.4.4).

6

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| ORIG_MODE           | 1             |
| PRI_SERVICE         | 16            |
| SEC_SERVICE         | 16            |
| RESERVED            | 7             |

7

- 8    ORIG\_MODE    -    Origination mode indicator.  
 9       If the current call is a mobile-originated call, the mobile  
 10      station shall set this field to '0'. If the current call is a mobile-  
 11      terminated call, the mobile station shall set this field to '1'.
- 12    PRI\_SERVICE    -    Primary service option.  
 13      The mobile station shall set this field to the value specified in  
 14      [30], corresponding to the current primary service option. If  
 15      no primary service option is active, the mobile station shall set  
 16      this field to '0000000000000000'.
- 17    SEC\_SERVICE    -    Secondary service option.  
 18      The mobile station shall set this field to the value specified in  
 19      [30], corresponding to the current secondary service option. If  
 20      no secondary service option is active, the mobile station shall  
 21      set this field to '0000000000000000'.
- 22    RESERVED    -    Reserved bits.  
 23      The mobile station shall set this field to '0000000'.

## 1    2.7.4.7 Terminal Information

2    This information record can be included in a *Status Message*, a *Status Response Message*,  
 3    or an *Extended Status Response Message* to return configuration information about the  
 4    mobile station.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| MOB_P_REV           | 8             |
| MOB_MFG_CODE        | 8             |
| MOB_MODEL           | 8             |
| MOB_FIRM_REV        | 16            |
| SCM                 | 8             |
| LOCAL_CTRL          | 1             |
| SLOT_CYCLE_INDEX    | 3             |

One or more occurrences of the following field:

|                |    |
|----------------|----|
| SERVICE_OPTION | 16 |
|----------------|----|

|          |   |
|----------|---|
| RESERVED | 4 |
|----------|---|

- 5
- 6    MOB\_P\_REV    -    Protocol revision of the mobile station.  
 7                 If the status request does not specify a band class, the mobile  
 8                 station shall set this field to '00000111'; otherwise, the  
 9                 mobile station shall set this field to the MOB\_P\_REV  
 10          associated with the requested band class and operating mode.
- 11    MOB\_MFG\_CODE    -    Manufacturer code.  
 12                 This field identifies the manufacturer of the mobile station.  
 13                 The mobile station shall set this field to the manufacturer  
 14          code assigned to its manufacturer.
- 15    MOB\_MODEL    -    Model number.  
 16                 This number is assigned by the manufacturer for a particular  
 17          model.  
 18                 The mobile station shall set this field to the model number  
 19          assigned by the manufacturer for this mobile station.
- 20    MOB\_FIRM\_REV    -    Firmware revision number.  
 21                 This number is assigned by the manufacturer for a particular  
 22          firmware version.  
 23                 The mobile station shall set this field to the revision number  
 24          assigned by the manufacturer for the firmware version  
 25          running in this mobile station.

- 1                   SCM     – Station class mark.  
2                                 The mobile station shall set this field to its station class mark.  
3                                 See 2.3.3.
- 4                   LOCAL\_CTRL     – Local control indicator.  
5                                 If local control is enabled, the mobile station shall set this  
6                                 field to '1'. If local control is disabled, the mobile station shall  
7                                 set this field to '0'. See [6].
- 8                   SLOT\_CYCLE\_INDEX     – Slot cycle index.  
9                                 If the requested operating mode is CDMA and the mobile  
10                                 station is configured for slotted mode operation, the mobile  
11                                 station shall set this field to the preferred slot cycle index,  
12                                 SLOT\_CYCLE\_INDEX<sub>p</sub> (see 2.6.2.1.1); otherwise, the mobile  
13                                 station shall set this field to '000'.
- 14                   SERVICE\_OPTION     – Supported service option.  
15                                 If the requested operating mode is CDMA, the mobile station  
16                                 shall include one occurrence of this field for each service  
17                                 option supported by the mobile station (see [30]); otherwise,  
18                                 the mobile station shall include one occurrence of this field  
19                                 with the value set to '0000000000000000'.
- 20                   RESERVED     – Reserved bits.  
21                                 The mobile station shall set this field to '0000'.

## 1    2.7.4.8 Roaming Information

2    This information record can be included in a *Status Message*, a *Status Response Message*,  
 3    or an *Extended Status Response Message* to return roaming information about the mobile  
 4    station.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| ACCOLC              | 4             |
| MOB_TERM_HOME       | 1             |
| MOB_TERM_FOR_SID    | 1             |
| MOB_TERM_FOR_NID    | 1             |

Zero or more occurrences of the following record:

|     |    |
|-----|----|
| SID | 15 |
| NID | 16 |

|          |                   |
|----------|-------------------|
| RESERVED | 0 - 7 (as needed) |
|----------|-------------------|

- 5                    ACCOLC    -    Overload class.

6                    The mobile station shall set this field to the access overload  
 7                    class assigned to the mobile station.

- 8                    MOB\_TERM\_HOME    -    Home (non-roaming) registration enable indicator.

9                    If the mobile station is configured to receive mobile station  
 10                  terminated calls when not roaming, the mobile station shall  
                       set this field to '1'; otherwise, the mobile station shall set this  
                       field to '0'. See 2.6.5.3.

- 11                  MOB\_TERM\_FOR\_SID    -    Foreign SID roaming registration enable indicator.

12                  If the mobile station is configured to receive mobile station  
 13                  terminated calls when it is a foreign SID roamer, the mobile  
                       station shall set this field to '1'; otherwise, the mobile station  
                       shall set this field to '0'. See 2.6.5.3.

- 14                  MOB\_TERM\_FOR\_NID    -    Foreign NID roaming registration enable indicator.

15                  If the mobile station is configured to receive mobile station  
 16                  terminated calls when it is a foreign NID roamer, the mobile  
                       station shall set this field to '1'; otherwise, the mobile station  
                       shall set this field to '0'. See 2.6.5.3.

1 The mobile station shall include one occurrence of the following two-field record for each  
2 home (non-roaming) (SID, NID) pair (see 2.6.5.2):

<sup>3</sup> SID – System identification.

4 The mobile station shall set this field to the SID value for this  
5 (SID, NID) pair.

6 NID – Network identification.

7 The mobile station shall set this field to the NID value for this  
8 (SID, NID) pair.

9                   RESERVED – Reserved bits.

10 The mobile station shall add reserved bits as needed in order  
11 to make the length of the entire information record equal to an  
12 integer number of octets. The mobile station shall set these  
13 bits to '0'.

## 1    2.7.4.9 Security Status

2    This information record can be included in a *Status Message* or a *Status Response Message*  
 3    to return the authentication, encryption, and voice privacy modes of the mobile station.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| AUTH_MODE           | 2             |
| ENCRYPT_MODE        | 2             |
| PRIVATE_LCM         | 1             |
| RESERVED            | 3             |

5

- 6    AUTH\_MODE    -    Authentication mode.

7                 If the mobile station provided standard authentication  
 8                 information at the initiation of this call, the mobile station  
 9                 shall set this field to '01'; otherwise, the mobile station shall  
 10          set this field to '00'. All other values are reserved.

- 11          ENCRYPT\_MODE    -    Message encryption mode.

12                 The mobile station shall set this field to the value shown in  
 13                 Table 3.7.2.3.2.8-2 corresponding to the message encryption  
 14                 mode currently in use for this call.

- 15          PRIVATE\_LCM    -    Private long code mask indicator.

16                 If the mobile station is using the private long code mask for  
 17                 this call, the mobile station shall set this field to '1'. If the  
 18                 mobile station is using the public long code mask for this call,  
 19                 the mobile station shall set this field to '0'.

- 20          RESERVED    -    Reserved bits.

21                 The mobile station shall set this field to '000'.

## 1    2.7.4.10 Connected Number

2    This information record can be included in a *Flash With Information Message* to identify the  
 3    responding party to a call.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |
| PI                  | 2             |
| SI                  | 2             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

|          |   |
|----------|---|
| RESERVED | 5 |
|----------|---|

- 4    NUMBER\_TYPE    - Type of number.  
 5    The mobile station shall set this field to the NUMBER\_TYPE  
 6    value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
 7    of the connected number as defined [7], Section 4.5.9.
- 8    NUMBER\_PLAN    - Numbering plan.  
 9    The mobile station shall set this field to the NUMBER\_PLAN  
 10   value shown in Table 2.7.1.3.2.4-3 corresponding to the  
 11   numbering plan used for the connected number, as defined,  
 12   in [7], Section 4.5.9.
- 13      PI    - Presentation indicator.  
 14      This field indicates whether or not the connected number  
 15   should be displayed. The mobile station shall set this field to  
 16   the PI value shown in Table 2.7.4.4-1 corresponding to the  
 17   presentation indicator, as defined in [7], Section 4.5.9.
- 18      SI    - Screening indicator.  
 19      This field indicates how the connected number was screened.  
 20   The mobile station shall set this field to the SI value shown in  
 21   Table 2.7.4.4-2 corresponding to the screening indicator  
 22   value, as defined in [7], Section 4.5.9.
- 23      CHARi    - Character.  
 24      The mobile station shall include one occurrence of this field  
 25   for each character in the connected number. The mobile  
 26   station shall set each occurrence of this field to the ASCII  
 27   representation corresponding to the character, as specified in  
 28   [9], with the most significant bit set to '0'.
- 29      RESERVED    - Reserved bits.  
 30      The mobile station shall set this field to '00000'.

## 1    2.7.4.11 IMSI

2    This information record can be included in a *Status Message*, a *Status Response Message*,  
 3    or an *Extended Status Response Message* to return the mobile station's operational IMSI.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| IMSI_CLASS          | 1             |
| IMSI_ADDR_NUM       | 3             |
| MCC_O               | 10            |
| IMSI_O_11_12        | 7             |
| IMSI_O_S            | 34            |
| RESERVED            | 1             |

- 4
- 5        IMSI\_CLASS    -    If IMSI\_O is a class 0 IMSI, the mobile station shall set this  
 6                  field to '0'; otherwise, the mobile station shall set this field to  
 7                  '1'.
  - 8        IMSI\_ADDR\_NUM    -    Number of IMSI\_O address digits.  
 9                  If IMSI\_O is a class 1 IMSI, the mobile station shall set this  
 10                 field to four less than the number of digits in the NMSI;  
 11                 otherwise, the mobile station shall set this field to '000'.
  - 12       MCC\_O    -    Mobile Country Code of the operational IMSI.  
 13                  The mobile station shall set this field to MCC\_O<sub>s</sub>. (see 2.3.1).
  - 14       IMSI\_O\_11\_12    -    The 11th and 12th digits of the operational IMSI.  
 15                  The mobile station shall set this field to IMSI\_O\_11\_12<sub>s</sub>.  
 16                 (see 2.3.1).
  - 17       IMSI\_O\_S    -    Last ten digits of the operational IMSI.  
 18                  The mobile station shall set this field to IMSI\_O\_S. (see 2.3.1.)
  - 19       RESERVED    -    Reserved bit.  
 20                  The mobile station shall set this field to '0'.

## 1    2.7.4.12 ESN

2    This information record can be included in a *Status Message*, a *Status Response Message*,  
3    or an *Extended Status Response Message* to return the mobile station ESN.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| ESN                 | 32            |

4

5    ESN      –    Mobile station electronic serial number.

6    The mobile station shall set this field to its electronic serial  
7    number (see 2.3.2).

## 1    2.7.4.13 Band Class Information

2    This information record can be included in a *Status Response Message*, or an *Extended*  
 3    *Status Response Message* to return band class information about the mobile station.

| Type-Specific Field | Length (bits)  |
|---------------------|----------------|
| BAND_CLASS_INFO     | 8 × RECORD_LEN |

- 4
- 5    BAND\_CLASS\_INFO    -    Band class information.  
 6                         This field indicates which band classes are supported by the  
 7                         mobile station.  
 8                         This field currently consists of the following subfields which  
 9                         are included in the information record in the order shown:

| Subfield                      | Length (bits)      | Subfield Description                   |
|-------------------------------|--------------------|----------------------------------------|
| BAND_CLASS_0                  | 1                  | 800 MHz cellular band                  |
| BAND_CLASS_1                  | 1                  | 1.8 to 2.0 GHz PCS band                |
| BAND_CLASS_2                  | 1                  | 872 to 960 MHz TACS band               |
| BAND_CLASS_3                  | 1                  | 832 to 925 MHz JTACS band              |
| BAND_CLASS_4                  | 1                  | 1.75 to 1.87 GHz Korean PCS band       |
| BAND_CLASS_5                  | 1                  | 450 MHz NMT band                       |
| BAND_CLASS_6                  | 1                  | 2 GHz IMT-2000 band                    |
| BAND_CLASS_7                  | 1                  | 700 MHz band                           |
| BAND_CLASS_8                  | 1                  | 1800 MHz band                          |
| BAND_CLASS_9                  | 1                  | 900 MHz band                           |
| <a href="#">BAND_CLASS_10</a> | <a href="#">1</a>  | <a href="#">Secondary 800 MHz band</a> |
| RESERVED                      | <a href="#">65</a> | <a href="#">Reserved Bits</a>          |

11

12    The mobile station shall set each subfield to ‘1’ if the  
 13    corresponding band class (see [2] and [30]) is supported by the  
 14    mobile station; otherwise, the mobile station shall set the  
 15    subfield to ‘0’.

- 16    RESERVED    -    Reserved bits.

17    The mobile station shall set this field to [‘000000’](#).

1 When more band classes are defined, the reserved bits will be  
2 used for the new corresponding subfields. Sufficient octets  
3 will be added to this field to accommodate the new subfields.  
4 All the undefined bits in an additional octet will be reserved  
5 bits.

6 The mobile station shall set all the reserved bits to '0'. If all  
7 bits are set to '0' in an octet and all succeeding octets, the  
8 mobile station shall omit the octet and the succeeding octets.

## 1    2.7.4.14 Power Class Information

2    This information record can be included in a *Status Response Message*, or an *Extended*  
3    *Status Response Message* to return power class information about the mobile station.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| MAX_EIRP            | 8             |

5

6    MAX\_EIRP    -    Maximum effective isotropic radiated power (EIRP).

7                 The mobile station shall set this field to the minimum EIRP at  
8                 maximum output (in dBW) for the mobile station plus 60 (see  
9                 [11]). When the mobile station output power is expressed in  
10          ERP, it may be converted to EIRP by adding 2 dB to the ERP  
11          value.<sup>2</sup>

---

<sup>2</sup> For example, if a mobile station has a minimum ERP at maximum output of -4 dBW, then the mobile station sets this field to 58.

## 1    2.7.4.15 Operating Mode Information

2    This information record can be included in a *Status Response Message* or an *Extended*  
 3    *Status Response Message* to return operating mode information about the mobile station.

4

5

| Type-Specific Field | Length (bits)  |
|---------------------|----------------|
| OP_MODE_INFO        | 8 × RECORD_LEN |

6

7    OP\_MODE\_INFO – Operating mode information.

8    This field indicates which operating modes are supported by  
 9    the mobile station in the band class for which information is  
 10   requested.

11   This field currently consists of the following subfields which  
 12   are included in the information record in the order shown in  
 13   Table 2.7.4.15-1 for P\_REV\_IN\_USE<sub>S</sub> less than or equal to  
 14   three and in Table 2.7.4.15-2 for P\_REV\_IN\_USE<sub>S</sub> greater  
 15   than three.

16

17   **Table 2.7.4.15-1. OP\_MODE for P\_REV\_IN\_USE<sub>S</sub> Less Than or Equal  
 18   to Three**

| Subfield | Length (bits) | Subfield Description                       |
|----------|---------------|--------------------------------------------|
| OP_MODE0 | 1             | CDMA mode in Band Class 1 and Band Class 4 |
| OP_MODE1 | 1             | CDMA mode in Band Class 0 and Band Class 3 |
| OP_MODE2 | 1             | Analog mode [6]                            |
| OP_MODE3 | 1             | wide analog mode [22]                      |
| OP_MODE4 | 1             | narrow analog mode [22]                    |
| RESERVED | 3             | <a href="#">-Reserved Bits</a>             |

19

**Table 2.7.4.15-2. OP\_MODE for P\_REV\_IN\_USEs Greater Than Three**

| <b>Subfield</b> | <b>Length<br/>(bits)</b> | <b>Subfield Description</b> | <b>Standards</b> |
|-----------------|--------------------------|-----------------------------|------------------|
| OP_MODE0        | 1                        | CDMA mode                   | [5]              |
| OP_MODE1        | 1                        | CDMA mode <sup>3</sup>      | [5]              |
| OP_MODE2        | 1                        | Analog mode                 | [65]             |
| OP_MODE3        | 1                        | Wide analog mode            | [22]             |
| OP_MODE4        | 1                        | Narrow analog mode          | [22]             |
| OP_MODE5        | 1                        | DS-41                       | [32]             |
| OP_MODE6        | 1                        | MC-MAP                      | [31]             |
| RESERVED        | 1                        | -                           | -                |

The mobile station shall set each subfield to '1', if the corresponding operating mode is supported by the mobile station; otherwise, the mobile station shall set the subfield to '0'.

**RESERVED** – Reserved bits.

The mobile station shall set each bit in this field to '0'.

When more operating modes are defined, the reserved bits will be used for the new corresponding subfields. Sufficient octets will also be added to this field to accommodate the corresponding new subfields. All the undefined bits in an additional octet will be reserved bits.

If all bits are set to '0' in an octet and all succeeding octets, the mobile station shall omit the octet and the succeeding octets.

<sup>3</sup> The mobile station shall set OP\_MODE1 ~~as the~~ same as OP\_MODE0.

1    2.7.4.16 Service Option Information

2    This information record can be included in a *Status Response Message*, or an *Extended*  
 3    *Status Response Message* to return service option information about the mobile station.

4

| Type-Specific Field                             | Length (bits) |
|-------------------------------------------------|---------------|
| One or more occurrences of the following field: |               |
| RESERVED                                        | 6             |
| FORWARD_SUPPORT                                 | 1             |
| REVERSE_SUPPORT                                 | 1             |
| SERVICE_OPTION                                  | 16            |

5

6    The mobile station shall include one occurrence of the following record for each service  
 7    option supported:

- 8            RESERVED    – Reserved bits.  
                   The mobile station shall set this field to ‘000000’.
- 9            FORWARD\_SUPPORT    – Support indicator for Forward Traffic Channel.  
                   The mobile station shall set this field to ‘1’ if the service option  
                   specified in the SERVICE\_OPTION field is supported on the  
                   Forward Traffic Channel.
- 10          REVERSE\_SUPPORT    – Support indicator for Reverse Traffic Channel.  
                   The mobile station shall set this field to ‘1’ if the service option  
                   specified in the SERVICE\_OPTION field is supported on the  
                   Reverse Traffic Channel.
- 11          SERVICE\_OPTION    – Service option.  
                   The mobile station shall set this field to the value specified in  
                   [30] for the service option supported.

12

1    2.7.4.17 Multiplex Option Information

2    This information record can be included in a *Status Response Message* or an *Extended*  
3    *Status Response Message* to return multiplex option information about the mobile station.  
4    The mobile station shall include at least one, and not more than six, instances of the record  
5    within the type-specific field according to the following rules:

- 6       • Within the type-specific field, the mobile station may include one instance of a  
7       record in which MULTIPLEX\_OPTION is set to 1. If this instance is included, the  
8       mobile station shall support Multiplex Option 1 for forward and reverse operation.
- 9       • Within the type-specific field, the mobile station may include one instance of a  
10      record in which MULTIPLEX\_OPTION is set to 2. If this instance is included, the  
11      mobile station shall support Multiplex Option 2 for forward and reverse operation.
- 12      • Within the type-specific field, the mobile station may include one instance of a  
13      record in which MULTIPLEX\_OPTION is set to 3, 5, 7, 9, 11, 13, or 15 and with  
14      **FOR\_NUM\_BITSRATES** set to '00000000'. If this instance is included, the mobile  
15      station shall set MULTIPLEX\_OPTION to the highest numbered multiplex option  
16      from the set {3, 5, 7, 9, 11, 13, 15} which the mobile station supports for reverse  
17      operation, and the mobile station shall support all multiplex options less than or  
18      equal to MULTIPLEX\_OPTION from that set for reverse operation.
- 19      • Within the type-specific field, the mobile station may include one instance of a  
20      record in which MULTIPLEX\_OPTION is set to 4, 6, 8, 10, 12, 14, or 16 and with  
21      **FOR\_NUM\_BITSRATES** set to '00000000'. If this instance is included, the mobile  
22      station shall set MULTIPLEX\_OPTION to the highest numbered multiplex option  
23      from the set {4, 6, 8, 10, 12, 14, 16} which the mobile station supports for reverse  
24      operation, and the mobile station shall support all multiplex options less than or  
25      equal to MULTIPLEX\_OPTION from that set for reverse operation.
- 26      • Within the type-specific field, the mobile station may include one instance of a  
27      record in which MULTIPLEX\_OPTION is set to 3, 5, 7, 9, 11, 13, or 15 and with  
28      **REV\_NUM\_BITSRATES** set to '00000000'. If this instance is included, the mobile  
29      station shall set MULTIPLEX\_OPTION to the highest numbered multiplex option  
30      from the set {3, 5, 7, 9, 11, 13, 15} which the mobile station supports for forward  
31      operation, and the mobile station shall support all multiplex options less than or  
32      equal to MULTIPLEX\_OPTION from that set for forward operation.
- 33      • Within the type-specific field, the mobile station may include one instance of a  
34      record in which MULTIPLEX\_OPTION is set to 4, 6, 8, 10, 12, 14, or 16 and with  
35      **REV\_NUM\_BITSRATES** set to '00000000'. If this instance is included, the mobile  
36      station shall set MULTIPLEX\_OPTION to the highest numbered multiplex option  
37      from the set {4, 6, 8, 10, 12, 14, 16} which the mobile station supports for forward  
38      operation, and the mobile station shall support all multiplex options less than or  
39      equal to MULTIPLEX\_OPTION from that set for forward operation.
- 40      • Within the type-specific field, the mobile station shall include at least one instance  
41      of a record in which **FOR\_NUM\_BITSRATES** is set to a value other than '00000000'.

- 1     • Within the type-specific field, the mobile station shall include at least one instance  
 2       of a record in which REV\_RATES is set to a value other than '00000000'.

3

| Type-Specific Field                              | Length (bits) |
|--------------------------------------------------|---------------|
| One or more occurrences of the following record: |               |
| MULTIPLEX_OPTION                                 | 16            |
| FOR_NUM_BITS                                     | 8             |
| REV_NUM_BITS                                     | 8             |

4

5     The mobile station shall include one occurrence of the following record for each specified  
 6       multiplex option according to the previously stated rules:

7       MULTIPLEX\_OPTION   – Supported multiplex option.

8           The mobile station shall set this field to the number of the  
 9           supported multiplex option from the set {1, 2, 3, 4, 5, 6, 7, 8,  
 10          9, 10, 11, 12, 13, 14, 15, 16} (e.g., 1 corresponds to Multiplex  
 11          Option 1).

12       FOR\_NUM\_BITS   – Forward Traffic Channel number of bits per frame.

13           If FOR\_NUM\_BITS = '00000000', then the specified multiplex  
 14           option in this record shall indicate the supported multiplex  
 15           option for the Reverse Traffic Channel only. In this case, no  
 16           further interpretation of the FOR\_NUM\_BITS field shall be  
 17           made. The mobile station shall not set both FOR\_NUM\_BITS  
 18           and REV\_NUM\_BITS equal to '00000000' in the same  
 19           information record.

20           If MULTIPLEX\_OPTION is equal to 1, 3, 5, 7, 9, 11, 13, or 15,  
 21           this field consists of the subfields specified in Table 2.7.4.17-1  
 22           which are included in the information record in the order  
 23           shown in the table. The subfields in Table 2.7.4.17-1 refer to  
 24           the number of bits per frame supported on the Fundamental  
 25           Code-Channel of the Forward Traffic Channel.

1  
2      **Table 2.7.4.17-1. Forward Fundamental Traffic Channel**  
Number of Bits per Frame for Forward Multiplex Option 1

| Subfield     | Length (bits) | Subfield Description          |
|--------------|---------------|-------------------------------|
| RS1_9600_FOR | 1             | 172 bits per F-FCH frame      |
| RS1_4800_FOR | 1             | 80 bits per F-FCH             |
| RS1_2400_FOR | 1             | 40 bits per F-FCH frame       |
| RS1_1200_FOR | 1             | 16 bits per F-FCH frame       |
| RESERVED     | 4             | <a href="#">Reserved Bits</a> |

3  
4      If MULTIPLEX\_OPTION is equal to 2, 4, 6, 8, 10, 12, 14, or 16,  
5      this field consists of the subfields specified in Table 2.7.4.17-2  
6      which are included in the information record in the order  
7      shown in the table. The subfields in Table 2.7.4.17-2 refer to  
8      the number of bits per frame supported on the Fundamental  
9      ~~Code~~-Channel of the Forward Traffic Channel.

10  
11     **Table 2.7.4.17-2. Forward Fundamental Traffic Channel**  
12     Number of Bits per Frame for [Forward Multiplex Option](#)  
13     [MO\\_FOR\\_FCH](#)=equal to 2

| Subfield      | Length (bits) | Subfield Description          |
|---------------|---------------|-------------------------------|
| RS2_14400_FOR | 1             | 267 bits per F-FCH frame      |
| RS2_7200_FOR  | 1             | 125 bits per F-FCH frame      |
| RS2_3600_FOR  | 1             | 55 bits per F-FCH frame       |
| RS2_1800_FOR  | 1             | 21 bits per F-FCH frame       |
| RESERVED      | 4             | <a href="#">Reserved Bits</a> |

14  
15      The mobile station shall set the subfields specified in Tables  
16      2.7.4.17-1 and 2.7.4.17-2, corresponding to the Forward  
17      Traffic Channel number of bits per frame supported by the  
18      mobile station for this multiplex option to '1', and shall set the  
19      remaining subfields to '0'. The mobile station shall set  
20      RESERVED to '0000'.

- 21      REV\_NUM\_BITS    - Reverse Traffic Channel transmission rates.  
22  
23      If REV\_NUM\_BITS is equal to '00000000', then the specified  
24      multiplex option in this record indicate the supported  
25      multiplex option for the Forward Traffic Channel only. In this  
26      case, no further interpretation of the REV\_NUM\_BITS field  
27      shall be made. The mobile station shall not set both  
28      FOR\_NUM\_BITS and REV\_NUM\_BITS equal to '00000000' in  
the same information record.

If MULTIPLEX\_OPTION is equal to 1, 3, 5, 7, 9, 11, 13, or 15, this field consists of the subfields specified in Table 2.7.4.17-3 which are included in the information record in the order shown in the table. The subfields in Table 2.7.4.17-3 refer to the number of bits per frame supported on the Fundamental [Code](#)-Channel of the Reverse Traffic Channel.

**Table 2.7.4.17-3. Reverse Fundamental Traffic Channel Number of Bits per Frame for [Reverse Multiplex Option MO\\_REV\\_FCH](#) equal to 1**

| Subfield     | Length (bits) | Subfield Description          |
|--------------|---------------|-------------------------------|
| RS1_9600_REV | 1             | 172 bits per R-FCH frame      |
| RS1_4800_REV | 1             | 80 bits per R-FCH frame       |
| RS1_2400_REV | 1             | 40 bits per R-FCH frame       |
| RS1_1200_REV | 1             | 16 bits per R-FCH frame       |
| RESERVED     | 4             | <a href="#">Reserved Bits</a> |

If MULTIPLEX\_OPTION is equal to 2, 4, 6, 8, 10, 12, 14, or 16, this field consists of the subfields specified in Table 2.7.4.17-4 which are included in the information record in the order shown in the table. The subfields in Table 2.7.4.17-4 refer to the number of bits per frame supported on the Fundamental [Code](#)-Channel of the Reverse Traffic Channel.

**Table 2.7.4.17-4. Reverse Fundamental Traffic Channel Number of Bits per Frame for [Reverse Multiplex Option MO\\_REV\\_FCH](#) equal to 21**

| Subfield      | Length (bits) | Subfield Description          |
|---------------|---------------|-------------------------------|
| RS2_14400_REV | 1             | 267 bits per R-FCH frame      |
| RS2_7200_REV  | 1             | 125 bits per R-FCH frame      |
| RS2_3600_REV  | 1             | 55 bits per R-FCH frame       |
| RS2_1800_REV  | 1             | 21 bits per R-FCH frame       |
| RESERVED      | 4             | <a href="#">Reserved Bits</a> |

1           The mobile station shall set the subfields specified in Table  
2           2.7.4.17-3 and Table 2.7.4.17-4 corresponding to the Reverse  
3           Traffic Channel transmission number of bits per frame  
4           supported by the mobile station for this multiplex option to '1',  
5           and shall set the remaining subfields to '0'. The mobile  
6           station shall set RESERVED to '0000'.

1    2.7.4.18 Service Configuration

2    The format of the Service Configuration information record is defined in 3.7.5.7.

3

## 1    2.7.4.19 Called Party Subaddress

2    This information record identifies the called party subaddress.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

3

4    EXTENSION\_BIT – The extension bit.

5                         The mobile station shall set this field to '1'.

6    SUBADDRESS\_TYPE – Type of subaddress.

7                         The mobile station shall set this field to the  
8                         SUBADDRESS\_TYPE value shown in Table 2.7.4.19-1  
9                         corresponding to the type of the subaddress, as defined in [7],  
10                        Section 4.5.8.

11

12                        **Table 2.7.4.19-1. Subaddress Types**

| Description                                                               | SUBADDRESS<br>TYPE<br>(binary) |
|---------------------------------------------------------------------------|--------------------------------|
| NSAP ( <a href="#">CCITT Recommendation X.213/ISO 8348 AD2 see [34]</a> ) | 000                            |
| User specified                                                            | 010                            |
| Reserved                                                                  | others                         |

13

14    ODD/EVEN\_INDICATOR – The indicator of odd/even bits.

15                         The mobile station shall set this field to the  
16                         ODD/EVEN\_INDICATOR value shown in Table 2.7.4.19-2  
17                         corresponding to the indicator of even/odd bits, as defined in  
18                         [7], Section 4.5.8. This field is only used when the type of  
19                         subaddress is "User specified" and the coding is BCD.

20

**Table 2.7.4.19-2. Odd/Even Indicator**

| <b>Description</b>             | <b>ODD/EVEN INDICATOR<br/>(binary)</b> |
|--------------------------------|----------------------------------------|
| Even number of address signals | 0                                      |
| Odd number of address signals  | 1                                      |

- RESERVED – Reserved bits.  
The mobile station shall set this field to '000'.
- CHARi – Character.  
The mobile station shall include one occurrence of this field for each character in the called party subaddress.  
When the SUBADDRESS\_TYPE field is equal to '000', the NSAP address shall be encoded using the preferred binary encoding specified in [CCITT Recommendation X.213 or ISO 8348-AD2\[35\]](#).  
When the SUBADDRESS\_TYPE field is set to '010', the user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with CCITT Recommendation X.25 networks, BCD coding should be applied.

## 1    2.7.4.20 Calling Party Subaddress

2    This information record identifies the calling party subaddress.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

3

4    EXTENSION\_BIT - The extension bit.

5                         The mobile station shall set this field to '1'.

6    SUBADDRESS\_TYPE - Type of subaddress.

7                         The mobile station shall set this field to the  
8                         SUBADDRESS\_TYPE value shown in Table 2.7.4.19-1  
9                         corresponding to the type of the subaddress, as defined in [7],  
10                        Section 4.5.10.

11   ODD/EVEN\_INDICATOR - The indicator of odd/even bits.

12                        The mobile station shall set this field to the  
13                        ODD/EVEN\_INDICATOR value shown in Table 2.7.4.19-2  
14                        corresponding to the indicator of even/odd bits, as defined in  
15                        [7], Section 4.5.10. It is only used when the type of  
16                        subaddress is "User specified" and the coding is BCD.

17                        RESERVED - Reserved bits.

18                        The mobile station shall set this field to '000'.

19                        CHARi - Character.

20                        The mobile station shall include one occurrence of this field  
21                        for each character in the calling party subaddress.22                        When the SUBADDRESS\_TYPE field is equal to '000', the  
23                        NSAP address shall be encoded using the preferred binary  
24                        encoding specified in [CCITT Recommendation X.213 or ISO 8348 AD2\[35\]](#).26                        When the SUBADDRESS\_TYPE field is set to '010', user-  
27                        specified subaddress field is encoded according to the user  
28                        specification, subject to a maximum length of 20 octets.  
29                        When interworking with [CCITT Recommendation X.25\[36\]](#)  
30                        networks, BCD coding should be applied.

## 1    2.7.4.21 Connected Subaddress

2    This information record identifies the subaddress of the responding party.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

4

5    EXTENSION\_BIT

- The extension bit.

6

The mobile station shall set this field to ‘1’.

7    SUBADDRESS\_TYPE

- Type of subaddress.

8

The mobile station shall set this field to the SUBADDRESS\_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.14.

9

10

11

12    ODD/EVEN\_INDICATOR

- The indicator of odd/even bits.

13

14

15

16

17

The mobile station shall set this field to the ODD/EVEN\_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.14. It is only used when the type of subaddress is “User specified” and the coding is BCD.

18

RESERVED

- Reserved bits.

19

The mobile station shall set this field to ‘000’.

20

CHARi

- Character.

21

22

The mobile station shall include one occurrence of this field for each character in the connected subaddress.

23

24

25

26

When the SUBADDRESS\_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [CCITT Recommendation X.213 or ISO 8348-AD2\[35\]](#).

27

28

29

30

31

When the SUBADDRESS\_TYPE field is set to ‘010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with [CCITT Recommendation X.25\[36\]](#) networks, BCD coding should be applied.

## 1    2.7.4.22 Power Control Information

2    This information record can be included in a *Status Response Message*, or an *Extended*  
 3    *Status Response Message* to return the minimum power control step size supported by the  
 4    mobile station (see 2.1.2.3.2).

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| MIN_PWR_CNTL_STEP   | 3             |
| RESERVED            | 5             |

5

6    MIN\_PWR\_CNTL\_STEP – Minimum power control step size

7                 The mobile station shall set this field to the PWR\_CNTL\_STEP  
 8                 value associated with the minimum closed loop power control  
 9                 step size shown in Table 3.7.3.3.2.25-1 that the mobile station  
 10          supports.

11          RESERVED – Reserved bits.

12                 The mobile station shall set this field to ‘00000’.

#### 2.7.4.23 IMSI\_M

This information record can be included in a *Status Response Message*, or an *Extended Status Response Message* to return the mobile station's  $\text{IMSI}_M$ .

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| IMSI_M_CLASS        | 1             |
| IMSI_M_ADDR_NUM     | 3             |
| MCC_M               | 10            |
| IMSI_M_11_12        | 7             |
| IMSI_M_S            | 34            |
| RESERVED            | 1             |

## 1    2.7.4.24 IMSI\_T

2    This information record can be included in a *Status Response Message*, or an *Extended*  
 3    *Status Response Message* to return the mobile station's IMSI\_T.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| IMSI_T_CLASS        | 1             |
| IMSI_T_ADDR_NUM     | 3             |
| MCC_T               | 10            |
| IMSI_T_11_12        | 7             |
| IMSI_T_S            | 34            |
| RESERVED            | 1             |

- 4
- 5    IMSI\_T\_CLASS    -    IMSI\_T Class assignment of the mobile station.  
 6                      If the mobile station's IMSI\_T is a class 0 IMSI, the mobile  
 7                      station shall set this field to '0'; otherwise, the mobile station  
 8                      shall set this field to '1'.
- 9    IMSI\_T\_ADDR\_NUM    -    Number of IMSI\_T<sub>p</sub> address digits.  
 10                     If the mobile station's IMSI\_T is a class 1 IMSI, the mobile  
 11                     station shall set this field to four less than the number of  
 12                     digits in the NMSI; otherwise, the mobile station shall set this  
 13                     field to '000'.
- 14    MCC\_T    -    Mobile Country Code of the IMSI\_T.  
 15                     The mobile station shall set this field to the MCC\_T<sub>p</sub>.  
 16                     See 2.3.1.
- 17    IMSI\_T\_11\_12    -    The 11th and 12th digits of the IMSI\_T<sub>p</sub>.  
 18                     The mobile station shall set this field to IMSI\_T\_11\_12<sub>p</sub>.  
 19                     See 2.3.1.
- 20    IMSI\_T\_S    -    Last ten digits of the IMSI\_T<sub>p</sub>.  
 21                     The mobile station shall set this field to IMSI\_T\_S<sub>p</sub>. See 2.3.1.
- 22    RESERVED    -    Reserved bit.  
 23                     The mobile station shall set this field to '0'.

1    2.7.4.25 Capability Information

2    This information record identifies whether the following optional or MOB\_P\_REV dependent  
3    features are supported by the mobile station.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| ACCESS_ENTRY_HO     | 1             |
| ACCESS_PROBE_HO     | 1             |
| ANALOG_SEARCH       | 1             |
| HOPPING_BEACON      | 1             |
| MAHHO               | 1             |
| PUF                 | 1             |
| ANALOG_553A         | 1             |
| QPCH                | 1             |
| SLOTTED_TIMER       | 1             |
| CHS_SUPPORTED       | 1             |
| GATING_RATE_SET     | 0 or 2        |
| EXT_CAP_INCLUDED    | 1             |

If EXT\_CAP\_INCLUDED is set to '1', include the following two-field record:

|      |                        |
|------|------------------------|
| MABO | <a href="#">0 or 1</a> |
| SDB  | <a href="#">0 or 1</a> |

|                      |                  |
|----------------------|------------------|
| RLP_INFO_LEN         | 3                |
| RLP_BLOB             | 8 X RLP_INFO_LEN |
| FLEX_SUPPORTED       | 1                |
| F_FCH_FLEX_SUPPORTED | 0 or 1           |
| R_FCH_FLEX_SUPPORTED | 0 or 1           |

(continues on next page)

5

1

| Type-Specific Field                     | Length (bits)     |
|-----------------------------------------|-------------------|
| F_DCCH_FLEX_SUPPORTED                   | 0 or 1            |
| R_DCCH_FLEX_SUPPORTED                   | 0 or 1            |
| F_SCH_FLEX_SUPPORTED                    | 0 or 1            |

| <a href="#">F SCH LTU TAB SUPPORTED</a> | <a href="#">1</a> |
| <a href="#">R SCH LTU TAB SUPPORTED</a> | <a href="#">1</a> |
| RESERVED                                | 0 - 7 (as needed) |

2

- 3      ACCESS\_ENTRY\_HO    - Access Entry Handoff Support.  
 4      This field identifies the mobile station's support for access  
 5      entry handoff (see 2.6.2.3). The mobile station shall set this  
 6      field to '1' if access entry handoff is supported; otherwise, the  
 7      mobile station shall set this field to '0'.  
 8      ACCESS\_PROBE\_HO    - Access Probe Handoff Support.  
 9      This field identifies the mobile station's support for access  
 10     probe handoff (see 2.6.3.1.3.3). The mobile station shall set this  
 11     field to '1' if access probe handoff is supported; otherwise,  
 12     the mobile station shall set this field to '0'.  
 13     ANALOG\_SEARCH    - Analog Search Support.  
 14     This field identifies the mobile station's support for analog  
 15     searching (see 2.6.6.2.10). The mobile station shall set this  
 16     field to '1' if analog searching is supported; otherwise, the  
 17     mobile station shall set this field to '0'.  
 18     HOPPING\_BEACON    - Hopping Beacon Support.  
 19     This field identifies the mobile station's support for hopping pilot  
 20     beacons. The mobile station shall set this field to '1' if hopping  
 21     pilot beacons are supported; otherwise, this field shall be set to  
 22     '0'.

- 1           MAHHO    – Mobile Assisted Hard Handoff Support.  
 2           This field identifies the mobile station's support for mobile  
 3           assisted hard handoff. The mobile station shall set this field to  
 4           ‘1’.
- 5           PUF      – Location Power Up Function Support.  
 6           This field identifies the mobile station's support for location  
 7           power up function (see 2.6.4.1.7).  
 8           If MOB\_P\_REV<sub>p</sub> is equal to ‘00000101’, the mobile station shall  
 9           set this field to ‘1’; otherwise the mobile station shall set this  
 10          field as follows:  
 11          If the mobile station supports location power up function, the  
 12          mobile station shall set this field to ‘1’, otherwise, the mobile  
 13          station shall set this field to ‘0’.
- 14          ANALOG\_553A – Analog Support.  
 15          This field identifies the mobile station's compatibility with [12].  
 16          The mobile station shall set this field to ‘1’.
- 17          QPCH     – Quick Paging Channel Support.  
 18          This field identifies the mobile station's support for the Quick  
 19          Paging Channel. The mobile station shall set this field to ‘1’ if  
 20          the Quick Paging Channel is supported; otherwise, the mobile  
 21          station shall set this field to ‘0’.
- 22          SLOTTED\_TIMER – Slotted Timer Support.  
 23          This field identifies the mobile station's support for the Slotted  
 24          Timer. The mobile station shall set this field to ‘1’ if the Slotted  
 25          Timer is supported; otherwise, the mobile station shall set this  
 26          field to ‘0’.
- 27          CHS\_SUPPORTED – Control Hold Mode supported indicator.  
 28          The mobile station shall set this field to ‘1’ to indicate that the  
 29          mobile station supports the Control Hold Mode; otherwise, the  
 30          mobile station shall set this field to ‘0’.
- 31          GATING\_RATE\_SET – Set of supported Reverse Pilot gating rates.  
 32          If CHS\_SUPPORTED is included and is set to ‘1’, the mobile  
 33          station shall set this field to value shown in Table 2.7.4.25-1  
 34          corresponding to the set of supported reverse pilot gating  
 35          rates; otherwise the mobile station shall omit this field.

36

1  
Table 2.7.4.25-1. Set of supported Reverse Pilot Gating Rates

| GATING_RATE_SET field (binary) | Gating Rates Capability                         |
|--------------------------------|-------------------------------------------------|
| 00                             | Gating rates 1                                  |
| 01                             | Gating rates 1 and $\frac{1}{2}$                |
| 10                             | Gating rates 1, $\frac{1}{2}$ and $\frac{1}{4}$ |
| 11                             | Reserved                                        |

- 2
- 3 EXT\_CAP\_INCLUDED - Extended Capabilities Included indicator.  
 4 The mobile station shall set this field to '1' to indicate that  
 5 extended capability indicators are included in this record;  
 6 otherwise, the mobile station shall set this field to '0'.
- 7 MABO - Mobile Assisted Burst Operation capability indicator.  
 8 If EXT\_CAP\_INCLUDED is set to '0', the mobile station shall omit  
 9 this field; otherwise, the mobile station shall include this field  
 10 and set it as follows:  
 11 ~~If EXT\_CAP\_INCLUDED is set to '1', t~~The mobile station shall set  
 12 this field to '1' ~~to indicate that if~~ it supports the Mobile Assisted  
 13 Burst Operation capability; otherwise, the mobile station shall  
 14 set this field to '0'.
- 15 SDB - Short Data Burst supported indicator.  
 16 If EXT\_CAP\_INCLUDED is set to '0', the mobile station shall  
 17 omit this field; otherwise, the mobile station shall include this  
 18 field and set it as follows:  
 19 ~~If EXT\_CAP\_INCLUDED is set to '1', t~~The mobile station shall  
 20 set this field to '1' ~~to indicate that if~~ it supports Short Data  
 21 Burst capability; otherwise, the mobile station shall set this  
 22 field to '0'.
- 23 RLP\_INFO\_LEN - RLP capability information length.  
 24 The mobile station shall set this field to '000' if the RLP\_BLOB  
 25 field is not included in this record; otherwise, it shall set this  
 26 field to the size of the RLP\_BLOB field in integer number of  
 27 octets.
- 28 RLP\_BLOB - Radio Link Protocol information block of bits.  
 29 If the RLP\_INFO\_LEN field is set to '000', the mobile station  
 30 shall omit this field; otherwise, the mobile station shall set  
 31 this field as follows:  
 32 The mobile station shall set this field to the Radio Link  
 33 Protocol information block of bits.
- 34 FLEX\_SUPPORTED - Flexible rate feature supported indicator.

1                   The mobile station shall set this field to '1' if it supports the  
 2                   flexible rate feature (the capability to support a non-listed  
 3                   frame format) on any of the forward or reverse Fundamental,  
 4                   Supplemental or Dedicated Control channels; otherwise, the  
 5                   mobile station shall set this field to '0'.  
 6

7                   **F\_FCH\_FLEX-**

- 8                   **\_SUPPORTED** – Forward Fundamental channel flexible rate feature supported  
 9                   indicator.

10                  The mobile station shall include this field only if  
 11                  FLEX\_SUPPORTED is equal to '1'. If this field is included, the  
 12                  mobile station shall set this field to '1' if it supports the  
 13                  flexible rate feature for the Forward Fundamental Channel;  
 14                  otherwise, the mobile station shall set this field to '0'.

15                  **R\_FCH\_FLEX-**

- 16                  **\_SUPPORTED** – Reverse Fundamental channel flexible rate feature supported  
 17                  indicator.

18                  The mobile station shall include this field only if  
 19                  FLEX\_SUPPORTED is equal to '1'. If this field is included, the  
 20                  mobile station shall set this field to '1' if it supports the  
 21                  flexible rate feature for the Reverse Fundamental Channel;  
 22                  otherwise, the mobile station shall set this field to '0'.

23                  **F\_DCCH\_FLEX-**

- 24                  **\_SUPPORTED** – Forward Dedicated Control channel flexible rate feature  
 25                  supported indicator.

26                  The mobile station shall include this field only if  
 27                  FLEX\_SUPPORTED is equal to '1'. If this field is included, the  
 28                  mobile station shall set this field to '1' if it supports the  
 29                  flexible rate feature for the Forward Dedicated Control  
 30                  Channel; otherwise, the mobile station shall set this field to  
 31                  '0'.

32                  **R\_DCCH\_FLEX-**

- 33                  **\_SUPPORTED** – Reverse Dedicated Control channel flexible rate feature  
 34                  supported indicator.

35                  The mobile station shall include this field only if  
 36                  FLEX\_SUPPORTED is equal to '1'. If this field is included, the  
 37                  mobile station shall set this field to '1' if it supports the  
 38                  flexible rate feature for the Reverse Dedicated Control  
 39                  Channel; otherwise, the mobile station shall set this field to  
 40                  '0'.

41

42                  **F\_SCH\_FLEX-**

- 43                  **\_SUPPORTED** – Forward Supplemental channel flexible rate feature supported  
 44                  indicator.

The mobile station shall include this field only if FLEX\_SUPPORTED is equal to '1'. If this field is included, the mobile station shall set this field to '1' if it supports the flexible rate feature for the Forward Supplemental Channel; otherwise, the mobile station shall set this field to '0'.

## R\_SCH\_FLEX-

- Reverse Supplemental channel flexible rate feature supported indicator.

The mobile station shall include this field only if FLEX\_SUPPORTED is equal to '1'. If this field is included, the mobile station shall set this field to '1' if it supports the flexible rate feature for the Reverse Supplemental Channel; otherwise, the mobile station shall set this field to '0'.

## VAR\_SUPPORTED

- Variable rate feature supported indicator.

The mobile station shall set this field to '1' if it supports the variable rate feature (the capability to support rate determination) on any of the forward or reverse Supplemental ~~or Dedicated Control~~ channels; otherwise, the mobile station shall set this field to '0'.

F\_SCH\_VAR-

- SUPPORTED – Forward Supplemental Channel Variable Rate supported indicator.

The mobile station shall include this field only if FLEXVAR\_SUPPORTED is equal to '1'. If this field is included, the mobile station shall set this field to '1' if it supports the rate determination feature on the Forward Supplemental Channels.

R\_SCH\_VAR-

- SUPPORTED – Reverse Supplemental Channel Variable Rate supported indicator.

The mobile station shall include this field only if FLEXVAR\_SUPPORTED is equal to '1'. If this field is included, the mobile station shall set this field to '1' if it supports the variable\_rate\_determination feature on the Reverse Supplemental Channels.

## MAX\_SUM-

- Maximum sum of number of bits corresponding to Convolutional rates in the variable rate set

The mobile station shall include this field only if F\_SCH\_VAR\_SUPPORTED is equal to '1'. If this field is included, the mobile station shall set this field to the maximum of the sum of possible information bits per 20 ms corresponding to the Convolutional Code rates in the Variable Rate Set for a Forward Supplemental Channel below which the mobile station is capable of performing rate determination on the forward supplemental channel when Convolutional coding is used.

| 31 |                             | The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to '0'.                                                                                                                                                                                                                                                                  |
| 32 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 33 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 34 |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

1    2.7.4.26 Extended Record Type - International

2    The use of this record type is country-specific. The first ten bits of the type-specific fields  
3    shall include the Mobile Country Code (MCC) associated with the national standards  
4    organization administering the use of the record type. Encoding of the MCC shall be as  
5    specified in 2.3.1.3. The remaining six bits of the first two octets of the type-specific fields  
6    shall be used to specify the country-specific record type.

1    2.7.4.27 Channel Configuration Capability Information

2    This information record can be included in a *Status Response Message* or an *Extended*  
 3    *Status Response Message* to return channel configuration capability information about the  
 4    mobile station.

5

| Type-Specific Field                           | Length (bits)     |
|-----------------------------------------------|-------------------|
| OTD_SUPPORTED                                 | 1                 |
| FCH_SUPPORTED                                 | 1                 |

6

7    OTD\_SUPPORTED    –    OTD supported indicator.

8    The mobile station shall set this field to ‘1’ if the mobile  
 9    station supports orthogonal transmission diversity; otherwise,  
 10   the mobile station shall set this field to ‘0’.

11   FCH\_SUPPORTED    –    Fundamental Channel supported indicator.

12   The mobile station shall set this field to ‘1’, if the mobile  
 13   station supports the Fundamental Channel; otherwise, the  
 14   mobile station shall set this field to ‘0’.

15   FCH Type-specific fields    –    Fundamental Channel configuration capability information.

16   If the FCH\_SUPPORTED field is set to ‘1’, the mobile station  
 17   shall include this field and set it as described in 2.7.4.27.1;  
 18   otherwise the mobile station shall omit this field.

19   DCCH\_SUPPORTED    –    Dedicated Control Channel supported indicator.

The mobile station shall set this field to '1' if the mobile station supports the Dedicated Control Channel; otherwise, the mobile station shall set this field to '0'.

- |                                         |                                                                                                                                                                                                                                                                                                                                                                                                                        |

1                   The mobile station shall set this field to '1' if the mobile  
2                   station supports Space Time Spreading Transmit Diversity;  
3                   otherwise, the mobile station shall set this field to '0'.  
4

- 5                   3X\_CCH\_SUPPORTED     – 3X Common Channel supported.  
6

7                   The mobile station shall set this field to '1' if the mobile  
8                   station supports the Spreading Rate 3 common channels (3X  
BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile  
station shall set this field to '0'.  
9

- 10                  RESERVED             – Reserved bits.  
11

12                  The mobile station shall add reserved bits as needed in order  
13                  to make the length of the entire information record equal to an  
integer number of octets. The mobile station shall set these  
bits to '0'.  
14

## 1    2.7.4.27.1 FCH Type-specific Fields

2    The Fundamental Channel configuration capability information included in the FCH Type-  
 3    specific fields contains the following subfields:

4

|                |                                 |
|----------------|---------------------------------|
| FCH_FRAME_SIZE | 1                               |
| FOR_FCH_LEN    | 3                               |
| FOR_FCH_RC_MAP | $3 \times \text{FOR\_FCH\_LEN}$ |
| REV_FCH_LEN    | 3                               |
| REV_FCH_RC_MAP | $3 \times \text{REV\_FCH\_LEN}$ |

5

6    FCH\_FRAME\_SIZE    -    Fundamental Channel Frame Size capability indicator.

7                         If in addition to the 20 ms frame size the mobile station also  
 8                         supports the 5 ms frame size on the Fundamental Channel,  
 9                         the mobile station shall set this field to '1'; otherwise, the  
 10                       mobile station shall set this field to '0'.

11                  FOR\_FCH\_LEN    -    Forward Fundamental Channel Configuration information  
 12                       length.

13                       The mobile station shall set this field to the number of 3 bit  
 14                       units required to specify the length, in bits, of the  
 15                       FOR\_FCH\_RC\_MAP field.

16                  FOR\_FCH\_RC\_MAP    -    Forward Fundamental Radio Configuration information.

17                       The mobile station shall set this field as described below to  
 18                       indicate which Radio Configurations (see [2] Table 3.1.3.1-1)  
 19                       are supported by the mobile station on the Forward  
 20                       Fundamental Channel.

21                       This field consists of the sequence of 1-bit indicators, each  
 22                       indicating the mobile station support for specific Radio  
 23                       Configuration. Bit positions of these indicators in the field  
 24                       and corresponding Radio Configurations are specified in Table  
 25                       2.7.4.27.1-1.

26                       The mobile station shall set each indicator to '1' if the  
 27                       corresponding Radio Configuration on the Forward  
 28                       Fundamental Channel is supported by the mobile station;  
 29                       otherwise, the mobile station shall set the indicator to '0'. The  
 30                       mobile station shall set any unused bits in the field to '0'.

**Table 2.7.4.27.1-1. Forward Channel Radio Configurations Supported**

| <b>Subfield</b> | <b>Length (bits)</b> | <b>Subfield Description</b> |
|-----------------|----------------------|-----------------------------|
| RC1             | 1                    | Radio Configuration 1       |
| RC2             | 1                    | Radio Configuration 2       |
| RC3             | 1                    | Radio Configuration 3       |
| RC4             | 1                    | Radio Configuration 4       |
| RC5             | 1                    | Radio Configuration 5       |
| RC6             | 1                    | Radio Configuration 6       |
| RC7             | 1                    | Radio Configuration 7       |
| RC8             | 1                    | Radio Configuration 8       |
| RC9             | 1                    | Radio Configuration 9       |

2

3           REV\_FCH\_LEN     – Reverse Fundamental Channel Configuration information  
 4           length.

5           The mobile station shall set this field to the number of 3 bit units  
 6           required to specify the length, in bits, of the  
 7           REV\_FCH\_RC\_MAP field.

8           REV\_FCH\_RC\_MAP   – Reverse Fundamental Radio Configuration information.

9           The mobile station shall set this field as described below to  
 10          indicate which Radio Configurations (see [2] Table 2.1.3.1-1)  
 11          are supported by the mobile station on the Reverse  
 12          Fundamental Channel.

13          This field consists of the sequence of 1-bit indicators, each  
 14          indicating the mobile station support for specific Radio  
 15          Configuration. Bit positions of these indicators in the field  
 16          and corresponding Radio Configurations are specified in Table  
 17          2.7.4.27.1-2.

18          The mobile station shall set each indicator to '1' if the  
 19          corresponding Radio Configuration on the Reverse  
 20          Fundamental Channel is supported by the mobile station;  
 21          otherwise, the mobile station shall set the indicator to '0'. The  
 22          mobile station shall set any unused bits in the field to '0'.

23

## 1    2.7.4.27.2 DCCH Type-Specific Fields

2    The Dedicated Control Channel configuration capability information included in the DCCH  
 3    Type-specific fields contains the following subfields:

|                 |                  |
|-----------------|------------------|
| DCCH_FRAME_SIZE | 2                |
| FOR_DCCH_LEN    | 3                |
| FOR_DCCH_RC_MAP | 3 x FOR_DCCH_LEN |
| REV_DCCH_LEN    | 3                |
| REV_DCCH_RC_MAP | 3 x REV_DCCH_LEN |

5    DCCH\_FRAME\_SIZE    -    Frame Size supported indicator on the Dedicated Control  
 6    Channel.

7    The mobile station shall set this field to the frame size  
 8    supported for the forward and reverse DCCH, as shown in  
 9    Table 2.7.4.27.2-1.

10    **Table 2.7.4.27.2-1. DCCH Frame Size Supported**

| DCCH_FRAME_SIZE<br>(binary) | Description                                                      |
|-----------------------------|------------------------------------------------------------------|
| 00                          | Either 5 ms or 20 ms frame sizes<br>(not dynamically switchable) |
| 01                          | 20 ms frame size only                                            |
| 10                          | 5 ms frame size only                                             |
| 11                          | Both 5 ms and 20 ms frame sizes<br>(Dynamically switchable)      |

11    FOR\_DCCH\_LEN    -    Forward Dedicated Control Channel Configuration information  
 12    length.

13    The mobile station shall set this field to the number of 3 bit  
 14    units required to specify the length, in bits, of the  
 15    FOR\_DCCH\_RC\_MAP field.

16    FOR\_DCCH\_RC\_MAP    -    Forward Dedicated Channel Radio Configuration information.

17    The mobile station shall set this field as described below to  
 18    indicate which Radio Configurations (See—see [2]—Table  
 19    3.1.3.1-1) are supported by the mobile station on the Forward  
 20    Dedicated Control Channel.

21    This field consists of the sequence of 1-bit indicators, each  
 22    indicating the mobile station support for specific Radio  
 23    Configuration. Bit positions of these indicators in the field  
 24    and corresponding Radio Configurations are specified in Table  
 25    2.7.4.27.1-1.

1                   The mobile station shall set each indicator to '1' if the  
2                   corresponding Radio Configuration on the Forward Dedicated  
3                   Control Channel is supported by the mobile station;  
4                   otherwise, the mobile station shall set the indicator to '0'. The  
5                   mobile station shall set any unused bits in the field to '0'.

6     REV\_DCCH\_LEN    - Reverse Dedicated Control Channel Configuration information  
7                   length.

8                   The mobile station shall set this field to the number of 3 bit  
9                   units required to specify the length, in bits, of the  
10                  REV\_DCCH\_RC\_MAP field.

11    REV\_DCCH\_RC\_MAP - Reverse Dedicated Control Channel Radio Configuration  
12                   information.

13                   The mobile station shall set this field as described below to  
14                   indicate which Radio Configurations (see [2]-[Table 2.1.3.1-1](#))  
15                   are supported by the mobile station on the Reverse Dedicated  
16                   Control Channel.

17                   This field consists of the sequence of 1-bit indicators, each  
18                   indicating the mobile station support for specific Radio  
19                   Configuration. Bit positions of these indicators in the field  
20                   and corresponding Radio Configurations are specified in Table  
21                  2.7.4.27.1-2.

22                   The mobile station shall set each indicator to '1' if the  
23                   corresponding Radio Configuration on the Reverse Dedicated  
24                   Control Channel is supported by the mobile station;  
25                   otherwise, the mobile station shall set the indicator to '0'. The  
26                   mobile station shall set any unused bits in the field to '0'.

1    2.7.4.27.3 FOR\_SCH Type-Specific Fields-

2    The Forward Supplemental Channel configuration capability information included in the  
3    FOR\_SCH Type-specific fields contains the following subfields:

4

|                |                 |
|----------------|-----------------|
| FOR_SCH_LEN    | 3               |
| FOR_SCH_RC_MAP | 3 x FOR_SCH_LEN |
| FOR_SCH_NUM    | 2               |

5

FOR\_SCH\_NUM occurrences of the following fields:

|                          |        |
|--------------------------|--------|
| FOR_TURBO_SUPPORTED      | 1      |
| FOR_MAX_TURBO_BLOCK_SIZE | 0 or 4 |
| FOR_CONV_SUPPORTED       | 1      |
| FOR_MAX_CONV_BLOCK_SIZE  | 0 or 4 |
| FOR_FRAME_40_SUPPORTED   | 1      |
| FOR_FRAME_80_SUPPORTED   | 1      |
| FOR_MAX_RATE             | 4      |

6

7    FOR\_SCH\_LEN    -    Forward Supplemental Channel information length in units of  
8    3 bits.

9                  The mobile station shall set this field to the number of 3 bit  
10   units required to specify the length, in bits, of the  
11   FOR\_SCH\_RC\_MAP field.

12   FOR\_SCH\_RC\_MAP    -    Forward Supplemental Channel Radio Configuration  
13   capability.

14                  The mobile station shall set this field as described below to  
15   indicate which Radio Configurations (see [2] Table 3.1.3.1-1)  
16   are supported by the mobile station on the Forward  
17   Supplemental Channel.

18                  This field consists of the sequence of 1-bit indicators, each  
19   indicating the mobile station support for specific Radio  
20   Configuration. Bit positions of these indicators in the field  
21   and corresponding Radio Configurations are specified in Table  
22   2.7.4.27.1-1.

23                  The mobile station shall set each indicator to '1' if the  
24   corresponding Radio Configuration on the Forward  
25   Supplemental Channel is supported by the mobile station;  
26   otherwise, the mobile station shall set the indicator to '0'. The  
27   mobile station shall set any unused bits in the field to '0'.

28   FOR\_SCH\_NUM    -    Number of Forward Supplemental Channels.

1                   The mobile station shall set this field to the number of  
 2                   Forward Supplemental Channels supported by the mobile  
 3                   station.

4                   If the FOR\_SCH\_NUM field is greater than zero, the mobile  
 5                   station shall include one occurrence of the following 8 fields  
 6                   for each Forward Supplemental Channel supported by the  
 7                   mobile station. The first occurrence is SCH0 related  
 8                   information. The second occurrence (if any) is SCH1 related  
 9                   information.

10                  FOR\_TURBO-  
 11                  \_SUPPORTED

- Forward Turbo Coding supported indicator.  
 If the mobile station supports Turbo Coding on this Forward Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

15                  FOR\_MAX\_TURBO-  
 16                  \_BLOCK\_SIZE

- Forward maximum Turbo Coding block size.  
 If the field FOR\_TURBO\_SUPPORTED is set to '0', the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Turbo coding (see Table 2.7.4.27.3-1).

21                  **Table 2.7.4.27.3-1. Block Size**

| <b>FOR_MAX_TURBO_BLOCK_SIZE</b><br><b>REV_MAX_TURBO_BLOCK_SIZE</b><br><b>FOR_MAX_CONV_BLOCK_SIZE</b><br><b>REV_MAX_CONV_BLOCK_SIZE</b><br><b>(binary)</b> | <b>Block Size</b>                                  |                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|--------------------------------------|
|                                                                                                                                                           | <b>R-SCH RC</b><br><b>3 and 5</b>                  | <b>R-SCH RC 4</b><br><b>and 6</b>    |
|                                                                                                                                                           | <b>F-SCH RC</b><br><b>3, 4, 6,</b><br><b>and 7</b> | <b>F-SCH RC</b><br><b>5, 8 and 9</b> |
|                                                                                                                                                           |                                                    | <b>Rate Set 2</b>                    |
|                                                                                                                                                           |                                                    | <b>Rate Set 1</b>                    |
| 0000                                                                                                                                                      | 172                                                | 267                                  |
| 0001                                                                                                                                                      | 360                                                | 552                                  |
| 0010                                                                                                                                                      | 744                                                | 1128                                 |
| 0011                                                                                                                                                      | 1512                                               | 2280                                 |
| 0100                                                                                                                                                      | 3048                                               | 4584                                 |
| 0101                                                                                                                                                      | 6120                                               | 9192                                 |

| 0110     | 12264                         | 20712 |
| RESERVED | All other values are reserved |       |

- 1
- 2           FOR\_CONV-
- 3            \_SUPPORTED    - Forward Convolutional Coding supported indicator.  
         If the mobile station supports Convolutional Coding on this Forward Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 4
- 5
- 6
- 7           FOR\_MAX\_CONV-
- 8            \_BLOCK\_SIZE    - Forward maximum Convolutional Coding block size.  
         If the field FOR\_CONV\_SUPPORTED is set to '0', the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Convolutional coding. (see Table 2.7.4.27.3-1)
- 9
- 10
- 11
- 12
- 13          FOR\_FRAME\_40-
- 14           \_SUPPORTED    - Forward 40ms frame indicator.  
         If the mobile station supports 40 ms frames on this Forward Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 15
- 16
- 17
- 18          FOR\_FRAME\_80-
- 19           \_SUPPORTED    - Forward 80ms frame Indicator.  
         If the mobile station supports 80 ms frames on this Forward Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 20
- 21
- 22
- 23          FOR\_MAX\_RATE    - Maximum forward supplemental channels rate  
         The mobile station shall set this field according to Table 2.7.4.27.3-2 to indicate the maximum forward supplemental channel frame rate supported.
- 24
- 25
- 26
- 27

1    2.7.4.27.4 REV\_SCH Type-Specific Fields-

2    The Reverse Supplemental Channel configuration capability information included in the  
3    REV\_SCH Type-specific fields contains the following subfields:

4

|                |                 |
|----------------|-----------------|
| REV_SCH_LEN    | 3               |
| REV_SCH_RC_MAP | 3 x REV_SCH_LEN |
| REV_SCH_NUM    | 2               |

5

REV\_SCH\_NUM occurrences of the following fields:

|                          |        |
|--------------------------|--------|
| REV_TURBO_SUPPORTED      | 1      |
| REV_MAX_TURBO_BLOCK_SIZE | 0 or 4 |
| REV_CONV_SUPPORTED       | 1      |
| REV_MAX_CONV_BLOCK_SIZE  | 0 or 4 |
| REV_FRAME_40_SUPPORTED   | 1      |
| REV_FRAME_80_SUPPORTED   | 1      |
| REV_MAX_RATE             | 4      |

6

7    REV\_SCH\_LEN    -    Reverse Supplemental Channel information length in units of  
8    3 bits.

9                  The mobile station shall set this field to the number of 3 bit  
10   units required to specify the length, in bits, of the  
11   REV\_SCH\_RC\_MAP field.

12   REV\_SCH\_RC\_MAP    -    Reverse Supplemental Channel Radio Configuration  
13   capability.

14                  The mobile station shall set this field as described below to  
15   indicate which Radio Configurations (See [2] Table 2.1.3.1-1)  
16   are supported by the mobile station on the Reverse  
17   Supplemental Channel.

18                  This field consists of the sequence of 1-bit indicators, each  
19   indicating the mobile station support for specific Radio  
20   Configuration. Bit positions of these indicators in the field  
21   and corresponding Radio Configurations are specified in Table  
22   2.7.4.27.1-[42](#).

23                  The mobile station shall set each indicator to '1' if the  
24   corresponding Radio Configuration on the Reverse  
25   Supplemental Channel is supported by the mobile station;  
26   otherwise, the mobile station shall set the indicator to '0'. The  
27   mobile station shall set any unused bits in the field to '0'.

28   REV\_SCH\_NUM    -    Number of Reverse Supplemental Channels

29                  The mobile station shall set this field to the number of Reverse  
30   Supplemental Channels supported by the mobile station.

If the REV\_SCH\_NUM field is greater than zero, the mobile station shall include one occurrence of the following 8 fields for each Reverse Supplemental Channel supported by the mobile station. The first occurrence is SCH0 related information. The second occurrence (if any) is SCH1 related information.

- 7           REV\_TURBO-
  - 8         \_SUPPORTED - Reverse Turbo Coding supported indicator.  
If the mobile station supports Turbo Coding on this Reverse Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 12          REV\_MAX\_TURBO-
  - 13         \_BLOCK\_SIZE - Reverse maximum Turbo Coding block size.  
If the field REV\_TURBO\_SUPPORTED is set to '0', the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Turbo coding (see Table 2.7.4.27.3-1).
- 18          REV\_CONV\_SUPPORTED - Reverse Convolutional Coding supported indicator.  
If the mobile station supports Convolutional Coding on this Reverse Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 22          REV\_MAX\_CONV-
  - 23         \_BLOCK\_SIZE - Reverse maximum Convolutional Coding block size.  
If the field REV\_CONV\_SUPPORTED is set to '0', the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Convolutional coding (see Table 2.7.4.27.3-1).
- 28          REV\_FRAME\_40-
  - 29         \_SUPPORTED - Reverse 40ms frame indicator.  
If the mobile station supports 40 ms frames on this Reverse Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 33          REV\_FRAME\_80-
  - 34         \_SUPPORTED - Reverse 80ms frame indicator.  
If the mobile station supports 80 ms frames on this Reverse Supplemental Channel, it shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.
- 38          REV\_MAX\_RATE - Maximum reverse supplemental channels rate  
The mobile station shall set this field according to Table 2.7.4.27.3-2 to indicate the maximum reverse supplemental channel frame rate supported.

1    2.7.4.28 Extended Multiplex Option Information

2    This information record can be included in a *Status Response Message* or an *Extended*  
3    *Status Response Message* to return multiplex option information about the mobile station.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUM_MO_FOR_FCH      | 4             |

NUM\_MO\_FOR\_FCH occurrences of the following two-field record:

|                  |    |
|------------------|----|
| MO_FOR_FCH       | 16 |
| FOR_NUM_BITS_FCH | 8  |

|                |   |
|----------------|---|
| NUM_MO_REV_FCH | 4 |
|----------------|---|

NUM\_MO\_REV\_FCH occurrences of the following two-field record:

|                  |    |
|------------------|----|
| MO_REV_FCH       | 16 |
| REV_NUM_BITS_FCH | 8  |

|                 |   |
|-----------------|---|
| NUM_MO_FOR_DCCH | 4 |
|-----------------|---|

NUM\_MO\_FOR\_DCCH occurrences of the following one-field record:

|             |    |
|-------------|----|
| MO_FOR_DCCH | 16 |
|-------------|----|

|                 |   |
|-----------------|---|
| NUM_MO_REV_DCCH | 4 |
|-----------------|---|

NUM\_MO\_REV\_DCCH occurrences of the following one-field record:

|             |    |
|-------------|----|
| MO_REV_DCCH | 16 |
|-------------|----|

|                |   |
|----------------|---|
| NUM_MO_FOR_SCH | 4 |
|----------------|---|

NUM\_MO\_FOR\_SCH occurrences of the following two-field record:

|            |    |
|------------|----|
| FOR_SCH_ID | 1  |
| MO_FOR_SCH | 16 |

|                |   |

| RESERVED | 0 - 7 (as needed) |
|----------|-------------------|

- 1
- 2 NUM\_MO\_FOR\_FCH – Number of Forward Fundamental Channel Multiplex Options.
- 3 The mobile station shall set this field to the number of the
- 4 Forward Fundamental Channel Multiplex Options supported
- 5 by the mobile station.
- 6 If NUM\_MO\_FOR\_FCH is not equal to ‘0000’, the mobile
- 7 station shall include NUM\_MO\_FOR\_FCH occurrences of the
- 8 following two fields for each supported Forward Fundamental
- 9 Channel multiplex option:
- 10 MO\_FOR\_FCH – Forward Fundamental Channel multiplex option.
- 11 The mobile station shall set this field to the Forward
- 12 Fundamental Channel multiplex option.
- 13 FOR\_NUM-
- 14 \_BITS\_FCH – Forward Fundamental Channel number of bits per frame.
- 15 The mobile station shall set this field as described below to
- 16 indicate which number of bits per frameare supported by the
- 17 mobile station on the Forward Fundamental Channel.
- 18 This field consists of the sequence of 1-bit indicators, each
- 19 indicating the mobile station support for specific number of
- 20 bits per frame. Bit positions of these indicators in the field
- 21 and corresponding number of bits per frameare specified in
- 22 Table 2.7.4.28-1 if MO\_FOR\_FCH is equal to 1, Table 2.7.4.28-
- 23 2 if MO\_FOR\_FCH is equal to 2, and Table 2.7.4.28-3 if
- 24 MO\_FOR\_FCH is equal to 0x704.
- 25 The mobile station shall set each indicator to ‘1’ if the
- 26 corresponding number of bits per frameon the Forward
- 27 Fundamental Channel is supported by the mobile station;
- 28 otherwise, the mobile station shall set the indicator to ‘0’.
- 29

**Bits per Frame for MO\_FOR\_FCH equal to 0x704**

| Subfield | Length (bits) | Subfield Description                                                                                                  |
|----------|---------------|-----------------------------------------------------------------------------------------------------------------------|
| R1       | 1             | Highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0000])              |
| R2       | 1             | Second highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0001])       |
| R3       | 1             | Third highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0010])        |
| R4       | 1             | Forth highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0011])        |
| R5       | 1             | Fifth Second highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0100]) |
| R6       | 1             | Sixth highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0101])        |
| R7       | 1             | Seventh highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0110])      |
| R8       | 1             | Eighth highest possible number of bits on F-FCH (specified by NUM_BITS <sub>S</sub> [FFCH_NBIT_TABLE_ID][0111])       |

6  
7      NUM\_MO\_REV\_FCH – Number of Reverse Fundamental Channel Multiplex Options.

1           The mobile station shall set this field to the number of the  
 2           Reverse Fundamental Channel Multiplex Options supported  
 3           by the mobile station.

4           If NUM\_MO\_REV\_FCH is not equal to '0000', the mobile  
 5           station shall include NUM\_MO\_REV\_FCH occurrences of the  
 6           following two fields for each supported Reverse Fundamental  
 7           Channel multiplex option:

- 8           MO\_REV\_FCH     – Reverse Fundamental Channel multiplex option.  
 9                         The mobile station shall set this field to the Reverse  
 10                       Fundamental Channel multiplex option.

- 11           REV\_NUM-  
 12           \_BITS\_FCH – Reverse Fundamental Channel number of bits per frame.

13           The mobile station shall set this field as described below to  
 14           indicate which number of bits per frame are supported by the  
 15           mobile station on the Reverse Fundamental Channel.

16           This field consists of the sequence of 1-bit indicators, each  
 17           indicating the mobile station support for number of bits per  
 18           frame. Bit positions of these indicators in the field and  
 19           corresponding number of bits per frame are specified in Table  
 20           2.7.4.28-4 if MO\_REV\_FCH is equal to 1, Table 2.7.4.28-5 if  
 21           MO\_REV\_FCH is equal to 2, and Table 2.7.4.28-6 if  
 22           MO\_REV\_FCH is equal to 0x704.

23           The mobile station shall set each indicator to '1' if the  
 24           corresponding number of bits per frame on the Reverse  
 25           Fundamental Channel is supported by the mobile station;  
 26           otherwise, the mobile station shall set the indicator to '0'.  
 27

**Table 2.7.4.28-6. Reverse Fundamental Channel Number of Bits per Frame for MO\_REV\_FCH equal to 0x704**

| Subfield | Length (bits) | Subfield Description                                                                                                  |
|----------|---------------|-----------------------------------------------------------------------------------------------------------------------|
| R1       | 1             | Highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0000])              |
| R2       | 1             | Second highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0001])       |
| R3       | 1             | Third highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0010])        |
| R4       | 1             | Forth highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0011])        |
| R5       | 1             | Fifth Second highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0100]) |
| R6       | 1             | Sixth highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0101])        |
| R7       | 1             | Seventh highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0110])      |
| R8       | 1             | Eighth highest possible number of bits on R-FCH (specified by NUM_BITS <sub>S</sub> [RFCH_NBIT_TABLE_ID][0111])       |

- 1       NUM\_MO\_FOR\_DCCH   – Number of Forward Dedicated Control Channel Multiplex  
 2                              Options.
- 3                              The mobile station shall set this field to the number of the  
 4                              Forward Dedicated Control Channel Multiplex Options  
 5                              supported by the mobile station.
- 6                              If NUM\_MO\_FOR\_DCCH is not equal to ‘0000’, the mobile  
 7                              station shall include NUM\_MO\_FOR\_DCCH occurrence of the  
 8                              following one field for each supported Forward Dedicated  
 9                              Control Channel multiplex option:
- 10          MO\_FOR\_DCCH   – Forward Dedicated Control Channel multiplex option.  
 11                              The mobile station shall set this field to the Forward  
 12                              Dedicated Control Channel multiplex option.
- 13          NUM\_MO\_REV\_DCCH   – Number of Reverse Dedicated Control Channel Multiplex  
 14                              Options.
- 15                              The mobile station shall set this field to the number of the  
 16                              Reverse Dedicated Control Channel Multiplex Options  
 17                              supported by the mobile station.
- 18                              If NUM\_MO\_REV\_DCCH is not equal to ‘0000’, the mobile  
 19                              station shall include NUM\_MO\_REV\_DCCH occurrence of the  
 20                              following one field for each supported Reverse Dedicated  
 21                              Control Channel multiplex option:
- 22          MO\_REV\_DCCH   – Reverse Dedicated Control Channel multiplex option.  
 23                              The mobile station shall set this field to the Reverse Dedicated  
 24                              Control Channel multiplex option.
- 25          NUM\_MO\_PERFOR\_SCH – Number of Forward Supplemental Channel Multiplex Options.  
 26                              The mobile station shall set this field to the number of the  
 27                              Reverse-Forward Supplemental Channel Multiplex Options  
 28                              supported by the mobile station included in this message.  
 29                              The mobile station shall include the multiplex option  
 30                              associated with the highest data rate it supports for each  
 31                              combination of MuxPDU type, rate set, and block size<sup>4</sup>.
- 32                              If NUM\_MO\_PERFOR\_SCH is not equal to ‘0000’, the mobile  
 33                              station shall include NUM\_MO\_PERFOR\_SCH occurrence of  
 34                              the following two fields:
- 35          FOR\_SCH\_ID   – Forward Supplemental Channel identifier.

---

<sup>4</sup> If any Rate Set 1 multiplex option is included, then mobile station support of MuxPDU Type 1 is implied and the mobile station is not required to include multiplex option 0x03. If any Rate Set 2 multiplex option is included, then mobile station support of MuxPDU Type 2 is implied and the mobile station is not required to include multiplex option 0x04 (see [3]).

The mobile station shall set this field to specify the Forward Supplemental Channel to which the Forward Supplemental multiplex option supported by the mobile station corresponds.

- MO\_FOR\_SCH** – Forward Supplemental Channel multiplex option.

The mobile station shall set this field to the Forward Supplemental Channel multiplex option associated with the maximum data rate (see [3]) that the mobile station supports<sup>5</sup>.

- NUM\_MO\_REV\_SCH** – Number of Reverse Supplemental Channel Multiplex Options.

The mobile station shall set this field to the number of the Reverse Supplemental Channel Multiplex Options supported by the mobile station included in this message. The mobile station shall include the multiplex option associated with the highest data rate it supports for each combination of MuxPDU type, rate set, and block size<sup>6</sup>.

If NUM\_MO\_REV\_SCH is not equal to '0000', the mobile station shall include NUM\_MO\_REV\_SCH occurrence of the following two fields:

- REV\_SCH\_ID** – Reverse Supplemental Channel identifier.

The mobile station shall set this field to specify the Reverse Supplemental Channel to which the Reverse Supplemental multiplex option supported by the mobile station corresponds.

- MO\_REV\_SCH** – Reverse Supplemental Channel multiplex option.

The mobile station shall set this field to the Reverse Supplemental Channel multiplex option associated with the maximum data rate (see [3]) that the mobile station supports<sup>7</sup>.

- RESERVED** – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to '0'.

5 If the mobile station supports the multiplex option associated with the maximum data rate, the mobile station shall support all lower data rates as specified in Table 2-46 of [3].

<sup>6</sup> If any Rate Set 1 multiplex option is included, then mobile station support of MuxPDU Type 1 is implied and the mobile station is not required to include multiplex option 0x03. If any Rate Set 2 multiplex option is included, then mobile station support of MuxPDU Type 2 is implied and the mobile station is not required to include multiplex option 0x04 (see [3]).

<sup>7</sup> If the mobile station supports the multiplex option associated with the maximum data rate, the mobile station shall support all lower data rates as specified in Table 2-46 of [3].

## 1    2.7.4.29 Geo-Location Capability

2    This information record identifies the geo-location capabilities of the mobile station. The  
 3    mobile station shall use the following fixed-length format for the type-specific fields:

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| GEO_LOC             | 3             |
| RESERVED            | 5             |

5            GEO\_LOC – Geo-location.

6            The mobile station shall set this field to the value shown in Table  
 7            2.7.4.34-1.

9            **Table 2.7.4.34-1. Geo-location Codes**

| GEO_LOC<br>(binary)                         | Type of Wireless Assisted GPS<br>Identifiers                                        |
|---------------------------------------------|-------------------------------------------------------------------------------------|
| 000                                         | No mobile station assisted geo-location capabilities                                |
| 001                                         | IS-801 capable (Advanced Forward Link Triangulation only)                           |
| 010                                         | IS-801 capable (Advanced Forward Link Triangulation and Global Positioning Systems) |
| 011                                         | Global Positioning Systems only                                                     |
| All other GEO_LOC_TYPE values are reserved. |                                                                                     |

10          RESERVED – Reserved bit.

11          The mobile station shall set this field to '00000'.

12

## 1    2.7.4.30 Band Subclass Information

2    This information record can be included in a *Status Response Message*, or an *Extended*  
 3    *Status Response Message* to return band subclass information about the mobile station.

4

| Type-Specific Field | Length (bits)  |
|---------------------|----------------|
| BAND_SUBCLASS_INFO  | 8 × RECORD_LEN |

5

6    BAND\_SUBCLASS\_INFO – Band subclass information.

7                  This field indicates which band subclasses are supported by  
 8                  the mobile station.

9                  If BAND\_CLASS specified in the *Status Request Message* is  
 10                 equal to '00000' (Cellular Band), this field consists of the  
 11                 following subfields which are included in the information  
 12                 record in the order shown:

13

| Subfield        | Length (bits) | Subfield Description          |
|-----------------|---------------|-------------------------------|
| BAND_SUBCLASS_0 | 1             | Band Subclass 0               |
| BAND_SUBCLASS_1 | 1             | Band Subclass 1               |
