15                  If BAND\_CLASS specified in the *Status Request Message* is  
 16                 equal to '00010' (TACS Band), this field consists of the  
 17                 following subfields which are included in the information  
 18                 record in the order shown:

19

| Subfield        | Length (bits) | Subfield Description          |
|-----------------|---------------|-------------------------------|
| BAND_SUBCLASS_0 | 1             | Band Subclass 0               |
| BAND_SUBCLASS_1 | 1             | Band Subclass 1               |
| BAND_SUBCLASS_2 | 1             | Band Subclass 2               |
| RESERVED        | 5             | <a href="#">Reserved Bits</a> |

20

21                  If BAND\_CLASS specified in the *Status Request Message* is  
 22                 equal to '00101' (450 MHz NMT Band), this field consists of  
 23                 the following subfields which are included in the information  
 24                 record in the order shown:

25

| <b>Subfield</b> | <b>Length<br/>(bits)</b> | <b>Subfield Description</b> |
|-----------------|--------------------------|-----------------------------|
| BAND_SUBCLASS_0 | 1                        | Band Subclass 0             |
| BAND_SUBCLASS_1 | 1                        | Band Subclass 1             |
| BAND_SUBCLASS_2 | 1                        | Band Subclass 2             |
| BAND_SUBCLASS_3 | 1                        | Band Subclass 3             |
| BAND_SUBCLASS_4 | 1                        | Band Subclass 4             |
| BAND_SUBCLASS_5 | 1                        | Band Subclass 5             |
| BAND_SUBCLASS_6 | 1                        | Band Subclass 6             |
| BAND_SUBCLASS_7 | 1                        | Band Subclass 7             |

If BAND CLASS specified in the Status Request Message is equal to '01010' (Secondary 800 MHz band), this field consists of the following subfields which are included in the information record in the order shown:

| <b>Subfield</b>        | <b>Length<br/>(bits)</b> | <b>Subfield Description</b> |
|------------------------|--------------------------|-----------------------------|
| <u>BAND SUBCLASS 0</u> | <u>1</u>                 | <u>Band Subclass 0</u>      |
| <u>BAND SUBCLASS 1</u> | <u>1</u>                 | <u>Band Subclass 1</u>      |
| <u>BAND SUBCLASS 2</u> | <u>1</u>                 | <u>Band Subclass 2</u>      |
| <u>BAND SUBCLASS 3</u> | <u>1</u>                 | <u>Band Subclass 3</u>      |
| <u>BAND SUBCLASS 4</u> | <u>1</u>                 | <u>Band Subclass 4</u>      |
| <u>RESERVED</u>        | <u>3</u>                 | <u>Reserved Bits</u>        |

The mobile station shall set each subfield to '1' if the corresponding sub-band class is supported by the mobile station; otherwise, the mobile station shall set the subfield to '0'.

RESERVED – Reserved bits.

The mobile station shall set all reserved bits to '0'.

When more band subclasses are defined, the reserved bits will be used for the new corresponding subfields. Sufficient octets will be added to this field to accommodate the new subfields. All the undefined bits in an additional octet will be reserved bits.

The mobile station shall set all the reserved bits to '0'. If all bits are set to '0' in an octet and all succeeding octets, the mobile station shall omit the octet and the succeeding octets.

## 1    2.7.4.31 Global Emergency Call

2    This information record identifies that an emergency call is being originated. This record  
 3    may be included in a *Flash With Information Message* or an *Extended Flash With Information*  
 4    *Message* and allows the user to originate an emergency call.

5

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUM_INCL            | 1             |
| DIGIT_MODE          | 0 or 1        |
| NUMBER_TYPE         | 0 or 3        |
| NUMBER_PLAN         | 0 or 4        |
| NUM_CHAR            | 0 or 8        |

If NUM\_INCL is set to '1', include NUM\_CHAR occurrences of the following field:

|       |        |
|-------|--------|
| CHARi | 4 or 8 |
|-------|--------|

|                     |                    |
|---------------------|--------------------|
| MS_ORIG_POS_LOC_IND | 1                  |
| RESERVED            | 0 to 7 (as needed) |

6

- 7    NUM\_INCL    -    Dialed number included indicator.  
 8                 The mobile station shall set this field to '1' to indicate that the  
 9                 dialed digits are included in this information record;  
 10                otherwise, the mobile station shall set this field to '0'.  
 11   DIGIT\_MODE    -    Digit mode indicator.  
 12                 If NUM\_INCL is set to '1', the mobile station shall set this field  
 13                 to indicate whether the dialed digits are 4-bit DTMF codes or  
 14                 8-bit ASCII codes using a specified numbering plan;  
 15                 otherwise, the mobile station shall omit this field.  
 16                 To originate the call using the binary representation of DTMF  
 17                 digits, the mobile station shall set this field to '0'. To originate  
 18                 the call using ASCII characters, the mobile station shall set  
 19                 this field to '1'.  
 20   NUMBER\_TYPE    -    Type of number.  
 21                 If NUM\_INCL is set to '1' and the DIGIT MODE field is set to  
 22                 '1', the mobile station shall set this field to the  
 23                 NUMBER\_TYPE value shown in Table 2.7.1.3.2.4-2  
 24                 corresponding to the type of the called number, as defined in  
 25                 [7], Section 4.5.9; otherwise, the mobile station shall omit this  
 26                 field.  
 27   NUMBER\_PLAN    -    Numbering plan.

1           If NUM\_INCL is set to '1' and the DIGIT MODE field is set to  
 2           '1', the mobile station shall set this field to the  
 3           NUMBER\_PLAN value shown in Table 2.7.1.3.2.4-3  
 4           corresponding to the numbering plan used for the called  
 5           number, as defined in [7], Section 4.5.9; otherwise, the mobile  
 6           station shall omit this field.

7        NUM\_CHAR    – Number of characters.  
 8           If NUM\_INCL is set to '1', the mobile station shall set this field  
 9           to the number of characters included in this record;  
 10          otherwise, the mobile station shall omit this field.

11      CHARi       – Character.  
 12           If the NUM\_INCL is set to '1', The the mobile stations shall  
 13           include one NUM CHAR – occurrences of this field ~~for each~~  
 14           character in the called number.

15           If the DIGIT MODE field is set to '0', the mobile station shall  
 16           set each occurrence of this field to the code value shown in  
 17           Table 2.7.1.3.2.4-4 corresponding to the dialed digit. If the  
 18           DIGIT MODE field is set to '1', The mobile station shall set  
 19           each occurrence of this field to the ASCII representation  
 20           corresponding to the character, as specified in [9], with the  
 21           most significant bit set to '0'.

22      MS\_INIT\_POS\_LOC\_IND – Mobile Initiated Position Location Session indicator.  
 23           The mobile station shall set this field to '1' if  
 24           MS INIT POS LOC SUP INDs is equal to '1' and if the mobile  
 25           station is to initiate a position location session associated with  
 26           this emergency call; otherwise, the mobile station shall set  
 27           this field to '0'.

28      RESERVED     – Reserved bits.  
 29           The mobile station shall add reserved bits as needed in order  
 30           to make the length of the entire information record equal to an  
 31           integer number of octets. The mobile station shall set these  
 32           bits to '0'.

## 1    2.7.4.32 Hook Status

2    This information record shall indicate the status of the hook switch in Wireless Local Loop  
3    mobile stations. The mobile station shall use the following fixed-length format for the type-  
4    specific fields:

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| HOOK_STATUS         | 4             |
| RESERVED            | 4             |

6              HOOK\_STATUS    -    WLL terminal hook status.

7              The mobile station shall set this sub-field to the value shown  
8              in Table 2.7.1.3.2.1-4 corresponding to the hook state.

9              RESERVED    -    Reserved bits.

10             The mobile station shall set this field to '0000'.  
11

## 1    2.7.4.33 QoS Parameters

2    This information record conveys to the user the QoS parameters associated with the service  
 3    to be provided:

| Type-Specific Field | Length (bits)     |
|---------------------|-------------------|
| QoS Parameters      | variable          |
| RESERVED            | 0 - 7 (as needed) |

- 4
- 5    QoS Parameters    -    Block containing the QoS Parameters.  
 6    The mobile station shall set this field to the QoS parameters  
 7    associated with the user (per subscription), service type (e.g.,  
 8    assured vs. non-assured services) and the service option. The  
 9    details of the QoS parameters may be found in documents  
 10   describing the service options.
- 11    RESERVED    -    Reserved bits for octet alignment.  
 12    The mobile station shall add the minimum number of bits  
 13    necessary to make the record length in bits an integral  
 14    multiple of 8. The mobile station shall set these bits to '0'.

## 1    2.7.4.34 Encryption Capability

2    This information record identifies the encryption capability of the mobile station.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| SIG_ENCRYPT_SUP     | 8             |
| UI_ENCRYPT_SUP      | 8             |

4

5    SIG\_ENCRYPT\_SUP    -    Signaling Encryption supported indicator.

6                          The mobile station shall set this field to indicate which  
7                          signaling encryption algorithms are supported by the mobile  
8                          station, as shown in Table 2.7.1.3.2.1-5.

9                          The mobile station shall set the subfields as follows:

10                         The mobile station shall set the CMEA subfield to '1'.

11                         The mobile station shall set each subfield to '1' if the  
12                         corresponding signaling encryption algorithm is supported by  
13                         the mobile station; otherwise, the mobile station shall set the  
14                         subfield to '0'.15                         The mobile station shall set the RESERVED subfield to  
16                         '00000E'.  
17                         UI\_ENCRYPT\_SUP    -    User information Encryption supported indicator.18                         The mobile station shall set this field to indicate the  
19                         supported user information encryption algorithms, as shown  
20                         in Table 2.7.1.3.2.4-9.21                         The mobile station shall set each subfield to '1' if the  
22                         corresponding user information encryption algorithm is  
23                         supported by the mobile station; otherwise, the mobile station  
24                         shall set the subfield to '0'.25                         The mobile station shall set the RESERVED subfield to  
26                         '000000'.

27

1    **3. REQUIREMENTS FOR BASE STATION CDMA OPERATION**

2    This section defines requirements that are specific to CDMA base station equipment and  
3    operation.

4    **3.1 Reserved**

5    **3.2 Reserved**

6    **3.3 Security and Identification**

7    3.3.1 Authentication

8    The base station may be equipped with a database that includes unique mobile station  
9    authentication keys, shared secret data, or both for each registered mobile station in the  
10   system. This database is used for authentication of mobile stations that are equipped for  
11   authentication operation.

12   If the base station supports mobile station authentication, it shall provide the following  
13   capabilities: The base station shall send and receive authentication messages and perform  
14   the authentication calculations described in 2.3.12.1. If the base station supports 800 MHz  
15   analog operation, the base station should set the RAND parameter of the *Access Parameters*  
16   *Message* to the same value transmitted on the forward analog control channel (see [6]).

17   3.3.2 Encryption

18   If the base station supports mobile station authentication (see 3.3.1), it may also support  
19   message encryption by providing the capability to send encryption control messages and  
20   the ability to perform the operations of encryption and decryption as specified in 2.3.12.2.

21   3.3.3 Voice Privacy

22   If the base station supports mobile station authentication (see 3.3.1), it may also support  
23   voice privacy using the private long code mask, as specified in 2.3.12.3.

24   3.3.4 Extended-Encryption

25   If the base station supports mobile station authentication (see 3.3.1), it may also support  
26   Extended-Encryption for Signaling Messages and User Information as specified in 2.3.12.4.

27   **3.4 Supervision**

28   3.4.1 Access Channel or Enhanced Access Channel

29   The base station shall continually monitor each active Access Channel or Enhanced Access  
30   Channel or both. The base station should provide control in cases of overload by using  
31   either the *Access Parameters Message* or the *Enhanced Access Parameters Message*.

32   3.4.2 Reverse Traffic Channel

33   The base station shall continually monitor each active Reverse Traffic Channel to determine

1 if the call is active. If the base station detects that the call is no longer active, the base  
 2 station shall declare loss of Reverse Traffic Channel continuity (see 3.6.4).

3 **3.5 Reserved**

4 **3.6 Layer 3 Processing**

5 This section describes base station ~~layer 3~~Layer 3 processing. It contains frequent  
 6 references to the messages that flow between the base station and the mobile station.  
 7 While reading this section, it may be helpful to refer to the message formats (see 2.7 and  
 8 3.7), and to the call flow examples (see Annex B). The values for the time and numeric  
 9 constants used in this section (e.g., T1b and N4m) are specified in Annex D.

10 Base station processing consists of the following types of processing:

- 11 • *Pilot and Sync Channel Processing* - During *Pilot and Sync Channel Processing*, the  
 12 base station transmits the Pilot Channel and Sync Channel which the mobile station  
 13 uses to acquire and synchronize to the CDMA system while the mobile station is in  
 14 the *Mobile Station Initialization State*.
- 15 • *Common Channel Processing* - During *Common Channel Processing*, the base station  
 16 transmits the Paging Channel and/or the Forward Common Control  
 17 Channel/Broadcast Control Channel which the mobile station monitors to receive  
 18 messages while the mobile station is in the *Mobile Station Idle State* and the *System*  
 19 *Access State*.
- 20 • *Access Channel and Enhanced Access Channel Processing* - During *Access Channel*  
 21 and *Enhanced Access Channel Processing*, the base station monitors the Access  
 22 Channel and/or the Enhanced Access Channel to receive messages which the  
 23 mobile station sends while the mobile station is in the *System Access State*.
- 24 • *Traffic Channel Processing* - During *Traffic Channel Processing*, the base station uses  
 25 the Forward and Reverse Traffic Channels to communicate with the mobile station  
 26 while the mobile station is in the *Mobile Station Control on the Traffic Channel State*.

27 **3.6.1 Pilot and Sync Channel Processing**

28 During *Pilot and Sync Channel Processing*, the base station transmits the Pilot and Sync  
 29 Channels which the mobile station uses to acquire and synchronize to the CDMA system  
 30 while the mobile station is in the *Mobile Station Initialization State*.

31 **3.6.1.1 Preferred Set of CDMA Channels**

32 The preferred set of frequency assignments are the CDMA Channels on which the mobile  
 33 station attempts to acquire the CDMA system (see [2]).

34 The base station shall support at least one member of the preferred set of frequency  
 35 assignments. The base station may support additional CDMA Channels.

1       3.6.1.2 Pilot Channel Operation

2       The Pilot Channel (see [2]) is a reference channel which the mobile station uses for  
3       acquisition, timing, and as a phase reference for coherent demodulation.

4       The base station shall continually transmit a Pilot Channel for every CDMA Channel  
5       supported by the base station, unless the base station is classified as a hopping pilot  
6       beacon.

7       3.6.1.3 Sync Channel Operation

8       The Sync Channel (see [2]) provides the mobile station with system configuration and  
9       timing information.

10      The base station shall transmit at most one Sync Channel for each supported CDMA  
11      Channel. The base station shall support a Sync Channel on at least one member of the  
12      preferred set of frequency assignments that it supports. The base station should support a  
13      Sync Channel on every member of the preferred set of frequency assignments that it  
14      supports.

15      If the base station operates in Band Class 0 or Band Class 3, and supports the Primary  
16      CDMA Channel, then the base station shall transmit a Sync Channel on the Primary CDMA  
17      Channel.

18      The base station shall continually send the *Sync Channel Message* on each Sync Channel  
19      that the base station transmits.

20      3.6.2 Common Channel Processing

21      3.6.2.1 Paging Channel and Forward Common Control Channel Procedures

22      During *Common Channel Processing*, the base station transmits the Paging Channel or the  
23      Forward Common Control Channel (see [2]) which the mobile station monitors to receive  
24      messages while the mobile station is in the *Mobile Station Idle State* and the *System Access  
25      State*.

26      The base station may transmit up to seven Paging Channels on each supported CDMA  
27      Channel. The base station may transmit up to seven Forward Common Control Channels  
28      and one Primary Broadcast Control Channel on each supported CDMA Channel.

29      For each Paging Channel that the base station transmits, the base station shall continually  
30      send valid Paging Channel messages (see 3.7.2), which may include the *Null Message* (see  
31      [4]).

32      The base station shall not send any message which is not completely contained within two  
33      consecutive Paging Channel or Forward Common Control Channel slots, unless the  
34      processing requirements for the message explicitly specify a different size limitation.<sup>1</sup>

<sup>1</sup>See, for example, [14] which specifies processing requirements for the *Data Burst Message*.

## 1    3.6.2.1.1 CDMA Channel Determination

2    The base station may send the *CDMA Channel List Message* and the *Extended CDMA*  
 3    *Channel List Message* on the Paging Channel. When the base station supports Broadcast  
 4    Control Channel, the base station shall send the *Extended CDMA Channel List Message* on  
 5    the Primary Broadcast Control Channel.

6    ~~To determine the mobile station's assigned CDMA Channel, the base station first~~  
 7    ~~determines a subset of CDMA channels in the Extended CDMA Channel List Message. The~~  
 8    ~~subset of CDMA channels is based on where the mobile station receives the Extended CDMA~~  
 9    ~~Channel List Message and the mobile station's capabilities of supporting RC greater than 2,~~  
 10   ~~Quick Paging Channel and transmit diversity, with which the mobile station is registered.~~

11   When the base station sends the *CDMA Channel List Message* on the Paging Channel, the  
 12   base station shall determine the assigned CDMA Channel ~~for MOB\_P\_REV<sub>s</sub> less than six~~  
 13   using the hash function specified in 2.6.7.1 with the following inputs:

- 14   • IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)
- 15   • Number of CDMA Channels in the *CDMA Channel List Message* in accordance with  
     the procedures defined in 2.6.2.2.12.1 for mobile stations with:
  - 17   – MOB\_P\_REV<sub>s</sub> less than six.
  - 18   – MOB\_P\_REV<sub>s</sub> equal to six if the base station does not send the Extended CDMA  
     Channel List Message on the Paging Channel.
  - 20   – MOB\_P\_REV<sub>s</sub> greater than or equal to seven, if the base station does not send  
     the Extended CDMA Channel List Message on the paging channel and does not  
     support Primary Broadcast Control Channel.

23   When the base station sends the *Extended CDMA Channel List Message* on the Paging  
 24   Channel, the base station shall determine the assigned CDMA Channel using the hash  
 25   function specified in 2.6.7.1 with the following inputs:

- 26   • IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)
- 27   • Number of CDMA Channels of the selected channel subset of CDMA channels in the  
     *Extended CDMA Channel List Message* in accordance with the procedures defined in  
     2.6.2.2.12.1 for mobile stations with:
  - 30   – MOB\_P\_REV<sub>s</sub> equal to six.
  - 31   – MOB\_P\_REV<sub>s</sub> greater than or equal to seven, if the base station does not support  
     Primary Broadcast Control Channel.

33   When the base station sends the *Extended CDMA Channel List Message* on the Primary  
 34   Broadcast Control Channel, the base station shall determine the assigned CDMA Channel  
 35   ~~for MOB\_P\_REV<sub>s</sub> greater than or equal to seven~~ using the hash function specified in 2.6.7.1  
 36   with the following inputs:

- 37   • IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)

- 1     • Number of CDMA Channels of the selected channel subset of CDMA channels in the  
 2       *Extended CDMA Channel List Message* in accordance with the procedures defined in  
 3       2.6.2.2.12.2.

4     3.6.2.1.2 Common Channel Determination

5     To determine the mobile station's assigned Paging Channel or Forward Common Control  
 6       Channel, the base station shall use the hash function specified in 2.6.7.1 with the following  
 7       inputs:

- 8       • IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)  
 9       • Number of Paging Channels or Forward Common Control Channels which the base  
 10      station transmits on the mobile station's assigned CDMA Channel.

11    3.6.2.1.3 Paging Slot Determination

12    To determine the assigned Paging Channel or Forward Common Control Channel slots for a  
 13      mobile station with a given slot cycle index, the base station shall select a number PGSLOT  
 14      using the hash function specified in 2.6.7.1 with the following inputs:

- 15      • IMSI\_S based on the IMSI with which the mobile station registered (see 6.3.1)  
 16      • Maximum number of Paging Channel or Forward Common Control Channel slots  
 17      (2048).

18    The assigned Paging Channel or Forward Common Control Channel slots for the mobile  
 19      station are those slots for which

$$\lfloor t/4 \rfloor - PGSLOT \bmod (16 \times T) = 0,$$

21    where  $t$  is the System Time in frames, and  $T$  is the slot cycle length in units of 1.28 seconds  
 22      given by

$$T = 2^i,$$

24    where  $i$  is the slot cycle index.

25    When the base station is able to determine that the mobile station is operating in the  
 26      slotted mode and is able to determine the mobile station's preferred slot cycle index, the  
 27      base station uses for the mobile station's slot cycle index the smaller of the mobile station's  
 28      preferred slot cycle index and the maximum slot cycle index.

29    When the base station is not able to determine whether the mobile station is operating in  
 30      the slotted mode, or the base station is not able to determine the mobile station's preferred  
 31      slot cycle index, the base station uses for the mobile station's slot cycle index the smaller of  
 32      the maximum slot cycle index and 1.

33    3.6.2.1.4 Message Transmission and Acknowledgment Procedures

34    The Paging Channel or Forward Common Control Channel acknowledgment procedures  
 35      facilitate the reliable exchange of messages between the base station and the mobile station  
 36      on the f-csch and r-csch. The acknowledgment procedures and requirements are described  
 37      in 3.1.1.2 and 3.1.2.1 of [4].

1    3.6.2.2 Overhead Information

2    The base station sends overhead messages to provide the mobile station with the  
3    information that it needs to operate with the base station. If the base station supports the  
4    Primary Broadcast Control Channel for overhead messages and is not a pilot beacon, it  
5    shall support the Forward Common Control Channel for all other general page information.

6    The base station with a P\_REV greater than six that supports Broadcast Control Channel  
7    shall send overhead messages on the Primary Broadcast Control Channel. The base station  
8    with a P\_REV greater than six that does not support the Broadcast Control Channel shall  
9    send overhead messages on each Paging Channel. The overhead messages sent on the  
10   Primary Broadcast Control Channel are:

- 11    1. *ANSI-41 System Parameters Message*
- 12    2. *User Zone Identification Message*
- 13    3. *Private Neighbor List Message*
- 14    4. *Extended Global Service Redirection Message*
- 15    5. *Extended CDMA Channel List Message*
- 16    6. *MC-RR Parameters Message*
- 17    7. *Universal Neighbor List Message*
- 18    8. *Enhanced Access Parameters Message*
- 19    9. *ANSI-41 RAND Message*

20    The overhead messages on the Paging Channel are:

- 21    1. *System Parameters Message*
- 22    2. *Neighbor List Message* (Band Class 0 only)
- 23    3. *Access Parameters Message*
- 24    4. *CDMA Channel List Message*
- 25    5. *Extended System Parameters Message*
- 26    6. *Extended Neighbor List Message* (band classes other than Band Class 0)
- 27    7. *General Neighbor List Message*
- 28    8. *Global Service Redirection Message*
- 29    9. *User Zone Identification Message*
- 30    10. *Private Neighbor List Message*
- 31    11. *Extended Global Service Redirection Message*
- 32    12. *Extended CDMA Channel List Message*

33    The base station shall maintain a configuration sequence number (CONFIG\_SEQ) for  
34    configuration messages transmitted on the Paging Channel, and shall increment  
35    CONFIG\_SEQ modulo 64 whenever the base station modifies the following messages:

- 1     1. *System Parameters Message*
- 2     2. *Neighbor List Message* (Band Class 0 only)
- 3     3. *CDMA Channel List Message*
- 4     4. *Extended System Parameters Message*
- 5     5. *Extended Neighbor List Message* (band classes other than Band Class 0)
- 6     6. *General Neighbor List Message*
- 7     7. *Global Service Redirection Message*
- 8     8. *User Zone Identification Message*
- 9     9. *Private Neighbor List Message*
- 10    10. *Extended Global Service Redirection Message*
- 11    11. *Extended CDMA Channel List Message*

12   The base station shall maintain a configuration sequence number (CONFIG\_SEQ) for  
 13   configuration messages transmitted on the Primary Broadcast Control Channel, and shall  
 14   increment CONFIG\_SEQ modulo 64 whenever the base station modifies the following  
 15   messages:

- 16    1. *ANSI-41 System Parameters Message*
- 17    2. *User Zone Identification Message*
- 18    3. *Private Neighbor List Message*
- 19    4. *Extended Global Service Redirection Message*
- 20    5. *Extended CDMA Channel List Message*
- 21    6. *MC-RR Parameters Message*
- 22    7. *Universal Neighbor List Message*

23   The base station shall maintain an access configuration sequence number  
 24   (ACC\_CONFIG\_SEQ) for the Access Channel, and shall increment ACC\_CONFIG\_SEQ  
 25   modulo 64 whenever the base station modifies the *Access Parameters Message*.

26   The base station shall maintain an access configuration sequence number  
 27   (ACC\_CONFIG\_SEQ) for the Enhanced Access Channel, and shall increment  
 28   ACC\_CONFIG\_SEQ modulo 64 whenever the base station modifies the *Enhanced Access  
 29   Parameters Message*.

30   On each Primary Broadcast Control Channel which the base station transmits, the base  
 31   station shall send each of the following system overhead messages at least once per T<sub>1b</sub>  
 32   seconds:

- 33    1. *Extended CDMA Channel List Message*
- 34    2. *ANSI-41 System Parameters Message*
- 35    3. *MC-RR Parameters Message*

## 1        4. Enhanced Access Parameters Message

## 2        5. Universal Neighbor List Message

3        If the base station supports Primary Broadcast Control Channels, and the base station is  
 4        sending the *ANSI-41 RAND Message*, it shall send it at least once per T<sub>1b</sub> seconds.

5        On each of the Paging Channels the base station transmits, the base station shall send  
 6        each of the following system overhead messages at least once per T<sub>1b</sub> seconds:

## 7        1. Access Parameters Message

## 8        2. CDMA Channel List Message

## 9        3. Extended System Parameters Message

## 10      4. System Parameters Message

11      For the messages sent on the Paging Channel, if the base station is operating in Band Class  
 12      1, Band Class 3, or Band Class 4 BAND\_CLASS is equal to '00001' or BAND\_CLASS is equal  
 13      to '00011' and MIN\_P\_REV is less than seven-six, the base station shall send the *Extended*  
 14      *Neighbor List Message*, and may also send the *General Neighbor List Message*. If the base  
 15      station is operating in Band Class 0 and MIN P REV is less than sevenBAND\_CLASS is  
 16      equal to '00000', the base station shall send the *Neighbor List Message*, and may also send  
 17      the *General Neighbor List Message*. If the base station is sending the *Neighbor List Message*,  
 18      it shall send it at least once per T<sub>1b</sub> seconds. If the base station is sending the *Extended*  
 19      *Neighbor List Message*, it shall send it at least once per T<sub>1b</sub> seconds. If the base station is  
 20      sending the *General Neighbor List Message*, it shall send it at least once per T<sub>1b</sub> seconds.

21      Overhead Messages sent on the Primary Broadcast Control Channel shall be transmitted on  
 22      a continuous basis, consecutively.

23      If the base station uses addressing modes requiring use of only the IMSI\_M\_S, independent  
 24      of values of the IMSI\_M\_11\_12 and MCC\_M, the base station shall set IMSI\_T\_SUPPORTED  
 25      to '0', MCC to '1111111111', and IMSI\_11\_12 to '1111111' in the *Extended System*  
 26      *Parameters Message*, MC-RR Parameters Message, and *ANSI-41 System Parameters*  
 27      *Message*.

28      If the base station sets IMSI\_T\_SUPPORTED to '1', the base station shall not set  
 29      PREF\_MSID\_TYPE to '00' in the *Extended System Parameters Message* and *ANSI-41 System*  
 30      *Parameters Message*.

31      The base station may send a *Global Service Redirection Message* on any given Paging  
 32      Channel. If the message is sent, the base station shall send it at least once per T<sub>1b</sub>  
 33      seconds.

34      If P\_REV is greater than or equal to six, the base station may send an *Extended Global*  
 35      *Service Redirection Message*. If the message is sent, the base station shall send it at least  
 36      once per T<sub>1b</sub> seconds. The base station may send this message to redirect only those  
 37      mobile stations with MOB\_P\_REV equal to or greater than six.

38      When both the *Global Service Redirection Message* and the *Extended Global Service*  
 39      *Redirection Message* are sent, the base station shall use the *Global Service Redirection*  
 40      *Message* for mobile stations with MOB\_P\_REV less than six, and shall use the *Extended*

1    Global Service Redirection Message for mobile stations with MOB\_P\_REV equal to or greater  
 2    than six. When only the Global Service Redirection Message is sent and this message is for  
 3    mobile station with MOB\_P\_REV less than six, the base station shall set EXCL\_P\_REV\_MS  
 4    to '1'.

5    If only the Global Service Redirection Message is sent and this message is for redirecting all  
 6    mobile stations, the base station shall set EXCL\_P\_REV\_MS to '0'.

7    The base station may send a User Zone Identification Message. If the message is sent, the  
 8    base station shall send it at least once per T<sub>1b</sub> seconds.

9    The base station may send a Private Neighbor List Message. If the message is sent, the base  
 10   station shall send it at least once per T<sub>1b</sub> seconds.

11   The base station may send an Extended CDMA Channel List [Message](#). If the message is sent,  
 12   the base station shall send it at least once per T<sub>1b</sub> seconds.

13   3.6.2.3 Mobile Station Directed Messages

14   The base station may send the following messages directed to a mobile station on the f-  
 15   csch. If the base station sends a message, the base station shall comply with the specified  
 16   requirements for sending the message, if any:

- 17     1. Abbreviated Alert Order
- 18     2. Audit Order
- 19     3. Authentication Challenge Message
- 20     4. Base Station Challenge Confirmation Order
- 21     5. Channel Assignment Message
- 22     6. Data Burst Message
- 23     7. Extended Channel Assignment Message
- 24     8. Feature Notification Message
- 25     9. General Page Message
- 26     10. Intercept Order
- 27     11. Local Control Order
- 28     12. Lock Until Power-Cycled Order
- 29     13. Maintenance Required Order
- 30     14. PACA Message
- 31     15. Registration Accepted Order
- 32     16. Registration Rejected Order
- 33     17. Registration Request Order
- 34     18. Release Order
- 35     19. Reorder Order

- 1        20. *Retry Order*
- 2        21. *Security Mode Command Message*
- 3        22. *Service Redirection Message*
- 4        23. *Service Release Message*
- 5        24. *Slotted Mode Order*
- 6        25. *SSD Update Message*
- 7        26. *Status Request Message*
- 8        27. *TMSI Assignment Message*
- 9        28. *Universal Page Message* (Forward Common Control Channel Only)
- 10      29. *Unlock Order*
- 11      30. *User Zone Reject Message*

12     The base station should send at least one *General Page Message* in each Paging Channel  
13    slot. The base station shall not omit a *General Page Message* in two adjacent Paging  
14    Channel slots.

15     The base station should send at least one *General Page Message* or *Universal Page Message*  
16    in each Forward Common Control Channel slot. The base station shall not omit both a  
17    *General Page Message* and a *Universal Page Message* in two adjacent slots.

#### 18    3.6.2.3.1 Processing when the General Page Message is Used

19     The base station shall use the following rules for selecting the Paging Channel or Forward  
20    Common Control Channel slot in which to send a message to a mobile station:

- 21     • If the base station is able to determine that the mobile station is operating in the  
22    non-slotted mode, the base station may send the message to the mobile station in  
23    any Paging Channel or Forward Common Control Channel slot.
- 24     • If the base station is able to determine that the mobile station is operating in the  
25    slotted mode and is able to determine the mobile station's slot cycle index (see  
26    2.6.2.1.1.3), the base station shall send the message at least once in an assigned  
27    Paging Channel slot for the mobile station (see 3.6.2.1.3), with the position within  
28    the slot subject to the following limitations:
  - 29        – If the mobile station has registered with a class 0 IMSI, the base station shall  
30    not send the message in the assigned Paging Channel slot after sending a  
31    *General Page Message* with CLASS\_0\_DONE set to '1' in that slot.
  - 32        – If the mobile station has registered with a class 1 IMSI, the base station shall  
33    not send the message in the assigned Paging Channel slot after sending a  
34    *General Page Message* with CLASS\_1\_DONE set to '1' in that slot.
  - 35        – If the mobile station has been assigned a TMSI, the base station shall not send  
36    the message in the assigned Paging Channel slot after sending a *General Page*  
37    *Message* with TMSI\_DONE set to '1' in that slot.

- If the base station is able to determine that the mobile station is operating in the slotted mode and that the mobile station is not waiting for a priority access channel assignment and that the slotted timer in the mobile station is not active, and the base station is able to determine the mobile station's slot cycle index (see 2.6.2.1.1.3), the base station shall send the message at least once in an assigned Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3), with the position within the slot subject to the following limitations:
  - If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in the assigned Forward Common Control Channel slot after sending a *General Page Message* with CLASS\_0\_DONE set to '1' in that slot.
  - If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in the assigned Forward Common Control Channel slot after sending a *General Page Message* with CLASS\_1\_DONE set to '1' in that slot.
  - If the mobile station has been assigned a TMSI, the base station shall not send the message in the assigned Forward Common Control Channel slot after sending a *General Page Message* with TMSI\_DONE set to '1' in that slot.
- If the base station is able to determine that the mobile station is operating in the slotted mode and that the mobile station is waiting for a priority access channel assignment, or that the slotted timer in the mobile station is active, the base station may send the message to the mobile station in any Forward Common Control Channel slot with the position within the slot subject to the following limitation:
  - If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in any Forward Common Control Channel slot after sending a *General Page Message* with CLASS\_0\_DONE set to '1' in that slot.
  - If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in any Forward Common Control Channel slot after sending a *General Page Message* with CLASS\_1\_DONE set to '1' in that slot.
  - If the mobile station has been assigned a TMSI, the base station shall not send the message in any Forward Common Control Channel slot after sending a *General Page Message* with TMSI\_DONE set to '1' in that slot.
- If the base station is not able to determine whether the mobile station is operating in the non-slotted mode, or the base station is not able to determine the mobile station's slot cycle index, the base station shall assume that the mobile station is operating in the slotted mode with a slot cycle index which is the smaller of MAX\_SLOT\_CYCLE\_INDEX and 1. The base station shall send the message at least once in an assigned Paging Channel or Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3), with the position within the slot subject to the following limitations:
  - If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in the assigned Paging Channel or Forward Common Control Channel slot after sending a *General Page Message* with CLASS\_0\_DONE set to '1' in that slot.

- If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in the assigned Paging Channel or Forward Common Control Channel slot after sending a *General Page Message* with CLASS\_1\_DONE set to ‘1’ in that slot.
- If the mobile station has been assigned a TMSI, the base station shall not send the message in the assigned Paging Channel or Forward Common Control Channel slot after sending a *General Page Message* with TMSI\_DONE set to ‘1’ in that slot.

The base station should send messages directed to mobile stations operating in the slotted mode as the first messages in the slot.

If the base station sends a *General Page Message* with ORDERED\_TMSIS set to ‘1’ in a slot, the base station shall order page records with PAGE\_CLASS equal to ‘10’ in ascending order such that if a particular TMSI\_CODE value for one page record is greater than the TMSI\_CODE value for another page record, the page record with the greater TMSI\_CODE value is sent later in the slot.

#### 3.6.2.3.2 Processing when the Universal Page Message is Used

The base station shall use the following rules for selecting the Forward Common Control Channel slot in which to send a message to a mobile station:

- If the base station is able to determine that the mobile station is operating in the non-slotted mode, the base station may send the message to the mobile station in any Forward Common Control Channel slot.
- If the base station is able to determine that the mobile station is capable of operating in the slotted mode and that the mobile station is waiting for a priority access channel assignment, or that the slotted timer in the mobile station is active, the base station may send the message to the mobile station in any Forward Common Control Channel slot with the position within the slot subject to the following limitation:
  - The base station shall not send the message later in the slot than a *Universal Page Message* which lacks a mobile station-directed message announcement and which lacks a mobile station-addressed page (see 3.7.2.3.2.25) for that mobile station.
- If the base station is able to determine that the mobile station is operating in the slotted mode and that the mobile station is not waiting for a priority access channel assignment and that the slotted timer in the mobile station is not active and the base station is able to determine the mobile station’s slot cycle index (see 2.6.2.1.1.3.3), the base station shall send the message at least once in an assigned Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3) or in the following slot, with the position within these two slots subject to the following limitation:

- 1     – The base station shall not send the message later in the slot than a *Universal*  
2       *Page Message* that lacks a mobile station-directed message announcement and  
3       which lacks a mobile station-addressed page (see 3.7.2.3.2.25) for that mobile  
4       station.
- 5     • If the base station is not able to determine whether the mobile station is operating in  
6       the non-slotted mode, or the base station is not able to determine the mobile  
7       station's slot cycle index, the base station shall assume that the mobile station is  
8       operating in the slotted mode with a slot cycle index which is the smaller of  
9       MAX\_SLOT\_CYCLE\_INDEX and 1. The base station shall send the message at least  
10      once in an assigned Forward Common Control Channel slot for the mobile station  
11      (see 3.6.2.1.3), or in the following slot, with the position within these two slots  
12      subject to the following limitation:
  - 13       – The base station shall not send the message later in the slot than a *Universal*  
14           *Page Message* that lacks a mobile station-directed message announcement and  
15           which lacks a mobile station-addressed page (see 3.7.2.3.2.25) for that mobile  
16           station.

17   The base station should send messages directed to both mobile stations operating in the  
18   slotted mode and mobile stations operating in the non-slotted mode later in the slot than  
19   the *Universal Page Message*.

#### 20   3.6.2.4 Broadcast Messages

##### 21   3.6.2.4.1 Broadcast Messages Sent on the Paging Channel

22   The base station may transmit *Data Burst Messages* directed to broadcast addresses. When  
23   transmitting broadcast messages that are to be received by mobile stations operating in the  
24   slotted mode, the base station may use broadcast page records (see 3.7.2.3.2.17) in  
25   accordance with the broadcast procedures specified in 3.6.2.4.1 to announce the presence  
26   of broadcast *Data Burst Messages* on the Paging Channel. The base station should use the  
27   rules specified in 3.6.2.4.1.1 for selecting the Paging Channel slot in which to send a  
28   broadcast *Data Burst Message*.

##### 29   3.6.2.4.1.1 Broadcast Procedures for Slotted Mode

30   The base station may announce the presence of broadcast Data Burst Messages on the  
31   Paging Channel by paging, using a broadcast address with PAGE\_CLASS equal to '11' and  
32   PAGE\_SUBCLASS equal to '00'.

##### 33   3.6.2.4.1.1.1 General Overview

34   The base station may transmit Data Burst Messages directed to broadcast addresses. Since  
35   mobile stations operating in slotted mode do not constantly monitor a Paging Channel, it is  
36   necessary to use special procedures to ensure that mobile stations operating in the slotted  
37   mode are able to receive the message. The base station may either send a broadcast  
38   message in many slots, or may send a broadcast message in a predetermined paging slot.  
39   This single transmission of the pending broadcast message may be announced by a

preceding “broadcast page”. A broadcast page is a *General Page Message* record with the PAGE\_CLASS field set to ‘11’.

If pending transmission of the broadcast message is announced by the broadcast page, mobile stations use the BC\_ADDR and the BURST\_TYPE fields of the broadcast page record to determine whether or not to receive the announced broadcast message. The base station sets the value of the BC\_ADDR according to the requirements of the standards related to the BURST\_TYPE. There is a predetermined timing relationship between the sending of the broadcast page and the sending of the related broadcast message. This timing relationship allows mobile stations to determine which slot to monitor in order to receive the broadcast message.

To reduce the overhead for sending broadcast pages or broadcast messages, a base station may use periodic broadcast paging (see 3.6.2.4.1.2.1.2). When periodic broadcast paging is enabled, broadcast pages or broadcast messages are sent only once during a broadcast paging cycle. Mobile stations that are operating in the slotted mode and are configured to receive broadcast messages monitor the paging channel during the slot in which the broadcast pages or broadcast messages are sent. For the purpose of periodic broadcast paging, system time is divided into broadcast paging cycles, each having a duration of  $(\mathbf{B} + 3)$  Paging Channel slots, where **B** is a power of two. In each broadcast paging cycle, the first paging slot may contain broadcast pages or broadcast messages.

#### 3.6.2.4.1.1.2 Requirements for Sending Broadcast Messages

##### 3.6.2.4.1.1.2.1 Broadcast Delivery Options

When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode and monitoring the Paging Channel, the base station shall use one of the two following procedures to transmit a broadcast message.

###### 3.6.2.4.1.1.2.1.1 Method 1: Multi-Slot Broadcast Message Transmission

The base station may send a broadcast message using this method without regard to whether periodic broadcast paging is enabled or disabled (see 3.6.2.4.1.2.3).

When using this method, the base station shall send the broadcast message in a sufficient number of paging slots such that it may be received by any mobile station that is operating in the slotted mode. For example, the base station may send the broadcast message in **M** successive paging slots where **M** is the number of slots in a maximum paging cycle as defined in 2.6.2.1.1.3.3.

###### 3.6.2.4.1.1.2.1.2 Method 2: Periodic Broadcast Paging

If the base station sends a broadcast message using this method, then the base station shall enable periodic broadcast paging (see 3.6.2.4.1.2.3).

To deliver a broadcast message using this method, the base station should perform the following:

- If the number and size of the broadcast messages waiting to be sent are such that the messages can be sent in a single slot, the base station should send the broadcast messages in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3).
- If there is a single broadcast message waiting to be sent, the base station should send the broadcast message beginning in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3).
- Otherwise, the base station should first include a broadcast page for each broadcast message to be sent, in a *General Page Message* that is sent in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3). The base station should then send the related broadcast messages in the paging slots specified in 3.6.2.4.1.2.4.

#### 3.6.2.4.1.1.2.2 Duplicate Broadcast Message Transmission

If the base station sends a broadcast message or a broadcast page and an associated broadcast message more than once when periodic broadcast paging is enabled (see 3.6.2.4.1.2.3), then all repetitions of the broadcast message or the broadcast page and the associated broadcast message should be sent within  $4 \times (\mathbf{B} + 3)$  paging slots of the paging slot in which the broadcast message or broadcast page was first sent. ( $\mathbf{B} + 3$  is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3).

When a base station sends a broadcast message or a broadcast page when periodic broadcast paging is enabled (see 3.6.2.4.1.2.3), and the base station has a second, different broadcast message to send which contains identical BURST\_TYPE and BC\_ADDR fields, then the base station shall wait  $4 \times (\mathbf{B} + 3)$  paging slots after the first slot of the broadcast paging cycle containing the final sending of the first broadcast message or broadcast page before sending the second, different broadcast message or related broadcast page.

#### 3.6.2.4.1.1.2.3 Periodic Broadcast Paging

The base station uses the BCAST\_INDEX field of the *Extended System Parameters Message* to specify the current state of periodic broadcast paging to all mobile stations.

To enable periodic broadcast paging, the base station shall set the BCAST\_INDEX field of the *Extended System Parameters Message* to an unsigned 3-bit number in the range 1-7, equal to the broadcast slot cycle index as defined in 2.6.2.1.1.3.3. The value of the BCAST\_INDEX field may exceed the value of the MAX\_SLOT\_CYCLE\_INDEX field sent in the *System Parameters Message*.

To indicate that periodic broadcast paging is either disabled or is not supported by the base station, the base station shall set the BCAST\_INDEX field to '000'.

#### 3.6.2.4.1.1.2.4 Broadcast Message Slot Determination

When a base station uses broadcast paging, it shall determine the slot in which to send the corresponding broadcast message using the following procedures:

- The base station shall consider a broadcast page to have been sent in the paging slot in which the *General Page Message* containing the broadcast page began.

- 1     • The reference slot is defined as the paging slot in which the broadcast page was  
2       sent.
- 3     • Let n represent the ordinal number of the broadcast page relative to other broadcast  
4       pages that are contained in the same *General Page Message* (n = 1, 2, 3,...). The  
5       base station shall send the broadcast message announced by broadcast page n in  
6       the paging slot that occurs  $n \times 3$  paging slots after the reference slot.

7     3.6.2.4.2 Broadcast Messages Sent on the Broadcast Control Channel

8     The base station may transmit *Data Burst Messages* directed to broadcast addresses. When  
9       transmitting broadcast messages that are to be received by mobile stations operating in the  
10      slotted mode, the base station may use enhanced broadcast pages (see 3.7.2.3.2.17) in  
11      accordance with the broadcast procedures specified in 3.6.2.4.2 to announce the presence  
12      of broadcast *Data Burst Messages* on the Broadcast Control Channel. The base station  
13      should use the rules specified in 3.6.2.4.2.1 for selecting the Broadcast Control Channel  
14      slot in which to send a broadcast *Data Burst Message*.

15    3.6.2.4.2.1 Broadcast Procedures for Slotted Mode

16    The base station may announce the presence of broadcast *Data Burst Messages* on the  
17      Broadcast Control Channel by sending an enhanced broadcast page.

18    3.6.2.4.2.1.1 General Overview

19    The base station may transmit *Data Burst Messages* directed to broadcast addresses. Since  
20      mobile stations operating in slotted mode do not constantly monitor a Broadcast Control  
21      Channel, it is necessary to use special procedures to ensure that mobile stations operating  
22      in the slotted mode are able to receive the message. The base station may either send an  
23      enhanced broadcast page in many Forward Common Control Channel slots, directing the  
24      mobile station to the appropriate Broadcast Control Channel slot, or the base station may  
25      also send an enhanced broadcast page in a predetermined slot, called a broadcast slot, on  
26      the Forward Common Control Channel, directing the mobile station to a specified Broadcast  
27      Control Channel slot.

28    If pending transmission of the broadcast message is announced by the enhanced broadcast  
29      page, mobile stations use the BC\_ADDR and the BURST\_TYPE fields of the enhanced  
30      broadcast page record to determine whether or not to receive the announced broadcast  
31      message. The base station sets the value of the BC\_ADDR according to the requirements of  
32      the standards related to the BURST\_TYPE. The timing relationship between the sending of  
33      the enhanced broadcast page and the sending of the related broadcast message is specified  
34      in the enhanced broadcast page. This timing relationship allows mobile stations to  
35      determine which Broadcast Control Channel slot to monitor in order to receive the  
36      broadcast message.

37    To reduce the overhead for sending broadcast pages or broadcast messages, a base station  
38      may use Periodic Enhanced Broadcast Paging (see 3.6.2.4.2.2.1.2). When Periodic  
39      Enhanced Broadcast Paging is enabled, enhanced broadcast pages are sent only once  
40      during a broadcast paging cycle. Mobile stations that are operating in the slotted mode and  
41      are configured to receive broadcast messages monitor the Forward Common Control

1 Channel during the broadcast slot in which the enhanced broadcast pages are sent. For  
 2 the purpose of Periodic Enhanced Broadcast Paging, system time is divided into broadcast  
 3 paging cycles, each having a duration of (**B** + 7) Forward Common Control Channel slots,  
 4 where **B** is a power of two. In each broadcast paging cycle, the first Forward Common  
 5 Control Channel slot may contain enhanced broadcast pages.

6 3.6.2.4.2.1.2 Requirements for Sending Broadcast Messages

7 3.6.2.4.2.1.2.1 Broadcast Delivery Options

8 When transmitting broadcast messages that are to be received by mobile stations operating  
 9 in the slotted mode and monitoring the Forward Common Control Channel/Broadcast  
 10 Control Channel, the base station shall use one of the two following procedures to transmit  
 11 a broadcast message.

12 3.6.2.4.2.1.2.1.1 Method 1: Multi-Slot Enhanced Broadcast Paging

13 The base station may send a broadcast message using this method without regard to  
 14 whether Periodic Enhanced Broadcast Paging is enabled or disabled (see 3.6.2.4.2.2.3).

15 When using this method, the base station shall send the enhanced broadcast page in a  
 16 sufficient number of Forward Common Control Channel slots such that it may be received  
 17 by any mobile station that is operating in the slotted mode. The enhanced broadcast page  
 18 then directs mobile stations to a subsequent Broadcast Control Channel slot.

19 The base station shall not send an enhanced broadcast page that directs a mobile station to  
 20 receive a broadcast message on the Primary Broadcast Control Channel.

21 The base station shall not send a broadcast message on the Forward Common Control  
 22 Channel.

23 3.6.2.4.2.1.2.1.2 Method 2: Periodic Enhanced Broadcast Paging

24 If the base station sends a broadcast message using this method, then the base station  
 25 shall enable Periodic Enhanced Broadcast Paging (see 3.6.2.4.2.2.3).

26 To deliver a broadcast message using this method, the base station should perform the  
 27 following:

- 28 • The base station should first include an enhanced broadcast page for each  
 29 broadcast message to be sent, in a page that is sent on the Forward Common  
 30 Control Channel in the first slot of the next broadcast paging cycle (see  
 31 2.6.2.1.1.3.3). The base station should then send the corresponding broadcast  
 32 messages in the Broadcast Control Channel slots specified in 3.6.2.4.2.2.4.

33 The base station shall not send an enhanced broadcast page that directs a mobile station to  
 34 receive a broadcast message on the Primary Broadcast Control Channel.

35 The base station shall not send a broadcast message on the Forward Common Control  
 36 Channel.

1    3.6.2.4.2.1.2.2 Duplicate Broadcast Message Transmission

2    If the base station sends an enhanced broadcast page and an associated broadcast message  
 3    more than once when Periodic Enhanced Broadcast Paging is enabled (see 3.6.2.4.2.2.3),  
 4    then all repetitions of the enhanced broadcast page should be sent within  $4 \times (\mathbf{B} + 7)$  slots  
 5    of the slot in which the enhanced broadcast page was first sent. ( $\mathbf{B} + 7$  is the duration of  
 6    the broadcast paging cycle as defined in 2.6.2.1.1.3.3).

7    When a base station sends an enhanced broadcast page when Periodic Enhanced Broadcast  
 8    Paging is enabled (see 3.6.2.4.2.2.3), and the base station has a second, different broadcast  
 9    message to send which contains identical BURST\_TYPE and BC\_ADDR fields, then the base  
 10   station shall wait  $4 \times (\mathbf{B} + 7)$  paging slots after the first slot of the broadcast paging cycle  
 11   containing the final sending of the first broadcast message or enhanced broadcast page  
 12   before sending the second, different enhanced broadcast page.

13   3.6.2.4.2.1.2.3 Periodic Enhanced Broadcast Paging

14   The base station uses the BCAST\_INDEX fields of the *MC-RR Parameters Message* to specify  
 15   the current state of Periodic Enhanced Broadcast Paging to all mobile stations.

16   To enable Periodic Enhanced Broadcast Paging, the base station shall set the  
 17   BCAST\_INDEX field to a non-zero unsigned 3-bit number equal to the broadcast slot cycle  
 18   index as defined in 2.6.2.1.1.3.3.

19   To indicate that Periodic Enhanced Broadcast Paging is either disabled or is not supported  
 20   by the base station, the base station shall set the BCAST\_INDEX field to '000'.

21   3.6.2.4.2.1.2.4 Broadcast Message Slot Determination

22   When a base station uses broadcast message announcement, it shall determine the slot in  
 23   which to send the corresponding broadcast message using the following procedures:

- 24   • The base station shall consider an enhanced broadcast page to have been sent in  
 25       the Forward Common Control Channel slot in which the page message containing  
 26       the enhanced broadcast page began.
- 27   • The reference slot is defined as the Forward Common Control Channel slot in which  
 28       the enhanced broadcast page was sent.
- 29   • The base station shall send a first transmission of the broadcast message  
 30       announced by the enhanced broadcast page in the Broadcast Control Channel slot  
 31       which begins  $40 \text{ ms} \times (1 + \text{TIME\_OFFSET})$  later than the beginning of the slot in  
 32       which the page message containing the enhanced broadcast page began. The base  
 33       station may send a repetition of the broadcast message announced by the enhanced  
 34       broadcast page in the Broadcast Control Channel slot which begins  $40 \text{ ms} \times (1 +$   
 35       REPEAT\_TIME\_OFFSET) later than the Broadcast Control Channel slot in which the  
 36       first transmission began.

37   3.6.2.5 Quick Paging Channel Processing

38   The base station may support a Quick Paging Channel. The base station may transmit up  
 39   to three Quick Paging Channels on each supported CDMA Channel.

1 When a Quick Paging Channel is supported, the base station shall transmit paging  
 2 indicators to the mobile station in the assigned positions in the assigned Quick Paging  
 3 Channel slot. The base station shall set the paging indicators to “ON” if the mobile station  
 4 is operating in the slotted mode and is to receive the Paging Channel or Forward Common  
 5 Control Channel in the assigned Paging Channel or Forward Common Control Channel slot  
 6 following its assigned Quick Paging Channel slot.

7 When the base station changes CONFIG\_MSG\_SEQ, the base station should set the paging  
 8 indicators for all mobile stations to “ON” for each Quick Paging Channel slot for a time  
 9 interval T (in units of 1.28 seconds), such that

$$10 \quad T = N \times 2^{\text{MAX\_SLOT\_CYCLE\_INDEX}},$$

11 where N is an integer greater than or equal to one.

12 If the base station supports configuration change indicators on the Quick Paging Channel,  
 13 when the base station changes CONFIG\_MSG\_SEQ, the base station shall set all  
 14 configuration change indicators to “ON” for each Quick Paging Channel slot for a time  
 15 interval of  $T_{31m}$  seconds. At all other times, the base station shall set all configuration  
 16 change indicators to “OFF”.

17 If the base station does not support configuration change indicators on the Quick Paging  
 18 Channel, then the base station shall set all configuration change indicators to “OFF”.

19 When the base station sends a broadcast message using Multi-Slot Broadcast Message  
 20 Transmission (see [3.6.2.4.1.1.2.1.1-3.6.2.4.1.2.1.1](#)), the base station should set all paging  
 21 indicators to “ON” for the Quick Paging Channel slot which begins 100 ms prior to the  
 22 beginning of the Paging Channel slot in which the broadcast message begins.

23 When the base station sends an enhanced broadcast page using Multi-Slot Enhanced  
 24 Broadcast Paging (see 3.6.2.4.2.1.2.1.1), the base station should set all paging indicators to  
 25 “ON” for the Quick Paging Channel slot which begins 100 ms prior to the beginning of the  
 26 Forward Common Control Channel slot in which the message containing the enhanced  
 27 broadcast page begins.

28 When the base station sends an enhanced broadcast page using Periodic Enhanced  
 29 Broadcast Paging (see 3.6.2.4.2.1.2.1.2), the base station should set all broadcast indicators  
 30 to “ON” for the Quick Paging Channel broadcast slot which begins 100 ms prior to the  
 31 beginning of the Forward Common Control Channel slot in which the message containing  
 32 the enhanced broadcast page begins. At all other times, the base station shall set all  
 33 broadcast indicators for a Quick Paging Channel broadcast slot to “OFF”.

34 The base station shall set all reserved indicators to “OFF”.

### 35 3.6.2.5.1 Quick Paging Channel Determination

36 To determine the mobile station’s assigned Quick Paging Channel, the base station shall  
 37 use the hash function specified in 2.6.7.1 with the following inputs:

- 38 • IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)
- 39 • Number of Quick Paging Channels which the base station transmits on the mobile  
 40 station’s assigned CDMA Channel.

## 1    3.6.2.5.2 Quick Paging Channel Slot Determination

2    The mobile station's assigned Quick Paging Channel slots are those slots for which

3                         
$$\lfloor(t+5)/4\rfloor - \text{PGSLOT} \bmod (16 \times T) = 0,$$

4    where  $t$  is the System Time in frames, PGSLOT is selected in the range 0 to 2047 by using  
5    the hash function specified in 2.6.7.1, and  $T$  is the slot cycle length in units of 1.28 seconds  
6    such that

7                         
$$T = 2^i,$$

8    and  $i$  is the slot cycle index.

## 9    3.6.2.5.3 Paging Indicator Position Determination

10   To determine the mobile station's assigned paging indicators, the base station shall use the  
11   same formula as used by the mobile station (see 2.6.2.1.2.2).

## 12   3.6.2.5.4 Configuration Change Indicator Position Determination

13   Configuration change indicators are transmitted on the first Quick Paging Channel.

14   If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit  
15   positions of the first pair of configuration change indicators in a Quick Paging Channel slot  
16   shall be the last two bits in the first 40 ms half of the Quick Paging Channel slot. The bit  
17   positions of the second pair of configuration change indicators in a Quick Paging Channel  
18   slot shall be the last two bits in the Quick Paging Channel slot.19   If the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the bit  
20   positions of the first four configuration change indicators in a Quick Paging Channel slot  
21   shall be the last four bits in the first 40 ms half of the Quick Paging Channel slot. The bit  
22   position of the second four configuration change indicators in a Quick Paging Channel slot  
23   shall be the last four bits in the Quick Paging Channel slot.

## 24   3.6.2.5.5 Broadcast Indicator Position Determination

25   Broadcast indicators are transmitted on the first Quick Paging Channel.

26   On the first Quick Paging Channel, if the Quick Paging Channel data rate is 2400 bps  
27   (indicator rate is 4800 bps), the broadcast indicator positions are described as follows:

- 28   • The two Quick Paging Channel bit positions prior to the last two bits in the first 40
- 
- 29   ms half of a Quick Paging Channel broadcast slot are broadcast indicators. The two
- 
- 30   Quick Paging Channel bit positions prior to the last two bits in a Quick Paging
- 
- 31   Channel broadcast slot are also broadcast indicators.

32   On the first Quick Paging Channel, if the Quick Paging Channel data rate is 4800 bps  
33   (indicator rate is 9600 bps), the broadcast indicator positions are described as follows:

- 34   • The four Quick Paging Channel bit positions prior to the last four bits in the first 40
- 
- 35   ms half of a Quick Paging Channel broadcast slot are broadcast indicators. The four
- 
- 36   Quick Paging Channel bit positions prior to the last four bits in a Quick Paging
- 
- 37   Channel broadcast slot are also broadcast indicators.

1       3.6.2.5.6 Reserved Indicator Positions

2       On the first Quick Paging Channel, if the Quick Paging Channel data rate is 2400 bps  
 3       (indicator rate is 4800 bps), the reserved indicator positions are described as follows:

- 4           • The two Quick Paging Channel bit positions prior to the last two bits in the first 40  
 5           ms half of a Quick Paging Channel slot that is not a Quick Paging Channel  
 6           Broadcast slot are reserved. The two Quick Paging Channel bit positions prior to  
 7           the last two bits in a Quick Paging Channel slot that is not a Quick Paging Channel  
 8           Broadcast slot are also reserved.

9       On the first Quick Paging Channel, if the Quick Paging Channel data rate is 4800 bps  
 10      (indicator rate is 9600 bps), the reserved indicator positions are described as follows:

- 11           • The four Quick Paging Channel bit positions prior to the last four bits in the first 40  
 12           ms half of a Quick Paging Channel slot that is not a Quick Paging Channel  
 13           Broadcast slot are reserved. The four Quick Paging Channel bit positions prior to  
 14           the last four bits in a Quick Paging Channel slot that is not a Quick Paging Channel  
 15           Broadcast slot are also reserved.

16       On Quick Paging Channels other than the first Quick Paging Channel, if the Quick Paging  
 17      Channel data rate is 2400 bps (indicator rate is 4800 bps), the reserved indicator positions  
 18      are described as follows:

- 19           • The last four Quick Paging Channel bit positions in the first 40 ms half of a Quick  
 20           Paging Channel slot are reserved. The last four Quick Paging Channel bit positions  
 21           in a Quick Paging Channel slot are also reserved.

22       On Quick Paging Channels other than the first Quick Paging Channel, if the Quick Paging  
 23      Channel data rate is 4800 bps (indicator rate is 9600 bps), the reserved indicator positions  
 24      are described as follows:

- 25           • The last eight Quick Paging Channel bit positions in the first 40 ms half of a Quick  
 26           Paging Channel slot are reserved. The last eight Quick Paging Channel bit positions  
 27           in a Quick Paging Channel slot are also reserved.

28       3.6.3 Access Channel and Enhanced Access Channel Processing

29       During *Access Channel Processing*, the base station monitors the Access Channel to receive  
 30      messages which the mobile station sends while the mobile station is in the *System Access  
 31      State*.

32       Each Access Channel is associated with a Paging Channel. Up to 32 Access Channels can  
 33      be associated with a Paging Channel. The number of Access Channels associated with a  
 34      particular Paging Channel is specified in the *Access Parameters Message* sent on that  
 35      Paging Channel.

36       If the base station supports Access Channels, the base station shall continually monitor all  
 37      Access Channels associated with each Paging Channel that the base station transmits.

38       If the base station supports Enhanced Access Channels, then during *Enhanced Access  
 39      Channel Processing*, the base station monitors the Enhanced Access Channel to receive

1 messages which the mobile station sends while the mobile station is in the *System Access*  
 2 *State*.

3 Each Enhanced Access Channel is associated with a Forward Common Control Channel.  
 4 Up to 32 Enhanced Access Channels can be associated with a Forward Common Control  
 5 Channel. The number of Enhanced Access Channels associated with a particular Forward  
 6 Common Control Channel is specified in the *Enhanced Access Parameters Message* sent on  
 7 the Primary Broadcast Control Channel.

8 If the base station supports Enhanced Access Channel, the base station shall continually  
 9 monitor all Enhanced Access Channels associated with each Forward Common Control  
 10 Channel that the base station transmits.

11 3.6.3.1 Reserved

12 3.6.3.2 Reserved

13 3.6.3.3 Response to Page Response Message

14 If the base station receives a *Page Response Message*, the base station should send a  
 15 *Channel Assignment Message*, an *Extended Channel Assignment Message*, or a *Release*  
 16 *Order*. The base station may also start authentication procedures (see 2.3.12), start TMSI  
 17 assignment procedures (see 2.3.15), send a *Data Burst Message*, or request status  
 18 information records with the *Status Request Message*. If the base station is operating with  
 19 the mobile station in Band Class 0, the base station may also request the status  
 20 information records with the *Status Request Order*.

21 If the base station sends the *Extended Channel Assignment Message*, the base station may  
 22 include more than one pilot to be in the Active Set.

23 If the base station sends a *Channel Assignment Message* or an *Extended Channel*  
 24 *Assignment Message*, the base station shall perform the following:

- 25 • If the message directs the mobile station to a CDMA Traffic Channel, the base  
 26 station shall begin *Traffic Channel Processing* (see 3.6.4) for the mobile station.
- 27 • If the message directs the mobile station to an 800 MHz wide analog voice channel,  
 28 the base station shall follow the procedure described in [6].
- 29 • If the message directs the mobile station to an 800 MHz narrow analog voice  
 30 channel, the base station shall follow the procedure described in 3.6.5A of [22].
- 31 • Layer 3 shall send a *mobile station inactive on common channel* indication to Layer 2  
 32 (see 3.1.1.2.2 of [4]).

33 3.6.3.4 Response to Orders

34 No requirements.

35 3.6.3.5 Response to Origination Message

36 If the base station receives an *Origination Message*, the base station should send a *Channel*  
 37 *Assignment Message*, an *Extended Channel Assignment Message*, an *Intercept Order*, a

1    *Reorder Order*, a *Release Order*, a *Retry Order*, a *PACA Message*, or a *Service Redirection*  
 2    *Message*. The base station may also commence authentication procedures (see 2.3.12) or  
 3    TMSI assignment procedures (see 2.3.15). The base station may also request status  
 4    information records with the *Status Request Message*. If the base station is operating with  
 5    the mobile station in Band Class 0, the base station may also request status information  
 6    records with the *Status Request Order*.

7    If the base station sends the *Extended Channel Assignment Message*, the base station may  
 8    include more than one pilot to be in the Active Set.

9    If the base station sends a *Channel Assignment Message* or an *Extended Channel*  
 10   *Assignment Message*, the base station shall perform the following:

- 11     • If the message directs the mobile station to a CDMA Traffic Channel, the base  
 12       station shall begin *Traffic Channel Processing* (see 3.6.4) for the mobile station.
- 13     • If the message directs the mobile station to an 800 MHz wide analog voice channel,  
 14       the base station shall follow the procedure described in [2].
- 15     • If the message directs the mobile station to an 800 MHz narrow analog voice  
 16       channel, the base station shall follow the procedure described in 3.6.5A of [22].
- 17     • The base station shall raise a *mobile station inactive on common channel* indication  
 18       for the mobile station.

19    If the base station sends a *Channel Assignment Message*, the base station shall not set  
 20   RESPOND equal to '0' when ASSIGN\_MODE = '001', ASSIGN\_MODE = '010', or  
 21   ASSIGN\_MODE = '101'. If the base station sends an *Extended Channel Assignment*  
 22   *Message*, the base station shall not set RESPOND equal to '0' when ASSIGN\_MODE = '001'  
 23   or ASSIGN\_MODE = '010'.

24    If the base station receives an *Origination Message* and the **GLOBAL EMERGENCY CALL**  
 25   indicator is set to '1' and the service associated with this origination is a voice service, the  
 26   base station shall recognize this as an emergency call and should process the message  
 27   using an implementation-dependent procedure which may include ignoring the dialed  
 28   digits. If the base station receives an *Origination Message* and the  
 29   **GLOBAL EMERGENCY CALL** indicator is set to '1' and the service associated with this  
 30   origination is not a voice service, the base station may recognize this as an emergency call  
 31   and should process the message using an implementation-dependent procedure which may  
 32   include ignoring the dialed digits.

### 33    3.6.3.6 Response to Registration Message

34    If the base station receives a *Registration Message*, the base station may send a *Registration*  
 35   *Accepted Order*, a *Registration Rejected Order*, or a *Service Redirection Message*. The base  
 36   station may also start authentication procedures (see 2.3.12), may start TMSI assignment  
 37   procedures (see 2.3.15), or may request status information records with the *Status Request*  
 38   *Message*. If the base station is operating with the mobile station in Band Class 0, the base  
 39   station may also request the status information records with a *Status Request Order*.

40    If the *Registration Message* specifies a power-down registration, Layer 3 shall send a *mobile*  
 41   *station inactive on common channel* indication to Layer 2 (see 3.1.1.2.2 of [4]).

When responding to a *Registration Message* that requests extended encryption, if the base station decides to turn on extended encryption and the CMEAKEY is available at the base station, the base station shall send a *Registration Accepted Order* with encryption information. Before the CMEAKEY is available, the base station may send a *Registration Accepted Order* without any encryption information. When the CMEAKEY becomes available, if the base station decides to turn on extended encryption, the base station shall send a *Registration Accepted Order* with encryption information.

### 3.6.3.7 Response to Data Burst Message

No requirements.

### 3.6.3.8 Reserved

### 3.6.3.9 Reserved

### 3.6.3.10 Service Redirection

If the base station sends a *Service Redirection Message* to the mobile station, Layer 3 shall send a *mobile station inactive on common channel* indication to Layer 2 (see 3.1.1.2.2 of [4]).

## 3.6.4 Traffic Channel Processing

During *Traffic Channel Processing*, the base station uses the Forward and Reverse Traffic Channels to communicate with the mobile station while the mobile station is in the *Mobile Station Control on the Traffic Channel State*.

Traffic Channel processing consists of the following substates:

- *Traffic Channel Initialization Substate* - In this substate, the base station begins transmitting on the Forward Traffic Channel and receiving on the Reverse Traffic Channel.
- *Traffic Channel Substate* - In this substate, the base station exchanges Traffic Channel frames with the mobile station in accordance with the current service configuration. While in this substate, one or more Call Control instances can be activated (see 3.6.8).
- *Release Substate* - In this substate, the base station disconnects the calls and the physical channels.

### 3.6.4.1 Special Functions and Actions

The base station performs the following special functions and actions in one or more of the Traffic Channel processing substates:

#### 3.6.4.1.1 Forward Traffic Channel Power Control

When the base station enables Forward Traffic Channel power control, the mobile station reports frame error rate statistics to the base station using the *Power Measurement Report Message*.

1    The base station may enable Forward Traffic Channel power control using the *System*  
 2    *Parameters Message* sent on the Paging Channel and the *Power Control Parameters Message*  
 3    sent on the Forward Traffic Channel. The base station may enable Forward Traffic Channel  
 4    power control using the *MC-RR Parameters Message* sent on the Primary Broadcast Control  
 5    Channel and the *Power Control Parameters Message* sent on the Forward Traffic Channel.  
 6    The base station may enable periodic reporting which causes the mobile station to report  
 7    frame error rate statistics at specified intervals. The base station may also enable threshold  
 8    reporting which causes the mobile station to report frame error rate statistics when the  
 9    frame error rate reaches a specified threshold.<sup>2</sup>

10   The base station may use the reported frame error rate statistics to adjust the transmit  
 11   power of the Forward Traffic Channel.

#### 12   3.6.4.1.2 Service Configuration and Negotiation

13   During Traffic Channel operation, the mobile station and base station communicate  
 14   through the exchange of Forward and Reverse Traffic Channel Configurations. The mobile  
 15   station and base station use a common set of attributes for building and interpreting Traffic  
 16   Channel frames. This set of attributes, referred to as a service configuration, consists of  
 17   both negotiable and non-negotiable parameters.

18   The set of negotiable service configuration parameters consists of the following:

- 19     1. *Forward and Reverse Multiplex Options*: These control the way in which the  
 20       information bits of the Forward and Reverse Traffic Channel frames, respectively,  
 21       are divided into various types of traffic, such as signaling traffic, primary traffic  
 22       and secondary traffic. A multiplex option together with a radio configuration  
 23       specifies the frame structures and transmission rates (see [3]). The Multiplex  
 24       Options which support Supplemental Code Channel transmission and  
 25       Supplemental Channel transmission on the Forward and Reverse Traffic Channels  
 26       are included in [3]. Invocation of Supplemental Code Channel operation on the  
 27       Forward or Reverse Traffic Channels occurs by transmission of the *Supplemental*  
 28       *Channel Request Message*, the *Supplemental Channel Assignment Message*, and  
 29       the *General Handoff Direction Message*. The Multiplex Options which support  
 30       Supplemental Code Channel transmission and Supplemental Channel  
 31       transmission on the Forward and Reverse Traffic Channels are included in [3].  
 32       The multiplex option used for the Forward Traffic Channel can be the same as  
 33       that used for the Reverse Traffic Channel, or it can be different.
- 34     2. *Forward and Reverse Traffic Channel Configurations*: These include the radio  
 35       configurations and other necessary attributes for the Forward and Reverse Traffic  
 36       Channels. The Traffic Channel Configuration used can be different for the  
 37       Forward and Reverse Traffic Channels or it can be the same.

---

<sup>2</sup>In this section the term base station may imply multiple cells or sectors.

- 1       3. Forward and Reverse Traffic Channel Transmission Rates: These are the  
2       transmission rates actually used for the Forward and Reverse Traffic Channels,  
3       respectively. The transmission rates for the Forward Traffic Channel can include  
4       all of the transmission rates supported by the radio configuration associated with  
5       the Forward Traffic Channel multiplex option, or a subset of the supported rates.  
6       Similarly, the transmission rates used for the Reverse Traffic Channel can include  
7       all rates supported by the radio configuration associated with the Reverse Traffic  
8       Channel multiplex option, or a subset of the supported rates. The transmission  
9       rates used for the Forward Traffic Channel can be the same as those used for the  
10      Reverse Traffic Channel, or they can be different.
- 11      4. Service Option Connections: These are the services in use on the Traffic Channel.  
12      There can be multiple service option connections. It is also possible that there is  
13      no service option connection, in which case the base station uses the Forward  
14      Traffic Channel as follows:
- 15       • Sends signaling traffic and null traffic on the Forward Fundamental  
16        Channel.
  - 17       • Sends signaling traffic on the Forward Dedicated Control Channel.
  - 18       • Sends power control bits on the Forward Fundamental Channel if  
19        FPC\_PRI\_CHAN is set to '0'; sends power control bits on the Forward  
20        Dedicated Control Channel if FPC\_PRI\_CHAN is set to '1'.

21      Associated with each service option connection are a service option, a Forward  
22      Traffic Channel traffic type, a Reverse Traffic Channel traffic type, and a service  
23      option connection reference. The associated service option formally defines the  
24      way in which traffic bits are processed by the mobile station and base station. The  
25      associated Forward and Reverse Traffic Channel traffic types specify the types of  
26      traffic used to support the service option. A service option can require the use of a  
27      particular type of traffic, such as primary or secondary, or it can accept more than  
28      one traffic type. A service option can be one-way, in which case it can be  
29      supported on the Forward Traffic Channel only or the Reverse Traffic Channel  
30      only. Alternatively, a service option can be two-way, in which case it can be  
31      supported on the Forward and Reverse Traffic Channels simultaneously.  
32      Connected service options can also invoke operation on Supplemental Code  
33      Channels in either one or both of the Forward and Reverse Traffic Channels by  
34      negotiating a multiplex option that supports operation on Supplemental Code  
35      Channels (see [3] for Multiplex Options applicable to Supplemental Code  
36      Channels), and by using the appropriate Supplemental Code Channel related  
37      messages (i.e., the *Supplemental Channel Request Message*, the *Supplemental*  
38      *Channel Assignment Message*, and the *General Handoff Direction Message*). After  
39      Supplemental Code Channels have been assigned by the base station, the  
40      connected service option can transmit primary and/or secondary traffic on  
41      Supplemental Code Channels. Connected service options can also invoke  
42      operation on Supplemental Channels in either one or both of the Forward and  
43      Reverse Traffic Channels by negotiating a multiplex option that supports operation  
44      on Supplemental Channels (see [3] for Multiplex Options applicable to

Supplemental Channels) and by using the appropriate Supplemental Channel related messages (i.e., the *Supplemental Channel Request Message*, the *Universal Handoff Direction Message*, the *Supplemental Channel Request Mini Message*, the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, and the *Reverse Supplemental Channel Assignment Mini Message*). After Supplemental Channels have been assigned by the base station, the connected service option can transmit primary and/or secondary traffic on Supplemental Channels. The associated service option connection reference provides a means for uniquely identifying the service option connection. The reference serves to resolve ambiguity when there are multiple service option connections in use.

The non-negotiable service configuration parameters are sent from the base station to the mobile stations only, and consist of the following:

1. *Reverse Pilot Gating Rate*: This controls the way in which the reverse pilot is gated on the Reverse Pilot Channel. The base station specifies the reverse pilot gating rate to be used in the *Service Connect Message*, the *General Handoff Direction Message*, and the *Universal Handoff Direction Message*.
2. *Forward and Reverse Power Control Parameters*: These consist of forward power control operation mode, outer loop power control parameters (e.g. target frame error rate, minimum  $E_b/N_t$  setpoint, and maximum  $E_b/N_t$  setpoint) for the Forward Fundamental Channel and Forward Dedicated Control Channel, and Power Control Subchannel indicator which indicates where the mobile station is to perform the primary inner loop estimation and the base station is to multiplex the Power Control Subchannel.
3. *Logical to Physical Mapping*: This is a table of logical to physical mapping entries, consisting of service reference identifier, logical resource, physical resource, forward flag, reverse flag, and priority.
4. *Partition Table*: The base station may include this table to specify the number of bits allocated for each service in the Fundamental Channel or Dedicated Control Channel.
5. *SCH LTU Size Table*: The base station may include this table to specify the number of bits per supplemental channel LTU.
6. Information related to Variable Rate feature (the capability to support rate determination) on Forward and Reverse Supplemental Channels
7. Information related to Flexible Rate feature (the capability to support non-listed rates) on Forward and Reverse Fundamental Channel, Dedicated Control Channel, and Supplemental Channels

The mobile station can request a default service configuration associated with a service option at call origination, and can request new service configurations during Traffic Channel operation. A requested service configuration can differ greatly from its predecessor or it can be very similar. For example, the mobile station can request a service configuration in which all of the service option connections are different from those of the

1 existing configuration; or the mobile station can request a service configuration in which  
2 the existing service option connections are maintained with only minor changes, such as a  
3 different set of transmission rates or a different mapping of service option connections to  
4 Forward and Reverse Traffic Channel traffic types.

5 If the mobile station requests a service configuration that is acceptable to the base station,  
6 they both begin using the new service configuration. If the mobile station requests a  
7 service configuration that is not acceptable to the base station, the base station can reject  
8 the requested service configuration or propose an alternative service configuration. If the  
9 base station proposes an alternative service configuration, the mobile station can accept or  
10 reject the base station's proposed service configuration, or propose yet another service  
11 configuration. This process, called service negotiation, ends when the mobile station and  
12 base station find a mutually acceptable service configuration, or when either the mobile  
13 station or base station rejects a service configuration proposed by the other.

14 It is also possible for the base station to request a default service configuration, associated  
15 with a service option, when paging the mobile station and to request new service  
16 configurations during Traffic Channel operation. The service negotiation proceeds as  
17 described above, but with the roles of the mobile station and base station reversed.

18 For CDMA mode operation in Band Class 0, the mobile station and base station can also  
19 use an alternative method for negotiating a service configuration known as service option  
20 negotiation. Service option negotiation is similar to service negotiation, but offers less  
21 flexibility for specifying the attributes of the service configuration. During service option  
22 negotiation, the base station or mobile station specifies only which service option is to be  
23 used. There is no facility for explicitly specifying the multiplex options, traffic types or  
24 transmission rates to be used on the Forward and Reverse Traffic Channels in conjunction  
25 with the service option. Instead, implicit service configuration attributes are assumed. In  
26 particular, the Forward and Reverse Multiplex Options and transmission rates are assumed  
27 to be the default multiplex options and transmission rates associated with the requested  
28 service option, and the traffic type for both the Forward and Reverse Traffic Channels is  
29 assumed to be primary traffic. Furthermore, a service configuration established using  
30 service option negotiation is restricted to having only a single service option connection.

31 At mobile station origination and termination, the type of negotiation to use, either service  
32 negotiation or service option negotiation, is indicated in the *Channel Assignment Message*.  
33 Service negotiation is always used with the *Extended Channel Assignment Message*. If a  
34 CDMA-to-CDMA hard handoff occurs during the call, the type of negotiation to use  
35 following the handoff is indicated in the *Extended Handoff Direction Message*, *General  
Handoff Direction Message*, or *Universal Handoff Direction Message*.

37 For CDMA mode operation in band classes other than Band Class 0, only service  
38 negotiation is to be used.

39 The following messages are used to support service negotiation:

- 40 1. *Service Request Message*: The mobile station can use this message to propose a  
41 service configuration, or to accept or reject a service configuration proposed in a  
42 *Service Response Message*. The base station can use this message to propose a

- 1       service configuration, or to reject a service configuration proposed in a *Service*  
 2       *Response Message*.
- 3       2. *Service Response Message*: The mobile station can use this message to accept or  
 4       reject a service configuration proposed in a *Service Request Message*, or to propose  
 5       an alternative service configuration. The base station can use this message to  
 6       reject a service configuration proposed in a *Service Request Message*, or to propose  
 7       an alternative service configuration.
- 8       3. *Service Connect Message*: The base station can use this message to accept a service  
 9       configuration proposed in a *Service Request Message* or *Service Response Message*,  
 10      and instruct the mobile station to begin using the service configuration. The base  
 11      station may use this message to instruct the mobile station to use the stored  
 12      service configuration (that is, both the Service Configuration information record  
 13      and the Non-negotiable Service Configuration information record) if based on the  
 14      value of 16-bit CRC computed over the new service configuration (see 2.6.11)  
 15      matches the SYNC\_ID that the mobile station has reported in the *Origination*  
 16      *Message* or *-Page Response Message*.
- 17      4. *Service Connect Completion Message*: The mobile station can use this message to  
 18      acknowledge the transition to a new service configuration.
- 19      5. *Service Option Control Message*: The mobile station and base station can use this  
 20      message to invoke service option specific functions.
- 21      6. *Extended Channel Assignment Message*: The base station can use this message to  
 22      accept or reject the initial service configuration proposed by the mobile station in  
 23      an *Origination Message* or a *Page Response Message*.

24      The following messages are used to support service option negotiation:

- 25       1. *Service Option Request Order*: The mobile station and base station can use this  
 26       message either to request a service option or suggest an alternative service option.
- 27       2. *Service Option Response Order*: The mobile station and base station can use this  
 28       message to accept or reject a service option request.
- 29       3. *Service Option Control Order*: The mobile station and base station can use this  
 30       message to invoke service option specific functions.

31      The following messages are used to support both service negotiation and service option  
 32      negotiation:

- 33       1. *Origination Message*: The mobile station can use this message to propose an initial  
 34       service configuration.
- 35       2. *Channel Assignment Message*: The base station can use this message to accept or  
 36       reject the initial service configuration proposed by the mobile station in an  
 37       *Origination Message* or a *Page Response Message*, and to indicate which type of  
 38       negotiation, either service negotiation or service option negotiation, is to be used  
 39       during the call.

- 1     3. *Extended Handoff Direction Message*: The base station can use this message to  
2       indicate which type of negotiation, either service negotiation or service option  
3       negotiation, is to be used following a CDMA-to-CDMA hard handoff.
- 4     4. *General Handoff Direction Message*: The base station can use this message to  
5       indicate which type of negotiation, either service negotiation or service option  
6       negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base  
7       station can use this message to accept a service configuration proposed in a *Service*  
8       *Request Message* or *Service Response Message*. The base station can also use this  
9       message to instruct the mobile station to begin using the service configuration.
- 10    5. *General Page Message* or *Universal Page Message*: The base station can use a  
11      mobile-station-addressed page in a *General Page Message* or *Universal Page*  
12      *Message* to propose an initial service configuration.
- 13    6. *Page Response Message*: The mobile station can use this message to accept or reject  
14      the initial service configuration proposed by the base station in a mobile-station-  
15      addressed page, or to propose an alternative initial service configuration.
- 16    7. *Status Request Message*: The base station can use this message to request service  
17      capability information from the mobile station.
- 18    8. *Status Response Message*: The mobile station can use this message to return the  
19      service capability information requested by the base station in a *Status Request*  
20      *Message*.
- 21    9. *Extended Status Response Message*: The mobile station can use this message to  
22      return the service capability information requested by the base station in a *Status*  
23      *Request Message*.
- 24    10. *Universal Handoff Direction Message*: The base station can use this message to  
25       indicate which type of negotiation, either service negotiation or service option  
26       negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base  
27       station can use this message to accept a service configuration proposed in a *Service*  
28       *Request Message* or *Service Response Message*. The base station can also use this  
29       message to instruct the mobile station to begin using the service configuration.

#### 30    3.6.4.1.2.1 Use of Variables

##### 31    3.6.4.1.2.1.1 Maintaining the Service Request Sequence Number

32    The base station shall maintain a service request sequence number variable,  
33      SERV\_REQ\_NUM, for use with service negotiation. Upon beginning Traffic Channel  
34      processing, the base station shall set SERV\_REQ\_NUM to 0. Each time the base station  
35      sends a new *Service Request Message*, it shall set the SERV\_REQ\_SEQ field of the message  
36      to the current value of SERV\_REQ\_NUM and shall then set SERV\_REQ\_NUM equal to  
37      (SERV\_REQ\_NUM + 1) modulo 8.

1       3.6.4.1.2.1.2 Maintaining the Service Connect Sequence Number

2       The base station shall maintain a service connect sequence number variable,  
 3       SERV\_CON\_NUM, for use with service negotiation. Upon beginning Traffic Channel  
 4       processing, the base station shall set SERV\_CON\_NUM to 0. Each time the base station  
 5       sends a new *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal*  
 6       *Handoff Direction Message* containing a service configuration record, it shall set the  
 7       SERV\_CON\_SEQ field of the message to the current value of SERV\_CON\_NUM and shall  
 8       then set SERV\_CON\_NUM equal to (SERV\_CON\_NUM + 1) modulo 8.

9       3.6.4.1.2.1.3 Assigning Service Option Connection References

10      When the base station assigns a service option connection reference for use in identifying a  
 11       new service option connection during service negotiation, the base station shall use the  
 12       following criteria:

- 13       1. The base station shall not assign a reference equal to '00000000'; and
- 14       2. The base station shall not assign a reference that is associated with a service option  
 15           connection of the current service configuration; and
- 16       3. If there was a previous service configuration, the base station shall not assign a  
 17           reference that was associated with a service option connection of the previous  
 18           service configuration.

19      3.6.4.1.2.1.4 Maintaining the Service Negotiation Indicator Variable

20      The base station shall maintain a service negotiation indicator variable, SERV\_NEG, to  
 21       indicate which type of negotiation to use, either service negotiation or service option  
 22       negotiation. The base station shall set SERV\_NEG to enabled whenever service negotiation  
 23       is to be used, and shall set SERV\_NEG to disabled whenever service option negotiation is to  
 24       be used. The precise rules for setting SERV\_NEG are specified in 3.6.4.2 and 3.6.6.2.2.2.

25      For CDMA operation in band classes other than Band Class 0, the base station shall set  
 26       SERV\_NEG to enabled.

27      3.6.4.1.2.1.5 Maintaining the Service Option Request Number

28      The base station shall maintain a service option request number variable, SO\_REQ, for use  
 29       with service option negotiation. The base station shall set SO\_REQ to a special value,  
 30       NULL, if the base station does not have an outstanding service option request. If the base  
 31       station has an outstanding service option request, the base station shall set SO\_REQ to the  
 32       number of the service option associated with the outstanding request.

33      3.6.4.1.2.2 Service Subfunctions

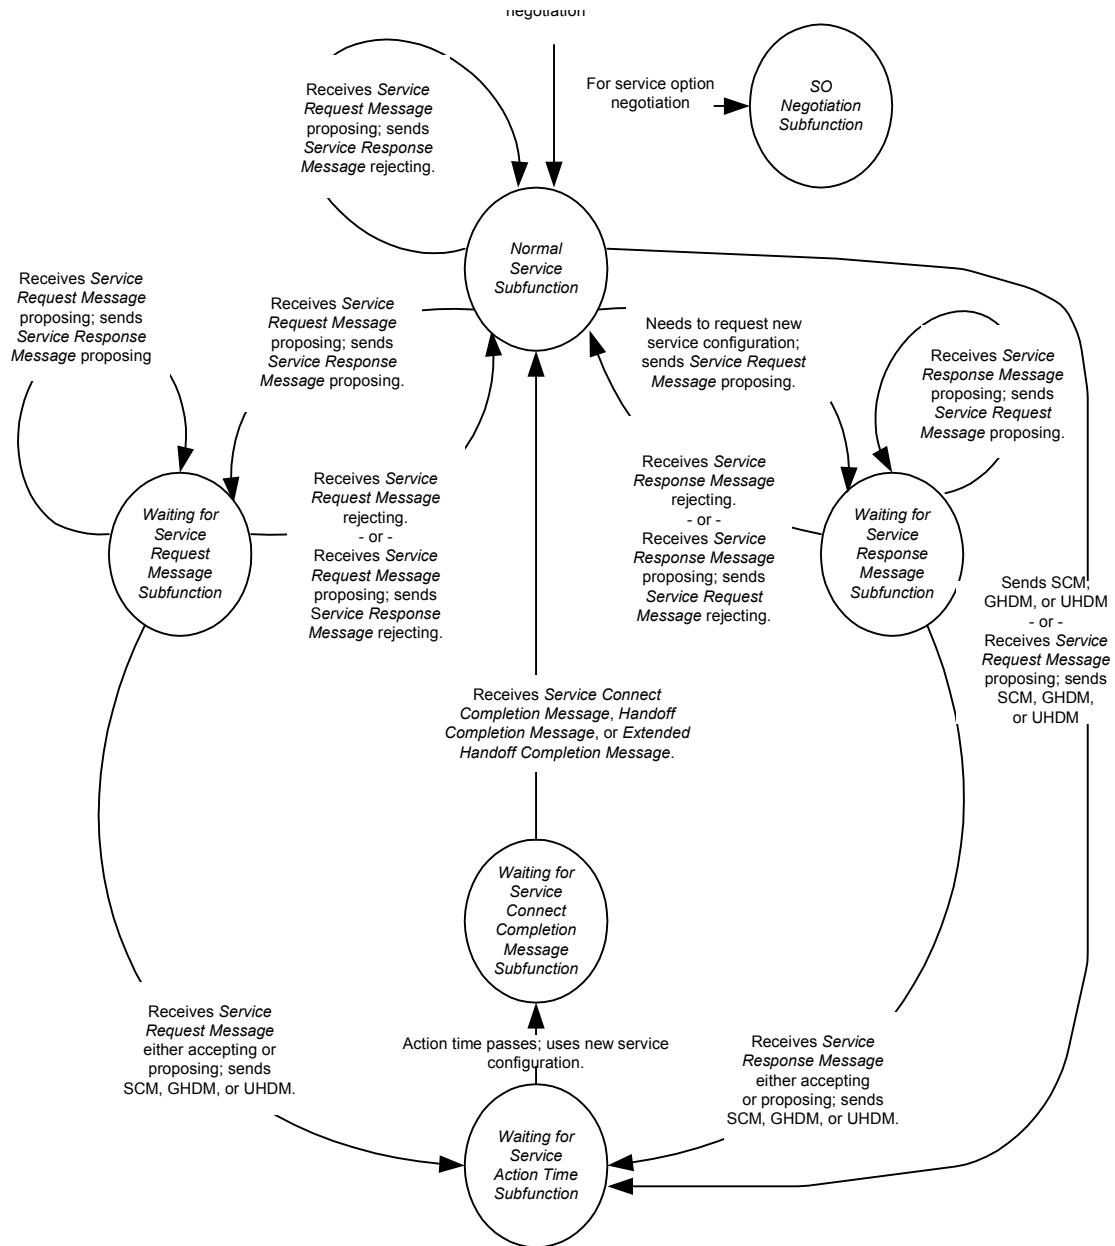

34      As illustrated in Figure 3.6.4.1.2.2-1, the base station supports service configuration and  
 35       negotiation by performing the following set of service subfunctions.

- 36       • *Normal Service Subfunction* - While this subfunction is active, the base station  
 37           processes service configuration requests from the mobile station and sends service  
 38           configuration requests to the mobile station.

- *Waiting for Service Request Message Subfunction* - While this subfunction is active, the base station waits to receive a *Service Request Message*.
- *Waiting for Service Response Message Subfunction* - While this subfunction is active, the base station waits to receive a *Service Response Message*.
- *Waiting for Service Action Time Subfunction* - While this subfunction is active, the base station waits for the action time associated with a new service configuration.
- *Waiting for Service Connect Completion Message Subfunction* - While this subfunction is active, the base station waits to receive a *Service Connect Completion Message*, a *Handoff Completion Message*, or an *Extended Handoff Completion Message*.
- *SO Negotiation Subfunction* - While this subfunction is active and the base station is operating in Band Class 0, the base station supports service option negotiation with the mobile station.

The *SO Negotiation Subfunction* supports service option negotiation. All of the other service subfunctions support service negotiation.

At any given time during Traffic Channel processing, only one of the service subfunctions is active. For example, when the base station first begins Traffic Channel processing, either the *Normal Service Subfunction* or the *SO Negotiation Subfunction* is active. Each of the other service subfunctions may become active in response to various events which occur during the Traffic Channel substates. Typically, the base station processes events pertaining to service configuration and negotiation in accordance with the requirements for the active service subfunction. However, some Traffic Channel substates do not allow for the processing of certain events pertaining to service configuration and negotiation, or specify requirements for processing such events which supersede the requirements of the active service subfunction.

**Figure 3.6.4.1.2.2-1. Base Station Service Subfunctions**

## 1    3.6.4.1.2.2.1 Normal Service Subfunction

2    While this subfunction is active, the base station processes service configuration requests  
3    from the mobile station and sends service configuration requests to the mobile station.

4    While the *Normal Service Subfunction* is active, the base station shall perform the following:

- 5       • The base station shall process Forward and Reverse Traffic Channel frames in  
6       accordance with the current service configuration. The base station shall discard  
7       any Reverse Traffic Channel frame which has a format that is not supported by the  
8       base station. The base station may discard any type of Reverse Traffic Channel  
9       traffic that is not signaling traffic and is not part of the current service  
10      configuration.
- 11      • To initiate service negotiation for a new service configuration, the base station shall  
12      send a *Service Request Message* to propose the new service configuration and shall  
13      activate the *Waiting for Service Response Message Subfunction*.
- 14      • For any service option connection that is part of the current service configuration,  
15      the base station may send a *Service Option Control Message* to invoke a service  
16      option specific function in accordance with the requirements for the associated  
17      service option.
- 18      • The base station may send a *Service Connect Message*, a *General Handoff Direction  
Message*, or a *Universal Handoff Direction Message* containing a service  
19      configuration record. If the base station sends this message, the base station shall  
20      activate the *Waiting for Service Action Time Subfunction*.
- 21      • If SERV\_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and  
22      3.6.6.2.2.11), the base station shall activate the *SO Negotiation Subfunction*.
- 23      • If the base station receives one of the following service negotiation messages, the  
24      base station shall process the message according to the specified requirements, if  
25      any:
  - 26           1. *Service Connect Completion Message*
  - 27           2. *Service Option Control Message*: If the service option connection specified by the  
28              message is part of the current service configuration, and the service option  
29              specified by the message is the same as the service option associated with the  
30              service option connection, the base station shall process the message in  
31              accordance with the requirements for the service option.
  - 32           3. *Service Request Message*: The base station shall process the message as follows:
    - 33              • If the purpose of the message is to propose a service configuration, the base  
34              station shall process the message as follows:

- If the base station accepts the proposed service configuration, the base station shall send a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message* containing a service configuration record and shall activate the *Waiting for Service Action Time Subfunction*.
- If the base station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the base station shall send a *Service Response Message* to reject the proposed service configuration.
- If the base station does not accept the proposed service configuration and has an alternative service configuration to propose, the base station shall perform one of the following actions:
  - o Send a *Service Response Message* to propose the alternative service configuration. ~~The base station shall and shall~~ activate the *Waiting for Service Request Message Subfunction*, or-
  - o Send a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message* containing a service configuration record and shall activate the *Waiting for Service Action Time Subfunction*

#### 4. Service Response Message

- If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:
  1. *Service Option Request Order*
  2. *Service Option Response Order*
  3. *Service Option Control Order*

##### 3.6.4.1.2.2.2 Waiting for Service Request Message Subfunction

While this subfunction is active, the base station waits to receive a *Service Request Message*.

While the *Waiting for Service Request Message Subfunction* is active, the base station shall perform the following:

- If the base station does not receive a *Service Request Message*, the base station shall activate the *Normal Service Subfunction*.
- The base station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The base station shall discard any Reverse Traffic Channel frame which has a format that is not supported by the base station. The base station may discard any type of Reverse Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.

- For any service option connection that is part of the current service configuration, the base station may send a *Service Option Control Message* to invoke a service option specific function in accordance with the requirements for the associated service option.
- If SERV\_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the *SO Negotiation Subfunction*.
- If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:
  1. *Service Connect Completion Message*
  2. *Service Option Control Message*: If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the base station shall process the message in accordance with the requirements for the service option.
  3. *Service Request Message*: The base station shall process the message as follows:
    - If the purpose of the message is to accept a proposed service configuration, the base station shall perform one of the following actions:
      - The base station shall send a *Service Connect Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message* and shall activate the *Waiting for Service Action Time Subfunction*.
      - The base station shall send a *Service Request Message* to propose an alternative service configuration and shall activate the *Waiting for Service Response Message Subfunction*.
    - If the purpose of the message is to reject a proposed service configuration, the base station shall activate the *Normal Service Subfunction*.
    - If the purpose of the message is to propose a service configuration, the base station shall process the message as follows:
      - If the base station accepts the proposed service configuration, the base station shall send a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message* containing a service configuration record and shall activate the *Waiting for Service Action Time Subfunction*.
      - If the base station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the base station shall send a *Service Response Message* to reject the proposed service configuration. The base station shall activate the *Normal Service Subfunction*.

- If the base station does not accept the proposed service configuration and has an alternative service configuration to propose, the base station shall perform one of the following actions:
  - o Ssend a *Service Response Message* to propose the alternative service configuration, or.
  - o Send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction

10           4. *Service Response Message*

- 11       • If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:
  - 14       1. *Service Option Request Order*
  - 15       2. *Service Option Response Order*
  - 16       3. *Service Option Control Order*

17       3.6.4.1.2.2.3 Waiting for Service Response Message Subfunction

18       While this subfunction is active, the base station waits to receive a *Service Response Message*.

20       While the *Waiting for Service Response Message Subfunction* is active, the base station shall perform the following:

- 22       • If the base station does not receive a *Service Response Message*, the base station shall activate the *Normal Service Subfunction*.
- 24       • The base station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The base station shall discard any Reverse Traffic Channel frame which has a format that is not supported by the base station. The base station may discard any type of Reverse Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.
- 30       • For any service option connection that is part of the current service configuration, the base station may send a *Service Option Control Message* to invoke a service option specific function in accordance with the requirements for the associated service option.
- 34       • If SERV\_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the *SO Negotiation Subfunction*.
- 36       • If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:

- 1        1. *Service Connect Completion Message*
- 2        2. *Service Option Control Message*: If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the base station shall process the message in accordance with the requirements for the service option.
- 3        3. *Service Request Message*: The base station should not process the [layer 3](#)Layer 3 fields of the message.
- 4        4. *Service Response Message*: The base station shall process the message as follows:
  - 11        • If the service request sequence number (SERV\_REQ\_SEQ) from the message does not match the sequence number of the *Service Request Message* for which the base station is expecting a response, the base station shall not process the [layer 3](#)Layer 3 fields of the message.
  - 12        • If the purpose of the message is to accept a proposed service configuration, the base station shall perform one of the following actions:
    - 17        – The base station shall send a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message* containing a service configuration record and shall activate the *Waiting for Service Action Time Subfunction*. Or
    - 18        – The base station shall send a *Service Request Message* to propose an alternative service configuration.
  - 19        • If the purpose of the message is to reject a proposed service configuration, the base station shall activate the *Normal Service Subfunction*.
  - 20        • If the purpose of the message is to propose a service configuration, the base station shall process the message as follows:
    - 25        – If the base station accepts the proposed service configuration, the base station shall send a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message* containing a service configuration record and shall activate the *Waiting for Service Action Time Subfunction*.
    - 26        – If the base station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the base station shall send a *Service Request Message* to reject the proposed service configuration. The base station shall activate the *Normal Service Subfunction*.
    - 27        – If the base station does not accept the proposed service configuration and has an alternative service configuration to propose, the base station shall [perform one of the following actions](#):

- 1           o Ssend a *Service Request Message* to propose the alternative service  
 2           configuration, or-  
 3           o Send a *Service Connect Message*, a *General Handoff Direction*  
 4           *Message*, or a *Universal Handoff Direction Message* containing a  
 5           service configuration record and shall activate the *Waiting for Service*  
 6           *Action Time Subfunction*

- 7       • If the base station receives one of the following service option negotiation messages,  
 8           the base station shall process the message according to the specified requirements,  
 9           if any:
  - 10          1. *Service Option Request Order*
  - 11          2. *Service Option Response Order*
  - 12          3. *Service Option Control Order*

#### 13       3.6.4.1.2.2.4 Waiting for Service Action Time Subfunction

14       While this subfunction is active, the base station waits for the action time associated with a  
 15       new service configuration.

16       While the *Waiting for Service Action Time Subfunction* is active, the base station shall  
 17       perform the following:

- 18       • Prior to the action time associated with the *Service Connect Message*, a *General*  
 19           *Handoff Direction Message*, or *Universal Handoff Direction Message* containing a  
 20           service configuration record, the base station shall process Forward and Reverse  
 21           Traffic Channel frames in accordance with the current service configuration. The  
 22           base station shall discard any Reverse Traffic Channel frame which has a format  
 23           that is not supported by the base station. The base station may discard any type of  
 24           Reverse Traffic Channel traffic that is not signaling traffic and is not part of the  
 25           current service configuration.
- 26       • At the action time associated with the *Service Connect Message*, *General Handoff*  
 27           *Direction Message*, or *Universal Handoff Direction Message* containing a service  
 28           configuration record, the base station shall begin to use the service configuration  
 29           specified by the *Service Connect Message*, the *General Handoff Direction Message*, or  
 30           the *Universal Handoff Direction Message* containing a service configuration record,  
 31           as the current service configuration and shall begin to process Forward and Reverse  
 32           Traffic Channel frames accordingly. The base station shall activate the *Waiting for*  
 33           *Service Connect Completion Message Subfunction*.
- 34       • If SERV\_NEG changes from enabled to disabled (see 3.6.6.2.2, 3.6.6.2.10, and  
 35           3.6.6.2.2.11), the base station shall activate the *SO Negotiation Subfunction*.
- 36       • If the base station receives one of the following service negotiation messages, the  
 37           base station shall process the message according to the specified requirements, if  
 38           any:
  - 39           1. *Service Connect Completion Message*

1           2. *Service Option Control Message*: If the service option connection specified by the  
 2           message is part of the current or pending service configuration, and the service  
 3           option specified by the message is the same as the service option associated with  
 4           the service option connection, the base station shall process the message in  
 5           accordance with the requirements for the service option.

6           3. *Service Request Message*

7           4. *Service Response Message*

- 8           • If the base station receives one of the following service option negotiation messages,  
 9           the base station shall process the message according to the specified requirements,  
 10          if any:

11          1. *Service Option Request Order*

12          2. *Service Option Response Order*

13          3. *Service Option Control Order*

#### 14        3.6.4.1.2.2.5 Waiting for Service Connect Completion Message Subfunction

15        While this subfunction is active, the base station waits to receive a *Service Connect*  
 16       *Completion Message*, a *Handoff Completion Message*, or an *Extended Handoff Completion*  
 17       *Message*.

18        While the *Waiting for Service Connect Completion Message Subfunction* is active, the base  
 19       station shall perform the following:

- 20          • If the base station has sent a *Service Connect Message* and does not receive a *Service*  
 21       *Connect Completion Message*, or if the base station has sent a *General Handoff*  
 22       *Direction Message* or a *Universal Handoff Direction Message* containing a Service  
 23       Configuration record and does not receive a *Handoff Completion Message*, or an  
 24       *Extended Handoff Completion Message*, the base station shall activate the *Normal*  
 25       *Service Subfunction*.
- 26          • The base station shall process Forward and Reverse Traffic Channel frames in  
 27       accordance with the current service configuration. The base station shall discard  
 28       any Reverse Traffic Channel frame which has a format that is not supported by the  
 29       base station. The base station may discard any type of Reverse Traffic Channel  
 30       traffic that is not signaling traffic and is not part of the current service  
 31       configuration.
- 32          • The base station shall not initiate service negotiation for a new service configuration.
- 33          • If SERV\_NEG changes from enabled to disabled (see 3.6.6.2.2, 3.6.6.2.2.10, and  
 34       3.6.6.2.2.11), the base station shall activate the *SO Negotiation Subfunction*.
- 35          • If the base station receives one of the following service negotiation messages, the  
 36       base station shall process the message according to the specified requirements, if  
 37       any:

1. *Service Connect Completion Message, Handoff Completion Message, or Extended*  
2. *Handoff Completion Message:* The base station shall activate the *Normal Service*  
3. *Subfunction.*
  4. *Service Option Control Message:* If the service option connection specified by the  
5. message is part of the current service configuration, and the service option  
6. specified by the message is the same as the service option associated with the  
7. service option connection, the base station shall process the message in  
8. accordance with the requirements for the service option.
  9. *Service Request Message*
  10. *Service Response Message*
  11. • If the base station receives one of the following service option negotiation messages,  
12. the base station shall process the message according to the specified requirements,  
13. if any:
    14. 1. *Service Option Request Order*
    15. 2. *Service Option Response Order*
    16. 3. *Service Option Control Order*
17. 3.6.4.1.2.2.6 SO Negotiation Subfunction
18. While this subfunction is active, the base station supports service option negotiation with  
19. the mobile station.
20. Upon activating the *SO Negotiation Subfunction*, the base station shall set SO\_REQ to NULL.  
21. The base station shall delete from the current service configuration any service option  
22. connection which does not use primary traffic on both the Forward and Reverse Traffic  
23. Channels.
24. While the *SO Negotiation Subfunction* is active, the base station shall perform the following:
- 25. • If the current service configuration includes a service option connection, the base  
26. station shall process the received primary traffic bits in accordance with the  
27. requirements for the service option associated with the service option connection;  
28. otherwise, the base station shall discard the received primary traffic bits.
  - 29. • If the current service configuration includes a service option connection, the base  
30. station shall transmit primary traffic bits in accordance with the requirements for  
31. the service option associated with the service option connection; otherwise, the base  
32. station shall transmit null traffic and power control bits on the Forward  
33. Fundamental Channel, if the Fundamental channel is present to transmit power  
34. control bits on the Forward Dedicated Control Channel, if only the Dedicated  
35. Control Channel is present.
  - 36. • If the current service configuration includes a service option connection, the base  
37. station may send a *Service Option Control Order* to invoke a service option specific  
38. function in accordance with the requirements for the service option associated with  
39. the service option connection.

- To initiate service option negotiation, the base station shall set SO\_REQ to the number of the requested service option and shall send a *Service Option Request Order* containing the requested service option number.
- If SERV\_NEG changes from disabled to enabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the *Normal Service Subfunction*.
- The base station shall process a service option request received in an *Origination Message*, a *Page Response Message*, or a *Service Option Request Order* as follows:
  - If the base station accepts the requested service option, the base station shall set SO\_REQ to NULL and shall send a *Service Option Response Order* accepting the requested service option within T<sub>4b</sub> seconds. The base station shall begin using the service configuration implied by the requested service option in accordance with the requirements for the requested service option. The implied service configuration shall include the default Forward and Reverse Multiplex Options and transmission radio configurations associated with the requested service option. This implied service configuration shall include one service option connection for which the service option connection reference is 1, for which the service option is the requested service option, and for which the Forward and Reverse Traffic Channel types are both primary traffic.
  - If the base station does not accept the requested service option and has an alternative service option to request, the base station shall set SO\_REQ to the alternative service option number and shall send a *Service Option Request Order* requesting the alternative service option within T<sub>4b</sub> seconds.
  - If the base station does not accept the requested service option and does not have an alternative service option to request, the base station shall set SO\_REQ to NULL and shall send a *Service Option Response Order* to reject the request within T<sub>4b</sub> seconds. The base station shall continue to use the current service configuration.
- If the base station receives a *Service Option Response Order*, it shall process the order as follows:
  - If the service option number specified in the order is equal to SO\_REQ, the base station shall set SO\_REQ to NULL and shall begin using the service configuration implied by the specified service option in accordance with the requirements for the service option. The implied service configuration shall include the default Forward and Reverse Multiplex Options and radio configurations associated with the requested service option. This implied service configuration shall include one service option connection for which the service option connection reference is 1, for which the service option is the requested service option, and for which the Forward and Reverse Traffic Channel types are both primary traffic.
  - If the order indicates a service option rejection, the base station shall set SO\_REQ to NULL. The base station shall continue to use the current service configuration.

- 1     – If the order does not indicate a service option rejection and the service option  
 2       specified in the order is not equal to SO\_REQ, the base station shall set SO\_REQ  
 3       to NULL, should send a *Release Order* (ORDQ = '00000010'), and should enter  
 4       the *Release Substate*.
- 5     • If the base station receives a *Service Option Control Order*, the base station shall  
 6       process the order as follows:
  - 7         – If the current service configuration includes a service option connection, the  
 8           base station shall process the received *Service Option Control Order* in  
 9           accordance with the requirements for the service option associated with the  
 10          service option connection.
  - 11         • If the base station receives one of the following service negotiation messages, the  
 12           base station shall process the message according to the specified requirements, if  
 13           any:
    - 14             1. *Service Connect Completion Message*
    - 15             2. *Service Option Control Message*
    - 16             3. *Service Request Message*
    - 17             4. *Service Response Message*

#### 18     3.6.4.1.3 Ordering of Messages

19     The Layer 2 protocol does not guarantee delivery of messages in any order. If the base  
 20    station requires that the mobile station receive a set of messages in a certain order, the  
 21    base station shall send each message in assured mode requiring confirmation of delivery  
 22    and shall wait for the confirmation of delivery of each message before transmitting the next  
 23    message in the set.

#### 24     3.6.4.1.4 Message Action Times

25     A Forward Traffic Channel message without a USE\_TIME field or with a USE\_TIME field set  
 26    to '0' has an implicit action time. A message that has its USE\_TIME field set to '1' has an  
 27    explicit action time that is specified in the ACTION\_TIME field of the message.

28     A message with an explicit action time is called a pending message.

29     Unless otherwise specified, a message having an implicit action time shall take effect no  
 30    later than the first 80 ms boundary (relative to System Time) occurring at least 80 ms after  
 31    the end of the frame containing the last bit of the message. A message with an explicit  
 32    action time, except for a *Power Up Function Message*, shall take effect when System Time (in  
 33    80 ms units) modulo 64 becomes equal to the message's ACTION\_TIME field. A *Power Up*  
 34    *Function Message* shall take effect ACTION\_TIME\_FRAME frames after the time when  
 35    System Time (in 80 ms units) modulo 64 becomes equal to the message's ACTION\_TIME  
 36    field. The difference in time between ACTION\_TIME and the end of the frame containing the  
 37    last bit of the message shall be at least 80 ms.

38     The base station shall support two pending messages at any given time, not including  
 39    pending *Service Option Control Orders*, *Service Option Control Messages*, or *Power Up*

1     *Function Messages.* The number of pending *Service Option Control Orders* or *Service Option*  
 2     *Control Messages* that the base station is required to support is specific to the service  
 3     option (see the relevant service option descriptions). In addition, the base station shall  
 4     support one pending *Power Up Function Message*.

5     3.6.4.1.5 Long Code Transition Request Processing

6     If a request for voice privacy is specified in the *Origination Message* or *Page Response*  
 7     *Message*, the base station may send a *Long Code Transition Request Order* (ORDQ =  
 8     '00000001') requesting a transition to the private long code.

9     The base station shall process the *Long Code Transition Request Order* as follows:

- 10    • If the *Long Code Transition Request Order* requests a transition to the private long  
 11    code and the base station accepts the request, the base station shall send a *Long*  
 12    *Code Transition Request Order* (ORDQ = '00000001'). If the base station does not  
 13    accept the private long code transition request, the base station shall send a *Long*  
 14    *Code Transition Request Order* (ORDQ = '00000000').
- 15    • If the *Long Code Transition Request Order* requests a transition to the public long  
 16    code and the base station accepts the request, the base station shall send a *Long*  
 17    *Code Transition Request Order* (ORDQ = '00000000'). If the base station does not  
 18    accept the public long code transition request, the base station shall send a *Long*  
 19    *Code Transition Request Order* (ORDQ = '00000001').

20    The base station shall process the *Long Code Transition Response Order* as follows:

- 21    • If the *Long Code Transition Response Order* indicates that the mobile station accepts  
 22    the long code transition requested in the *Long Code Transition Request Order* sent by  
 23    the base station, the base station shall use the requested long code mask on both  
 24    the Forward Traffic Channel and the Reverse Traffic Channel. The base station  
 25    shall specify an explicit action time in the *Long Code Transition Request Order*. The  
 26    base station shall begin using the requested long code mask using the explicit action  
 27    time (see 3.6.4.1.4).

28    3.6.4.1.6 Processing Resource Request Messages

29    The base station shall process *Resource Request Message* and *Resource Request Mini*  
 30    *Message*, as follows:

- 31    • The base station may send one of the messages that assign appropriate resources  
 32    (e.g. *Extended Supplemental Channel Assignment Message*, *Resource Allocation*  
 33    *Message*, *Resource Allocation Mini Message*, *Universal Handoff Direction Message*,  
 34    *Retry Order*, etc) to the mobile station. If the base station sends one of these  
 35    messages, the base station shall set PILOT\_GATING\_USE\_RATE to '0' and start  
 36    transmitting the Forward Power Control Subchannel with the maximum rate at the  
 37    action time of the message.
- 38    • The base station may send a *Retry Order* to the mobile station.

1        3.6.4.1.7 Response to Enhanced Origination Message

2        If the base station receives an *Enhanced Origination Message*, the base station should  
3        perform the following:

- 4           • If the base station does not accept this call request from the mobile station, the base  
5        station should send one of the following messages:

- 6             + A *Call Assignment Message* to the mobile station, with the RESPONSE\_IND field  
7        set to ‘1’, the ACCEPT\_IND field set to ‘0’, and the TAG field set to the value of  
8        the TAG field of the *Enhanced Origination Message*.
- 9             + A *Retry Order* if the *Enhanced Origination Message* is for a packet data service  
10      option.

- 11           • If the base station accepts this call request from the mobile station, the base station  
12      should send a *Call Assignment Message*, *Service Connect Message*, *General Handoff*  
13      *Direction Message* (with the *Service Configuration information record included*), or  
14      *Universal Handoff Direction Message* (with the Service Configuration information  
15      record included) to assign the call:

- 16             – If the GLOBAL EMERGENCY CALL indicator is set to ‘1’ and the service  
17        associated with this origination is a voice service, the base station shall  
18        recognize this as an emergency call and should process the message using an  
19        implementation-dependent procedure which may include ignoring the dialed  
20        digits. If the base station receives an *Origination Message* and the  
21        GLOBAL EMERGENCY CALL indicator is set to ‘1’ and the service associated  
22        with this origination is not a voice service, the base station may recognize this as  
23        an emergency call and should process the message using an implementation-  
24        dependent procedure which may include ignoring the dialed digits.

- 25             – If the base station sends a *Call Assignment Message* to assign the call, the base  
26        station shall perform the following:

- 27             + The base station shall set the RESPONSE\_IND field to ‘1’, the ACCEPT\_IND  
28        field to ‘1’, and the TAG field to the value of the TAG field of the *Enhanced*  
29        *Origination Message*. The base station shall set the CON\_REF\_INCL field of  
30        the message to ‘1’ and the CON\_REF field of the message to the value of the  
31        connection reference of the service option connection corresponding to this  
32        call.

- 33             + A service option connection corresponding to this call (if not already  
34        established) shall be established by performing service negotiation; the base  
35        station should initiate service negotiation to establish the service option  
36        connection, if permitted by the current service negotiation subfunction.

- 37             + At the action time corresponding to this message, the *layer 3Layer 3* shall  
38        instantiate a Call Control instance (as specified in 3.6.8). The *layer 3Layer 3*  
39        shall identify this Call Control instance by the value of the CON\_REF field

1 included in the *Call Assignment Message*.

- 2 – If the base station sends a *Service Connect Message*, *General Handoff Direction*  
 3 *Message (with the Service Configuration information record included)*, or a  
 4 *Universal Handoff Direction Message* (with the Service Configuration information  
 5 record included), to assign the call, the base station shall perform the following:
- 6 + The base station shall set the call control parameters corresponding to this  
 7 call included in the message as follows: The base station shall set the  
 8 RESPONSE\_IND field to ‘1’, and the TAG field to the value of the TAG field of  
 9 the *Enhanced Origination Message*.
- 10 + At the action time corresponding to this message, the *layer 3Layer 3* shall  
 11 instantiate a Call Control instance (as specified in 3.6.8). The *layer 3Layer 3*  
 12 shall identify this Call Control instance by the value of the CON\_REF  
 13 assigned to the service option connection corresponding to this call.

14 3.6.4.1.8 Processing Resource Release Request Message and Resource Release Request Mini  
 15 Message

16 The base station may perform the following in response to receiving a *Resource Release*  
 17 *Request Message* or a *Resource Release Request Mini Message* from the mobile station:

- 18 • If the mobile station requests to release a service option connection, the base station  
 19 may send a *Service Connect Message*, *General Handoff Direction Message*, or a  
 20 *Universal Handoff Direction Message* to release the service option connection.
- 21 • If the mobile station requests to commence reverse pilot gating operation, the base  
 22 station may send a *Extended Release Message*, *Extended Release Mini Message*, or a  
 23 *Universal Handoff Direction Message* to instruct the mobile station to commence the  
 24 reverse pilot gating operation.

25 3.6.4.1.9 Processing Base Station Status Request Message

26 If the requested RECORD TYPE equals ‘00000000’ (Pilot Information), the base station  
 27 should send a Base Station Status Response Message with a RECORD TYPE of ‘00000000’  
 28 (Pilot Information) to the mobile station:

- 29 • For each pilot being requested by the mobile station, the base station shall include  
 30 the corresponding Base Station Identification number.
- 31 • If SID and NID information is being requested by the mobile station, the base station  
 32 shall include the SID and NID information corresponding to these pilots.

1       3.6.4.2 Traffic Channel Initialization Substate

2       In this substate, the base station begins transmitting on the Forward Traffic Channel and  
 3       acquires the Reverse Traffic Channel.

4       Upon entering the *Traffic Channel Initialization Substate*, the base station shall perform the  
 5       following:

- 6           • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to reset the  
     7           message acknowledgment procedures as specified in 3.2.1.1 and 3.2.2.1 of [4].
- 8           • The base station shall set its Forward and Reverse Traffic Channel long code masks  
     9           to the public long code mask (see [2]).
- 10          • The base station shall set its Forward and Reverse Traffic Channel frame offsets (see  
     11           [2]) to the frame offset assigned to the mobile station.
- 12          • If the base station set the ASSIGN\_MODE field of the *Channel Assignment Message*  
     13           to '000', the base station shall set SERV\_NEG to disabled. If the base station set the  
     14           ASSIGN\_MODE field of the *Channel Assignment Message* to '100', the base station  
     15           shall set SERV\_NEG to enabled. For operation in band classes other than Band  
     16           Class 0, SERV\_NEG is always equal to enabled.
- 17          • If the base station uses the *Extended Channel Assignment Message*, the base station  
     18           shall set the SERV\_NEG to enabled.
- 19          • The base station shall determine the initial service configuration as follows:
  - 20           – If SERV\_NEG is equal to disabled, the initial service configuration shall include  
     21           Multiplex Option 1 and Radio Configuration 1 for both the Forward and Reverse  
     22           Traffic Channels, and shall include no service option connections.
  - 23           – If SERV\_NEG is equal to enabled and the base station set the GRANTED\_MODE  
     24           field of the *Channel Assignment Message* or the *Extended Channel Assignment*  
     25           Message to '00', the initial service configuration shall include the multiplex  
     26           option and radio configuration for the Forward and Reverse Traffic Channels as  
     27           specified by the DEFAULT\_CONFIG field, and shall include no service option  
     28           connections.
  - 29           – If SERV\_NEG is equal to enabled and the base station set the GRANTED\_MODE  
     30           field of the *Channel Assignment Message* or the *Extended Channel Assignment*  
     31           Message to '01' or '10', the initial service configuration shall include the default  
     32           Forward and Reverse Traffic Channel multiplex options ~~that are derived from the~~  
     33           ~~radio configurations corresponding to Table 3.7.2.3.2.21-7 and transmission~~  
     34           ~~rates corresponding to the service option requested by the mobile station in the~~  
     35           ~~Origination Message, in the case of a mobile station originated call, or the~~  
     36           ~~Page Response Message, in the case of a mobile station terminated call,~~ and shall  
     37           include no service option connections.

1       – If SERV\_NEG is equal to enabled and the base station set the GRANTED\_MODE  
 2           field of the *Channel Assignment Message* to '01' or '10', the initial service  
 3           configuration shall include the default Forward and Reverse Traffic Channel  
 4           multiplex options and transmission rates corresponding to the service option  
 5           requested by the mobile station in the *Origination Message*, in the case of a  
 6           mobile station originated call, or the *Page Response Message*, in the case of a  
 7           mobile station terminated call, and shall include no service option connections.

- 8       • If SERV\_NEG is equal to disabled, the base station shall activate the *SO Negotiation*  
 9           *Subfunction* (see 3.6.4.1.2.2.6); otherwise, the base station shall activate the *Normal*  
 10          *Service Subfunction* (see 3.6.4.1.2.2.1).
- 11       • The base station shall set PILOT\_GATING\_USE\_RATE to '0'.

12       While in the *Traffic Channel Initialization Substate*, the base station shall perform the  
 13          following:

- 14       • If the Forward Fundamental Channel is assigned, the base station shall transmit  
 15           null Traffic Channel data on the Forward Fundamental Channel, except when  
 16           transmitting signaling traffic.
- 17       • If FPC\_PRI\_CHAN is set to '0', the base station shall transmit power control bits on  
 18           the Forward Fundamental Channel. If FPC\_PRI\_CHAN is set to '1', the base station  
 19           shall transmit power control bits on the Forward Dedicated Control Channel.
- 20       • If the base station acquires the Reverse Traffic Channel, Layer 3 shall send a *reverse*  
 21           *dedicated channel acquired* indication to Layer 2 (see 2.2.2.1.2 of [4]). The *layer*  
 22           *3Layer 3* shall instantiate a Call Control instance (as specified in 3.6.8). The *layer*  
 23           *3Layer 3* shall assign the default identifier of NULL to this Call Control instance. The  
 24           *layer 3Layer 3* shall enter the *Traffic Channel Substate*.
- 25       • If the base station fails to acquire the Reverse Traffic Channel, the base station  
 26           should perform one of the following:
  - 27           - retransmit the *Channel Assignment Message* or the *Extended Channel*  
 28              *Assignment Message* on the Paging Channel and remain in the *Traffic Channel*  
 29              *Initialization Substate*
  - 30           - retransmit the *Extended Channel Assignment Message* on the Forward Common  
 31              Control Channel and remain in the *Traffic Channel Initialization Substate*, or
  - 32           - disable transmission on the Forward Traffic Channel and discontinue the *Traffic*  
 33              *Channel Processing* for the mobile station.

### 34       3.6.4.3 Traffic Channel Substate

35       In this substate, the base station may exchange Traffic Channel frames with the mobile  
 36          station in accordance with the current service configuration.

37       Upon entering the *Traffic Channel Substate*, the base station shall perform the following:

- 38       • If the call is a mobile station terminated call and the base station set  
 39           BYPASS\_ALERT\_ANSWER to '0', the base station shall perform the following:

- If SERV\_NEG is equal to disabled, the base station shall process the service option request specified in the *Page Response Message* in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
- If SERV\_NEG is equal to enabled and the base station sets the GRANTED\_MODE field of the *Channel Assignment Message* or the *Extended Channel Assignment Message* to ‘00’ or ‘01’, the base station should initiate service negotiation to request a service configuration in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
- If SERV\_NEG is equal to enabled and the base station set the GRANTED\_MODE field of the *Channel Assignment Message* or the *Extended Channel Assignment Message* to ‘10’, the base station should send a *Service Connect Message* in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
- Otherwise, the base station shall perform the following:
  - If SERV\_NEG equals enabled, the call is mobile-station-originated and the base station sets the GRANTED\_MODE field of the *Channel Assignment Message* or the *Extended Channel Assignment Message* to ‘10’, the base station should send a *Service Connect Message* in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
  - If SERV\_NEG equals disabled and the call is mobile-station-originated, the base station shall process the service option request specified in the *Origination Message* in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

While in the *Traffic Channel Substate*, the base station shall perform the following:

- The base station shall transmit the power control subchannel as specified in [2].
- The base station shall process Forward and Reverse Traffic Channel frames in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
- When PILOT\_GATING\_USE\_RATE is equal to ‘0’ and the base station is to establish a Fundamental Channel or a Dedicated Control Channel, the base station shall send a *Universal Handoff Direction Message* to the mobile station.
- When PILOT\_GATING\_USE\_RATE is equal to ‘1’ and the base station has data to send, the base station may send a *Resource Allocation Message*, *Resource Allocation Mini Message*, *Extended Supplemental Channel Assignment Message*, *Forward Supplemental Channel Assignment Mini Message*, *Reverse Supplemental Channel Assignment Mini Message*, or *Universal Handoff Direction Message* to start transmitting the Forward Power Control Subchannel with the maximum rate at the action time of the message and start exchange of user information.

- If both the Fundamental Channel and the Dedicated Control Channel are currently established, and the base station is to release one of these two channels, the base station shall send a *Universal Handoff Direction Message, Extended Release Message*, or an *Extended Release Mini Message* to the mobile station.
- When PILOT\_GATING\_USE\_RATE is equal to '0' and the base station does not have any data to send and the base station has determined that the mobile station does not have any data to send (see the RLP out-of-data indication in TIA/EIA/IS-707-A), then the base station may send an *Extended Release Message, Extended Release Mini Message or Universal Handoff Direction Message* to start transmitting the Forward Power Control Subchannel with the specified rate at the action time of the message and stop the exchange of user information.
- If the base station declares a loss of Reverse Traffic Channel continuity (see 3.4), the base station should send a *Release Order* to the mobile station. If the base station sends a *Release Order*, the [layer 3](#)[Layer 3](#) shall send a "release indication" to all Call Control instances, and shall enter the *Release Substate*.
- The base station may perform Forward Traffic Channel power control as specified in 3.6.4.1.1.
- The base station may request a new service configuration by initiating service negotiation or service option negotiation in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
- The base station may send a *Service Option Control Message* or *Service Option Control Order* to invoke a service option specific function in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
- The base station may request a long code transition, as specified in 3.6.4.1.5, either autonomously or in response to a request for voice privacy specified in the *Origination Message* or *Page Response Message*.
- The base station may perform authentication procedures as specified in 3.3.1.
- The base station may perform TMSI assignment procedures (see 2.3.15).
- For the first call, if the call is mobile-station-originated and the PACA\_REORIG field of the *Origination Message* is equal to '1', the [layer 3](#)[Layer 3](#) shall send a "paca reorig indication" to the Call Control instance.
- The base station may control operation of the Forward or Reverse Supplemental Code Channels by including Supplemental Code Channel assignment information in the *Supplemental Channel Assignment Message*, or the *General Handoff Direction Message*.
- The base station may control operation of the Forward or Reverse Supplemental Channels by including Supplemental Channel assignment information in the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, or the *Reverse Supplemental Channel Assignment Mini Message*.

- 1     • The base station may assign a new call by sending a *Call Assignment Message*,  
 2        *Service Connect Message*, *General Handoff Direction Message (with the Service*  
 3        *Configuration information record included)*, or *Universal Handoff Direction Message*  
 4        (*with the Service Configuration information record included*) to assign the call:
  - 5           – If the base station sends a *Call Assignment Message* to assign the call, the base  
 6           station shall perform the following:
    - 7              + The base station shall set the RESPONSE\_IND field to '0'.
    - 8              + The base station shall set the CON\_REF\_INCL field of the message to '1' and  
 9              the CON\_REF field of the message to the value of the connection reference of  
 10             the service option connection corresponding to this call.
    - 11              + A service option connection corresponding to this call (if not already  
 12             established) shall be established by performing service negotiation; the base  
 13             station should initiate service negotiation to establish the service option  
 14             connection, if permitted by the current service negotiation subfunction.
    - 15              + At the action time corresponding to this message, the *layer-3Layer 3* shall  
 16             instantiate a Call Control instance (as specified in 3.6.8). The *layer-3Layer 3*  
 17             shall identify this Call Control instance by the value of the CON\_REF field  
 18             included in the *Call Assignment Message*.
  - 19           – If the base station sends a *Service Connect Message*, *General Handoff Direction*  
 20        *Message (with the Service Configuration information record included)*, or  
 21        *Universal Handoff Direction Message* (*with the Service Configuration information*  
 22        *record included*) to assign the call, the base station shall perform the following:
    - 23              + The base station shall set the call control parameters corresponding to this  
 24             call included in the message as follows: The base station shall set the  
 25             RESPONSE\_IND field to '0', and the BYPASS\_ALERT\_ANSWER field as  
 26             required.
    - 27              + At the action time corresponding to this message, the *layer-3Layer 3* shall  
 28             instantiate a Call Control instance (as specified in 3.6.8). The *layer-3Layer 3*  
 29             shall identify this Call Control instance by the value of the CON\_REF  
 30             assigned to the service option connection corresponding to this call.
  - 31        • If the *layer-3Layer 3* receives a 'call release request' from a Call Control instance, the  
 32        *layer-3Layer 3* shall perform the following:
    - 33              – If the service option connection corresponding to this call is the only one  
 34             connected, the base station should send the mobile station a *Release Order* and  
 35             enter the *Release Substate*.

- 1        – If the service option connection corresponding to this call is not the only one  
 2        connected, the base station should release this service option connection. At the  
 3        action time of the message, the layer 3Layer 3 shall terminate this Call Control  
 4        instance.
- 5        • The base station may send the following messages. Some of these messages are  
 6        generated by the Call Control Instance. If the base station sends a message, the  
 7        base station shall comply with the specified requirements for sending the message,  
 8        if any:
  - 9        1. *Alert With Information Message*:
  - 10      2. *Analog Handoff Direction Message*: The base station shall perform the following:
    - 11        – If the CON\_REF\_INCL field was set to '0', the layer 3Layer 3 shall terminate  
 12        all Call Control instances (if there are any) except the one identified by NULL;  
 13        otherwise, the layer 3Layer 3 shall terminate all Call Control instances (if  
 14        there are any) except the one identified by CON\_REF field set in the message.  
 15        The base station shall perform the following (see [6] for handoff to a wide  
 16        analog channel and [22] for handoff to an 800 MHz narrow analog channel):
      - 17        + If this Call Control instance is in the *Waiting for Order Substate*, the base  
 18        station shall enter the Waiting for Order Task.
      - 19        + If this Call Control instance is in the *Waiting for Answer Substate*, the  
 20        base station shall enter the Waiting for Answer Task.
      - 21        + If this Call Control instance is in the *Conversation Substate*, the base  
 22        station shall enter the Conversation Task.
  - 23      3. *Audit Order*
  - 24      4. *Authentication Challenge Message*
  - 25      5. *Base Station Challenge Confirmation Order*
  - 26      6. *Base Station Status Response Message*
  - 27      6.7. *Call Assignment Message*
  - 28      7.8. *Candidate Frequency Search Request Message*
  - 29      8.9. *Candidate Frequency Search Control Message*
  - 30      9.10. *Continuous DTMF Tone Order*
  - 31      10.11. *Data Burst Message*
  - 32      11.12. *Extended Alert With Information Message*
  - 33      12.13. *Extended Flash With Information Message*
  - 34      13.14. *Extended Handoff Direction Message*
  - 35      14.15. *Extended Neighbor List Update Message*

- 1        [15.16. \*Extended Release Message:\*](#) If the physical channels indicated in CH\_IND  
 2                  field of this message includes all the physical channels currently being  
 3                  processed by the mobile station, the [layer 3Layer 3](#) shall send a “release  
 4                  indication” to all Call Control instances, and shall enter the *Release Substate*.
- 5        [16.17. \*Extended Release Mini Message:\*](#) If the physical channels indicated in

 34           *Analog Handoff Direction Message*.

35           [35.36.](#) *Request Wide Analog Service Order:* The base station may respond with an  
 36           *Analog Handoff Direction Message*.

37           [36.37.](#) *Send Burst DTMF Message:* If the CON\_REF\_INCL field is not included in this  
 38           message or if the CON\_REF\_INCL field equals ‘0’, the ~~layer 3~~Layer 3 shall deliver

1           this message to the Call Control instance identified by NULL; otherwise, the  
 2           ~~layer-3~~Layer 3 shall deliver this message to the Call Control instance identified  
 3           by CON\_REF.

4           37.38. Service Connect Completion Message: The base station shall process the  
 5           message in accordance with the requirements for the active service subfunction  
 6           (see 3.6.4.1.2.2).

7           38.39. Service Option Control Message: The base station shall process the message  
 8           in accordance with the requirements for the active service subfunction (see  
 9           3.6.4.1.2.2).

10          39.40. Service Option Control Order: The base station shall process the message in  
 11           accordance with the requirements for the active service subfunction (see  
 12           3.6.4.1.2.2).

13          40.41. Service Option Request Order: The base station shall process the message in  
 14           accordance with the requirements for the active service subfunction (see  
 15           3.6.4.1.2.2).

16          41.42. Service Option Response Order: The base station shall process the message  
 17           in accordance with the requirements for the active service subfunction (see  
 18           3.6.4.1.2.2).

19          42.43. Service Request Message: The base station shall process the message in  
 20           accordance with the requirements for the active service subfunction (see  
 21           3.6.4.1.2.2).

22          43.44. Service Response Message: The base station shall process the message in  
 23           accordance with the requirements for the active service subfunction (see  
 24           3.6.4.1.2.2).

25          44.45. SSD Update Confirmation Order

26          45.46. SSD Update Rejection Order

27          46.47. Status Response Message

28          47.48. Status Message

29          48.49. Supplemental Channel Request Message: The base station may respond with  
 30           a *Supplemental Channel Assignment Message*, an *Extended Supplemental*  
 31           *Channel Assignment Message*, or a *Retry Order*.

32          49.50. Supplemental Channel Request Mini Message: The base station may respond  
 33           with a *Forward Supplemental Channel Assignment Mini Message* or a *Reverse*  
 34           *Supplemental Channel Assignment Mini Message*, or both. The base station may  
 35           also respond with a *Retry Order*.

36          50.51. TMSI Assignment Completion Message

37          51.52. User Zone Update Request Message: The base station shall process this  
 38           message as specified in 3.6.7.2.

## 1    3.6.4.4 Release Substate

2    In this substate, the base station disconnects all calls and physical channels.

3    While in the *Release Substate*, the base station shall perform the following:

- 4       • The base station shall transmit the power control subchannel as specified in [2].
- 5       • The base station shall transmit on the Forward Traffic Channel for at least T<sub>3b</sub>
- 6       seconds. The base station shall transmit null traffic and power control bits on the
- 7       Forward Fundamental Channel, except when transmitting signaling traffic, if the
- 8       Fundamental Channel is present or transmit power control bits on the Forward
- 9       Dedicated Control Channel, if only the dedicated Control Channel is present. After
- 10      T<sub>3b</sub> seconds, the base station should stop transmitting on the Forward Traffic
- 11      Channel.
- 12      • The base station shall process Reverse Traffic Channel signaling traffic and may
- 13      discard other types of Reverse Traffic Channel traffic.
- 14      • The base station may perform TMSI assignment procedures (see 2.3.15).
- 15      • The base station may perform Forward Traffic Channel power control as specified in
- 16      3.6.4.1.1.
- 17      • The base station may send a *Service Option Control Message* to invoke a service
- 18      option specific function in accordance with the requirements for the active service
- 19      subfunction (see 3.6.4.1.2.2).
- 20      • The base station may send the following messages. Some of these messages are
- 21      generated by the Call Control Instance. If the base station sends a message, the
- 22      base station shall comply with the specified requirements for sending the message,
- 23      if any.
  - 24       1. *Alert With Information Message*
  - 25       2. *Audit Order*
  - 26       3. *Candidate Frequency Search Request Message*
  - 27       4. *Candidate Frequency Search Control Message*
  - 28       5. *Data Burst Message*
  - 29       6. *Extended Alert With Information Message*
  - 30       7. *Extended Handoff Direction Message*
  - 31       8. *Extended Neighbor List Update Message*
  - 32       9. *Extended Release Message*
  - 33       10. *Extended Supplemental Channel Assignment Message*
  - 34       11. *Forward Supplemental Channel Assignment Mini Message*
  - 35       12. *General Handoff Direction Message*
  - 36       13. *In-Traffic System Parameters Message*

- 1        14. *Local Control Order*
- 2        15. *Lock Until Power-Cycled Order*: The base station should send this order in  
3              unassured mode.
- 4        16. *Maintenance Order*
- 5        17. *Maintenance Required Order*
- 6        18. *Mobile Assisted Burst Operation Parameters Message*
- 7        19. *Mobile Station Registered Message*
- 8        20. *Neighbor List Update Message*
- 9        21. *Parameter Update Order* (see 2.3.12.1.3 or 3.7.4).
- 10       22. *Power Control Message*
- 11       23. *Power Control Parameters Message*
- 12       24. *Power Up Function Message*
- 13       25. *Power Up Function Completion Message*
- 14       26. *Release Order*
- 15       27. *Resource Allocation Message*
- 16       28. *Resource Allocation Mini Message*
- 17       29. *Resource Release Request Message*
- 18       30. *Resource Release Request Mini Message*
- 19       31. *Resource Request Message*
- 20       32. *Resource Request Mini Message*
- 21       33. *Retrieve Parameters Message*
- 22       34. *Reverse Supplemental Channel Assignment Mini Message*
- 23       35. *Service Option Control Message*: The base station shall send the message in  
24              accordance with the requirements for the active service subfunction (see  
25                      3.6.4.1.2.2).
- 26       36. *Service Option Control Order*
- 27       37. *Status Request Message*
- 28       38. *Status Request Order*
- 29       39. *Supplemental Channel Assignment Message*
- 30       40. *TMSI Assignment Message*
- 31       41. *Universal Handoff Direction Message*
- 32       42. *User Zone Reject Message*
- 33       43. *User Zone Update Message*

- If the base station receives one of the following messages from the mobile station, the base station shall process the message according to the specified requirements, if any:
  1. *Base Station Challenge Order*: The base station shall process the message as described in 2.3.12.1.5.
  2. *Call Cancel Message*
  3. *Candidate Frequency Search Report Message*: The base station shall process the message as described in 3.6.6.2.2.6.
  4. *Candidate Frequency Search Response Message*: The base station shall process the message as described in 3.6.6.2.2.4.
  5. *Connect Order*: If the CON\_REF\_INCL field is not included in this message or if the CON\_REF\_INCL field equals '0', the [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by NULL; otherwise, the [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by CON\_REF.
  6. *Continuous DTMF Tone Order*: If the CON\_REF\_INCL field is not included in this message or if the CON\_REF\_INCL field equals '0', the [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by NULL; otherwise, the [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by CON\_REF.
  7. *Data Burst Message*
  8. *Enhanced Origination Message*
  9. *Extended Flash With Information Message*: If CON\_REF\_INCL equals '0', the [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by NULL; otherwise, the [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by CON\_REF.
  10. *Extended Handoff Completion Message*: The base station shall process the message as described in 3.6.6.2.2.7.
  11. *Extended Pilot Strength Measurement Message*: The base station shall process the message as described in 3.6.6.2.2.1.
  12. *Extended Release Response Message*:
  13. *Flash With Information Message*: The [layer 3](#)[Layer 3](#) shall deliver this message to the Call Control instance identified by NULL.
  14. *Handoff Completion Message*: The base station shall process the message as described in 3.6.6.2.2.7.
  15. *Local Control Response Order*
  16. *Long Code Transition Request Order*
  17. *Long Code Transition Response Order*

- 1       18. *Mobile Station Reject Order*: If the CON\_REF\_INCL field is included in this  
 2       message, ***layer 3Layer 3*** shall perform the following: if the CON\_REF\_INCL field  
 3       equals '0', ***layer 3Layer 3*** shall send a 'messages rejected indication' to the Call  
 4       Control instance identified by NULL; otherwise, ***layer 3Layer 3*** shall send a  
 5       'messages rejected indication' to the Call Control instance identified by  
 6       CON\_REF.
- 7       19. *Origination Continuation Message*: The ***layer 3Layer 3*** shall deliver this message  
 8       to the Call Control instance identified by NULL.
- 9       20. *Parameter Update Confirmation Order*
- 10      21. *Parameters Response Message*
- 11      22. *Periodic Pilot Strength Measurement Message*
- 12      23. *Pilot Strength Measurement Message*: The base station shall process the message  
 13       as described in 3.6.6.2.2.1.
- 14      24. *Power Measurement Report Message*
- 15      25. *Release Order*
- 16      26. *Request Analog Service Order*
- 17      27. *Request Narrow Analog Service Order*
- 18      28. *Request Wide Analog Service Order*
- 19      29. *Send Burst DTMF Message*: If the CON\_REF\_INCL field is not included in this  
 20       message or if the CON\_REF\_INCL field equals '0', the ***layer 3Layer 3*** shall deliver  
 21       this message to the Call Control instance identified by NULL; otherwise, the  
 22       ***layer 3Layer 3*** shall deliver this message to the Call Control instance identified  
 23       by CON\_REF.
- 24      30. *Service Connect Completion Message*
- 25      31. *Service Option Control Message*: The base station shall process the message in  
 26       accordance with the requirements for the active service subfunction (see  
 27       3.6.4.1.2.2).
- 28      32. *Service Option Control Order*
- 29      33. *Service Option Request Order*
- 30      34. *Service Option Response Order*
- 31      35. *Service Request Message*
- 32      36. *Service Response Message*:
- 33      37. *SSD Update Confirmation Order*
- 34      38. *SSD Update Rejection Order*
- 35      39. *Status Response Message*
- 36      40. *Status Message*

1           41. *TMSI Assignment Completion Message*2           42. *User Zone Update Request Message*: The base station shall process this message  
3           as specified in 3.6.7.2.

## 4           3.6.5 Registration

5           Registration is the process by which a mobile station notifies the base station of its location,  
6           status, identification, slot cycle, and other characteristics. The base station can make use  
7           of location information to efficiently page the mobile station when establishing a mobile  
8           station terminated call. Registration also provides the mobile station's  
9           SLOT\_CYCLE\_INDEX parameter so that the base station can determine which Paging  
10          Channel or Forward Common Control Channel slots a mobile station operating in the  
11          slotted mode is monitoring. Registration also provides the protocol revision number so that  
12          the base station knows the capabilities of the mobile station.

13          The CDMA system supports ten different forms of registration:

- 14           1. Power-up registration. The mobile station registers when it powers on, or switches  
15           from using the analog system.
- 16           2. Power-down registration. The mobile station registers when it powers off if  
17           previously registered in the current serving system.
- 18           3. Timer-based registration. The mobile station registers when a timer expires.
- 19           4. Distance-based registration. The mobile station registers when the distance  
20           between the current base station and the base station in which it last registered  
21           exceeds a threshold.
- 22           5. Zone-based registration. The mobile station registers when it enters a new zone.
- 23           6. Parameter-change registration. The mobile station registers when certain of its  
24           stored parameters change or when it enters a new system.
- 25           7. Ordered registration. The mobile station registers when the base station requests  
26           it.
- 27           8. Implicit registration. When a mobile station successfully sends an *Origination*  
28           *Message* or *Page Response Message*, the base station can infer the mobile station's  
29           location. This is considered an implicit registration.
- 30           9. Traffic Channel registration. Whenever the base station has registration  
31           information for a mobile station that has been assigned to a Traffic Channel, the  
32           base station can notify the mobile station that it is registered.
- 33           10. User Zone Registration. The mobile station registers when it selects an active User  
34           Zone (see 2.6.9.1.2).

35          The first five forms of registration, as a group, are called autonomous registration and are  
36          conditioned, in part, by roaming status and by indicators contained in the *System*  
37          *Parameters Message* and *ANSI-41 System Parameters Message* (see 2.6.5.3). The base  
38          station may initiate ordered registration through the *Registration Request Order*.

1 The base station can obtain registration information by sending the *Status Request Message*  
 2 to the mobile station on the Paging Channel, the Forward Common Control Channel, or the  
 3 Forward Traffic Channel. If the base station is operating with the mobile station in Band  
 4 Class 0, the base station can also obtain registration information by sending the *Status*  
 5 *Request Order* to the mobile station on the Forward Traffic Channel. The base station may  
 6 notify the mobile station that it is registered through the *Mobile Station Registered Message*.

7 3.6.5.1 Registration on the Common Channels

8 The base station shall specify the forms of registration that are enabled, the corresponding  
 9 registration parameters, and the roaming status conditions for which registration is enabled  
 10 in the *System Parameters Message* and *ANSI-41 System Parameters Message*. If any of the  
 11 autonomous registration forms are enabled, the base station should also enable parameter-  
 12 change registration.

13 The base station should process an *Origination Message* or *Page Response Message* sent on  
 14 the r-csch as an implicit registration of the mobile station sending the message. The base  
 15 station can obtain complete registration information about the mobile station at any time  
 16 by sending a *Registration Request Order* to the mobile station.

17 3.6.5.2 Registration on the Traffic Channels

18 The base station can obtain registration information from a mobile station on the Traffic  
 19 Channel by means of the *Status Request Message* or the *Status Request Order*. When the  
 20 base station has registration information for a mobile station, the base station may send a  
 21 *Mobile Station Registered Message* to the mobile station, specifying the base station's  
 22 registration system, zone, and location information.

23 3.6.6 Handoff Procedures

24 3.6.6.1 Overview

25 3.6.6.1.1 Types of Handoff

26 The base station supports the following three handoff procedures:

- 27 • *Soft Handoff*: A handoff in which a new base station commences communications  
 28 with the mobile station without interrupting the communications with the old base  
 29 station. The base station<sup>3</sup> can direct the mobile station to perform a soft handoff  
 30 only when all Forward Traffic Channels assigned to the mobile station have identical  
 31 band classes, frequency assignments and frame offsets. Soft handoff provides  
 32 diversity of Forward Traffic Channels and Reverse Traffic Channel paths on the  
 33 boundaries between base stations.

---

<sup>3</sup>In this section the term base station may imply multiple cells or sectors.

- *CDMA-to-CDMA Hard Handoff*: A handoff in which the base station directs the mobile station to transition between disjoint sets of base stations, different band classes, different frequency assignments, [different radio configuration](#), or different frame offsets.

- *CDMA-to-Analog Handoff*: A handoff in which the base station directs the mobile station from a Forward Traffic Channel to an analog voice channel.

Base station support of CDMA-to-CDMA hard handoff between different band classes and support of CDMA-to-analog handoff is optional.

Section 2.6.6 describes the mobile station requirements during handoff.

#### 3.6.6.1.2 Active Set

The Active Set contains the pilots (see 2.6.6.1.2) associated with the Forward Traffic Channels assigned to the mobile station. Initially the base station informs the mobile station of the contents of the Active Set using the *Channel Assignment Message* or the *Extended Channel Assignment Message*; subsequent changes to the contents of the Active Set are provided using the *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message*.

#### 3.6.6.2 Requirements

##### 3.6.6.2.1 Overhead Information

The base station sends the following messages governing the pilot search procedures performed by the mobile station:

- *System Parameters Message*
- *In-Traffic System Parameters Message*
- *Neighbor List Message*
- *Extended Neighbor List Message*
- *Neighbor List Update Message*
- *Extended Neighbor List Update Message*
- *General Neighbor List Message*
- *General Handoff Direction Message*
- *Extended Handoff Direction Message*
- *Candidate Frequency Search Request Message*
- *Candidate Frequency Search Control Message*
- *Universal Handoff Direction Message*
- *Universal Neighbor List Message*
- *MC-RR Parameters Message*

1       3.6.6.2.1.1 System Parameters

2       The base station sends handoff related parameters on the Paging Channel in the *System*  
 3       *Parameters Message* and the *Extended System Parameters Message*, and on the Primary  
 4       Broadcast Control Channel in the *MC-RR Parameters Message*.

5       The base station may revise handoff related parameters for a mobile station operating on  
 6       the Traffic Channel by sending the *In-Traffic System Parameters Message*.

7       The base station may modify the values of the parameters SRCH\_WIN\_A, T\_ADD, T\_DROP,  
 8       T\_COMP, and T\_TDROPO through the *Extended Handoff Direction Message*, the *General*  
 9       *Handoff Direction Message*, or the *Universal Handoff Direction Message*. In addition, the  
 10      base station may also modify the values of the parameters SRCH\_WIN\_N, SRCH\_WIN\_R,  
 11      SOFT\_SLOPE, ADD\_INTERCEPT, and DROP\_INTERCEPT through the *General Handoff*  
 12      *Direction Message* or the *Universal Handoff Direction Message*.

13      3.6.6.2.1.2 Neighbor List

14      The base station sends a Neighbor List on the Paging Channel in the *Neighbor List Message*,  
 15      the *Extended Neighbor List Message*, or the *General Neighbor List Message*. The base station  
 16      should list the pilots in the *Neighbor List Message* in descending priority order (see  
 17      2.6.6.2.6.3).

18      The base station may revise the Neighbor List for a mobile station operating on the Traffic  
 19      Channel by sending a *Neighbor List Update Message* or an *Extended Neighbor List Update*  
 20      *Message*.

21      The base station shall not include a pilot that is a member of the mobile station's Active Set  
 22      in a *Neighbor List Update Message* or an *Extended Neighbor List Update Message*. The base  
 23      station shall not specify more than N8m pilots in the *Neighbor List Message*, *Extended*  
 24      *Neighbor List Message*, *General Neighbor List Message*, or in the *Extended Neighbor List*  
 25      *Update Message*. The base station shall not specify more than 20 pilots in the *Neighbor List*  
 26      *Update Message*. The base station should list the pilots in the *Neighbor List Update*  
 27      *Message* in descending priority order (see 2.6.6.2.6.3).

28      The base station may also indicate the availability of neighboring analog systems in the  
 29      *General Neighbor List Message* to assist the mobile station in performing system reselection  
 30      (see 2.6.2.1.6).

31      3.6.6.2.1.3 Candidate Frequency Neighbor List

32      The base station sends a Candidate Frequency Neighbor List and inter-frequency hard  
 33      handoff related parameters in the *Candidate Frequency Search Request Message*. The base  
 34      station shall not specify more than N8m pilots in the *Candidate Frequency Search Request*  
 35      *Message*.

36      3.6.6.2.1.4 Candidate Frequency Search List

37      The base station designates a subset of the Candidate Frequency Neighbor List included in  
 38      the *Candidate Frequency Search Request Message* as the Candidate Frequency Search List.  
 39      For each pilot belonging to the Candidate Frequency Search List, the base station shall set

1 the corresponding SEARCH\_SET field of the *Candidate Frequency Search Request Message*  
 2 to '1'.

3 3.6.6.2.2 Call Processing During Handoff

4 3.6.6.2.2.1 Processing the Pilot Strength Measurement Message

5 The base station should use the pilot strength measurements in the *Pilot Strength*  
 6 *Measurement Message* or the *Extended Pilot Strength Measurement Message* to determine a  
 7 new Active Set.

8 The base station may also use the PN phase measurements in the *Pilot Strength*  
 9 *Measurement Message* or the *Extended Pilot Strength Measurement Message* to estimate the  
 10 propagation delay to the mobile station. This estimate can be used to reduce Reverse  
 11 Traffic Channel acquisition time.

12 The base station may respond to a *Pilot Strength Measurement Message* or an *Extended Pilot*  
 13 *Strength Measurement Message* received from the mobile station by sending the *Extended*  
 14 *Handoff Direction Message*, the *General Handoff Direction Message*, or the *Universal Handoff*  
 15 *Direction Message*.

16 3.6.6.2.2.2 Processing the Extended Handoff Direction Message

17 The base station shall maintain a handoff message sequence number. If the base station  
 18 specifies that the mobile station is to use service negotiation, the base station shall set the  
 19 SERV\_NEG variable (see 3.6.4.1.2.1.4) to be enabled at the action time of the message. The  
 20 sequence number shall be initialized to zero prior to the transmission of the first *Extended*  
 21 *Handoff Direction Message*, *General Handoff Direction Message* (see 3.6.6.2.2.10), or the  
 22 *Universal Handoff Direction Message* to the mobile station. The base station shall increment  
 23 the sequence number modulo 4 each time the base station modifies the pilot list (including  
 24 the order in which pilots are specified within the list) or the code channels (including a  
 25 change in the ordering such that the first code channel occurrence for any pilot is changed)  
 26 sent to the mobile station in an *Extended Handoff Direction Message*, a *General Handoff*  
 27 *Direction Message*, or a *Universal Handoff Direction Message*.

28 Following a hard handoff, the base station should set the handoff message sequence  
 29 number to the value of the LAST\_HDM\_SEQ field of the *Handoff Completion Message* or  
 30 *Extended Handoff Completion Message* and should use the pilot order contained in the  
 31 *Handoff Completion Message* or *Extended Handoff Completion Message* to interpret the  
 32 contents of subsequent *Power Measurement Report Messages*.

33 The base station shall set the contents of an *Extended Handoff Direction Message* according  
 34 to the following rules:

- 35 • An *Extended Handoff Direction Message* shall list no more than N<sub>6m</sub> pilots in the  
 36 new Active Set.
- 37 • An *Extended Handoff Direction Message* shall identify the identical power control  
 38 subchannels (i.e., those carrying identical power control bits).

- 1     • An *Extended Handoff Direction Message* may change the code channel associated  
2       with an Active Set pilot that remains in the new Active Set.
- 3     • The base station specifies the long code mask to be used on the new Forward Traffic  
4       Channel by using the PRIVATE\_LCM field of the *Extended Handoff Direction*  
5       *Message*. The base station may change the long code mask to be used on the new  
6       Forward Traffic Channel via the PRIVATE\_LCM field of the *Extended Handoff*  
7       *Direction Message* only for CDMA-to-CDMA hard handoffs. If a change of long code  
8       mask is specified and the base station does not specify an explicit action time in the  
9       *Extended Handoff Direction Message*, the base station shall begin using the new long  
10      code mask on the first 80 ms boundary (relative to System Time) occurring at least  
11      80 ms after the end of the frame containing the last bit of the message.
- 12     • For CDMA-to-CDMA handoffs, the base station may require the mobile station to  
13       perform a reset of the acknowledgment procedures by using the RESET\_L2 field of  
14       the *Extended Handoff Direction Message*. If the base station requires the mobile  
15       station to reset the acknowledgment procedures, Layer 3 shall send an indication to  
16       Layer 2 to reset the acknowledgment procedures (see 3.2.1.1 and 3.2.2.1 of [4]). The  
17       acknowledgment procedures shall be reset immediately after the action time of the  
18       *Extended Handoff Direction Message*.
- 19     • For CDMA-to-CDMA hard handoffs, the base station may alter the frame offset by  
20       setting the FRAME\_OFFSET field to a new value. If the base station specifies a new  
21       frame offset and does not specify an explicit action time, the base station shall  
22       change its Forward and Reverse Traffic Channel frame offsets at the second 80 ms  
23       boundary (relative to System Time) after the end of transmission of the *Extended*  
24       *Handoff Direction Message*, unless the end of transmission of the message coincides  
25       with an 80 ms boundary, in which case the change in frame offsets shall occur 80  
26       ms after the end of transmission.
- 27     • For CDMA-to-CDMA hard handoffs to Band Class 0 or Band Class 3, the base  
28       station may alter the nominal transmit power offset after handoff by setting the  
29       NOM\_PWR field to the new nominal transmit power offset. For CDMA-to-CDMA  
30       hard handoffs to band classes other than Band Class 0 and Band Class 3, the base  
31       station may alter the nominal transmit power offset after handoff by setting both the  
32       NOM\_PWR and NOM\_PWR\_EXT fields to the new nominal transmit power offset.
- 33     • The base station may specify a different band class by setting the BAND\_CLASS and  
34       CDMA\_FREQ fields to the band class and CDMA frequency assignment respectively.  
35       The base station shall not specify a band class not supported by the mobile station.
- 36     • If the base station sends the *Extended Handoff Direction Message* in assured mode,  
37       the base station should set the action time of the message such that there is  
38       sufficient time for the mobile station to transmit a message containing the  
39       acknowledgment prior to the action time.

- 1     • For CDMA-to-CDMA hard handoffs, the base station may specify whether the mobile  
2       station is to use service negotiation or service option negotiation by setting the  
3       SERV\_NEG\_TYPE field of the *Extended Handoff Direction Message*. If the base  
4       station specifies that the mobile station is to use service negotiation, the base  
5       station shall set the SERV\_NEG variable (see 3.6.4.1.2.1.4) to enabled at the action  
6       time of message. If the base station specifies that the mobile station is to use  
7       service option negotiation, the base station shall set SERV\_NEG to disabled at the  
8       action time of the message.

9     3.6.6.2.2.3 Processing the Candidate Frequency Search Request Message

10    The base station may send a *Candidate Frequency Search Request Message* to direct the  
11      mobile station to perform a single or periodic search on the Candidate Frequency.

12    The base station may request the mobile station to perform an aligned search of the  
13      Candidate Frequency Search Set (see 2.6.6.2.8.3). If the base station requests the mobile  
14      station to perform an aligned search, the base station shall specify an explicit action time  
15      for the *Candidate Frequency Search Request Message*.

16    The base station shall maintain a search message sequence number. The sequence number  
17      shall be initialized to zero prior to the transmission of the first *Candidate Frequency Search*  
18      *Request Message* to the mobile station. Each time the base station sends a new *Candidate*  
19      *Frequency Search Request Message* to the mobile station, it shall set the CFSRM\_SEQ field  
20      to the current value of the sequence number, and increment the sequence number modulo  
21      4.

22     3.6.6.2.2.4 Processing the Candidate Frequency Search Response Message

23    The base station should use the mobile station's search capabilities as reported in the  
24      *Candidate Frequency Search Response Message* to determine an appropriate period for the  
25      mobile station's periodic search on the Candidate Frequency.

26     3.6.6.2.2.5 Processing the Candidate Frequency Search Control Message

27    The base station may send a *Candidate Frequency Search Control Message* to direct the  
28      mobile station to perform a single search, or to start or stop a periodic search on the  
29      Candidate Frequency.

30    The base station may request the mobile station to perform an aligned search of the  
31      Candidate Frequency Search Set (see 2.6.6.2.8.3). If the base station requests the mobile  
32      station to perform an aligned search, the base station shall specify an explicit action time  
33      for the *Candidate Frequency Search Control Message*.

34    Each time the base station sends a new *Candidate Frequency Search Control Message* to the  
35      mobile station, it shall set the CFSCM\_SEQ field to the current value of the sequence  
36      number, and increment the sequence number modulo 4.

1       3.6.6.2.2.6 Processing the Candidate Frequency Search Report Message

2       The base station should use the value of the LAST\_SRCH\_MSG field and of the  
 3       LAST\_SRCH\_MSG\_SEQ field of the *Candidate Frequency Search Report Message* to interpret  
 4       the contents of the message.

5       If the SEARCH\_MODE field of the *Candidate Frequency Search Report Message* is equal to  
 6       ‘0000’, the base station should use the pilot strength measurements in the message to  
 7       determine whether to direct the mobile station to perform a CDMA-to-CDMA inter-  
 8       frequency handoff, and to determine the new Active Set. If the SEARCH\_MODE field of the  
 9       *Candidate Frequency Search Report Message* is equal to ‘0001’, the base station should use  
 10      the analog frequency strength measurements in the message to determine whether to direct  
 11      the mobile station to perform a CDMA-to-Analog handoff.

12      3.6.6.2.2.7 Transmitting During Handoff

13      The base station shall continue transmission to the mobile station on the Fundamental  
 14      Channel or the Dedicated Control Channel of a Forward Traffic Channel removed from the  
 15      Active Set until it receives the *Handoff Completion Message* or *Extended Handoff Completion  
 16      Message* from the mobile station or determines that the call has been released.

17      The base station should discontinue transmission to the mobile station on the Fundamental  
 18      Channel or the Dedicated Control Channel of a Forward Traffic Channel removed from the Active Set after it receives the *Handoff Completion Message* or *Extended  
 19      Handoff Completion Message*.

21      For Forward Multiplex Options 3 through 16, the base station should discontinue  
 22      transmission of Forward Supplemental Code Channels removed from the Code Channel List  
 23      according to the following rules:

- 24       • If a *General Handoff Direction Message* is used to remove one or more Forward  
 25          Supplemental Code Channels, the base station should discontinue transmission on  
 26          those code channels no later than the action time of the *General Handoff Direction  
 27          Message*.
- 28       • If a *Supplemental Channel Assignment Message* is used to remove one or more  
 29          Forward Supplemental Code Channels, the base station should discontinue  
 30          transmission on those Forward Supplemental Code Channels no later than the  
 31          implicit action time of the *Supplemental Channel Assignment Message*.

32      3.6.6.2.2.8 Ordering Pilot Measurements From the Mobile Station

33      The base station may direct the mobile station to send a *Pilot Strength Measurement  
 34      Message* by sending a *Pilot Measurement Request Order*.

35      The base station may send a *Periodic Pilot Measurement Request Order* to direct the mobile  
 36      station to send pilot strength measurements one time or periodically. In response to the  
 37      order, the mobile station reports the pilot strength measurements using the *Periodic Pilot  
 38      Strength Measurement Message*.

1    3.6.6.2.2.9 Processing the Supplemental Channel Assignment Message

2    The base station may use this message to specify Supplemental Code Channel assignment  
3    parameters for the mobile station's Forward Traffic Channel, Reverse Traffic Channel, or  
4    both. This information includes the parameters that control the timing of the Supplemental  
5    Code Channel assignment (e.g., starting time and duration), and parameters that control  
6    the number of Supplemental Code Channels which will be used during the assignment  
7    (e.g., the number of Reverse Supplemental Code Channels on which the mobile station may  
8    transmit and the set of Walsh codes on which the mobile station receives Forward  
9    Supplemental Code Channels for each pilot in the mobile station's Active Set). The  
10   *Supplemental Channel Assignment Message* shall be used only with Multiplex Options 3  
11   through 16.

12   The base station shall set the content of a *Supplemental Channel Assignment Message*  
13   according to the following rules:

- 14   • The base station may set USE\_RETRY\_DELAY to '1' and RETRY\_DELAY to a delay in  
15   320 ms units starting at the next 80 ms system time boundary during which the  
16   mobile station is to refrain from sending subsequent *Supplemental Channel Request*  
17   *Messages*. The base station may set RETRY\_DELAY to '11111111' to indicate that  
18   the mobile station is to refrain from transmitting *Supplemental Channel Request*  
19   *Messages* indefinitely. Otherwise, the base station shall set USE\_RETRY\_DELAY to  
20   '0' and omit RETRY\_DELAY in which case the mobile station is to reset any  
21   previously set RETRY\_DELAY indication.
- 22   • The base station shall set REV\_DTX\_DURATION to the maximum duration of time in  
23   units of 20 ms that the mobile station is allowed to stop transmission on a Reverse  
24   Supplemental Code Channel before resuming transmission on the Reverse  
25   Supplemental Code Channel within the reverse assignment duration. The base  
26   station shall set this field to '0000' if the mobile station is to stop using a Reverse  
27   Supplemental Code Channel once it has stopped transmitting on that Reverse  
28   Supplemental Code Channel. The base station shall set this field to '1111' if the  
29   mobile station is allowed to resume transmission on a Reverse Supplemental Code  
30   Channel at any time within the reverse assignment duration.
- 31   • A *Supplemental Channel Assignment Message* may specify Reverse Supplemental  
32   Code Channel assignments. If Reverse Supplemental Code Channel assignment  
33   information is included, the base station shall set REV\_INCLUDED to '1' and include  
34   the appropriate Reverse Supplemental Code Channel assignment information.  
35   Otherwise, the base station shall set REV\_INCLUDED to '0'.
- 36   • The base station shall indicate the implicit, explicit, or linked start time for a  
37   Reverse Supplemental Code Channel assignment as follows:
  - 38   – The base station may set EXPL\_REV\_START\_TIME to '1' and set  
39   REV\_START\_TIME to the System Time, in units of 80 ms (modulo 64), at which  
40   the mobile station is to start transmitting on the Reverse Supplemental Code  
41   Channels.

- The base station may set USE\_REV\_HDM\_SEQ to ‘1’ and set REV\_LINKED\_HDM\_SEQ to the sequence number of the *General Handoff Direction Message* (HDM\_SEQ) with which this message is linked to indicate that the mobile station is to start processing the Reverse Supplemental Code Channels at the action time of the linked *General Handoff Direction Message*.
- The base station may set EXPL\_REV\_START\_TIME to ‘0’ and USE\_REV\_HDM\_SEQ to ‘0’ to indicate that the mobile station is to start processing Reverse Supplemental Code Channels at the implicit action time of this message.
- The base station shall not set both EXPL\_REV\_START\_TIME and USE\_REV\_HDM\_SEQ to ‘1’.
- The base station may set USE\_REV\_DURATION to ‘1’ and REV\_DURATION to the time interval, in units of 80 ms, after the implicit, explicit, or linked action time for the message (as specified in 2.6.6.2.5.1), during which the mobile station is to transmit on the specified Reverse Supplemental Code Channels. The base station may set USE\_REV\_DURATION to ‘0’ to indicate an infinite duration for the assignment of Reverse Supplemental Code Channels. If NUM\_REV\_CODES is ‘000’, then the base station shall set USE\_REV\_DURATION to ‘0’.
- If Reverse Supplemental Code Channel assignment information is included, the base station shall set NUM\_REV\_CODES to the number of Reverse Supplemental Code Channels to be used in this Reverse Supplemental Code Channel assignment. The base station shall not set NUM\_REV\_CODES to be greater than the number of codes supported by the currently negotiated multiplex option.
- The base station may set USE\_T\_ADD\_ABORT, the Reverse Supplemental Code Channel assignment T\_ADD abort indicator, to ‘1’ to indicate that the mobile station is to abort Reverse Supplemental Code Channel assignments implicitly when a T\_ADD trigger occurs. Otherwise, the base station shall set USE\_T\_ADD\_ABORT to ‘0’. If NUM\_REV\_CODES is set to ‘000’, the base station shall set USE\_T\_ADD\_ABORT to ‘0’.
- If the base station is sending this message in response to a *Supplemental Channel Request Message* which includes a *Supplemental Channel Request Message* sequence number and the mobile station is to clear the IGNORE\_SCAM field, the base station shall set USE\_SCRM\_SEQ\_NUM to ‘1’ and set SCRM\_SEQ\_NUM to the sequence number corresponding to the SCRM\_SEQ\_NUM field in a *Supplemental Channel Request Message* to which the mobile station is to match this message. Otherwise, the base station shall set USE\_SCRM\_SEQ\_NUM to ‘0’ and omit SCRM\_SEQ\_NUM.
- A *Supplemental Channel Assignment Message* may specify Forward Supplemental Code Channel assignments. If Forward Supplemental Code Channel assignment information is included, the base station shall set FORINCLUDED to ‘1’ and include the appropriate Forward Supplemental Code Channel assignment information. Otherwise, the base station shall set FORINCLUDED to ‘0’.

- 1     • The base station shall set FOR\_SUP\_CONFIG to '00' if the mobile station is to stop  
2       processing the forward supplemental code after the action time of the *Supplemental*  
3       *Channel Assignment Message*. The base station should not transmit to the mobile  
4       station on the Forward Supplemental Code Channels after the message takes effect.
- 5     • The base station shall set FOR\_SUP\_CONFIG to '01' if the mobile station is to start  
6       processing the Forward Supplemental Code Channels in the Code Channel List at  
7       the implicit, explicit, or linked action time for the message as specified in  
8       2.6.6.2.5.1.
- 9     • The base station shall set FOR\_SUP\_CONFIG to '10' if the Forward Supplemental  
10      Code Channels associated with the pilots in the Active set are specified in the  
11      *Supplemental Channel Assignment Message* and is to stop processing Forward  
12      Supplemental Code Channels at the implicit action time of the message. The base  
13      station should not transmit to the mobile station on the Forward Supplemental  
14      Code Channels after the message takes effect.
- 15     • The base station shall set FOR\_SUP\_CONFIG to '11' if the Forward Supplemental  
16      Code Channels associated with the pilots in the Active set are specified in the  
17      *Supplemental Channel Assignment Message* and the mobile station is to start  
18      processing the Forward Supplemental Code Channels at the implicit, explicit, or  
19      linked action time for the message as specified in 2.6.6.2.5.1.
- 20     • The base station shall set FOR\_DURATION to the time interval, in units of 80 ms,  
21       after the implicit, explicit, or linked action time for the message (as specified in  
22       2.6.6.2.5.1), during which the mobile station is to process the specified Forward  
23       Supplemental Code Channels. The base station may set USE\_FOR\_DURATION to '0'  
24       to indicate an infinite duration for the allocation of Forward Supplemental Code  
25       Channels. The base station should not transmit to the mobile station on the  
26       Forward Supplemental Code Channels outside the time interval specified by  
27       FOR\_DURATION.
- 28     • The base station may set EXPL\_FOR\_START\_TIME to '1' and set FOR\_START\_TIME  
29       to the System Time, in units of 80 ms (modulo 64), at which the mobile station is to  
30       start processing the Forward Supplemental Code Channels.
- 31     • The base station may set USE\_FOR\_HDM\_SEQ to '1' and set  
32       FOR\_LINKED\_HDM\_SEQ to the sequence number of the *General Handoff Direction*  
33       *Message* (HDM\_SEQ) with which this message is linked to indicate that the mobile  
34       station is to start processing the Forward Supplemental Code Channels at the action  
35       time of the linked *General Handoff Direction Message*.
- 36     • The base station shall not set both USE\_FOR\_HDM\_SEQ and  
37       EXPL\_FOR\_START\_TIME within a *Supplemental Channel Assignment Message* to '1'.
- 38     • The number of Supplemental Code Channels assigned by *Supplemental Channel*  
39       *Assignment Message* shall not exceed the maximum number of Supplemental Code  
40       Channels for the negotiated Forward Multiplex Option.

- 1     • The base station may set EXPL\_FOR\_START\_TIME to '0' and USE\_FOR\_HDM\_SEQ  
 2       to '0' to indicate that the mobile station is to start processing Forward Supplemental  
 3       Code Channels at the implicit action time of this message.

4     3.6.6.2.2.10 Processing the General Handoff Direction Message

5     The base station shall maintain a handoff message sequence number. The sequence  
 6       number shall be initialized to zero prior to the transmission of the first *Extended Handoff*  
 7       *Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction*  
 8       *Message* (see 3.6.6.2.2.11) to the mobile station (see 2.6.6.2.2.2). The base station shall  
 9       increment the sequence number modulo 4 each time the base station modifies the pilot list  
 10      (including the order in which pilots are specified within the list) or the code channels  
 11      (including a change in the ordering such that the first code channel occurrence for any pilot  
 12       is changed) sent to the mobile station in an *Extended Handoff Direction Message*, ~~or a~~  
 13       *General Handoff Direction Message*, or ~~a~~*Universal Handoff Direction Message*.

14    Following a hard handoff, the base station should set the handoff message sequence number  
 15      to the value of the LAST\_HDM\_SEQ field of the *Handoff Completion Message* or  
 16      *Extended Handoff Completion Message* and should use the pilot order contained in the  
 17      *Handoff Completion Message* or *Extended Handoff Completion Message* to interpret the  
 18      contents of subsequent *Power Measurement Report Messages*.

19    The base station shall set the contents of a *General Handoff Direction Message* according to  
 20      the following rules:

- 21     • A *General Handoff Direction Message* shall list no more than N<sub>6m</sub> pilots in the new  
 22       Active Set.
- 23     • The base station may include a Service Configuration Information Record in the  
 24       *General Handoff Direction Message* to accept a service configuration proposed in a  
 25       *Service Request Message* or *Service Response Message*, and instruct the mobile  
 26       station to begin using the service configuration.
- 27     • A *General Handoff Direction Message* shall identify the identical power control  
 28       subchannels (i.e., those carrying identical power control bits).
- 29     • A *General Handoff Direction Message* shall identify the transmit power level of the  
 30       power control subchannels to the transmit power level of 20 ms frames at a 9600  
 31       bps or 14400 bps rate on their respective associated channels (Forward  
 32       Fundamental Channel or Forward Dedicated Control Channel).
- 33     • For CDMA-to-CDMA handoffs, the base station may specify Power Control  
 34       Subchannel Gain action time [PC\_ACTION\_TIME]. If PC\_ACTION\_TIME is included  
 35       in this message, the base station shall apply the new FPC\_SUBCHAN\_GAIN at the  
 36       time specified by PC\_ACTION\_TIME. If the PC\_ACTION\_TIME is not included in this  
 37       message but the explicit action time is included, the base station shall apply the  
 38       new FPC\_SUBCHAN\_GAIN at the action time of the *General Handoff Direction*  
 39       *Message*. If the implicit action time is used, the base station should gradually apply  
 40       any change in FPC\_SUBCHAN\_GAIN.

- 1     • A *General Handoff Direction Message* may change the code channel associated with  
2       an Active Set pilot that remains in the new Active Set.
- 3     • The base station specifies the long code mask to be used on the new Forward Traffic  
4       Channel by using the PRIVATE\_LCM field of the *General Handoff Direction Message*.  
5       The base station may change the long code mask to be used on the new Forward  
6       Traffic Channel via the PRIVATE\_LCM field of the *General Handoff Direction Message*  
7       only for CDMA-to-CDMA hard handoffs. If a change of long code mask is specified  
8       and the base station does not specify an explicit action time in the *General Handoff  
9       Direction Message*, the base station shall begin using the new long code mask on the  
10      first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end  
11      of the frame containing the last bit of the message.
- 12     • For CDMA-to-CDMA handoffs, the base station may require the mobile station to  
13       perform a reset of the acknowledgment procedures by using the RESET\_L2 field of  
14       the *General Handoff Direction Message*. If the base station requires the mobile  
15       station to reset the acknowledgment procedures, Layer 3 shall send an indication to  
16       Layer 2 to reset the acknowledgment procedures (see 3.2.1.1 and 3.2.2.1 of [4]). The  
17       acknowledgment procedures of the base station that the mobile station is to handoff  
18       to shall be reset immediately after the action time of the *General Handoff Direction  
19       Message*.
- 20     • For CDMA-to-CDMA hard handoffs, the base station may alter the frame offset by  
21       setting the FRAME\_OFFSET field to a new value. If the base station specifies a new  
22       frame offset and does not specify an explicit action time, the base station shall  
23       change its Forward and Reverse Traffic Channel frame offsets at the second 80 ms  
24       boundary (relative to System Time) after the end of transmission of the *General  
25       Handoff Direction Message*, unless the end of transmission of the message coincides  
26       with an 80 ms boundary, in which case the change in frame offsets shall occur 80  
27       ms after the end of transmission.
- 28     • For CDMA-to-CDMA hard handoffs to Band Class 0 or Band Class 3, the base  
29       station may alter the nominal transmit power offset after handoff by setting the  
30       NOM\_PWR field to the new nominal transmit power offset. For CDMA-to-CDMA  
31       hard handoffs to band classes other than Band Class 0 and Band Class 3, the base  
32       station may alter the nominal transmit power offset after handoff by setting both the  
33       NOM\_PWR and NOM\_PWR\_EXT fields to the new nominal transmit power offset.
- 34     • The base station may specify a different band class by setting the BAND\_CLASS and  
35       CDMA\_FREQ fields to the band class and CDMA frequency assignment respectively.  
36       The base station shall not specify a band class not supported by the mobile station.
- 37     • If the base station sends the *General Handoff Direction Message* in assured mode,  
38       the base station should set the action time of the message such that there is  
39       sufficient time for the mobile station to transmit a message containing the  
40       acknowledgment prior to the action time.

- 1     • For CDMA-to-CDMA hard handoffs, the base station may specify whether the mobile  
2       station is to use service negotiation or service option negotiation by setting the  
3       SERV\_NEG\_TYPE field of the *General Handoff Direction Message*. If the base station  
4       specifies that the mobile station is to use service negotiation, the base station shall  
5       set the SERV\_NEG variable (see 3.6.4.1.2.1.4) to enabled at the action time of  
6       message. If the base station specifies that the mobile station is to use service option  
7       negotiation, the base station shall set SERV\_NEG to disabled at the action time of  
8       the message.
- 9     • The base station may specify whether the mobile station is to restore its  
10      configuration to what it was before the handoff attempt, if it fails in the handoff  
11      attempt using criteria specified in the *Candidate Frequency Search Request Message*,  
12      by using the RETURN\_IF\_HANDOFF\_FAIL field of the *General Handoff Direction  
Message*. The base station may specify whether the mobile station is to periodically  
13      search a CDMA Candidate Frequency for useable pilots, using criteria specified in  
14      the *Candidate Frequency Search Request Message*, by using the PERIODIC\_SEARCH  
15      field of the *General Handoff Direction Message*.
- 16     • The base station may include Forward Supplemental Code Channel assignment  
17      information in the *General Handoff Direction Message* if the Forward Multiplex  
18      Option for the currently connected service option is 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13,  
19      14, 15, or 16. If Forward Supplemental Code Channel assignment information is  
20      included, the base station shall include FORINCLUDED, set FORINCLUDED to '1',  
21      and include the appropriate Forward Supplemental Code Channel assignment  
22      information.
- 23     • The number of Forward Supplemental Code Channels assigned by the *General  
Handoff Direction Message* shall not exceed the maximum number of Forward  
25      Supplemental Code Channels for the negotiated Forward Multiplex Option.
- 26     • The base station shall set FOR\_SUP\_CONFIG to '00' if the mobile station is to stop  
27      processing the Forward Supplemental Code Channel after the action time of *General  
Handoff Direction Message*. The base station should not transmit to the mobile  
28      station on the Forward Supplemental Code Channels after the message takes effect.
- 29     • The base station shall set FOR\_SUP\_CONFIG to '01' if the mobile station is to start  
30      processing the Forward Supplemental Code Channels in the Code Channel List at  
31      the action time of the message.
- 32     • The base station shall set FOR\_SUP\_CONFIG to '10' if the Forward Supplemental  
33      Code Channels associated with the pilots in the Active set are specified in the  
34      *General Handoff Direction Message* and the mobile station is to stop processing  
35      Forward Supplemental Code Channels at the implicit action time of the message.  
36      The base station should not transmit to the mobile station on the Forward  
37      Supplemental Code Channels after the message takes effect.
- 38     • The base station shall set FOR\_SUP\_CONFIG to '11' if the Forward Supplemental  
39      Code Channels associated with the pilots in the Active set are specified in the  
40      *General Handoff Direction Message* and the mobile station is to start processing the  
41      Forward Supplemental Code Channels at the action time of the message.

- 1     • The base station shall set FOR\_DURATION to the time interval after the action time  
2         of the message, in units of 80 ms, during which the mobile station is to process the  
3         specified Forward Supplemental Code Channels. The base station may set  
4         USE\_FOR\_DURATION to '0' to indicate an infinite duration for the allocation of  
5         Forward Supplemental Code Channels. The base station should not transmit to the  
6         mobile station on the Forward Supplemental Code Channels outside the time  
7         interval specified by FOR\_DURATION.
- 8     • If FORINCLUDED is included in the message, the base station shall include  
9         EXPL\_CODE\_CHAN for each pilot included in the message. If EXPL\_CODE\_CHAN is  
10        included and set to '1' for a pilot, the code channels associated with the pilot in the  
11        *General Handoff Direction Message* shall be ordered such that the first code channel  
12        occurrence is associated with the Forward Fundamental Channel and the successive  
13        occurrences are associated with Forward Supplemental Code Channels. If  
14        EXPL\_CODE\_CHAN is included and is set to '0', for each pilot in the new Active Set,  
15        the base station shall include BASE\_CODE\_CHAN and set it to the base code  
16        channel index in the range of 1 to (63 - NUM\_FOR\_SUP + 1), inclusive, that the  
17        mobile station is to use as the first Forward Supplemental Code Channel associated  
18        with this pilot. The mobile station is to use NUM\_FOR\_SUP adjacent code channels  
19        beginning with index BASE\_CODE\_CHAN (i.e., BASE\_CODE\_CHAN through  
20        BASE\_CODE\_CHAN + NUM\_FOR\_SUP - 1) for the Forward Supplemental Code  
21        Channels associated with this pilot.
- 22     • The base station may include Reverse Supplemental Code Channel assignment  
23        information in the *General Handoff Direction Message* if the Reverse Multiplex  
24        Option is 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, or 16. If Reverse Supplemental  
25        Code Channel assignment information is included, the base station shall include  
26        REVINCLUDED, set REVINCLUDED to '1', and include the appropriate Reverse  
27        Supplemental Code Channel assignment information in the additional fields.
- 28     • If Reverse Supplemental Code Channel assignment information is included, the base  
29        station shall set NUM\_REV\_CODES to the number of Reverse Supplemental Code  
30        Channels to be used by the mobile station. The base station shall not set  
31        NUM\_REV\_CODES to be greater than the number of codes supported by the  
32        currently negotiated multiplex option.
- 33     • The base station may set USE\_T\_ADD\_ABORT, the Reverse Supplemental Code  
34        Channel assignment T\_ADD abort indicator, to '1' to indicate that the mobile station  
35        is to abort Reverse Supplemental Code Channel assignments implicitly when a  
36        T\_ADD trigger occurs. Otherwise, the base station shall set USE\_T\_ADD\_ABORT to  
37        '0'. If NUM\_REV\_CODES is set to '000', the base station shall set  
38        USE\_T\_ADD\_ABORT to '0'.

- 1     • The base station shall set REV\_DTX\_DURATION to the maximum duration of time in  
 2       units of 20 ms that the mobile station is allowed to stop transmission on a Reverse  
 3       Supplemental Code Channel before resuming transmission on the Reverse  
 4       Supplemental Code Channel. The base station shall set this field to '0000' if the  
 5       mobile station is to stop using a Reverse Supplemental Code Channel once it has  
 6       stopped transmitting on that Reverse Supplemental Code Channel. The base station  
 7       shall set this field to '1111' if the mobile station is allowed to resume transmission  
 8       on a Reverse Supplemental Code Channel at any time within the reverse assignment  
 9       duration.
- 10    • The base station may set CLEAR\_RETRY\_DELAY to '1' to indicate that the mobile  
 11      station is to cancel any previously stored retry delay. Otherwise, the base station  
 12      shall set CLEAR\_RETRY\_DELAY to '0' to indicate that the mobile station is to  
 13      continue to honor any previously stored retry delay (see 2.6.6.2.5.1).
- 14    • The base station may indicate a duration for the Reverse Supplemental Code  
 15      Channel assignment (in 80 ms superframes) by setting USE\_REV\_DURATION to '1'  
 16      and indicating the desired duration in the REV\_DURATION field. If  
 17      USE\_REV\_DURATION is set to '0', a duration of infinity is indicated, and the base  
 18      station shall set the REV\_DURATION to '00000000'. If NUM\_REV\_CODES is '000',  
 19      then the base station shall set USE\_REV\_DURATION to '0' and shall set  
 20      REV\_DURATION to '00000000'.
- 21    • The base station may set USE\_REV\_DURATION to '1' and REV\_DURATION to the  
 22      time interval after the action time of the message, in units of 80 ms, during which  
 23      the mobile station may transmit on the assigned Reverse Supplemental Code  
 24      Channels. The base station may set USE\_REV\_DURATION to '0' to indicate an  
 25      infinite duration for the allocation of Forward Supplemental Code Channels.
- 26    • The base station may specify a closed loop power control step size by setting  
 27      USE\_PWR\_CNTL\_STEP to '1' and indicating the desired power control step size in  
 28      the PWR\_CNTL\_STEP field (see 2.1.2.3.2). Otherwise, the base station shall set  
 29      USE\_PWR\_CNTL\_STEP to '0'. The base station shall not specify a power control step  
 30      size not supported by the mobile station.

### 31    3.6.6.2.2.11 Processing the Universal Handoff Direction Message

32    The base station shall maintain a handoff message sequence number. The sequence  
 33    number shall be initialized to zero prior to the transmission of the first *Extended Handoff*  
 34    *Direction Message* (see 3.6.6.2.2.2), *General Handoff Direction Message* (see 3.6.6.2.2.10), or  
 35    *Universal Handoff Direction Message* to the mobile station. The base station shall increment  
 36    the sequence number modulo 4 each time the base station modifies the pilot list (including  
 37    the order in which pilots are specified within the list) or the code channels (including a  
 38    change in the ordering such that the first code channel occurrence for any pilot is changed)  
 39    sent to the mobile station in an *Extended Handoff Direction Message*, a *General Handoff*  
 40    *Direction Message*, or an *Universal Direction Message*.

41    Following a hard handoff, the base station should set the handoff message sequence  
 42    number to the value of the LAST\_HDM\_SEQ field of the *Handoff Completion Message* or

1    *Extended Handoff Completion Message* and should use the pilot order contained in the  
2    *Handoff Completion Message* or *Extended Handoff Completion Message* to interpret the  
3    contents of subsequent *Power Measurement Report Messages*.

4    The base station shall set the contents of a *Universal Handoff Direction Message* according  
5    to the following rules:

- 6       • A *Universal Handoff Direction Message* shall list no more than  $N_{6m}$  pilots in the new  
7       Active Set.
- 8       • The base station may include a Service Configuration Information Record in the  
9       *Universal Handoff Direction Message* to accept a service configuration proposed in a  
10      *Service Request Message* or *Service Response Message*, and instruct the mobile  
11      station to begin using the service configuration.
- 12      • A *Universal Handoff Direction Message* shall identify the identical power control  
13      subchannels (i.e., those carrying identical power control bits).
- 14      • A *Universal Handoff Direction Message* shall identify the transmit power level of the  
15      power control subchannels to the transmit power level of 20 ms frames at a 9600  
16      bps or 14400 bps rate on their respective associated channels (Forward  
17      Fundamental Channel or Forward Dedicated Control Channel).
- 18      • For CDMA-to-CDMA handoffs, the base station may specify Power Control  
19      Subchannel Gain action time [PC\_ACTION\_TIME]. If PC\_ACTION\_TIME is included  
20      in this message, the base station shall apply the new FPC\_SUBCHAN\_GAIN at the  
21      time specified by PC\_ACTION\_TIME. If the PC\_ACTION\_TIME is not included in this  
22      message but the explicit action time is included, the base station shall apply the  
23      new FPC\_SUBCHAN\_GAIN at the action time of the *Universal Handoff Direction  
Message*. If the implicit action time is used, the base station should gradually apply  
24      any change in FPC\_SUBCHAN\_GAIN.
- 25      • A *Universal Handoff Direction Message* may change the code channel associated with  
26      an Active Set pilot that remains in the new Active Set.
- 27      • A *Universal Handoff Direction Message* may delete the code channel associated with  
28      an Active Set pilot that remains in the new Active Set.
- 29      • A *Universal Handoff Direction Message* may add the code channel associated with an  
30      Active Set pilot that remains in the new Active Set.
- 31      • The base station specifies the long code mask to be used on the new Forward Traffic  
32      Channel by using the PRIVATE\_LCM field of the *Universal Handoff Direction  
Message*. The base station may change the contents of this field only for CDMA-to-  
33      CDMA hard handoffs. If a change of long code mask is specified and the base  
34      station does not specify an explicit action time in the *Universal Handoff Direction  
Message*, the base station shall begin using the new long code mask on the first 80  
35      ms boundary (relative to System Time) occurring at least 80 ms after the end of the  
36      frame containing the last bit of the message.
- 37      • The base station specifies the long code mask to be used on the new Forward Traffic  
38      Channel by using the PRIVATE\_LCM field of the *Universal Handoff Direction  
Message*. The base station may change the contents of this field only for CDMA-to-  
39      CDMA hard handoffs. If a change of long code mask is specified and the base  
station does not specify an explicit action time in the *Universal Handoff Direction  
Message*, the base station shall begin using the new long code mask on the first 80 ms  
boundary (relative to System Time) occurring at least 80 ms after the end of the  
frame containing the last bit of the message.

- 1     • For CDMA-to-CDMA handoffs, the base station may require the mobile station to  
 2       perform a reset of the acknowledgment procedures by using the RESET\_L2 field of  
 3       the *Universal Handoff Direction Message*. If the base station requires the mobile  
 4       station to reset the acknowledgment procedures, Layer 3 shall send an indication to  
 5       Layer 2 to reset the acknowledgment procedures (see 3.2.1.1 and 3.2.2.1 of [4]). The  
 6       acknowledgment procedures of the base station that the mobile station is to handoff  
 7       to shall be reset immediately after the action time of the *General Handoff Direction  
 8       Message*.
- 9     • For CDMA-to-CDMA hard handoffs, the base station may alter the frame offset by  
 10      setting the FRAME\_OFFSET field to a new value. If the base station specifies a new  
 11      frame offset and does not specify an explicit action time, the base station shall  
 12      change its Forward and Reverse Traffic Channel frame offsets at the second 80 ms  
 13      boundary (relative to System Time) after the end of transmission of the *Universal  
 14      Handoff Direction Message*, unless the end of transmission of the message coincides  
 15      with an 80 ms boundary, in which case the change in frame offsets shall occur 80  
 16      ms after the end of transmission.
- 17     • For CDMA-to-CDMA hard handoffs to Band Class 0 or Band Class 3, the base  
 18      station may alter the nominal transmit power offset after handoff by setting the  
 19      NOM\_PWR field to the new nominal transmit power offset. For CDMA-to-CDMA  
 20      hard handoffs to band classes other than Band Class 0 and Band Class 3, the base  
 21      station may alter the nominal transmit power offset after handoff by setting both the  
 22      NOM\_PWR and NOM\_PWR\_EXT fields to the new nominal transmit power offset.
- 23     • The base station may specify a different band class by setting the BAND\_CLASS and  
 24      CDMA\_FREQ fields to the band class and CDMA frequency assignment respectively.  
 25      The base station shall not specify a band class not supported by the mobile station.
- 26     • If the base station sends the *Universal Handoff Direction Message* in assured mode,  
 27      the base station should set the action time of the message such that there is  
 28      sufficient time for the mobile station to transmit a message containing the  
 29      acknowledgment prior to the action time.
- 30     • For CDMA-to-CDMA handoffs, the base station may specify whether the mobile  
 31      station is to use service negotiation or service option negotiation by setting the  
 32      SERV\_NEG\_TYPE field of the *Universal Handoff Direction Message*. If the base  
 33      station specifies that the mobile station is to use service negotiation, the base  
 34      station shall set the SERV\_NEG variable (see 3.6.4.1.2.1.4) to enabled at the action  
 35      time of message. If the base station specifies that the mobile station is to use  
 36      service option negotiation, the base station shall set SERV\_NEG to disabled at the  
 37      action time of the message.

- The base station may specify whether the mobile station is to restore its configuration to what it was before the handoff attempt, if it fails in the handoff attempt using criteria specified in the *Candidate Frequency Search Request Message*, by using the RETURN\_IF\_HANDOFF\_FAIL field of the *Universal Handoff Direction Message*. The base station may specify whether the mobile station is to periodically search a CDMA Candidate Frequency for useable pilots, using criteria specified in the *Candidate Frequency Search Request Message*, by using the PERIODIC\_SEARCH field of the *Universal Handoff Direction Message*.
- The base station specifies Active Set for the Fundamental Channel only, the Dedicated Control Channel only, or both. The Active Set of the Dedicated Control Channel shall be the same as the Active Set of the Fundamental Channel when both the Fundamental Channel and Dedicated Control Channel are assigned.
- The base station may specify the Active Set of the Supplemental Channels. The Active Set of the Supplemental Channels shall be a subset of the Active Set of the Fundamental Channel or the Dedicated Control Channel.
- A *Universal Handoff Direction Message* may specify a Reverse Supplemental Channel assignment. If Reverse Supplemental Channel assignment information is included, this message contains information that specifies the start time, duration, and the data transfer rate associated with this Reverse Supplemental Channel assignment.
- A *Universal Handoff Direction Message* may specify a Forward Supplemental Channel assignment. If Forward Supplemental Channel assignment information is included, this message contains the start time, duration, and SCCL\_INDEX associated with this Forward Supplemental Channel assignment.
- A *Universal Handoff Direction Message* may update the mapping between a particular SCCL\_INDEX and a set of fields that specifies the data transfer rate, QOF index, Forward Supplemental Channel Walsh code for each PILOT\_PN, and the active set for the Forward Supplemental Channel associated with FOR\_SCH\_ID.
- A *Universal Handoff Direction Message* may update REV\_WALSH\_ID field which specifies the Reverse Supplemental Walsh cover.
- The base station may set CLEAR\_RETRY\_DELAY to '1' to indicate that the mobile station is to cancel any previously stored retry delay. Otherwise, the base station shall set CLEAR\_RETRY\_DELAY to '0' to indicate that the mobile station is to continue to honor any previously stored retry delay (see 2.6.6.2.5.1).

#### 3.6.6.2.12 Processing of Extended Supplemental Channel Assignment Message

The base station may use this message to carry Forward Supplemental Channel assignment information or Reverse Supplemental Channel assignment information.

If Forward Supplemental Channel assignment information is included, this message contains the start time, duration, and SCCL\_INDEX associated with this Forward Supplemental Channel assignment. If Reverse Supplemental Channel assignment information is included, this message contains information that specifies the start time, duration, and the number of information bits per frame (or set of number of bits per frame

1 if RSCH\_VAR\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is not equal to '000' associated with this Reverse  
 2 Supplemental Channel assignment.

3 This message may specify the mapping between a particular SCCL\_INDEX and a set of  
 4 fields that specifies the number of information bits per frame (or set of number of bits per  
 5 frame if FSCH\_VAR\_TABLE\_ID<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] is not equal to '000'), QOF index, Forward  
 6 Supplemental Channel Walsh code for each PILOT\_PN, and the active set for the Forward  
 7 Supplemental Channel associated with FOR\_SCH\_ID.

8 This message may also include REV\_WALSH\_ID field which specifies the Reverse  
 9 Supplemental Walsh cover.

10 This message also includes START\_TIME\_UNIT for this message, *Forward Supplemental*  
 11 *Channel Assignment Mini Messages*, or *Reverse Supplemental Channel Assignment Mini*  
 12 *Messages*, or *Universal Handoff Direction Message*.

13 The base station shall set the contents of an *Extended Supplemental Channel Assignment*  
 14 *Message* according to the following rules:

- 15 • An *Extended Supplemental Channel Assignment Message* may specify a Reverse  
 16 Supplemental Channel assignment. The base station shall set NUM\_REV\_SCH to  
 17 the number of Reverse Supplemental Channels to be assigned.
- 18 • An *Extended Supplemental Channel Assignment Message* may specify a Forward  
 19 Supplemental Channel assignment. The base station shall set NUM\_FOR\_SCH to  
 20 the number of Forward Supplemental Channels to be assigned..
- 21 • The base station shall set the START\_TIME\_UNIT field to indicate the unit of the  
 22 FOR\_SCH\_START\_TIME included in this message and the *Forward Supplemental*  
 23 *Channel Assignment Mini Messages* and REV\_SCH\_START\_TIME included in this  
 24 message and the *Reverse Supplemental Channel Assignment Mini Messages*. The  
 25 base station shall set this field to one less than the number of 20 ms intervals that  
 26 is to be used by the mobile station for calculating the start time included in Forward  
 27 Supplemental Channel assignments or Reverse Supplemental Channel assignments.
- 28 • An *Extended Supplemental Channel Assignment Message* may specify Forward  
 29 Supplemental Channel configuration information. The base station shall set  
 30 NUM\_FOR\_SCH\_CFG to the number of Forward Supplemental Channel to be  
 31 configured.
- 32 • The base station shall set the NUM\_REC field to the number of instances of the  
 33 following record minus one included in this message. The base station shall set the  
 34 fields within each record as follows:
  - 35 – The base station shall set the SCCL\_INDEX field to the index of the  
 36 Supplemental Channel Code Information Record in the Supplemental  
 37 Channel Code List Table.
  - 38 – The base station shall set the FOR\_SCH\_NUM\_BITS\_IDX field to the Forward  
 39 Supplemental Channel number of information bits index associated with  
 40 SCCL\_INDEX.

- 1           – The base station shall set the NUM\_SUP\_SHO field to the number of Forward  
 2           Supplemental Channels minus one, corresponding to the FOR\_SCH\_ID and  
 3           the SCCL\_INDEX, for which the frames are to be soft-combined by the  
 4           mobile station. The base station shall set the fields within each record as  
 5           follows:
- 6           + The base station shall set the PILOT\_PN field to the pilot PN sequence  
 7           offset for this pilot in units of 64 PN chips.
- 8           + The base station shall set the QOF\_MASK\_ID\_SCH field to the ID of the  
 9           Quasi Orthogonal Function mask ID corresponding to the Forward  
 10          Supplemental Channel Code index.
- 11          + The base station shall set the CODE\_CHAN\_SCH field to the code  
 12          channel on the Supplemental Channel corresponding to the PILOT\_PN.
- 13         • REV\_SCH\_DTX\_DURATION: The base station shall set REV\_SCH\_DTX\_DURATION to  
 14           the maximum duration of time in units of 20 ms that the mobile station is allowed  
 15           to stop transmission on a Reverse Supplemental Channel before resuming  
 16           transmission on the Reverse Supplemental Channel within the reverse assignment  
 17           duration. The base station shall set this field to ‘0000’ if the mobile station is to  
 18           stop using a Reverse Supplemental Channel once it has stopped transmitting on  
 19           that Reverse Supplemental Channel. The base station shall set this field to ‘1111’ if  
 20           the mobile station is allowed to resume transmission on a Reverse Supplemental  
 21           Channel at any time within the reverse assignment duration.
- 22         • The base station may set USE\_T\_ADD\_ABORT, the Reverse Supplemental Channel  
 23           assignment T\_ADD abort indicator, to ‘1’ to indicate that the mobile station is to  
 24           abort Reverse Supplemental Channel assignments when a T\_ADD trigger occurs.  
 25           Otherwise, the base station shall set USE\_T\_ADD\_ABORT to ‘0’.
- 26         • If the base station is sending this message in response to a *Supplemental Channel*  
 27           *Request Message* which includes a *Supplemental Channel Request Message* sequence  
 28           number and the mobile station is to clear the IGNORE\_ESCAM field, the base  
 29           station shall set USE\_SCRM\_SEQ\_NUM to ‘1’ and set SCRM\_SEQ\_NUM to the  
 30           sequence number corresponding to the SCRM\_SEQ\_NUM field in a *Supplemental*  
 31           *Channel Request Message* to which the mobile station is to match this message.  
 32           Otherwise, the base station shall set USE\_SCRM\_SEQ\_NUM to ‘0’ and omit  
 33           SCRM\_SEQ\_NUM.

### 34         3.6.6.2.2.13 Processing of Forward Supplemental Channel Assignment Mini Message

35         The base station may use this message to specify Forward Supplemental Channel  
 36           assignment parameters for the mobile station’s Forward Supplemental Channel. This  
 37           information includes the FOR\_SCH\_ID, duration, start time, and the index to the previously  
 38           specified Forward Supplemental Channel Code List, which determines number of  
 39           information bits per frame (or set of number of bits per frame if  
 40           FSCH\_VAR\_TABLE\_ID<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] is not equal to ‘000’), code channel index, and the  
 41           identifier of the Quasi Orthogonal Function corresponding to the assignment.

1 The base station shall set the content of a *Forward Supplemental Channel Assignment Mini*  
 2 *Message* according to the following rules:

- 3 • The base station shall set the FOR\_SCH\_ID to Forward Supplemental Channel  
 4 identifier of the burst assignment that this message carries.
- 5 • The base station shall set the FOR\_SCH\_DURATION field to '0000' to indicate that  
 6 the mobile station should stop processing the Forward Supplemental Channel  
 7 starting at the explicit start time of the message specified by  
 8 FOR\_SCH\_START\_TIME. The base station shall set the FOR\_SCH\_DURATION field  
 9 to '1111' to indicate that the mobile station should process the Forward  
 10 Supplemental Channel, starting at the explicit start time of the message specified by  
 11 FOR\_SCH\_START\_TIME, until a subsequent *Forward Supplemental Channel*  
 12 *Assignment Mini Message* or an *Extended Supplemental Channel Assignment*  
 13 *Message* with the same FOR\_SCH\_ID field is received. The base station shall set the  
 14 FOR\_SCH\_DURATION field to the duration in units of 20 ms (see Table 3.7.3.3.2.37-  
 15 3), starting at the explicit start time of the message specified by  
 16 FOR\_SCH\_START\_TIME, during which the mobile station is to process the Forward  
 17 Supplemental Channel.
- 18 • The base station shall set the FOR\_SCH\_START\_TIME field to the System Time, in  
 19 units of time specified by START\_TIME\_UNIT, (modulo 32) at which the mobile  
 20 station is to start processing the Forward Supplemental Channel specified in this  
 21 message. The explicit start time for processing Forward Supplemental Channels is  
 22 the time for which:

$$(\lfloor t / (\text{START\_TIME\_UNIT} + 1) \rfloor - \text{FOR\_SCH\_START\_TIME}) \bmod 32 = 0,$$

24 where t is the System Time in units of 20 ms.

- 25 • The base station shall set the SCCL\_INDEX field to the index of the record in the  
 26 Forward Supplemental Channel Code list corresponding to the FOR\_SCH\_ID.
- 27 • If the PILOT\_GATING\_USE\_RATE to equal to '1', the base station shall set  
 28 PILOT\_GATING\_USE\_RATE to '0' and start transmitting the Forward Power Control  
 29 Subchannel with the maximum rate at the action time of the message.

### 30 3.6.6.2.14 Processing of Reverse Supplemental Channel Assignment Mini Message

31 The base station may use this message to specify Reverse Supplemental Channel  
 32 assignment parameters for the mobile station Reverse Supplemental Channel. This  
 33 information includes the reverse supplemental channel identifier (REV\_SCH\_ID), the  
 34 duration of transmission on the Reverse Supplemental Channel, the start time for the burst  
 35 assignment, and the number of information bits per frame that the mobile station may  
 36 transmit.

37 The base station shall set the content of the *Reverse Supplemental Channel Assignment Mini*  
 38 *Message* according to the following rules:

- 1     • The base station shall set the REV\_SCH\_DURATION field to '0000' to indicate that  
2       the mobile station should stop transmitting on the Reverse Supplemental Channel  
3       specified by REV\_SCH\_ID at the start time specified by REV\_SCH\_START\_TIME.  
4       The base station shall set this field to '1111' to indicate that the mobile station may  
5       transmit on the Reverse Supplemental Channel specified by REV\_SCH\_ID, starting  
6       at the start time specified by REV\_SCH\_START\_TIME. The base station shall set the  
7       REV\_SCH\_DURATION field to the allocated duration (see Table 3.7.3.3.2.37-3),  
8       starting at the start time specified by REV\_SCH\_START\_TIME, during which the  
9       mobile station may transmit on the Reverse Supplemental Channel specified by  
10      REV\_SCH\_ID.
- 11    • The base station shall set the REV\_SCH\_START\_TIME field to the System Time, in  
12      units of time specified by START\_TIME\_UNIT, (modulo 32) at which the mobile  
13      station may start transmitting on the Reverse Supplemental Channel specified in  
14      this message. The explicit start time for transmitting on the Reverse Supplemental  
15      Channel is the time for which:

$$( \lfloor t / (\text{START\_TIME\_UNIT} + 1) \rfloor - \text{REV\_SCH\_START\_TIME} ) \bmod 32 = 0,$$

17    where  $t$  is the System Time in units of 20 ms.

- 18    • The base shall set the REV\_SCH\_BITS\_IDX (see Table 3.7.3.3.2.37-[24](#)) to indicate  
19      the Reverse Supplemental Channel number of information bits per frame index.
- 20    • If the PILOT\_GATING\_USE\_RATE to equal to '1', the base station shall set  
21      PILOT\_GATING\_USE\_RATE to '0' and start transmitting the Forward Power Control  
22      Subchannel with the maximum rate at the action time of the message.

### 23    3.6.6.2.2.15 Processing of the Mobile Assisted Burst Operation Parameters Message

24    The base station may use this message to specify the operating parameters in the mobile  
25    station for Mobile Assisted Burst Operation procedures.

- 26    • A *Mobile Assisted Burst Operation Parameters Message* may specify pilot strength  
27      order change reporting information. If order change reporting information is  
28      included, the base station shall set ORDER\_FLAG to '1' and include the appropriate  
29      order change reporting fields. Otherwise, the base station shall set ORDER\_FLAG to  
30      '0'. If ORDER\_FLAG is set to '1', the base station shall perform the following  
31      procedures:
  - 32       – The base station shall set PS\_MIN\_DELTA to one less than the minimum pilot  
33          strength measurement difference between any two pilots in the Active Set (in  
34          units of 0.5 dB) that must be measured in order for the mobile station to send a  
35          *Pilot Strength Measurement Mini Message*.
  - 36       – The base station shall set ORDER\_INTERVAL to the minimum interval (in 20 ms  
37          units) during which the indicated pilot strength measurement difference (greater  
38          than or equal to PS\_MIN\_DELTA + 1, in units of 0.5 dB) must be measured by  
39          the mobile station in order for the mobile station to send a *Pilot Strength*  
40          *Measurement Mini Message*.

- A *Mobile Assisted Burst Operation Parameters Message* may specify periodic pilot strength reporting. If periodic reporting information is included, the base station shall set PERIODIC\_FLAG to '1' and include the appropriate periodic reporting fields. Otherwise, the base station shall set PERIODIC\_FLAG to '0'. If PERIODIC\_FLAG is set to '1', the base station shall perform the following procedures:
  - The base station shall set NUM\_PILOTS to the number of pilots for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.
  - The base station shall set PERIODIC\_INTERVAL to the interval (in 20 ms units) between *Pilot Strength Measurement Mini Messages*.
- A *Mobile Assisted Burst Operation Parameters Message* may specify threshold based pilot strength reporting. If threshold based reporting information is included, the base station shall set THRESHOLD\_FLAG to '1' and include the appropriate threshold based reporting fields. Otherwise, the base station shall set THRESHOLD\_FLAG to '0'. If THRESHOLD\_FLAG is set to '1', the base station shall perform the following procedures:
  - The base station shall set PS\_FLOOR\_HIGH to the high water mark for lower limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.
  - The base station shall set PS\_FLOOR\_LOW to the low water mark for lower limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.
  - The base station shall set PS\_CEILING\_HIGH to the high water mark for upper limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.
  - The base station shall set PS\_CEILING\_LOW to the low water mark for upper limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.
  - The base station shall set THRESHOLD\_INTERVAL to the interval (in 20 ms units) between *Pilot Strength Measurement Mini Messages*.

### 3.6.6.2.3 Active Set Maintenance

The base station shall maintain an Active Set for each mobile station under its control as follows:

- When the base station sends the *Channel Assignment Message*, it shall initialize the Active Set to contain only the pilot associated with the assigned Forward Traffic Channel.
- When the base station sends the *Extended Channel Assignment Message*, it shall initialize the Active Set to contain all pilots included in the message.

- When the base station sends an *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message*, it shall add to the Active Set, before the action time of the message, all pilots included in the message, if they are not already in the Active Set.
- The base station shall delete the pilots that were not included in the most recent *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message*, from the Active Set upon receipt of the *Handoff Completion Message* or *Extended Handoff Completion Message*.

#### 3.6.6.2.4 Soft Handoff

The base station should use soft handoff when directing a mobile station from one Forward Traffic Channel to another Forward Traffic Channel having the same frequency assignment.

##### 3.6.6.2.4.1 Receiving During Soft Handoff

Each base station in the Active Set shall demodulate the Reverse Traffic Channel. The base station should provide diversity combining of the demodulated signals obtained by each base station in the Active Set.

##### 3.6.6.2.4.2 Transmitting During Soft Handoff

The base station shall begin transmitting identical modulation symbols on all Forward Traffic Channels specified in an *Extended Handoff Direction Message* or *General Handoff Direction Message*, or *Universal Handoff Direction Message* (with the possible exception of the power control subchannel) by the action time of the message.

The base station shall transmit identical power control bits on all identical power control subchannels that were identified as such in the last *Extended Handoff Direction Message*, or *General Handoff Direction Message*, or *Universal Handoff Direction Message*.

The base station shall use the same long code mask on all Forward Traffic Channels whose associated pilots are in the Active Set.

#### 3.6.6.2.5 CDMA-to-Analog Hard Handoff

The base station may direct the mobile station to perform a handoff from the CDMA system to an analog system in a band class that the mobile station supports by sending an *Analog Handoff Direction Message*.

### 3.6.7 CDMA Tiered Services

#### 3.6.7.1 Overview

##### 3.6.7.1.1 Definition

The base station may support Tiered Services to provide individual users or groups of users with custom services and special features based upon their location. The base station may also support Tiered Services to provide private network support. Important to the operation of CDMA Tiered Services is the concept of User Zones. It is via User Zones by which the base station offers custom services based upon the mobile station location.

User Zones are associated with a set of features and services, plus a geographic area in which the User Zone features/services are made available to the customers that have subscribed to that User Zone. The boundary of the User Zone Geographic area may be established based on the coverage area of a public or private base station, or it may be established independent of RF topology.

User Zones may be supported by the public system on the same frequency as the serving base station, or they may be supported on a private system operating on a different frequency.

### 3.6.7.1.2 Types of User Zones

User Zones may be of two basic types:

- *Broadcast User Zones*: Broadcast User Zones are identified to the mobile station using the Paging Channel or the Primary Broadcast Control Channel. In this case, the base station broadcasts messages on the Paging Channel or the Primary Broadcast Control Channel identifying the User Zones that fall within the coverage area of the particular cell/sector. A mobile station, as part of its monitoring of the Paging Channel or the Primary Broadcast Control Channel, will identify the presence of a particular User Zone.
- *Mobile Specific User Zones*: Mobile Specific User Zones are not broadcast by the base station. A mobile station may use other overhead message parameters and compare them with internally stored User Zone parameters to identify the presence of a particular User Zone. These parameters may include: SID, NID, BASE\_ID, BASE\_LAT, and BASE\_LONG.

### 3.6.7.2 Requirements

If the base station supports CDMA Tiered Services, the base station sends the following messages to assist the mobile station in identifying the presence of User Zones and to validate the User Zone requested by a mobile station:

- *User Zone Identification Message*
- *Private Neighbor List Message*
- *User Zone Reject Message*
- *User Zone Update Message*

#### 3.6.7.2.1 User Zone Identification Message

The base station identifies Broadcast User Zones supported by the base station by sending the *User Zone Identification Message* on the Paging Channel or the Primary Broadcast Control Channel. The base station should list the UZID of each Broadcast User Zone supported by the base station.

#### 3.6.7.2.2 Private Neighbor List Message

The base station sends a Private Neighbor List and identifies the User Zones supported by

1 its private neighbor base stations by sending the *Private Neighbor List Message* on the  
 2 Paging Channel or the Primary Broadcast Control Channel. The *Private Neighbor List*  
 3 *Message* shall list no more than N<sub>8m</sub> private neighbors.

4 3.6.7.2.3 User Zone Update Message and User Zone Reject Message on f-dsch

5 For a mobile station operating in the *Traffic Channel Substate* or *Release Substate* of the  
 6 *Mobile Station Control on the Traffic Channel State*, the base station may update the User  
 7 Zone associated with the mobile station by sending a *User Zone Update Message*. The base  
 8 station may also send a *User Zone Reject Message* to reject the User Zone requested by the  
 9 mobile station in the *Origination Message*, *Page Response Message*, or *User Zone Update*  
 10 *Request Message*. The base station may include the ASSIGN\_UZID field in the *User Zone*  
 11 *Reject Message* to assign a User Zone to the mobile station to replace the rejected User  
 12 Zone.

13 3.6.7.2.4 User Zone Reject Message on f-csch

14 The base station may send the *User Zone Reject Message* on the Paging Channel or the  
 15 Forward Common Control Channel to reject the User Zone requested by the mobile station  
 16 in the *Registration Message*, *Origination Message*, or *Page Response Message*. The base  
 17 station may include the ASSIGN\_UZID field in the *User Zone Reject Message* record to  
 18 assign a User Zone to the mobile station to replace the rejected User Zone.

19 3.6.8 Call Control Processing

20 The Call Control consists of the following states:

- 21 • *Waiting for Order Substate* - In this substate, the Call Control instance sends the  
 22 *Alert With Information Message* or the *Extended Alert With Information Message* to the  
 23 mobile station.
- 24 • *Waiting for Answer Substate* - In this substate, the Call Control instance waits for  
 25 the *Connect Order* from the mobile station.
- 26 • *Conversation Substate* - In this substate, the parties involved in this call exchanges  
 27 Traffic Channel frames in accordance with the current service configuration.
- 28 • *Call Release Substate* - In this substate, the Call Control instance waits for the call  
 29 to be disconnected.

30 The following messages are processed by the Call Control:

- 31 • *Alert With Information Message*
- 32 • *Extended Alert with Information Message*:
- 33 • *Flash With Information Message*
- 34 • *Extended Flash With Information Message*

- 1     • *Send Burst DTMF Message*
- 2     • *Origination Continuation Message*

3     The following orders are processed by the Call Control:

- 4     • *Continuous DTMF Tone Order*
- 5     • *Maintenance Order*
- 6     • *Connect Order*

7     Upon instantiation, the Call Control instance shall perform the following:

- 8       • If the call is a mobile station terminated call and the base station set  
9        BYPASS\_ALERT\_ANSWER to ‘1’, the Call Control instance shall enter the  
10      *Conversation Substate* (see 3.6.8.2). If the call is a mobile station terminated call  
11      and the base station set BYPASS\_ALERT\_ANSWER to ‘0’, the Call Control instance  
12      shall enter the *Waiting for Order Substate* (see 3.6.8.1.1).
- 13       • If the call is a mobile-station-originated call, the Call Control instance shall enter  
14       the *Conversation Substate* (see 3.6.8.2).

### 15     3.6.8.1 Alerting

#### 16     3.6.8.1.1 Waiting for Order Substate

17     In this substate, the Call Control instance sends an *Alert With Information Message* or an  
18     *Extended Alert With Information Message* to the mobile station.

19     While in the *Waiting for Order Substate*, the Call Control instance shall perform the  
20     following:

- 21       • If the Call Control instance receives a “release indication” from the [layer 3](#)[Layer 3](#),  
22       the Call Control instance shall enter the *Call Release Substate*.
- 23       • If the Call Control instance receives a “send alert with info message indication” from  
24       the [layer 3](#)[Layer 3](#), the Call Control instance shall send an *Alert with Information*  
25       *Message* or an *Extended Alert With Information Message* to the mobile station within  
26       T2b seconds, and enter the *Waiting for Answer Substate*.
- 27       • The Call Control instance may send the following messages:
  - 28           1. *Alert With Information Message*: The Call Control instance shall enter the  
29           *Waiting for Answer Substate*.
  - 30           2. *Extended Alert With Information Message*: The Call Control instance shall enter  
31           the *Waiting for Answer Substate*.

- 1       3. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Answer*  
 2       *Substate*.

3       3.6.8.1.2 Waiting for Answer Substate

4       In this substate, the Call Control instance waits for a *Connect Order* from the mobile  
 5       station.

6       While in the *Waiting for Answer Substate*, the Call Control instance shall perform the  
 7       following:

- 8       • If the Call Control instance receives a “release indication” from the [layer 3Layer 3](#),  
  9       the Call Control instance shall enter the *Call Release Substate*.
- 10      • If the Call Control instance receives a “send alert with info message indication” from  
  11     the [layer 3Layer 3](#), the Call Control instance shall send an *Alert with Information*  
  12     *Message* or an *Extended Alert with Information Message* to the mobile station, within  
  13     T2b seconds, and enter the *Waiting for Answer Substate*.
- 14      • The Call Control instance may send the following messages:
  - 15       1. *Alert With Information Message*
  - 16       2. *Extended Alert With Information Message*
  - 17       3. *Maintenance Order*
- 18      • If the Call Control instance receives one of the following messages from the [layer](#)  
  19     [3Layer 3](#), the Call Control instance shall process the message according to the  
  20     specified requirements, if any:
  - 21       1. *Connect Order*: The Call Control instance shall enter the *Conversation Substate*.
  - 22       2. *Flash With Information Message*: If the message contains a Keypad Facility  
  23       record with feature codes indicating User Selective Call Forwarding with a pre-  
  24       registered number, a stored number, or voice mail, the Call Control instance  
  25       may send a ‘call release request’ to the [layer 3Layer 3](#). [If this message contains](#)  
  26       [the Global Emergency Call information record and the call associated with this](#)  
  27       [Call Control instance is a voice call, the base station shall recognize this as an](#)  
  28       [emergency call and should process the message using an implementation-](#)  
  29       [dependent procedure which may include ignoring the dialed digits. If this](#)  
  30       [message contains the Global Emergency Call information record and the call](#)  
  31       [associated with this Call Control instance is not a voice call, the base station](#)  
  32       [may recognize this as an emergency call and should process the message using](#)  
  33       [an implementation-dependent procedure which may include ignoring the dialed](#)  
  34       [digits.](#)

1       3. *Extended Flash With Information Message:* If the message contains a Keypad  
 2 Facility record with feature codes indicating User Selective Call Forwarding with  
 3 a pre-registered number, a stored number, or voice mail, the Call Control  
 4 instance may send a ‘call release request’ to the layer 3Layer 3. If this message  
 5 contains the Global Emergency Call information record and the call associated  
 6 with this Call Control instance is a voice call, the base station shall recognize  
 7 this as an emergency call and should process the message using an  
 8 implementation-dependent procedure which may include ignoring the dialed  
 9 digits. If this message contains the Global Emergency Call information record  
 10 and the call associated with this Call Control instance is not a voice call, the  
 11 base station may recognize this as an emergency call and should process the  
 12 message using an implementation-dependent procedure which may include  
 13 ignoring the dialed digits.

14      4. *Origination Continuation Message*

15      3.6.8.2 Conversation Substate

16      While in the *Conversation Substate*, the Call Control instance shall perform the following:

- 17       • If the Call Control instance receives a “release indication” from the layer 3Layer 3,  
 18       the Call Control instance shall enter the *Call Release Substate*.
- 19       • If the Call Control instance receives a “paca reorig indication” from the layer 3Layer  
 20       3, the Call Control instance should send either an *Alert With Information*  
 21       *Message/ Extended Alert With Information Message* which contains a signal  
 22       information record with the SIGNAL\_TYPE field set to ‘01’ or ‘10’, or an *Alert With*  
 23       *Information Message/ Extended Alert With Information Message* which does not  
 24       contain a signal information record.
- 25       • If the Call Control instance receives a “send alert with info message indication” from  
 26       layer 3Layer 3, the Call Control instance shall send an *Alert with Information*  
 27       *Message* or an *Extended Alert With Information Message* to the mobile station within  
 28       T2b seconds, and enter the *Waiting for Answer Substate*.
- 29       • The Call Control instance may send the following messages:
  - 30           1. *Alert With Information Message:* If the message contains a signal information  
 31           record with the SIGNAL\_TYPE field set to ‘01’ or ‘10’, or if the message does not  
 32           contain a signal information record, the Call Control instance shall enter the  
 33           *Waiting for Answer Substate*.
  - 34           2. *Extended Alert With Information Message:* If the message contains a signal  
 35           information record with the SIGNAL\_TYPE field set to ‘01’ or ‘10’, or if the  
 36           message does not contain a signal information record, the Call Control instance  
 37           shall enter the *Waiting for Answer Substate*.

- 1       3. *Continuous DTMF Tone Order*
- 2       4. *Flash With Information Message*
- 3       5. *Extended Flash With Information Message*
- 4       6. *Maintenance Order:* The Call Control instance shall enter the *Waiting for Answer Substate*.
- 5       7. *Send Burst DTMF Message*

- 7       • If the Call Control instance receives one of the following messages from Layer 3Layer 3, the Call Control instance shall process the message according to the specified requirements, if any:
  - 10      1. *Continuous DTMF Tone Order*
  - 11      2. *Flash With Information Message:* If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is a voice call, the base station shall recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits. If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is not a voice call, the base station may recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits.
  - 12      3. *Extended Flash With Information Message:* If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is a voice call, the base station shall recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits. If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is not a voice call, the base station may recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits.
  - 13      4. *Origination Continuation Message*
  - 14      5. *Send Burst DTMF Message*

### 31       3.6.8.3 Call Release Substate

- 32      • The Call Control instance may send the following messages:
  - 33       1. *Alert With Information Message:* If the message contains a signal information record with the SIGNAL\_TYPE field set to '01' or '10', or if the message does not

1 contain a signal information record, the base station shall enter the *Waiting for*  
 2 *Answer Substate*.

- 3     2. *Extended Alert With Information Message*: If the message contains a signal  
 4 information record with the SIGNAL\_TYPE field set to '01' or '10', or if the  
 5 message does not contain a signal information record, the base station shall  
 6 enter the *Waiting for Answer Substate*.
- 7     3. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Answer*  
 8 *Substate*.
- 9     • If the Call Control instance receives one of the following messages from layer 3Layer  
 10 3, the Call Control instance shall process the message according to the specified  
 11 requirements, if any:
  - 12       1. *Connect Order*
  - 13       2. *Continuous DTMF Tone Order*
  - 14       3. *Flash With Information Message*: If this message contains the Global Emergency  
Call information record and the call associated with this Call Control instance is  
a voice call, the base station shall recognize this as an emergency call and  
should process the message using an implementation-dependent procedure  
which may include ignoring the dialed digits. If this message contains the Global  
Emergency Call information record and the call associated with this Call Control  
instance is not a voice call, the base station may recognize this as an emergency  
call and should process the message using an implementation-dependent  
procedure which may include ignoring the dialed digits.
  - 15       4. *Extended Flash With Information Message*: If this message contains the Global  
Emergency Call information record and the call associated with this Call Control  
instance is a voice call, the base station shall recognize this as an emergency call  
and should process the message using an implementation-dependent procedure  
which may include ignoring the dialed digits. If this message contains the Global  
Emergency Call information record and the call associated with this Call Control  
instance is not a voice call, the base station may recognize this as an emergency  
call and should process the message using an implementation-dependent  
procedure which may include ignoring the dialed digits.
  - 16       5. *Origination Continuation Message*
  - 17       6. *Send Burst DTMF Message*

1 No text.

1    **3.7 PDU Formats for Messages**

2    The following sections specify the requirements on the PDU formats transmitted on the f—  
3    csch, and the f-dsch.

4    In any multi-bit field in the following messages, the most significant bit (MSB) shall be  
5    transmitted first.

6    3.7.1 Reserved

7    3.7.2 f-csch

8    The f-csch is used to send control information to mobile stations that have not been  
9    assigned to a Traffic Channel.

10   3.7.2.1 Reserved

11   3.7.2.2 Reserved

- 1    3.7.2.3 PDU Formats for Messages on the f-csch
- 2    The messages sent on the f-csch are summarized in Table 3.7.2.3-1.

- PILOT\_PN - Pilot PN sequence offset index.  
The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.
- CONFIG\_MSG\_SEQ - Configuration message sequence number.  
The base station shall set this field to CONFIG\_SEQ (see 3.6.2.2).
- SID - System identification.  
The base station shall set this field to the system identification number for this system (see 2.6.5.2).
- NID - Network identification.  
This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the network identification number for this network (see 2.6.5.2).

- |           |                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REG_ZONE  | - Registration zone.<br><br>The base station shall set this field to its registration zone number (see 2.6.5.1.5).                                                                                                                                                                                                            |
| TAL_ZONES | - Number of registration zones to be retained.<br><br>The base station shall set this field to the number of registration zones the mobile station is to retain for purposes of zone-based registration (see 2.6.5.1.5).<br><br>If zone-based registration is to be disabled, the base station shall set this field to '000'. |
| ONE_TIMER | - Zone timer length.<br><br>The base station shall set this field to the ZONE_TIMER value shown in Table 3.7.2.3.2.1-1 corresponding to the length of the zone registration timer to be used by mobile stations.                                                                                                              |

**Table 3.7.2.3.2.1-1. Value of Zone Timer**

| <b>ZONE_TIMER<br/>Value (binary)</b> | <b>Timer Length<br/>(Minutes)</b> |
|--------------------------------------|-----------------------------------|
| 000                                  | 1                                 |
| 001                                  | 2                                 |
| 010                                  | 5                                 |
| 011                                  | 10                                |
| 100                                  | 20                                |
| 101                                  | 30                                |
| 110                                  | 45                                |
| 111                                  | 60                                |

- MULT\_SIDS - Multiple SID storage indicator.  
If mobile stations may store entries of SID\_NID\_LIST containing different SIDs, the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.
  - MULT\_NIDS - Multiple NID storage indicator.  
If mobile stations may store multiple entries of SID\_NID\_LIST having the same SID (with different NIDs), the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.
  - BASE\_ID - Base station identification.

1                   The base station shall set this field to its identification  
 2                   number.

- 3            BASE\_CLASS - Base station class.  
 4                   The base station shall set this field ~~to the value shown in~~  
 5                   ~~Table 3.7.2.3.2.1-2 corresponding to the class of service~~  
 6                   ~~provided by this base station as follows:~~  
 7                   For Band Class 1 and 4, the base station shall set this field to  
 8                   '0001'; otherwise, the base station shall set this field to '0000'.

9

10                  **Table 3.7.2.3.2.1-2. Base Station Classes**

| <b>Value<br/>(binary)</b>                 | <b>Class of Service Provided</b>       |
|-------------------------------------------|----------------------------------------|
| 0000                                      | <del>Public Macrocellular System</del> |
| 0001                                      | <del>Public PCS System</del>           |
| <del>All other values are reserved.</del> |                                        |

- 11
- 12            PAGE\_CHAN - Number of Paging Channels.  
 13                   The base station shall set this field to the number of Paging  
 14                   Channels on this CDMA Channel. The base station shall not  
 15                   set this field to '000'.  
 16            MAX\_SLOT\_CYCLE-  
 17                   \_INDEX - Maximum slot cycle index.  
 18                   The base station shall set this field to the  
 19                   SLOT\_CYCLE\_INDEX value corresponding to the maximum  
 20                   slot cycle length permitted (see 2.6.2.1.1).  
 21            HOME\_REG - Home registration indicator.  
 22                   If mobile stations that are not roaming (see 2.6.5.3) and have  
 23                   MOB\_TERM\_HOME equal to '1' are to be enabled for  
 24                   autonomous registrations, the base station shall set this field  
 25                   to '1'. If such mobile stations are not to be enabled for  
 26                   autonomous registration, the base station shall set this field  
 27                   to '0'.  
 28            FOR\_SID\_REG - SID roamer registration indicator.  
 29                   If mobile stations that are foreign SID roamers (see 2.6.5.3)  
 30                   and have MOB\_TERM\_FOR\_SID equal to '1' are to be enabled  
 31                   for autonomous registration, the base station shall set this  
 32                   field to '1'. If such mobile stations are not to be enabled for  
 33                   autonomous registration, the base station shall set this field  
 34                   to '0'.  
 35            FOR\_NID\_REG - NID roamer registration indicator.

If mobile stations that are foreign NID roamer (see 2.6.5.3) and have MOB\_TERM\_FOR\_NID equal to '1' are to be enabled for autonomous registration, the base station shall set this field to '1'. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to '0'.

If mobile stations are not to perform distance-based registration, the base station shall set this field to 0.</p>                                                        |

- 1           SRCH\_WIN\_A    - Search window size for the Active Set and Candidate Set.  
 2                          The base station shall set this field to the value shown in  
 3                          Table 2.6.6.2.1-1 corresponding to the search window size to  
 4                          be used by mobile stations for the Active Set and Candidate  
 5                          Set.
- 6           SRCH\_WIN\_N    - Search window size for the Neighbor Set.  
 7                          The base station shall set this field to the value shown in  
 8                          Table 2.6.6.2.1-1 corresponding to the search window size to  
 9                          be used by mobile stations for the Neighbor Set.
- 10          SRCH\_WIN\_R    - Search window size for the Remaining Set.  
 11                         The base station shall set this field to the value shown in  
 12                         Table 2.6.6.2.1-1 corresponding to the search window size to  
 13                         be used by mobile stations for the Remaining Set.
- 14          NGHBR\_MAX\_AGE - Neighbor Set maximum AGE.  
 15                         The base station shall set this field to the maximum AGE  
 16                         value beyond which mobile stations are to drop members from  
 17                         the Neighbor Set (see 2.6.6.2.6.3).
- 18          PWR REP THRESH - Power control reporting threshold.  
 19                         The base station shall set this field to the number of bad  
 20                         frames (see [2]) to be received in a measurement period on the  
 21                         channel which carries the Power Control Subchannel before  
 22                         mobile stations are to generate a *Power Measurement Report*  
 23                         *Message* (see 2.6.4.1.1). If the base station sets  
 24                         PWR\_THRESH\_ENABLE to '1', it shall not set this field to  
 25                         '00000'.
- 26          PWR REP FRAMES - Power control reporting frame count.  
 27                         The base station shall set this field to the value such that the  
 28                         number given by  

$$\lfloor 2^{(PWR\_REP\_FRAMES/2)} \times 5 \rfloor \text{ frames}$$
 29                         is the number of frames over which mobile stations are to  
 30                         count frame errors.
- 32          PWR\_THRESH-    - Threshold report mode indicator.  
 33                         If mobile stations are to generate threshold *Power*  
 34                         *Measurement Report Messages*, the base station shall set this  
 35                         field to '1'. If mobile stations are not to generate threshold  
 36                         *Power Measurement Report Messages*, the base station shall  
 37                         set this field to '0'.
- 38          PWR\_PERIOD-    - Periodic report mode indicator.  
 39                         If mobile stations are to generate periodic *Power Measurement*  
 40                         *Report Messages*, the base station shall set this field to '1'. If  
 41                         mobile stations are not to generate periodic *Power*  
 42                         *Measurement Report Messages*, the base station shall set this  
 43                         field to '0'.
- 44          PWR REP DELAY - Power report delay.

| 34 | T_TDROPO          | - Drop timer value.<br><br>Timer value after which an action is taken by mobile stations for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a <i>Pilot Strength Measurement Message</i> or an <i>Extended Pilot Strength Measurement Message</i> is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.<br><br>The base station shall set this field to the T_TDROPO value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by mobile stations. |

| 45 | EXT_SYS_PARAMETER | - <i>Extended System Parameters Message</i> indicator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

- 1                   The base station shall set this field to '1'.
- 2 | EXT\_NGHBR\_LIST - *Extended Neighbor List Message* indicator.
- 3                   The base station sets this field to '1' when it sends the  
4                   *Extended Neighbor List Message* on the Paging Channel;  
5                   otherwise the base station sets this field to '0'.
- 6                   If the base station is operating in Band Class 1, Band Class 3,  
7                   or Band Class 4 with MIN\_P\_REV less than ~~sixseven~~, it shall  
8                   set this field to '1'. If the base station is operating in Band  
9                   Class 0, it shall set this field to '0'.
- 10 | GEN\_NGHBR\_LIST - *General Neighbor List Message* indicator.
- 11                  If the base station is sending the *General Neighbor List  
12                  Message* on the Paging Channel, it shall set this field to '1';  
13                  otherwise, it shall set this field to '0'.
- 14                  If the base station is operating in Band Class 1, Band Class 3,  
15                  or Band Class 4 with MIN\_P\_REV greater than or equal to  
16                  ~~sixseven~~, and if EXT\_NGHBR\_LIST is set to '0', the base  
17                  station shall set this field to '1'.
- 18                  If the base station is operating in Band Class 0 with  
19                  MIN\_P\_REV greater than or equal to seven and if the *Neighbor  
20                  List Message* is not sent, the base station shall set this field to  
21                  '1'.
- 22                  If the base station is operating in Band Class 2, Band Class 5,  
23                  Band Class 6, Band Class 7, Band Class 8, ~~or~~-Band Class 9,  
24                  or Band Class 10, and if EXT\_NGHBR\_LIST is set to '0', the  
25                  base station shall set this field to '1'.
- 26 | GLOBAL\_REDIRECT - *Global Service Redirection Message* indicator.
- 27                  If the base station is sending the *Global Service Redirection  
28                  Message* on the Paging Channel, it shall set this field to '1';  
29                  otherwise, it shall set this field to '0'.
- 30 | PRI\_NGHBR\_LIST - *Private Neighbor List Message* indicator.
- 31                  If the base station is sending the *Private Neighbor List Message*  
32                  on the Paging Channel, it shall set this field to '1'; otherwise,  
33                  it shall set this field to '0'.
- 34 | USER\_ZONE\_ID - *User Zone Identification Message* indicator.
- 35                  If the base station is sending the *User Zone Identification  
36                  Message* on the Paging Channel, it shall set this field to '1';  
37                  otherwise, it shall set this field to '0'.
- 38 | EXT\_GLOBAL\_-REDIRECT - *Extended Global Service Redirection Message* indicator.
- 39                  If the base station is sending the *Extended Global Service  
40                  Redirection Message* on the Paging Channel, it shall set this  
41                  field to '1'; otherwise, the base station shall set this field to '0'.
- 42 | EXT\_CHAN\_LIST - Extended CDMA Channel List Message indicator.

1       The base station shall set this field to ‘1’, if the *Extended*  
2       *Channel List Message* is sent on the Paging Channel,  
3       otherwise, it shall set this field to ‘0’.

| <a href="#">NUM_ACCT_SO_GRP</a>  | <a href="#">0 or 3</a> |

If ACCT\_SO\_GRP\_INCL is equal to '1', NUM\_ACCT\_SO\_GRP + 1 occurrences of the following variable-field record:

|                                  |                        |
|----------------------------------|------------------------|
| <a href="#">ACCT_AOC_BITMAP2</a> | <a href="#">0 or 5</a> |
| <a href="#">ACCT_SO_GRP</a>      | <a href="#">5</a>      |

2

3

PILOT\_PN - Pilot PN sequence offset index.

4

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

5

ACC\_MSG\_SEQ - Access parameters message sequence number.

7

The base station shall set this field to ACC\_CONFIG\_SEQ (see 3.6.2.2).

8

ACC\_CHAN - Number of Access Channels.

- |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| AX_CAP_SZ  | <ul style="list-style-type: none"> <li>- Maximum Access Channel message capsule size.<br/>The base station shall set this field to the value in the range 0 to 7, three less than the maximum number of Access Channel frames in an Access Channel message capsule.</li> </ul>                                                                                                                                                                             |
| PAM_SZ     | <ul style="list-style-type: none"> <li>- Access Channel preamble length.<br/>The base station shall set this field to one less than the number of Access Channel frames that mobile stations are to transmit in each Access Channel preamble.</li> </ul>                                                                                                                                                                                                   |
| PSIST(0-9) | <ul style="list-style-type: none"> <li>- Persistence value for access overload classes 0 through 9.<br/>If mobile stations in access overload classes 0 through 9 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to '111111'.</li> </ul> |
| PSIST(10)  | <ul style="list-style-type: none"> <li>- Persistence value for access overload class 10 (test mobile stations).<br/>If mobile stations in access overload class 10 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to '111'.</li> </ul>   |

- 1 PSIST(11) - Persistence value for access overload class 11 (emergency  
2 mobile stations).
- 3 If mobile stations in access overload class 11 are permitted to  
4 transmit requests on the Access Channel, the base station  
5 shall set this field to the persistence value to be used. If such  
6 mobile stations are not permitted to transmit requests on the  
7 Access Channel, the base station shall set this field to '111'.
- 8 PSIST(12) - Persistence value for access overload class 12.
- 9 If mobile stations in access overload class 12 are permitted to  
10 transmit requests on the Access Channel, the base station  
11 shall set this field to the persistence value to be used. If such  
12 mobile stations are not permitted to transmit requests on the  
13 Access Channel, the base station shall set this field to '111'.
- 14 PSIST(13) - Persistence value for access overload class 13.
- 15 If mobile stations in access overload class 13 are permitted to  
16 transmit requests on the Access Channel, the base station  
17 shall set this field to the persistence value to be used. If such  
18 mobile stations are not permitted to transmit requests on the  
19 Access Channel, the base station shall set this field to '111'.
- 20 PSIST(14) - Persistence value for access overload class 14.
- 21 If mobile stations in access overload class 14 are permitted to  
22 transmit requests on the Access Channel, the base station  
23 shall set this field to the persistence value to be used. If such  
24 mobile stations are not permitted to transmit requests on the  
25 Access Channel, the base station shall set this field to '111'.
- 26 PSIST(15) - Persistence value for access overload class 15.
- 27 If mobile stations in access overload class 15 are permitted to  
28 transmit requests on the Access Channel, the base station  
29 shall set this field to the persistence value to be used. If such  
30 mobile stations are not permitted to transmit requests on the  
31 Access Channel, the base station shall set this field to '111'.
- 32 MSG\_PSIST - Persistence modifier for Access Channel attempts for message  
33 transmissions.  
34 A mobile station multiplies its transmission probability by  
35  $2^{-\text{MSG\_PSIST}}$  for such attempts.  
36 The base station shall set this field to the persistence modifier  
37 for Access Channel attempts for message transmissions.
- 38 REG\_PSIST - Persistence modifier for Access Channel attempts for  
39 registrations which are not responses to the *Registration  
40 Request Order*.  
41 A mobile station multiplies its transmission probability by  
42  $2^{-\text{REG\_PSIST}}$  for such attempts.  
43 The base station shall set this field to the persistence modifier  
44 for Access Channel attempts for registrations which are not  
45 responses to the *Registration Request Order*.

- 1           PROBE\_PN\_RAN   - Time randomization for Access Channel probes.  
 2           A mobile station delays its transmission from System Time by  
 3           RN PN chips, where RN is a number determined by hashing  
 4           between 0 and  $2^{\text{PROBE\_PN\_RAN}} - 1$  PN chips.
- 5           The base station shall set this field to the value in the range 0  
 6           to 9 inclusive such that the time randomization range is  
 7            $2^{\text{PROBE\_PN\_RAN}} - 1$  PN chips.
- 8           ACC\_TMO   - Acknowledgment timeout.  
 9           The base station shall set this field to two less than the length  
 10          of time mobile stations are to wait after the end of an Access  
 11          Channel transmission before determining that the base  
 12          station did not receive the transmission, in units of 80 ms.
- 13          PROBE\_BKOFF   - Access Channel probe backoff range.  
 14          The base station shall set this field to one less than the  
 15          maximum number of slots mobile stations are to delay due to  
 16          random backoff between consecutive access probes.
- 17          BKOFF   - Access Channel probe sequence backoff range.  
 18          The base station shall set this field to one less than the  
 19          maximum number of slots mobile stations are to delay due to  
 20          random backoff between successive access probe sequences  
 21          and before the first access probe sequence of a response  
 22          access.
- 23          MAX\_REQ\_SEQ   - Maximum number of access probe sequences for an Access  
 24          Channel request.  
 25          The base station shall set this field to the maximum number  
 26          of access probe sequences mobile stations are to transmit for  
 27          an Access Channel request. The base station shall set this  
 28          field to a value greater than 0.
- 29          MAX\_RSP\_SEQ   - Maximum number of access probe sequences for an Access  
 30          Channel response.  
 31          The base station shall set this field to the maximum number  
 32          of access probe sequences mobile stations are to transmit for  
 33          an Access Channel response. The base station shall set this  
 34          field to a value greater than 0.
- 35          AUTH   - Authentication mode.  
 36          If mobile stations are to include standard authentication data  
 37          in Access Channel messages, the base station shall set this  
 38          field to '01'. If mobile stations are not to include  
 39          authentication data in Access Channel messages, the base  
 40          station shall set this field to '00'. All other values are  
 41          reserved.
- 42          RAND   - Random challenge value.

1                   If the AUTH field is set to '01', the base station shall set this  
 2                   field to the random challenge value to be used by mobile  
 3                   stations for authentication. If the AUTH field is set to any  
 4                   other value, the base station shall omit this field.

5                   NOM\_PWR\_EXT     - Extended nominal transmit power.  
 6                   If the base station is operating in Band Class 0 or Band Class  
 7                   3, it shall set this field to '0'.  
 8                   If the base station is operating in a band class other than  
 9                   Band Class 0 or Band Class 3 otherwise, then it shall set this  
 10                  field as follows:

11                  If the correction factor to be used by mobile stations in the  
 12                  open loop power estimate is between -24 dB and -9 dB  
 13                  inclusive, the base station shall set this field to '1'; otherwise  
 14                  (the correction factor is in the range -8 dB to 7 dB inclusive),  
 15                  the base station shall set this field to '0'.

16                  PSIST\_EMG\_INCL    - Emergency persistence included indicator.  
 17                  If PSIST\_EMG is included in this message, the base station  
 18                  shall set this field to '1'; otherwise, the base station shall set  
 19                  this field to '0'. The base station shall not include PSIST\_EMG  
 20                  in this message if the base station supports the Enhanced  
 21                  Access Channel.

22                  If the base station does not support Common Channel  
 23                  operation and if the base station includes PSIST\_EMG, which  
 24                  is applicable to mobile stations with MOB\_P\_REV equal to or  
 25                  greater than 7, the base station shall set this field to '1'.

26                  PSIST\_EMG        - Persistence value for emergency call for access overload  
 27                  classes 0 through 9.

28                  If PSIST\_EMG\_INCL is set to '0', the base station shall omit  
 29                  this field; otherwise, the base station shall set this field as  
 30                  follows:

31                  If a mobile station in access overload classes 0 through 9 is  
 32                  permitted to transmit emergency requests on the Access  
 33                  Channel, the base station shall set this field to the persistence  
 34                  value to be used for the emergency calls. If such a mobile  
 35                  station is not permitted to transmit emergency requests on  
 36                  the Access Channel, the base station shall set this field to  
 37                  '111'.

38                  ACCT\_INCL        - Access Control based on Call Type (ACCT) information  
 39                  included indicator.

40                  If the base station enables ACCT for at least one service  
 41                  option, the base station shall set this field to '1'; otherwise,  
 42                  the base station shall set this field to '0'.

43                  If the base station sets this field to '1', then the base station  
 44                  shall also set at least one of ACCT\_SO\_INCL or  
 45                  ACCT\_SO\_GRP\_INCL to '1'.

1        ACCT INCL EMG - Access Control based on Call Type (ACCT) includes emergency  
 2        calls indicator.

3        If ACCT INCL is set to '0', the base station shall omit this  
 4        field; otherwise, the base station shall include this field and  
 5        set it as follows:

6        The base station shall set this field to '0' if the mobile station  
 7        is not to apply ACCT to a call that is recognized by the mobile  
 8        station to be an emergency call; otherwise, the base station  
 9        shall set this field to '1'.

10      ACCT AOC

11      BITMAP INCL - Access Control based on Call Type (ACCT) access overload  
 12      class bitmap included indicator.

13      If ACCT INCL is set to '0', the base station shall omit this  
 14      field; otherwise, the base station shall include this field and  
 15      set it as follows:

16      The base station shall set this field to '0' if all mobile stations  
 17      are to apply ACCT regardless of their access overload classes;  
 18      otherwise, the base station shall set this field to '1' to indicate  
 19      that the mobile station is to apply ACCT according to its  
 20      access overload class.

21      ACCT SO INCL - Access Control based on Call Type (ACCT) service option  
 22      included indicator.

23      If ACCT INCL is set to '0', the base station shall omit this  
 24      field; otherwise, the base station shall include this field and  
 25      set it as follows:

26      The base station shall set this field to '1' if at least one  
 27      occurrence of the ACCT SO field is included in this message;  
 28      otherwise, the base station shall set this field to '0'.

29      NUM ACCT SO - Number of service options for Access Control based on Call  
 30      Type (ACCT).

31      If ACCT SO INCL is not included, or is included and set to '0',  
 32      then the base station shall omit this field; otherwise, the base  
 33      station shall include this field and set it to one less than the  
 34      number of occurrences of the ACCT SO field included in this  
 35      message.

36      If ACCT SO INCL is included and set to '1', then the base station shall include  
 37      NUM ACCT SO + 1 occurrences of the following variable-field record:

38      ACCT AOC BITMAP1 - Access Control based on Call Type (ACCT) access overload  
 39      class bitmap.

40      If ACCT AOC BITMAP1 INCL is set to '0', then the base station  
 41      shall omit this field; otherwise, the base station shall include  
 42      this field and set it as follows:

43      This field consists of the subfields defined in Table  
 44      3.7.2.3.2.2-1.

1 **Table 3.7.2.3.2.2-1. ACCT access overload class bitmap subfields.**

| <u>Subfield</u>   | <u>Length<br/>(bits)</u> | <u>Subfield Description</u>            |
|-------------------|--------------------------|----------------------------------------|
| <u>ACCOLC_0_1</u> | <u>1</u>                 | <u>Access overload classes 0 and 1</u> |
| <u>ACCOLC_2_3</u> | <u>1</u>                 | <u>Access overload classes 2 and 3</u> |
| <u>ACCOLC_4_5</u> | <u>1</u>                 | <u>Access overload classes 4 and 5</u> |
| <u>ACCOLC_6_7</u> | <u>1</u>                 | <u>Access overload classes 6 and 7</u> |
| <u>ACCOLC_8_9</u> | <u>1</u>                 | <u>Access overload classes 8 and 9</u> |

2  
3       The base station shall set a subfield to '1' to indicate that  
4       mobile stations having the corresponding access overload  
5       class are not permitted to perform access attempts using the  
6       associated service option ACCT SO; otherwise, the base  
7       station shall set the subfield to '0'.

8       ACCT SO - Access Control based on Call Type (ACCT) service option  
9       number.

10      The base station shall set this field to the value of the service  
11       option number (as specified in [30]) that has ACCT enabled.

12      ACCT SO GRP INCL - Access Control based on Call Type (ACCT) service option group  
13       included indicator.

14      If ACCT INCL is set to '0', the base station shall omit this  
15       field; otherwise, the base station shall include this field and  
16       set it as follows:

17      The base station shall set this field to '1' if at least one  
18       occurrence of the ACCT SO GRP field is included in this  
19       message; otherwise, the base station shall set this field to '0'.

20      NUM ACCT SO GRP - Number of service option groups for Access Control based on  
21       Call Type (ACCT).

22      If ACCT SO GRP INCL is not included, or is included and set  
23       to '0', then the base station shall omit this field; otherwise, the  
24       base station shall include this field and set it to one less than  
25       the number of occurrences of the ACCT SO GRP field  
26       included in this message.

27      If ACCT SO GRP INCL is included and set to '1', then the base station shall include  
28       NUM ACCT SO GRP + 1 occurrences of the following variable-field record:

29      ACCT AOC\_BITMAP2 - Access Control based on Call Type (ACCT) access overload  
30       class bitmap.

31      If ACCT AOC\_BITMAP INCL is set to '0', then the base station  
32       shall omit this field; otherwise, the base station shall include  
33       this field and set it as follows:

This field consists of the subfields defined in Table 3.7.2.3.2.2-1. The base station shall set a subfield to '1' to indicate that mobile stations having the corresponding access overload class are not permitted to perform access attempts using a service option specified by the associated ACCT SO GRP field; otherwise, the base station shall set the subfield to '0'.

ACCT SO GRP - Access Control based on Call Type (ACCT) service option group number.

The base station shall set this field to the value of the service option group number (as specified in [30]) whose members all have ACCT enabled.

## 1    3.7.2.3.2.3 Neighbor List Message

2    MSG\_TAG: NLM

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| PILOT_PN       | 9                    |
| CONFIG_MSG_SEQ | 6                    |
| PILOT_INC      | 4                    |

Zero or more occurrences of the following record:

|              |   |
|--------------|---|
| NGHBR_CONFIG | 3 |
| NGHBR_PN     | 9 |

3

4    PILOT\_PN    -    Pilot PN sequence offset index.

5                 The base station shall set this field to the pilot PN sequence  
6                 offset for this base station, in units of 64 PN chips.

7    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.

8                 The base station shall set this field to CONFIG\_SEQ  
9                 (see 3.6.2.2).

10    PILOT\_INC    -    Pilot PN sequence offset index increment.

11                 A mobile station searches for Remaining Set pilots at pilot PN  
12                 sequence index values that are multiples of this value.13                 The base station shall set this field to the pilot PN sequence  
14                 increment, in units of 64 PN chips, that mobile stations are to  
15                 use for searching the Remaining Set. The base station should  
16                 set this field to the largest increment such that the pilot PN  
17                 sequence offsets of all its neighbor base stations are integer  
18                 multiples of that increment.19                 The base station shall set this field to a value in the range 1 to  
20                 15 inclusive.

21

22                 The base station shall include one occurrence of the following two-field record for each  
23                 member mobile stations are to place in their Neighbor Sets. The base station may include  
24                 zero or more occurrences of the following record.

25    NGHBR\_CONFIG    -    Neighbor configuration.

26                 The base station shall set this field to the value shown in  
27                 Table 3.7.2.3.2.3-1 corresponding to the configuration of this  
28                 neighbor.

29

**Table 3.7.2.3.2.3-1. Neighbor Configuration Field**

| <b>Value<br/>(binary)</b> | <b>Neighbor Configuration</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000                       | <p>The neighbor base station has the same number of frequencies having Paging Channels as the current base station.</p> <p>The neighbor base station has a CDMA frequency assignment that is same as this current CDMA frequency assignment and with the same number of Paging Channels.</p> <p>The position of the neighbor CDMA frequency assignment in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the current base station.</p>                                                                                                              |
| 001                       | <p>The neighbor base station has the same number of frequencies having Paging Channels as the current base station.</p> <p>The neighbor base station has a CDMA frequency assignment that is same as this current CDMA frequency assignment but possibly with a different number of Paging Channels.</p> <p>The position of the neighbor CDMA frequency assignment in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the current base station.</p> <p>This corresponding neighbor CDMA frequency assignment does have a Primary Paging Channel.</p> |
| 010                       | <p>The neighbor base station may have a different number of frequencies having Paging Channels as the current base station.</p> <p>The neighbor base station has a Primary Paging Channel on the first CDMA Channel listed in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the current base station.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|         |                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 011     | The neighbor base station configuration is unknown but the neighbor base station has a Pilot Channel on the CDMA frequency assignment that is same as this current CDMA frequency assignment. |
| 100-111 | Reserved.                                                                                                                                                                                     |

1

2

NGHBR\_PN - Neighbor pilot PN sequence offset index.

3

The base station shall set this field to the pilot PN sequence offset for this neighbor, in units of 64 PN chips.

4

## 1    3.7.2.3.2.4 CDMA Channel List Message

2    MSG\_TAG: CCLM

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| PILOT_PN       | 9                    |
| CONFIG_MSG_SEQ | 6                    |

One or more occurrences of the following field:

|           |    |
|-----------|----|
| CDMA_FREQ | 11 |
|-----------|----|

3

4    PILOT\_PN    -    Pilot PN sequence offset index.  
5                 The base station shall set this field to the pilot PN sequence  
6                 offset for this base station, in units of 64 PN chips.7    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.  
8                 The base station shall set this field to CONFIG\_SEQ  
9                 (see 3.6.2.2).10      CDMA\_FREQ    -    CDMA Channel frequency assignment.  
11                 The order in which occurrences of this field are included gives  
12                 the designations of the supported CDMA Channels as CDMA  
13                 Channel 1 through CDMA Channel N.14  
15                 The base station shall include one occurrence of this field for  
16                 each CDMA Channel containing a Paging Channel that is  
17                 supported by this base station. If the supported CDMA  
18                 Channels are in the preferred set of CDMA frequency  
19                 assignments (see [2]), the base station shall include their  
20                 occurrences of this field first.21                 The base station shall set each occurrence of this field to the  
22                 CDMA channel number corresponding to the CDMA frequency  
23                 assignment for that CDMA Channel (see [2]).

## 1    3.7.2.3.2.7 Order Message

2    MSG\_TAG: ORDM

| <b>Field</b>                    | <b>Length (bits)</b>  |
|---------------------------------|-----------------------|
| ORDER                           | 6                     |
| ADD_RECORD_LEN                  | 3                     |
| Order-specific fields (if used) | 8<br>× ADD_RECORD_LEN |

3

4            ORDER    -    Order code.

5                         The base station shall set this field to the ORDER code  
6                         (see 3.7.4) for this type of order.

7            ADD\_RECORD\_LEN    -    Additional record length.

8                         The base station shall set this field to the number of octets in  
9                         the order-specific fields included in this order record.

10          Order-specific fields    -    Order-specific fields.

11                         The base station shall include order-specific fields as specified  
12                         in 3.7.4 for this type of order.

## 1 3.7.2.3.2.8 Channel Assignment Message

2 MSG\_TAG: CAM

| Field                    | Length (bits)      |
|--------------------------|--------------------|
| ASSIGN_MODE              | 3                  |
| ADD_RECORD_LEN           | 3                  |
| Additional record fields | 8 × ADD_RECORD_LEN |

3

4 If ASSIGN\_MODE = '000', the additional record fields shall be:

5

|                                |                   |
|--------------------------------|-------------------|
| FREQ_INCL                      | 1                 |
| CODE_CHAN                      | 8                 |
| CDMA_FREQ                      | 0 or 11           |
| FRAME_OFFSET                   | 4                 |
| ENCRYPT_MODE                   | 2                 |
| <u>D SIG_ENCRYPT_MODE</u>      | 0 or 3            |

3

4 If ASSIGN\_MODE = '101', the additional record fields shall be:

5

|            |         |
|------------|---------|
| RESPOND    | 1       |
| FREQ_INCL  | 1       |
| BAND_CLASS | 0 or 5  |
| CDMA_FREQ  | 0 or 11 |

One or more occurrences of the following field:

|          |   |
|----------|---|
| PILOT_PN | 9 |
|----------|---|

|          |                   |
|----------|-------------------|
| RESERVED | 0 - 7 (as needed) |
|----------|-------------------|

6

7 ASSIGN\_MODE - Assignment mode.

1           The base station shall set this field to the value shown in  
 2           Table 3.7.2.3.2.8-1 corresponding to the assignment mode for  
 3           this assignment.

5           **Table 3.7.2.3.2.8-1. Assignment Mode**

| <b>Value<br/>(binary)</b>      | <b>Assignment Mode</b>                            |
|--------------------------------|---------------------------------------------------|
| 000                            | Traffic Channel Assignment<br>(Band Class 0 only) |
| 001                            | Paging Channel Assignment<br>(Band Class 0 only)  |
| 010                            | Acquire Analog System                             |
| 011                            | Analog Voice Channel Assignment                   |
| 100                            | Extended Traffic Channel<br>Assignment            |
| 101                            | Extended Paging Channel<br>Assignment             |
| All other values are reserved. |                                                   |

- 6
- 7        ADD\_RECORD\_LEN    - Additional record length.  
 8           The base station shall set this field to the number of octets in  
 9           the additional record fields included in this assignment  
 10          record.
- 11      Additional record fields    - Additional record fields.  
 12           The additional record fields are determined by the value of  
 13           ASSIGN\_MODE, as described below.
- 14
- 15      If the ASSIGN\_MODE field is set to '000', the base station shall include the following fields:
- 16        FREQ\_INCL    - Frequency included indicator.  
 17           If the CDMA\_FREQ field is included in this assignment record,  
 18           the base station shall set this bit to '1'. If the CDMA\_FREQ  
 19           field is not included in this assignment record, the base  
 20           station shall set this bit to '0'.
- 21        CODE\_CHAN    - Code channel.  
 22           The base station shall set this field to the code channel index  
 23           (see [2]) in the range 1 to 63 inclusive that the mobile station  
 24           is to use on the Fundamental Channel of the Forward Traffic  
 25           Channel.
- 26        CDMA\_FREQ    - Frequency assignment.

If the FREQ\_INCL bit is set to '1', the base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ\_INCL bit is set to '0', the base station shall omit this field.

- 7      FRAME\_OFFSET    -    Frame offset.  
8      The Forward and Reverse Traffic Channel frames are delayed  
9      FRAME\_OFFSET × 1.25 ms relative to system timing (see [2]).  
10     The base station shall set this field to the Forward and  
11    Reverse Traffic Channel frame offset.
- 12     ENCRYPT\_MODE    -    Message encryption mode.  
13     The base station shall set this field to the ENCRYPT\_MODE  
14    value shown in Table 3.7.2.3.2.8-2 corresponding to the  
15    encrypting mode that is to be used for signaling messages, as  
16    specified in 2.3.12.2.

**Table 3.7.2.3.2.8-2. Message Encryption Modes**

| <b>ENCRYPT_MODE Field<br/>(binary)</b> | <b>Encryption Mode Used</b>                  |
|----------------------------------------|----------------------------------------------|
| 00                                     | Encryption disabled                          |
| 01                                     | Basic encryption of call control messages    |
| 10                                     | Enhanced encryption of call control messages |
| 11                                     | Extended encryption of call control messages |

- 19     D\_SIG\_ENCRYPT-  
20     \_MODE    -    General-Dedicated channel signaling encryption mode indicator.  
21     If ENCRYPT\_MODE is set to '11', the base station shall include  
22     this field and shall set it to the dedicated channel signaling  
23     message-encryption mode, as shown in Table 3.7.4.5-1; otherwise  
24     the base station shall omit this field.
- 26     USE\_NEW\_KEY    Use new encryption key indication  
27     If ENCRYPT\_MODE is set to '10' or '11', the base station shall  
28     include this field; otherwise, the base station shall omit this field.  
29     If this field is included, the base station shall set this field to '0' to  
30     indicate that the stored encryption key is to be used by the mobile  
31     station and to '1' to indicate that the new encryption key is to be  
32     used by the mobile station.
- 33     ENC\_KEY\_SIZE    -    Encryption key size indication.

1            If ENCRYPT MODE is set to '10' or '11', USE\_NEW\_KEY is  
 2            included and is set to '0', the base station shall omit this field;  
 3            otherwise, the base station shall include this field and shall set it  
 4            to the encryption key size, as shown in Table 3.7.4.5-2; otherwise,  
 5            the base station shall omit this field.

6            KEY\_SEQ — Encryption key sequence number.

7            If USE\_NEW\_KEY is included and is set to '0', the base station  
 8            shall include this field; otherwise, the base station shall omit this  
 9            field. If this field is included, the base station shall set it to the  
 10          encryption key sequence number to be used by the mobile  
 11          station.

### C SIG ENCRYPT

13          MODE INCL - Common channel signaling encryption mode included  
 14          indicator.

15          If P REV IN USE is less than seven, the base station shall set  
 16          this field to '0'; otherwise, the base station shall set this field  
 17          as follows:

18          If common channel signaling encryption information is  
 19          included in this message, the base station shall set this field  
 20          to '1'; otherwise, the base station shall set this field to '0'.

### C SIG ENCRYPT

22          MODE - Common channel signaling encryption mode indicator.

23          If C SIG ENCRYPT MODE INCL is set to '1', the base station  
 24          shall include this field and shall set it to the common channel  
 25          signaling encryption mode, as shown in Table 3.7.4.5-1;  
 26          otherwise, the base station shall omit this field.

27          RESERVED - Reserved bits.

29          The base station shall add reserved bits as needed in order to  
 30          make the total length of the fields after the preceding  
 31          ADD\_RECORD\_LEN field through this RESERVED field equal  
 32          to an integer number of octets. The base station shall set  
 33          these bits to '0'.

35          If the ASSIGN\_MODE field is set to '001', the base station shall include the following fields:

36          RESPOND - Respond on new Access Channel indicator.

37          If the mobile station is to retransmit an *Origination Message* or  
 38          *Page Response Message* after processing this channel  
 39          assignment, the base station shall set this field to '1'. The  
 40          base station may set this field to '0' only in response to a *Page*  
 41          *Response Message*.

- 1           FREQ\_INCL   - Frequency included indicator.  
 2           If the CDMA\_FREQ field is included in this assignment record,  
 3           the base station shall set this bit to '1'. If the CDMA\_FREQ  
 4           field is not included in this assignment record, the base  
 5           station shall set this bit to '0'.
- 6           CDMA\_FREQ   - Frequency assignment.  
 7           If the FREQ\_INCL bit is set to '1', the base station shall set  
 8           this field to the CDMA Channel number corresponding to the  
 9           CDMA frequency assignment for the CDMA Channel  
 10          containing the Paging Channel the mobile station is to use. If  
 11          the FREQ\_INCL bit is set to '0', the base station shall omit this  
 12          field.
- 13          PILOT\_PN   - Pilot PN sequence offset index.  
 14          The base station shall include one occurrence of this field for  
 15          each base station whose Paging Channel may be monitored by  
 16          the mobile station. For each occurrence, the base station  
 17          shall set this field to the pilot PN sequence offset for a base  
 18          station, in units of 64 PN chips. The base station having this  
 19          pilot PN sequence offset should support a Primary Paging  
 20          Channel with the same Paging Channel rate as the current  
 21          base station.
- 22          RESERVED   - Reserved bits.  
 23          The base station shall add reserved bits as needed in order to  
 24          make the total length of the fields, after the preceding  
 25          ADD\_RECORD\_LEN field through this RESERVED field, equal  
 26          to an integer number of octets. The base station shall set  
 27          these bits to '0'.
- 28
- 29          If the ASSIGN\_MODE field is set to '010', the base station shall include the following fields:
- 30           RESPOND   - Respond on analog control channel indicator.  
 31           If the mobile station is to retransmit an *Origination Message* or  
 32           *Page Response Message* on the analog control channel (see [6])  
 33           after processing this channel assignment, the base station  
 34           shall set this field to '1'. The base station may set this field to  
 35           '0' only in response to a *Page Response Message*.
- 36           ANALOG\_SYS   - System indicator.  
 37           If USE\_ANALOG\_SYS is equal to '0', the base station shall set  
 38           this field to '0'. Otherwise, the base station shall set this field  
 39           to '0' if the mobile station is to use analog system A, or to '1' if  
 40           the mobile station is to use analog system B.
- 41           USE\_ANALOG\_SYS   - Use analog system indicator.  
 42           The base station shall set this field to '1' to direct the mobile  
 43           station to the analog system specified by ANALOG\_SYS;  
 44           otherwise, the base station shall set this field to '0'.
- 45           BAND\_CLASS   - Band class.

1                   The base station shall set this field according to values defined  
 2                   in [30].  
 3

4     If the ASSIGN\_MODE field is set to '011', the base station shall include the following fields:

- 5         SID      - System identification of the analog system.  
        The base station shall set this field to the system identification  
        of the analog system supporting the assigned voice channel  
        for this assignment (see [6]).
- 6         VMAC     - Voice mobile station attenuation code.  
        The base station shall set this field to the mobile station  
        power level associated with the assigned voice channel for this  
        assignment (see [6]).
- 7         ANALOG\_CHAN - Voice channel number.  
        The base station shall set this field to the voice channel  
        number for this assignment (see [6]).
- 8         SCC      - SAT color code.  
        The base station shall set this field to the supervisory audio  
        tone color code associated with the assigned voice channel. If  
        the assignment is to a narrow analog channel, the base  
        station shall set this field to the two least significant bits of  
        the DSCC.
- 9         MEM      - Message encryption mode indicator.  
        If analog control message encryption is to be enabled on the  
        assigned forward and reverse analog voice channels, the base  
        station shall set this bit to '1'; otherwise, the base station  
        shall set this bit to '0'.
- 10        AN\_CHAN\_TYPE - Analog voice channel type.  
        The base station shall set this field to the analog channel type  
        as specified in Table 3.7.3.3.2.6-1. If the mobile station does  
        not have narrow analog capability, the base station shall set  
        this field to '00'.
- 11        DSCC\_MSB   - Digital supervisory audio tone color code most significant bit.  
        The base station shall set this field to '0' when directing  
        handoff to a wide analog channel. The base station shall set  
        this field to the most significant bit of the DSCC when  
        directing handoff to a narrow analog channel.
- 12        BAND\_CLASS - Band class.  
        The base station shall set this field according to values defined  
        in [30].

41    If the ASSIGN\_MODE field is set to '100', the base station shall include the following fields:

- 1           FREQ\_INCL    - Frequency included indicator.  
2  
3  
4  
5  
6  
7           RESERVED     - Reserved bits.  
8  
9           BYPASS\_ALERT-  
10           \_ANWER      - Bypass alert indicator.  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20           DEFAULT\_CONFIG - Default Configuration.  
21  
22  
23  
24
- If the BAND\_CLASS and CDMA\_FREQ fields are included in this assignment record, the base station shall set this bit to '1'. If the BAND\_CLASS and CDMA\_FREQ fields are not included in this assignment record, the base station shall set this bit to '0'.
- The base station shall set this field to '000'.
- If the MOB\_P\_REV of the current band class of the mobile station is less than or equal to three, the base station shall set this field to '0'; otherwise, the base station shall set this field as follows.
- If the base station has received a *Page Response Message* that specifies a packet data service option, and the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for Mobile Station Answer Substate*, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.
- If the GRANTED\_MODE field is set to '00', the base station shall set this field as specified in Table 3.7.2.3.2.8-3 to indicate an initial multiplex option and radio configuration for the Forward and Reverse Traffic Channels.

**Table 3.7.2.3.2.8-3. Default Configuration**

| <b>Value<br/>(binary)</b>      | <b>Default Configuration</b>                                                                                                                               |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000                            | Multiplex Option 1 and Radio Configuration 1 for both the Forward Traffic Channel and the Reverse Traffic Channel                                          |
| 001                            | Multiplex Option 2 and Radio Configuration 2 for both the Forward Traffic Channel and the Reverse Traffic Channel                                          |
| 010                            | Multiplex Option 1 and Radio Configuration 1 for the Forward Traffic channel; Multiplex Option 2 and Radio Configuration 2 for the Reverse Traffic channel |
| 011                            | Multiplex Option 2 and Radio Configuration 2 for the Forward Traffic channel; Multiplex Option 1 and Radio Configuration 1 for the Reverse Traffic channel |
| All other values are reserved. |                                                                                                                                                            |

GRANTED\_MODE - Granted mode.

The base station shall set this field to '00' to indicate that the mobile station is to use an initial service configuration consisting of the multiplex option and radio configuration defined by the DEFAULT\_CONFIG field for the Forward and Reverse Traffic Channels, and to indicate that service negotiation is to take place before the base station sends the first *Service Connect Message*.

The base station shall set this field to '01' to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option and transmission rates corresponding to the service option requested by the mobile station either in the *Origination Message* or *Page Response Message*, and to indicate that service negotiation is to take place before the base station sends the first *Service Connect Message*.

The base station shall set this field to '10' to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option and transmission rates corresponding to the service option requested by the mobile station either in the *Origination Message* or *Page Response Message*, and to indicate that service negotiation is not to take place before the base station sends the first *Service Connect Message*.

- |              |                                                                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CODE_CHAN    | - Code channel.                                                                                                                                                                                                                                                                                                                                              |
|              | The base station shall set this field to the code channel index (see [2]) in the range 1 to 63 inclusive that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel.                                                                                                                                                        |
| FRAME_OFFSET | - Frame offset.                                                                                                                                                                                                                                                                                                                                              |
|              | The Forward and Reverse Traffic Channel frames are delayed <u>FRAME_OFFSET</u> × 1.25 ms relative to system timing (see [2]).                                                                                                                                                                                                                                |
|              | The base station shall set this field to the Forward and Reverse Traffic Channel frame offset.                                                                                                                                                                                                                                                               |
| CRYPT_MODE   | - Message encryption mode.                                                                                                                                                                                                                                                                                                                                   |
|              | The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.                                                                                                                                                       |
| BAND_CLASS   | - Band class.                                                                                                                                                                                                                                                                                                                                                |
|              | If the FREQ_INCL bit is set to '1', the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to '0', the base station shall omit this field.                 |
| CDMA_FREQ    | - Frequency assignment.                                                                                                                                                                                                                                                                                                                                      |
|              | If the FREQ_INCL bit is set to '1', the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to '0', the base station shall omit this field. |
| ENCRYPT_MODE | - <u>Dedicated channel signalingGeneral</u> -encryption mode indicator                                                                                                                                                                                                                                                                                       |
|              | If ENCRYPT_MODE is set to '11', the base station shall include this field and shall set it to <u>the dedicated channel signal message encryption-encyption</u> -mode, as shown in Table 3.7.4.5; otherwise the base station shall omit this field.                                                                                                           |
| SE_NEW_KEY   | <u>Use new encryption key indication</u>                                                                                                                                                                                                                                                                                                                     |

1                    If ENCRYPT\_MODE is set to '10' or '11', the base station shall  
 2                    include this field; otherwise, the base station shall omit this field.  
 3                    If this field is included, the base station shall set this field to '0' to  
 4                    indicate that the stored encryption key is to be used by the mobile  
 5                    station and to '1' to indicate that the new encryption key is to be  
 6                    used by the mobile station.

7            **ENC\_KEY\_SIZE** - Encryption key size indication.

8                    If ENCRYPT\_MODE is set to '10' or '11' USE\_NEW\_KEY is included  
 9                    and is set to '0', the base station shall omit this field; otherwise,  
 10                  the base station shall include this field and shall set it to the  
 11                  encryption key size, as shown in Table 3.7.4.5-2; otherwise, the  
 12                  base station shall omit this field.

13            **KEY\_SEQ** - Encryption key sequence number.

14                    If USE\_NEW\_KEY is included and is set to '0', the base station  
 15                    shall include this field; otherwise, the base station shall omit this  
 16                    field. If this field is included, the base station shall set it to the  
 17                    encryption key sequence number to be used by the mobile  
 18                    station.

### 19            **C SIG ENCRYPT**

20            **MODE\_INCL** - Common channel signaling encryption mode included  
 21                    indicator.

22                    If P\_REV\_IN\_USE is less than seven, the base station shall set  
 23                    this field to '0'; otherwise, the base station shall set this field  
 24                    as follows:

25                    If common channel signaling encryption information is  
 26                    included in this message, the base station shall set this field  
 27                    to '1'; otherwise, the base station shall set this field to '0'.

### 28            **C SIG ENCRYPT**

29            **MODE** - Common channel signaling encryption mode indicator.

30                    If C\_SIG\_ENCRYPT\_MODE\_INCL is set to '1', the base station  
 31                    shall include this field and shall set it to the common channel  
 32                    signaling encryption mode, as shown in Table 3.7.4.5-1;  
 33                    otherwise, the base station shall omit this field.

35            **RESERVED** - Reserved bits.

36                    The base station shall add reserved bits as needed in order to  
 37                    make the total length of the fields after the preceding  
 38                    ADD\_RECORD\_LEN field through this RESERVED field equal  
 39                    to an integer number of octets. The base station shall set  
 40                    these bits to '0'.

41            If the ASSIGN\_MODE field is set to '101', the base station shall include the following fields:

- 1           RESPOND    -    Respond on new Access Channel indicator.
- 2                         If the mobile station is to retransmit an *Origination Message* or  
 3                         *Page Response Message* after processing this channel  
 4                         assignment, the base station shall set this field to '1'. The  
 5                         base station may set this field to '0' only in response to a *Page*  
 6                         *Response Message*.
- 7           FREQ\_INCL    -    Frequency included indicator.
- 8                         If the BAND\_CLASS and CDMA\_FREQ fields are included in  
 9                         this assignment record, the base station shall set this bit to  
 10                        '1'. If the BAND\_CLASS and CDMA\_FREQ fields are not  
 11                        included in this assignment record, the base station shall set  
 12                        this bit to '0'.
- 13          BAND\_CLASS    -    Band class.
- 14                         If the FREQ\_INCL bit is set to '1', the base station shall set  
 15                        this field to the CDMA band class, as specified in [30],  
 16                        corresponding to the CDMA frequency assignment for the  
 17                        CDMA Channel containing the Paging Channel the mobile  
 18                        station is to use. If the FREQ\_INCL bit is set to '0', the base  
 19                        station shall omit this field.
- 20          CDMA\_FREQ    -    Frequency assignment.
- 21                         If the FREQ\_INCL bit is set to '1', the base station shall set  
 22                        this field to the CDMA Channel number, in the specified  
 23                        CDMA band class, corresponding to the CDMA frequency  
 24                        assignment for the CDMA Channel containing the Paging  
 25                        Channel the mobile station is to use. If the FREQ\_INCL bit is  
 26                        set to '0', the base station shall omit this field.
- 27          PILOT\_PN      -    Pilot PN sequence offset index.
- 28                         The base station shall include one occurrence of this field for  
 29                         each base station whose Paging Channel may be monitored by  
 30                         the mobile station. For each occurrence, the base station  
 31                         shall set this field to the pilot PN sequence offset for a base  
 32                         station, in units of 64 PN chips. The base station having this  
 33                         pilot PN sequence offset should support a Primary Paging  
 34                         Channel with the same Paging Channel rate as the current  
 35                         base station.
- 36          RESERVED     -    Reserved bits.
- 37                         The base station shall add reserved bits as needed in order to  
 38                         make the total length of the fields after the preceding  
 39                         ADD\_RECORD\_LEN field through this RESERVED field equal  
 40                         to an integer number of octets. The base station shall set  
 41                         these bits to '0'.

## 1    3.7.2.3.2.9 Data Burst Message

## 2    MSG\_TAG: DBM

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| MSG_NUMBER   | 8                    |
| BURST_TYPE   | 6                    |
| NUM_MSGS     | 8                    |
| NUM_FIELDS   | 8                    |

NUM\_FIELDS occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

3

- 4    MSG\_NUMBER    -    Message number.  
 5                    The base station shall set this field to the number of this  
 6                    message within the data burst stream.
- 7    BURST\_TYPE    -    Data burst type.  
 8                    The base station shall set the value of this field for the type of  
 9                    this data burst as defined in [30]. If the mobile station sets  
 10                 this field equal to '111110', it shall set the first two CHARi  
 11                 fields of this message equal to  
 12                 EXTENDED\_BURST\_TYPE\_INTERNATIONAL as described in  
 13                 the definition of CHARi below. If the base station sets this  
 14                 field equal to '111111', it shall set the first two CHARi fields of  
 15                 this message equal to the EXTENDED\_BURST\_TYPE as  
 16                 described in the definition of CHARi below.
- 17    NUM\_MSGS    -    Number of messages in the data burst stream.  
 18                    The base station shall set this field to the number of messages  
 19                 in this data burst stream.
- 20    NUM\_FIELDS    -    Number of characters in this message.  
 21                    The base station shall set this field to the number of  
 22                 occurrences of the CHARi field included in this message.
- 23    CHARi    -    Character.  
 24                    The base station shall include NUM\_FIELDS occurrences of  
 25                 this field. The base station shall set these fields to the  
 26                 corresponding octet of the data burst stream.

If the BURST\_TYPE field of this message is equal to '111110', the first two CHARi octets shall represent a 16 bit EXTENDED\_BURST\_TYPE\_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC) associated with the national standards organization administering the use of the remaining octets of the message. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED\_BURST\_TYPE\_INTERNATIONAL field shall specify the COUNTRY\_BURST\_TYPE. The base station shall set the value of the COUNTRY\_BURST\_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

| <b>Field</b>           | <b>Length (bits)</b>               |
|------------------------|------------------------------------|
| Mobile Country Code    | 10                                 |
| COUNTRY_BURST_TYPE     | 6                                  |
| Remaining CHARi fields | $8 \times (\text{NUM_FIELDS} - 2)$ |

If the BURST\_TYPE field of this message is equal to '111111', the first two CHARi octets shall represent a single, 16 bit, EXTENDED\_BURST\_TYPE field, as shown below. The base station shall set the value of the EXTENDED\_BURST\_TYPE according to the type of this data burst as defined in [30].

| <b>Field</b>                                    | <b>Length (bits)</b>               |
|-------------------------------------------------|------------------------------------|
| EXTENDED_BURST_TYPE<br>(first two CHARi fields) | 16                                 |
| Remaining CHARi fields                          | $8 \times (\text{NUM_FIELDS} - 2)$ |

## 1    3.7.2.3.2.10 Authentication Challenge Message

2    MSG\_TAG: AUCM

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| RANDU        | 24                   |

3

4            RANDU    -    Random challenge data.

5            The base station shall set this field to the random challenge  
6            data (see 2.3.12.1.4).

1    3.7.2.3.2.11 SSD Update Message

2    MSG\_TAG: SSDUM

| Field   | Length (bits) |
|---------|---------------|
| RANDSSD | 56            |

3

4    RANDSSD - Random data for the computation of SSD.

5    The base station shall set this field as specified in 2.3.12.1.5.

## 1    3.7.2.3.2.12 Feature Notification Message

2    MSG\_TAG: FNM

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| RELEASE      | 1                    |

One or more occurrences of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

3

4    RELEASE    -    Origination completion indicator.

5                 The base station shall set this field to '1' if this message is  
6                 used to complete an origination request from the mobile  
7                 station (see 2.6.3.5); otherwise, the base station shall set this  
8                 field to '0'.

9

10          The base station shall include occurrences of the following three-field record as specified in  
11         3.7.5.

12          RECORD\_TYPE    -    Information record type.

13                 The base station shall set this field as specified in 3.7.5.

14          RECORD\_LEN    -    Information record length.

15                 The base station shall set this field to the number of octets in  
16                 the type-specific fields included in this record.

17          Type-specific fields    -    Type-specific fields.

18                 The base station shall include type-specific fields as specified  
19                 in 3.7.5.

## 1 3.7.2.3.2.13 Extended System Parameters Message

2 MSG\_TAG: ESPM

| <b>Field</b>          | <b>Length (bits)</b>              |
|-----------------------|-----------------------------------|

| <u>PILOT_INFO_REQ_SUPPORTED</u> | <u>1</u>      |

2

- 3 PILOT\_PN - Pilot PN sequence offset index.  
4 The base station shall set this field to the pilot PN sequence  
5 offset for this base station, in units of 64 PN chips.
- 6 CONFIG\_MSG\_SEQ - Configuration message sequence number.  
7 The base station shall set this field to CONFIG\_SEQ  
8 (see 3.6.2.2).
- 9 DELETE\_FOR\_TMSI - Delete foreign TMSI.  
10 The base station shall set this field to '1' to cause the mobile  
11 station to delete its TMSI if the TMSI was assigned in a  
12 different TMSI zone from that specified by the TMSI\_ZONE  
13 field of this message; otherwise, the base station shall set this  
14 field to '0'.
- 15 USE\_TMSI - Use TMSI indicator.  
16 The base station shall set this field to the value shown in  
17 Table 3.7.2.3.2.13-1 corresponding to the type of MSID that  
18 the mobile station is to use on the Access Channel.
- 19 PREF\_MSID\_TYPE - Preferred Access Channel Mobile Station Identifier Type.  
20 The base station shall set this field to the value shown in  
21 Table 3.7.2.3.2.13-1 corresponding to the type of MSID that  
22 the mobile station is to use on the Access Channel.
- 23

**Table 3.7.2.3.2.13-1. Preferred MSID Types**

| <b>USE_TMSI<br/>(binary)</b>   | <b>PREF_MSID_TYPE<br/>(binary)</b> | <b>Description</b>                                                 |
|--------------------------------|------------------------------------|--------------------------------------------------------------------|
| 0                              | 00                                 | IMSI_S and ESN                                                     |
| 0                              | 10                                 | IMSI                                                               |
| 0                              | 11                                 | IMSI and ESN                                                       |
| 1                              | 10                                 | TMSI (valid TMSI is assigned);<br>IMSI (TMSI not assigned)         |
| 1                              | 11                                 | TMSI (valid TMSI is assigned);<br>IMSI and ESN (TMSI not assigned) |
| All other values are reserved. |                                    |                                                                    |

- 2
- 3           MCC     - Mobile Country Code.  
         The base station shall set this field to the MCC (see 2.3.1)
- 4           IMSI\_11\_12 - 11<sup>th</sup> and 12<sup>th</sup> digits of the IMSI.  
         The base station shall set this field to the IMSI\_11\_12 (see 2.3.1).
- 5           TMSI\_ZONE\_LEN - TMSI zone length.  
         The base station shall set this field to the number of octets included in the TMSI\_ZONE. The base station shall set this field to a value in the range 1 to 8 inclusive.
- 6           TMSI\_ZONE - TMSI zone.  
         The base station shall set this field to the TMSI zone number as specified in [27].
- 7           BCAST\_INDEX - Broadcast slot cycle index.  
         To enable periodic broadcast paging, the base station shall set this field to an unsigned 3-bit number in the range 1-7, equal to the broadcast slot cycle index as defined in 2.6.2.1.1.3.3. To disable periodic broadcast paging, the base station shall set this field to '000'.
- 8           IMSI\_T\_SUPPORTED - IMSI\_T support indicator.  
         The base station shall set this field to '1' to indicate support for a 15-digit IMSI\_T addressing according to [18].
- 9           P\_REV     - Protocol revision level.  
         The base station shall set this field to '00000111'.
- 10          MIN\_P\_REV - Minimum protocol revision level.

The base station sets this field to prevent mobile stations which cannot be supported by the base station from accessing the system.

The base station shall set this field to the minimum protocol revision level that it supports. For Band Class 0 operation, the base station should set this field to a value of '00000010' or greater. For Band Class 1 or Band Class 4 operation, the base station should set this field to a value of '00000001' or greater. For Band Class 3 operation, the base station should set this field to a value of '00000011' or greater. For Band Class 2 or Band Class 5 operation, the base station should set this field to '00000101' or greater. For Band Class 6, Band Class 7, Band Class 8, ~~or~~ Band Class 9, or Band Class 10 operation, the base station should set this field to '00000110' or greater.

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| KET_ZONE_ID | <ul style="list-style-type: none"> <li>- Packet data services zone identifier.<br/>If the base station supports a packet data service zone, the base station shall set this field to its non-zero packet data services zone identifier.<br/>If the base station does not support a packet data service zone, the base station shall set this field to '00000000'.</li> </ul>                                                                                                                                                                                                  |
| _NUM_ALT_SO | <ul style="list-style-type: none"> <li>- Maximum number of alternative service options.<br/>The base station shall set this field to the maximum number of alternative service option numbers that the mobile station is allowed to include in the <i>Origination Message</i> or the <i>Page Response Message</i>.<br/>For mobile stations with MOB_P_REV<sub>s</sub> less than seven, the alternative service options are those service options defined in [30] and related to SERVICE_OPTION in <i>Origination Message</i> and the <i>Page Response Message</i>.</li> </ul> |

For mobile stations with MOB\_P\_REV<sub>s</sub> equal to or greater than seven, the alternative service options are those service options defined in [30] without service group number assigned and related to SERVICE\_OPTION in *Origination Message* and the *Page Response Message*.

If the base station sets this field to a value greater than zero, in addition, the base station shall allow the mobile station with MOB\_P\_REV<sub>s</sub> equal to or greater than 7 to include

- a 4 or 8-bit service option bitmap in the *Origination Message* and the *Page Response Message*;
- alternate service option numbers, not limited to MAX\_ALT\_SO\_NUM, in the *Enhanced Origination Message*.

RESELECT\_INCLUDED - System reselection parameters included.

If the base station is including system reselection parameters, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

EC\_THRESH - Pilot power threshold.

If RESELECT\_INCLUDED is set to '1', the base station shall include the field EC\_THRESH and set this field to:

$$\lceil (pilot\_power\_threshold + 115) \rceil$$

where *pilot\_power\_threshold* is the pilot power, E<sub>c</sub>, in dBm/1.23 MHz, below which the mobile station is to perform system reselection; otherwise, the base station shall omit this field.

EC\_IO\_THRESH - Pilot E<sub>c</sub>/I<sub>o</sub> threshold.

If RESELECT\_INCLUDED is set to '1', the base station shall include the field EC\_IO\_THRESH and set this field to:

$$\lfloor -20 \times \log_{10} (pilot\_threshold) \rfloor$$

where *pilot\_threshold* is the pilot E<sub>c</sub>/I<sub>o</sub> below which the mobile station is to perform system reselection; otherwise, the base station shall omit this field.

PILOT\_REPORT - Pilot reporting indicator.

The base station shall set this field to '1' if the mobile station is to report the additional pilots which have pilot strengths exceeding T\_ADD in all Access Channel messages. The base station shall set this field to '0' if the mobile station is to report the additional pilots which have pilot strengths exceeding T\_ADD only in the *Origination Message* and the *Page Response Message*.

NGHBR\_SET-  
\_ENTRY\_INFO

- Neighbor Set access entry handoff information included indicator.

If the base station is including information on the Neighbor Set access entry handoff, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- 1    ACC\_ENT\_HO\_ORDER    -    Access entry handoff permitted indicator.  
 2                          If NGHBR\_SET\_ENTRY\_INFO is set to '1', the base station  
 3                          shall include this field and set it as described below;  
 4                          otherwise, the base station shall omit this field.  
 5                          The base station shall set this field to '1' if the mobile station  
 6                          is permitted to perform an access entry handoff after receiving  
 7                          a message while performing the *Mobile Station Order and*  
 8                          *Message Processing Operation* in the *Mobile Station Idle State*  
 9                          (see 2.6.2.4); otherwise, the base station shall set this field to  
 10                         '0'.  
 11                         NGHBR\_SET-  
 12                         \_ACCESS\_INFO    -    Neighbor Set access handoff included indicator.  
 13                         If the base station is including information on the Neighbor  
 14                         Set access handoff or access probe handoff, the base station  
 15                         shall set this field to '1', otherwise, the base station shall set  
 16                         this field to '0'.  
 17                         ACCESS\_HO    -    Access handoff permitted indicator.  
 18                         If NGHBR\_SET\_ACCESS\_INFO is set to '1', the base station  
 19                         shall include this field and set it as described below;  
 20                         otherwise, the base station shall omit this field.  
 21                         The base station shall set this field to '1' if the mobile station  
 22                         is permitted to perform an access handoff (see 2.6.3.1.3.2);  
 23                         otherwise, the base station shall set this field to '0'.  
 24                         ACCESS\_HO\_MSG\_RSP    -    Access handoff permitted for message response indicator.  
 25                         If ACCESS\_HO is set to '1', the base station shall include this  
 26                         field and set it as described below; otherwise, the base station  
 27                         shall omit this field.  
 28                         The base station shall set this field to '1' if the mobile station  
 29                         is permitted to perform an access handoff after receiving a  
 30                         message and before responding to that message in the *System*  
 31                         *Access State*; otherwise, the base station shall set this field to  
 32                         '0'.  
 33                         ACCESS\_PROBE\_HO    -    Access probe handoff permitted indicator.  
 34                         If NGHBR\_SET\_ACCESS\_INFO is set to '1', the base station  
 35                         shall include this field and set it as described below;  
 36                         otherwise, the base station shall omit this field.  
 37                         The base station shall set this field to '1' if the mobile station  
 38                         is permitted to perform an access probe handoff (see  
 39                         2.6.3.1.3.3); otherwise, the base station shall set this field to  
 40                         '0'.  
 41                         ACC\_HO\_LIST\_UPD    -    Access handoff list update permitted indicator.  
 42                         If ACCESS\_PROBE\_HO is included and is set to '1', the base  
 43                         station shall include this field and set it as described below;  
 44                         otherwise, the base station shall omit this field.

The base station shall set this field to '1' if the mobile station is permitted to update the access handoff list during an access attempt (see 2.6.3.1.7.2); otherwise, the base station shall set this field to '0'.

## ACC\_PROBE\_HO-

- Access probe handoff permitted for messages other than the *Origination Message* and the *Page Response Message*.

If ACCESS\_PROBE\_HO is set to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to '1' if the mobile station is permitted to perform an access probe handoff for messages other than the *Origination Message* and the *Page Response Message*. The base station shall set this field to '0' if the mobile station is permitted to perform an access probe handoff only for the *Origination Message* and the *Page Response Message*. See 2.6.3.1.3.3.

MAX\_NUM\_PROBE\_HO

- Maximum number of times that the mobile station is permitted to perform an access probe handoff.

If ACCESS\_PROBE\_HO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the maximum number of times the mobile station is allowed to perform an access probe handoff within an access attempt minus one.

## NGHBR\_SET\_SIZE

- Size of the Neighbor Set.

If NGHBR\_SET\_ENTRY\_INFO or NGHBR\_SET\_ACCESS\_INFO is equal to '1', the base station shall set this field to the number of pilots included in the *Neighbor List Message*, *Extended Neighbor List Message*, or *General Neighbor List Message*; otherwise, the base station shall omit this field.

If `NGHBR_SET_ENTRY_INFO` is equal to '1', the base station shall include `NGHBR_SET_SIZE` occurrences of the following field:

## ACCESS ENTRY HO

- Access entry handoff permitted when entering the System Access State.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access entry handoff to the base station associated with the corresponding pilot between the time it receives a message on the Paging Channel when in the *Mobile Station Idle State* and it enters the *System Access State* to respond to the message; otherwise, the base station shall set this field to ‘0’. The base station shall use the same order for the ACCESS\_ENTRY\_HO fields in this message as is used for pilots which are listed in the *Neighbor List Message*, *Extended Neighbor List Message*, or *General Neighbor List Message*. Specifically, the  $i^{th}$  occurrence of the ACCESS\_ENTRY\_HO field shall correspond the  $i^{th}$  pilot in the *Neighbor List Message*, *Extended Neighbor List Message*, or *General Neighbor List Message*.

If NGHBR\_SET\_ACCESS\_INFO is equal to ‘1’, the base station shall include NGHBR\_SET\_SIZE occurrences of the following field:

ACCESS\_HO\_ALLOWED - Access handoff and access probe handoff permitted for the corresponding pilot while in the *System Access State*.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff or access probe handoff to the base station associated with the corresponding pilot when the mobile station is in the *System Access State* (see 2.6.3.1.8 and 2.6.3.1.9); otherwise, the base station shall set this field to ‘0’. The base station shall use the same order for the ACCESS\_HO\_ALLOWED fields in this message as is used for pilots which are listed in the *Neighbor List Message*, *Extended Neighbor List Message*, or *General Neighbor List Message*. Specifically, the  $i^{th}$  occurrence of the ACCESS\_HO\_ALLOWED field shall correspond the  $i^{th}$  pilot in the *Neighbor List Message*, *Extended Neighbor List Message*, or *General Neighbor List Message*.

BROADCAST\_GPS\_ASST - Broadcast GPS Assist Indicator.

The base station shall set this field to ‘1’ if it supports Broadcast GPS Assist capability; otherwise, the base station shall set this field to ‘0’.

QPCH\_SUPPORTED - Quick Paging Channel Supported Indication.

If the base station supports Quick Paging Channel operation, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

NUM\_QPCH - Number of Quick Paging Channels.

If the base station sets QPCH\_SUPPORTED to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the number of Quick Paging Channels on this CDMA Channel. The base station shall not set this field to ‘00’.

QPCH\_RATE - Quick Paging Channel indicator rate.

If the base station sets QPCH\_SUPPORTED to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the QPCH\_RATE field value shown in Table 3.7.2.3.2.13-2 corresponding to the indicator rate used by the Quick Paging Channel in the system.

**Table 3.7.2.3.2.13-2. QPCH Indicator Data Rate**

| <b>QPCH_RATE Field<br/>(binary)</b> | <b>QPCH indicator data rate</b> |
|-------------------------------------|---------------------------------|
| 0                                   | 4800 bps                        |
| 1                                   | 9600 bps                        |

QPCH\_POWER-  
\_LEVEL\_PAGE

- Quick Paging Channel paging indicator transmit power level.
- If the base station sets QPCH\_SUPPORTED to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.
- The base station shall set this field to the Quick Paging Channel paging indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.13-3.

**Table 3.7.2.3.2.13-3 Quick Paging Channel Transmit Power Level**

| <b>QPCH_POWER_LEVEL_PAGE</b>                | <b>Transmit Power Level</b>                 |
|---------------------------------------------|---------------------------------------------|
| <b>QPCH_POWER_LEVEL_CONFIG<br/>(binary)</b> |                                             |
| 000                                         | 5 dB below the Pilot Channel Transmit Power |
| 001                                         | 4 dB below the Pilot Channel Transmit Power |
| 010                                         | 3 dB below the Pilot Channel Transmit Power |
| 011                                         | 2 dB below the Pilot Channel Transmit Power |
| 100                                         | 1 dB below the Pilot Channel Transmit Power |
| 101                                         | Same as the Pilot Channel Transmit Power    |
| 110                                         | 1 dB above the Pilot Channel Transmit Power |
| 111                                         | 2 dB above the Pilot Channel Transmit Power |

- |    |                         |   |                                                                                                                                                                                                                                                                                                                                                                      |
|----|-------------------------|---|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | QPCH_CCI_SUPPORTED      | - | Quick Paging Channel configuration change indicator supported.                                                                                                                                                                                                                                                                                                       |
| 2  |                         |   | If QPCH_SUPPORTED is set to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.                                                                                                                                                                                                         |
| 3  |                         |   | If the base station supports configuration change indicators on the Quick Paging Channel, the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.                                                                                                                                                                      |
| 4  | QPCH_POWER_LEVEL_CONFIG | - | Quick Paging Channel configuration change indicator transmit power level.                                                                                                                                                                                                                                                                                            |
| 5  |                         |   | If the base station includes the QPCH_CCI_SUPPORTED field and sets it to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.                                                                                                                                                            |
| 6  |                         |   | The base station shall set this field to the Quick Paging Channel configuration change indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.13-3.                                                                                                                                                                    |
| 7  | SDB_SUPPORTED           | - | Short Data Burst supported indicator.                                                                                                                                                                                                                                                                                                                                |
| 8  |                         |   | The base station shall set this field to '1' if the mobile station is permitted to send a Short Data Burst; otherwise, the base station shall set this field to '0'.                                                                                                                                                                                                 |
| 9  | RLGAIN_TRAFFIC_PILOT    | - | Gain adjustment of the Reverse Traffic Channel relative to the Reverse Pilot Channel for Radio Configurations greater than 2.                                                                                                                                                                                                                                        |
| 10 |                         |   | The base station shall set this field to the correction factor to be used by mobile stations in setting the power of a reverse traffic channel, expressed as a two's complement value in units of 0.125 dB (see 2.1.2.3.3 of [2]).                                                                                                                                   |
| 11 | REV_PWR-CNTL_DELAY_INCL | - | Reverse Power Control Delay included indicator.                                                                                                                                                                                                                                                                                                                      |
| 12 |                         |   | The base station shall set this field to '1' if the base station includes the REV_PWR_CNTL_DELAY field in this message; otherwise, the base station shall set this field to '0'.                                                                                                                                                                                     |
| 13 | REV_PWR-CNTL_DELAY      | - | The reverse power control delay.                                                                                                                                                                                                                                                                                                                                     |
| 14 |                         |   | If REV_PWR_CNTL_DELAY_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:                                                                                                                                                                                                        |
| 15 |                         |   | The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see 2.1.2.3.2 of [2]), in units of 1.25 ms. |

- 1            \_SUPPORTED    - Autonomous message supported indicator.  
 2            If the base station allows the autonomous delivery of the  
 3            *Device Information Message* on the r-csch, the base station  
 4            shall set this field to '1'; otherwise, the base station shall set  
 5            this field to '0'.
- 6            AUTO\_MSG-  
 7            \_INTERVAL    - Autonomous message interval.  
 8            If AUTO\_MSG\_SUPPORTED is set to '[04](#)', [the base station](#)  
 9            [shall omit this field; otherwise,](#) the base station shall [include](#)  
 10          [this field and shall](#) set this field to the AUTO\_MSG\_INTERVAL  
 11          value shown in Table 3.7.2.3.2.13-4 to indicate the minimum  
 12          time interval between autonomous messages sent by a mobile  
 13          station to the infrastructure. This parameter is intended to  
 14          allow the infrastructure to limit the frequency of autonomous  
 15          messages sent by a mobile station on the r-csch.

**Table 3.7.2.3.2.13-4. AUTO\_MSG\_INTERVAL Values**

| AUTO_MSG_INTERVAL<br>(binary) | Interval Length<br>(milliseconds) |
|-------------------------------|-----------------------------------|
| 000                           | 200                               |
| 001                           | 500                               |
| 010                           | 1000                              |
| 011                           | 1500                              |
| 100                           | 2000                              |
| 101                           | 5000                              |
| 110                           | 10000                             |
| 111                           | 15000                             |

- 17  
 18            MOB\_QOS    - Indicator granting permission to the mobile station to request  
 19            QoS parameter settings in the *Origination Message*, [Origination](#)  
 20            [Continuation Message](#), or [Enhanced Origination Message](#).  
 21            The base station shall set this field to '1', if the mobile station  
 22            is allowed to include a QoS record in the *Origination Message*,  
 23            [Origination Continuation Message](#), or [Enhanced Origination](#)  
 24            [Message](#); or to '0', otherwise, [the base station shall set this](#)  
 25            [field to '0'.](#)

|    |                  |                                                                                                                                                                                                                                                                                                                                                                                       |

| 27 | <u>STORE_KEY</u> | <u>Store session key indicator</u>                                                                                                                                                                                                                                                                                                                                                    |
| 34 |                  | <p><del>If ENC_SUPPORTED is equal to '1', the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field to '1' to indicate that the mobile station is to store the session key; otherwise the base station shall set this field to '0'.</del></p>                                    |
| 40 | USE_SYNC_ID      | <ul style="list-style-type: none"> <li>- Sync ID supported indicator.</li> </ul> <p>The base station shall set this field to '1' to indicate that the mobile station is permitted to include the SYNC_ID field in the <i>Page Response Message</i> and the <i>Origination Message</i>. Otherwise, the base station shall set this field to '0'.</p>                                   |
| 45 | CS_SUPPORTED     | <ul style="list-style-type: none"> <li>- Concurrent Services supported indicator.</li> </ul>                                                                                                                                                                                                                                                                                          |

1                   If the base station supports concurrent services, the base  
2                   station shall set this field to '1'; otherwise, the base station  
3                   shall set this field to '0'.

4            BCCH\_SUPPORTED - Primary Broadcast Channel Supported Indicator.

5                   If the base station supports Primary Broadcast Control  
6                   Channel, the base station shall set this field to '1'; otherwise,  
7                   the base station shall set this field to '0'.

8            MS INIT POS LOC - Mobile station initiated position location determination

9            SUP IND supported indicator.

10                  If the base station supports mobile station initiated position  
11                  determination, the base station shall set this field to '1';  
12                  otherwise, the base station shall set this field to '0'.

13            PILOT INFO REQ

14            SUPPORTED - Pilot information request supported indicator.

15                  If the base station supports mobile station request for pilot  
16                  information using the "Pilot Information" record in the *Base*  
17                  *Station Status Request Message*, the base station shall set this  
18                  field to '1'; otherwise, the base station shall set this field to '0'.

## 1    3.7.2.3.2.14 Extended Neighbor List Message

2    MSG\_TAG: ENLM

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| PILOT_PN       | 9                    |
| CONFIG_MSG_SEQ | 6                    |
| PILOT_INC      | 4                    |

Zero or more occurrences of the following record:

|                 |         |
|-----------------|---------|
| NGHBR_CONFIG    | 3       |
| NGHBR_PN        | 9       |
| SEARCH_PRIORITY | 2       |
| FREQ_INCL       | 1       |
| NGHBR_BAND      | 0 or 5  |
| NGHBR_FREQ      | 0 or 11 |

3

4    PILOT\_PN    -    Pilot PN sequence offset index.

5                 The base station shall set this field to the pilot PN sequence  
6                 offset for this base station, in units of 64 PN chips.

7    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.

8                 The base station shall set this field to CONFIG\_SEQ  
9                 (see 3.6.2.2).

10    PILOT\_INC    -    Pilot PN sequence offset index increment.

11                 A mobile station searches for Remaining Set pilots at pilot PN  
12                 sequence index values that are multiples of this value.13                 The base station shall set this field to the pilot PN sequence  
14                 increment, in units of 64 PN chips, that mobile stations are to  
15                 use for searching the Remaining Set. The base station should  
16                 set this field to the largest increment such that the pilot PN  
17                 sequence offsets of all its neighbor base stations are integer  
18                 multiples of that increment.19                 The base station shall set this field to a value in the range 1 to  
20                 15 inclusive.

1 The base station shall include one occurrence of the following record for each pilot that a  
 2 mobile station is to place in its Neighbor Set.

3 NGHBR\_CONFIG - Neighbor configuration.

4 The base station shall set this field to the value shown in  
 5 Table 3.7.2.3.2.14-1 corresponding to the configuration of this  
 6 neighbor.

7

8 **Table 3.7.2.3.2.14-1. Neighbor Configuration Field**

| <b>Value<br/>(binary)</b> | <b>Neighbor Configuration</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 100-111 | Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

- 1
- 2           NGHBR\_PN    - Neighbor pilot PN sequence offset index.  
3                         The base station shall set this field to the pilot PN sequence  
4                         offset for this neighbor, in units of 64 PN chips.
- 5           SEARCH\_PRIORITY    - Pilot Channel search priority.  
6                         The base station shall set this field to the search priority for  
7                         the Pilot Channel corresponding to NGHBR\_PN. The base  
8                         station shall set the search priority as shown in Table  
9                         3.7.2.3.2.14-2.

10 **Table 3.7.2.3.2.14-2. Search Priority Field**

| <b>Value<br/>(binary)</b> | <b>Search Priority</b> |
|---------------------------|------------------------|
| 00                        | Low                    |
| 01                        | Medium                 |
| 10                        | High                   |
| 11                        | Very high              |

- 11
- 12           FREQ\_INCL    - Frequency included indicator.  
13                         If the NGHBR\_BAND and NGHBR\_FREQ fields are included  
14                         for this neighbor base station, the base station shall set this  
15                         bit to ‘1’. If the NGHBR\_BAND and NGHBR\_FREQ fields are  
16                         not included for this neighbor base station, the base station  
17                         shall set this bit to ‘0’.
- 18           NGHBR\_BAND    - Neighbor band class.  
19                         If the FREQ\_INCL bit is set to ‘1’, the base station shall set  
20                         this field to the CDMA band class, as specified in [30],  
21                         corresponding to the CDMA frequency assignment for the  
22                         CDMA Channel containing the Paging Channel the mobile  
23                         station is to search. If the FREQ\_INCL bit is set to ‘0’, the  
24                         base station shall omit this field.

- 1           NGHBR\_FREQ    - Neighbor frequency assignment.  
2  
3  
4  
5  
6  
7
- If the FREQ\_INCL bit is set to '1', the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to search. If the FREQ\_INCL bit is set to '0', the base station shall omit this field.

3

4    RESERVED    -    Reserved bits.

5                 The base station shall set this field to '0000'.

6    QUAL\_INFO\_TYPE    -    Qualification information type.

7                 The base station shall set this field to the value shown in  
8                 Table 3.7.2.3.2.15-1 to show the inclusion of qualification  
9                 information in the type-specific fields. The base station shall  
10          include the required qualification information in this message.11                 **Table 3.7.2.3.2.15-1. Qualification Information Type**

| <b>Value (binary)</b>          | <b>Included Information</b> |
|--------------------------------|-----------------------------|
| 00000000                       | None                        |
| 00000001                       | BAND_CLASS                  |
| 00000010                       | BAND_CLASS and OP_MODE      |
| All other values are reserved. |                             |

| Hook Status                                  | <u>00100001</u><br><u>00100000</u>                      | 00000000                           |
| Encryption Capability                        | <u>00100011</u><br><u>00100001</u>                      | 00000000                           |
| All other record type values are reserved.   |                                                         |                                    |

2

- 1           QUAL\_INFO\_LEN   - Qualification information length.  
 2                             The base station shall set this field to the number of octets  
 3                             included in the type-specific fields of the qualification  
 4                             information.

- 5           Type-specific fields - Type-specific fields.  
 6                             The base station shall set these fields to the qualification  
 7                             information according to the QUAL\_INFO\_TYPE field.

8                             If QUAL\_INFO\_TYPE is equal to '00000000', the type-specific  
 9                             fields are omitted.

10                          If QUAL\_INFO\_TYPE is equal to '00000001', the base station  
 11                          shall use the following fixed-length format for the type-specific  
 12                          fields:

| Type-specific Field | Length (bits) |
|---------------------|---------------|
| BAND_CLASS          | 5             |
| RESERVED            | 3             |

14                          If QUAL\_INFO\_TYPE is equal to '00000010', the base station  
 15                          shall use the following fixed-length format for the type-specific  
 16                          fields:

| Type-specific Field | Length (bits) |
|---------------------|---------------|
| BAND_CLASS          | 5             |
| OP_MODE             | 8             |
| RESERVED            | 3             |

- 19           BAND\_CLASS   - Band class.  
 20                             The base station shall set this field as defined in [30] to  
 21                             specify the band class qualification information.  
 22  
 23           OP\_MODE   - Operating mode.  
 24                             The base station shall set this field as shown in  
 25                             Table 3.7.2.3.2.15-3 to specify the operating mode  
 26                             qualification information if MOB\_P\_REV of the current band  
 27                             class is less than or equal to three. The base station shall set  
 28                             this field as shown in Table 3.7.2.3.2.15-4 to specify the  
 29                             operating mode qualification information if MOB\_P\_REV of the  
 30                             current band class is greater than three.

**Table 3.7.2.3.2.15-3. Operating Mode for MOB\_P\_REV  
Less Than or Equal to Three**

| Description                                      | Value (binary) |
|--------------------------------------------------|----------------|
| CDMA mode in Band Class 1 <u>or Band Class 4</u> | 00000000       |
| CDMA mode in Band Class 0 or Band Class 3        | 00000001       |
| analog mode [6]                                  | 00000010       |
| wide analog mode [22]                            | 00000011       |
| Narrow analog mode [22]                          | 00000100       |
| All other values are reserved.                   |                |

**Table 3.7.2.3.2.15-4. Operating Mode for MOB\_P\_REV  
Greater Than Three**

| <b>Description</b>             | <b>Standards</b> | <b>Value (binary)</b>   |
|--------------------------------|------------------|-------------------------|
| CDMA mode                      | [5]              | 00000000 or<br>00000001 |
| Analog mode                    | [6]              | 00000010                |
| Wide analog mode               | [22]             | 00000011                |
| Narrow analog mode             | [22]             | 00000100                |
| DS-41 mode                     | [32]             | 00000101                |
| MC-MAP mode                    | [31]             | 00000110                |
| All other values are reserved. |                  |                         |

**NUM FIELDS** - Number of requested fields in this message.

The base station shall set this field to the number of occurrences of RECORD\_TYPE in this message.

The base station shall only request the status information records qualified by the included qualification information in this message. The base station shall include one occurrence of the following field for each information record that is requested:

**RECORD\_TYPE** - Information record type.

The base station shall set this field to the record type value shown in Table 3.7.2.3.2.15-2 corresponding to the information record requested.

1           If MOB\_P\_REV is equal to or greater than seven, the base  
2           station shall not request the Call Mode information record  
3           (record type 00000111in Table 3.7.2.3.2.15-2).

4

## 1    3.7.2.3.2.16 Service Redirection Message

2    MSG\_TAG: SRDM

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| RETURN_IF_FAIL | 1                    |
| DELETE_TMSI    | 1                    |
| REDIRECT_TYPE  | 1                    |

One occurrence of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

3

4    RETURN\_IF\_FAIL    -    Return if fail indicator.

5                         The base station shall set this field to '1' if the mobile station  
 6                         is required to return to the system from which it is being  
 7                         redirected upon failure to obtain service using the redirection  
 8                         criteria specified in this message; otherwise, the base station  
 9                         shall set this field to '0'.

10                  DELETE\_TMSI    -    Delete TMSI indicator.

11                         The base station shall set this field to '1' if the mobile station  
 12                         is required to delete the TMSI assigned to the mobile station;  
 13                         otherwise, the base station shall set this field to '0'.

14                  REDIRECT\_TYPE    -    Redirect indicator.

15                         The base station shall set this field to the REDIRECT\_TYPE  
 16                         value shown in table 3.7.2.3.2.16-2 corresponding to the  
 17                         redirection type.

18                         **Table 3.7.2.3.2.16-1. Redirection Types**

| <b>Description</b> | <b>REDIRECT_TYPE<br/>(binary)</b> |
|--------------------|-----------------------------------|
| Normal redirection | 0                                 |
| NDSS redirection   | 1                                 |

19

20    The base station shall include one occurrence of the following record:

21                  RECORD\_TYPE    -    Redirection record type.

22                         The base station shall set this field to the RECORD\_TYPE  
 23                         value shown in Table 3.7.2.3.2.16-2 corresponding to the type  
 24                         of redirection specified by this record.

25

**Table 3.7.2.3.2.16-2. Redirection Record Types**

| <b>Description</b>                                                                                                                                                       | <b>RECORD_TYPE<br/>(binary)</b> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| NDSS off indication                                                                                                                                                      | 00000000                        |
| Redirection to an analog system as defined in [12], [21], [22], [25], [24], and [6]                                                                                      | 00000001                        |
| Redirection to a CDMA system as defined in [24] and [2]                                                                                                                  | 00000010                        |
| Redirection to a TACS analog system as defined in Department of Trade and Industry's TACS Mobile Station-Land Station Compatibility Specification, Issue 4, Amendment 1. | 00000011                        |
| Redirection to a JTACS analog system as defined in ARIB's RCR STD-36.                                                                                                    | 00000100                        |
| Redirection to a DS-41 system as defined in [32].                                                                                                                        | 00000101                        |
| All other RECORD_TYPE values are reserved                                                                                                                                |                                 |

- RECORD\_LEN - Redirection record length.  
If RECORD\_TYPE equals to '00000000', the base station shall set this field to '00000000'; otherwise, the base station shall set this field to the number of octets in the type-specific fields of this redirection record.
- Type-specific fields - Redirection record type-specific fields.  
The base station shall include type-specific fields based on the RECORD\_TYPE of this redirection record.
- If RECORD\_TYPE is equal to '00000000', the base station shall not include the type-specific fields.
- If RECORD\_TYPE is equal to '00000001', the base station shall include the following fields:

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| EXPECTED_SID | 15                   |
| IGNORE_CDMA  | 1                    |
| SYS_ORDERING | 3                    |
| RESERVED     | 5                    |

- 1           EXPECTED\_SID    -    Expected SID.  
2  
3  
4  
5  
6           IGNORE\_CDMA     -    Ignore CDMA Available indicator.  
7  
8  
9  
10  
11  
12  
13  
14  
15          SYS\_ORDERING    -    System ordering.  
16  
17  
18  
19  
20
- If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.
- The base station shall set this field to '1' to indicate that the mobile station is to ignore the *CDMA Capability Message* on the analog system to which it is being redirected. The base station shall set this field to '0' to indicate that the mobile station may discontinue service on the system to which it is being redirected if the mobile station receives a *CDMA Capability Message* with CDMA\_AVAIL equal to '1', and the preferred mode of the mobile station is CDMA.
- The base station shall set this field to the SYS\_ORDERING value shown in Table 3.7.2.3.2.16-3 corresponding to the order in which the mobile station is to attempt to obtain service on an analog system.

1

**Table 3.7.2.3.2.16-3. SYS\_ORDERING**

| <b>Description</b>                                                                                                                                   | <b>SYS_ORDERING<br/>(binary)</b> |
|------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Attempt to obtain service on either System A or B in accordance with the custom system selection process (see 2.6.1.1.1).                            | 000                              |
| Attempt to obtain service on System A only.                                                                                                          | 001                              |
| Attempt to obtain service on System B only.                                                                                                          | 010                              |
| Attempt to obtain service on System A first. If unsuccessful, attempt to obtain service on System B.                                                 | 011                              |
| Attempt to obtain service on System B first. If unsuccessful, attempt to obtain service on System A.                                                 | 100                              |
| Attempt to obtain service on either System A or System B. If unsuccessful, attempt to obtain service on the alternate system (System A or System B). | 101                              |
| All other SYS_ORDERING values are reserved                                                                                                           |                                  |

2

- 3           RESERVED   -   Reserved bits.  
 4                         The base station shall set this field to '00000'.  
 5   If RECORD\_TYPE is equal to '00000010', the base station shall include the following fields:

1

| <b>Subfield</b> | <b>Length (bits)</b> |
|-----------------|----------------------|
| BAND_CLASS      | 5                    |
| EXPECTED_SID    | 15                   |
| EXPECTED_NID    | 16                   |
| RESERVED        | 4                    |
| NUM_CHANS       | 4                    |

NUM\_CHANS occurrences of the following field:

|           |    |
|-----------|----|
| CDMA_CHAN | 11 |
|-----------|----|

|          |                 |
|----------|-----------------|
| RESERVED | 0-7 (as needed) |
|----------|-----------------|

2

3

BAND\_CLASS - Band class.

4

The base station shall set this field to the CDMA band class, as specified in [30].

5

EXPECTED\_SID - Expected SID.

6

If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.

7

EXPECTED\_NID - Expected NID.

8

If the base station is redirecting the mobile station to a specific network, the base station shall set this field to the NID of that network; otherwise, the base station shall set this field to 65535.

9

RESERVED - Reserved bits.

10

The base station shall set this field to '0000'.

11

NUM\_CHANS - Number of CDMA Channels.

12

The base station shall set this field to the number of occurrences of the CDMA\_CHAN field in this record.

13

CDMA\_CHAN - CDMA Channel number.

14

For each CDMA Channel on which the mobile station is to attempt to acquire a CDMA system, the base station shall include one occurrence of this field specifying the associated CDMA Channel number.

15

RESERVED - Reserved bits.

16

The base station shall add reserved bits as needed in order to make the length of the record equal to an integer number of octets. The base station shall set these bits to '0'.

## 1    3.7.2.3.2.17 General Page Message

2    MSG\_TAG: GPM

3    When Layer 3 at the base station sends a PDU corresponding to the *General Page Message*  
 4    to Layer 2, it also sends the GPM Common fields to Layer 2. These GPM Common fields  
 5    and PDUs are used by Layer 2 to assemble a Layer 2 PDU corresponding to the *General*  
 6    *Page Message* (see 3.1.2.3 of [4]).

7    GPM Common Fields:

8

| Field          | Length (bits)                 |
|----------------|-------------------------------|
| CONFIG_MSG_SEQ | 6                             |
| ACC_MSG_SEQ    | 6                             |
| CLASS_0_DONE   | 1                             |
| CLASS_1_DONE   | 1                             |
| TMSI_DONE      | 1                             |
| ORDERED_TMSIS  | 1                             |
| BROADCAST_DONE | 1                             |
| RESERVED       | 4                             |
| ADD_LENGTH     | 3                             |
| ADD_PFIELD     | $8 \times \text{ADD\_LENGTH}$ |

9

10    PDU Format for a mobile station-addressed page:

11

| Field          | Length (bits) |
|----------------|---------------|
| SERVICE_OPTION | 0 or 16       |

12

13    PDU Format for a broadcast page:

14

| Field | Length (bits) |
|-------|---------------|
| -     | 0             |

15

16    PDU Format for an enhanced broadcast page:

17

| Field                                 | Length (bits)                                           |
|---------------------------------------|---------------------------------------------------------|
| <a href="#"><u>BCCH_INDEX_BCN</u></a> | 3                                                       |
| TIME_OFFSET                           | 10                                                      |
| REPEAT_TIME_OFFSET                    | 0 or 5                                                  |
| ADD_BCAST_RECORD                      | 0 or $8 \times \text{EXT_BCAST\_SDU\_LENGTH}$ (see [4]) |

- 1
- 2     CONFIG\_MSG\_SEQ     - Configuration message sequence number.  
3                         The base station shall set this field to CONFIG\_SEQ  
4                         (see 3.6.2.2).
- 5     ACC\_MSG\_SEQ         - Access parameters message sequence number.  
6                         The base station shall set this field to ACC\_CONFIG\_SEQ  
7                         (see 3.6.2.2).
- 8     CLASS\_0\_DONE         - Class 0 pages are done.  
9                         If all messages and records directed to mobile stations  
10                        operating in the slotted mode, active in this slot, and having  
11                        an assigned class 0 IMSI have been sent by the end of this  
12                        *General Page Message*, the base station shall set this field to  
13                        ‘1’; otherwise, the base station shall set this field to ‘0’.
- 14    CLASS\_1\_DONE         - Class 1 pages are done.  
15                         If all messages and records directed to mobile stations  
16                        operating in the slotted mode, active in this slot, and having  
17                        an assigned class 1 IMSI have been sent by the end of this  
18                        *General Page Message*, the base station shall set this field to  
19                        ‘1’; otherwise, the base station shall set this field to ‘0’.
- 20    TMSI\_DONE             - TMSI pages are done.  
21                         If all the page records having PAGE\_CLASS equal to ‘10’ or  
22                        other directed messages for mobile stations operating in the  
23                        slotted mode, active in this slot, and having an assigned TMSI  
24                        have been sent by the end of this *General Page Message*, the  
25                        base station shall set this field to ‘1’; otherwise, the base  
26                        station shall set this field to ‘0’.
- 27    ORDERED\_TMSIS         - TMSIs sent in numerical order.  
28                         If all the page records of PAGE\_CLASS equal to ‘10’ are sent  
29                        such that the TMSI code values of the TMSI\_CODE\_ADDR  
30                        fields for the mobile stations operating in the slotted mode are  
31                        in ascending numerical order in all the *General Page*  
32                        *Messges* sent within this slot, the base station shall set this  
33                        field to ‘1’; otherwise, the base station shall set this field to ‘0’.
- 34    BROADCAST\_DONE         - Broadcast pages are done.

1                   If all broadcast page records (PAGE\_CLASS equal to '11') have  
 2                   been sent by the end of this *General Page Message*, the base  
 3                   station shall set this field to '1'; otherwise, the base station  
 4                   shall set this field to '0'.

5                   RESERVED    - Reserved bits.  
 6                                 The base station shall set this field to '0000'.

7                   ADD\_LENGTH - Number of octets in the page message specific fields.  
 8                                 If there are no additional page message specific fields, the  
 9                                 base station shall set this field to '000'.

10                  ADD\_PFIELD - Additional page message specific fields.  
 11                                 The base station shall not include any additional page  
 12                                 message specific fields, if ADD\_LENGTH is '000'.

13                  SERVICE\_OPTION - Service option.  
 14                                 If the base station requests a special service option in the page  
 15                                 type-specific fields(i.e., the SDU INCLUDED field, see [4], is  
 16                                 set to '1'), the base station shall set this field to the service  
 17                                 option code shown in [30], corresponding to the requested  
 18                                 service option; otherwise, the base station shall omit this field.

19                  BCCH\_INDEX\_BCN - BCCH index Broadcast Control Channel Number.  
 20                                 The base station shall set this field to the index of the BCCH  
 21                                 to which the mobile station is being redirected.

22                  TIME\_OFFSET - BCCH time offset.  
 23                                 The base station shall set this field to one less than the time  
 24                                 offset, in units of 40 ms, from the beginning of the slot in  
 25                                 which this message began to the beginning of the Broadcast  
 26                                 Control Channel slot to which the mobile station is being  
 27                                 directed.

28                  REPEAT\_TIME-  
 29                                 \_OFFSET - BCCH offset of repeat.  
 30                                         If EXT\_BCAST\_SDU\_LENGTH\_IND (see [4]) is set to '01' or '11'  
 31                                         this field is included, the base station shall set this field to  
 32                                         one less than the time offset, in units of 40 ms, from the time  
 33                                         specified by TIME\_OFFSET to the beginning of the Broadcast  
 34                                         Control Channel slot to which the mobile station is being  
 35                                         directed for a repeat of the broadcast message. Otherwise, the  
 36                                         base station shall omit this field.

37                  ADD\_BCAST\_RECORD - Additional broadcast information record.  
 38                                         The base station shall omit this field if  
 39                                         EXT\_BCAST\_SDU\_LENGTH\_IND (see 3.1.2.3.1.8 of [4]) is set  
 40                                         to '00' or '01'; otherwise, the base station shall include  
 41                                         EXT\_BCAST\_SDU\_LENGTH (see 3.1.2.3.1.8 of [4]) octets in  
 42                                         this field.

## 1    3.7.2.3.2.18 Global Service Redirection Message

## 2    MSG\_TAG: GSRDM

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| PILOT_PN        | 9                    |
| CONFIG_MSG_SEQ  | 6                    |
| REDIRECT_ACCOLC | 16                   |
| RETURN_IF_FAIL  | 1                    |
| DELETE_TMSI     | 1                    |
| EXCL_P_REV_MS   | 1                    |

One occurrence of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

3

4    PILOT\_PN    -    Pilot PN sequence offset index.

5                 The base station shall set this field to the pilot PN sequence  
6                 offset for this base station, in units of 64 PN chips.

7    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.

8                 The base station shall set this field to CONFIG\_SEQ  
9                 (see 3.6.2.2).

- 1   REDIRECT\_ACCOLC   -   Redirected access overload classes.

2                         This field consists of the following subfields:

| <b>Subfield</b> | <b>Length<br/>(bits)</b> | <b>Subfield Description</b> |
|-----------------|--------------------------|-----------------------------|
| ACCOLC_0        | 1                        | Access overload class 0     |
| ACCOLC_1        | 1                        | Access overload class 1     |
| ACCOLC_2        | 1                        | Access overload class 2     |
| ACCOLC_3        | 1                        | Access overload class 3     |
| ACCOLC_4        | 1                        | Access overload class 4     |
| ACCOLC_5        | 1                        | Access overload class 5     |
| ACCOLC_6        | 1                        | Access overload class 6     |
| ACCOLC_7        | 1                        | Access overload class 7     |
| ACCOLC_8        | 1                        | Access overload class 8     |
| ACCOLC_9        | 1                        | Access overload class 9     |
| ACCOLC_10       | 1                        | Access overload class 10    |
| ACCOLC_11       | 1                        | Access overload class 11    |
| ACCOLC_12       | 1                        | Access overload class 12    |
| ACCOLC_13       | 1                        | Access overload class 13    |
| ACCOLC_14       | 1                        | Access overload class 14    |
| ACCOLC_15       | 1                        | Access overload class 15    |

3                         The base station shall set the subfields corresponding to the  
4                         access overload classes of mobile stations which are to be  
5                         redirected to '1', and shall set the remaining subfields to '0'.

- 6   RETURN\_IF\_FAIL   -   Return if fail indicator.

7                         The base station shall set this field to '1' if the mobile station  
8                         is required to return to the system from which it is being  
9                         redirected upon failure to obtain service using the redirection  
10                        criteria specified in this message; otherwise, the base station  
11                        shall set this field to '0'.

- 12   DELETE\_TMSI   -   Delete TMSI indicator.

13                         The base station shall set this field to '1' if the mobile station,  
14                         which the corresponding REDIRECT\_ACCOLC subfield is set  
15                        to '1', is required to delete the TMSI assigned to the mobile  
16                        station; otherwise, the base station shall set this field to '0'.

- 17   EXCL\_P\_REV\_MS   -   Exclude redirection indicator.

If this message does not apply to mobile stations with MOB\_P\_REV greater than or equal to six, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

5

6 The base station shall include one occurrence of the following three-field record:

- |                         |                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 RECORD_TYPE           | <ul style="list-style-type: none"> <li>- Redirection record type.</li> </ul> <p>The base station shall set this field to the RECORD_TYPE value shown in Table 3.7.2.3.2.16-2 corresponding to the type of redirection specified by this record.</p> |
| 11 RECORD_LEN           | <ul style="list-style-type: none"> <li>- Redirection record length.</li> </ul> <p>The base station shall set this field to the number of octets in the type-specific fields of this redirection record.</p>                                         |
| 14 Type-specific fields | <ul style="list-style-type: none"> <li>- Redirection record type-specific fields.</li> </ul> <p>The base station shall include type-specific fields based on the RECORD_TYPE of this redirection record.</p>                                        |

17 If RECORD\_TYPE is equal to '00000001', the base station shall include the following fields:

18

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| EXPECTED_SID       | 15                   |
| IGNORE_CDMA        | 1                    |
| SYS_ORDERING       | 3                    |
| MAX_REDIRECT_DELAY | 5                    |

19

- |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

The base station shall set this field to '0' to indicate that the mobile station may discontinue service on the system to which it is being redirected if the mobile station receives a <i>CDMA Capability Message</i> with CDMA_AVAIL equal to '1', and the preferred mode of the mobile station is CDMA.</p> |
| 34 SYS_ORDERING | <ul style="list-style-type: none"> <li>- System ordering.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

1                   The base station shall set this field to the SYS\_ORDERING  
 2                   value shown in Table 3.7.2.3.2.16-3 corresponding to the  
 3                   order in which the mobile station is to attempt to obtain  
 4                   service on an analog system.

5     MAX\_REDIRECT\_DELAY - Maximum delay upon redirection.

6                   The base station shall set this field to the maximum delay  
 7                   time, in units of 8 second increments, to be used by mobile  
 8                   stations in the event of a global redirection to analog mode.  
 9                   This operation can be invoked to avoid overloading an  
 10                  underlying analog cell's reverse control channel.

11                  If RECORD\_TYPE is equal to '00000010', the base station shall include the following fields:

| <b>Subfield</b> | <b>Length (bits)</b> |
|-----------------|----------------------|
| BAND_CLASS      | 5                    |
| EXPECTED_SID    | 15                   |
| EXPECTED_NID    | 16                   |
| RESERVED        | 4                    |
| NUM_CHANS       | 4                    |

12                  NUM\_CHANS occurrences of the following field:

|           |    |
|-----------|----|
| CDMA_CHAN | 11 |
|-----------|----|

|          |                 |
|----------|-----------------|
| RESERVED | 0-7 (as needed) |
|----------|-----------------|

14                  BAND\_CLASS - Band class.

15                  The base station shall set this field to the CDMA band class,  
 16                  as specified in [30].

17                  EXPECTED\_SID - Expected SID.

18                  If the base station is redirecting the mobile station to a  
 19                  specific system, the base station shall set this field to the SID  
 20                  of that system; otherwise, the base station shall set this field  
 21                  to 0.

22                  EXPECTED\_NID - Expected NID.

23                  If the base station is redirecting the mobile station to a  
 24                  specific network, the base station shall set this field to the  
 25                  NID of that network; otherwise, the base station shall set this  
 26                  field to 65535.

27                  RESERVED - Reserved bits.

28                  The base station shall set this field to '0000'.

29                  NUM\_CHANS - Number of CDMA Channels.

1                   The base station shall set this field to the number of  
2                   occurrences of the CDMA\_CHAN field in this record.

3           CDMA\_CHAN    -    CDMA Channel number.

4                   For each CDMA Channel on which the mobile station is to  
5                   attempt to acquire a CDMA system, the base station shall  
6                   include one occurrence of this field specifying the associated  
7                   CDMA Channel number.

8           RESERVED     -    Reserved bits.

9                   The base station shall add reserved bits as needed in order to  
10                  make the length of the record equal to an integer number of  
11                  octets. The base station shall set these bits to '0'.

## 1    3.7.2.3.2.19 TMSI Assignment Message

2    MSG\_TAG: TASM

| <b>Field</b>  | <b>Length (bits)</b>              |
|---------------|-----------------------------------|
| RESERVED      | 5                                 |
| TMSI_ZONE_LEN | 4                                 |
| TMSI_ZONE     | $8 \times \text{TMSI\_ZONE\_LEN}$ |
| TMSI_CODE     | 32                                |
| TMSI_EXP_TIME | 24                                |

3

4    RESERVED    -    Reserved bits.

5                 The base station shall set this field to '00000'.

6    TMSI\_ZONE\_LEN    -    TMSI zone length.

7                 The base station shall set this field to the number of octets  
8                 included in the TMSI\_ZONE. The base station shall set this  
9                 field to a value in the range 1 to 8 inclusive.

10    TMSI\_ZONE    -    TMSI zone.

11                 The base station shall set this field to the TMSI zone number,  
12                 as specified in [27].

13    TMSI\_CODE    -    Temporary mobile station identity code.

14                 The base station shall set this field to the 32-bit TMSI code  
15                 assigned to the mobile station.16                 If the base station is to deassign the TMSI, the base station  
17                 shall set all the bits in this field to '1'.

18    TMSI\_EXP\_TIME    -    TMSI expiration time.

19                 The base station shall set this field to the System Time in the  
20                 units of  $80 \text{ ms} \times 2^{12}$  when the TMSI is to expire.

## 1    3.7.2.3.2.20 PACA Message

2    MSG\_TAG: PACAM

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| RESERVED     | 7                    |
| PURPOSE      | 4                    |
| Q_POS        | 8                    |
| PACA_TIMEOUT | 3                    |

3

- 4    RESERVED    -    Reserved bits.  
                     The base station shall set this field to '0000000'.
- 5    PURPOSE    -    Purpose of the *PACA Message*.  
                     The base station shall set this field to the appropriate  
                     PURPOSE code from Table 3.7.2.3.2.20-1 to indicate the  
                     purpose of the message.

10

11    **Table 3.7.2.3.2.20-1. Purpose of PACA Message**

| <b>PURPOSE<br/>(binary)</b> | <b>Meaning</b>                                                                                             |
|-----------------------------|------------------------------------------------------------------------------------------------------------|
| 0000                        | Indicates that the purpose of the message is to respond to an <i>Origination Message</i> .                 |
| 0001                        | Indicates that the purpose of the message is to provide the queue position of the PACA call.               |
| 0010                        | Indicates that the purpose of the message is to instruct the mobile station to re-originate the PACA call. |
| 0011                        | Indicates that the purpose of the message is to cancel the PACA call.                                      |
| 0100 – 1111                 | Reserved                                                                                                   |

12

- 13    Q\_POS    -    PACA queue position.  
                     If the PURPOSE field of this message is set to '0000' or '0001',  
                     the base station shall set this field to the queue position of the  
                     PACA call. If the queue position exceeds 255, the base station  
                     shall set this field to '11111111'. If the queue position is  
                     unknown or the PURPOSE field of this message is set to '0010'  
                     or '0011', the base station shall set this field to '00000000'.

1           PACA\_TIMEOUT   - PACA state timer duration.

2           The base station shall set this field to the PACA\_TIMEOUT  
3           value shown in Table 3.7.2.3.2.20-2 corresponding to the  
4           length of the PACA state timer to be used by the mobile  
5           stations.

6           **Table 3.7.2.3.2.20-2. Value of PACA State Timer**

| PACA_TIMEOUT<br>Value (binary) | Timer Length<br>(Minutes) |
|--------------------------------|---------------------------|
| 000                            | 1                         |
| 001                            | 2                         |
| 010                            | 5                         |
| 011                            | 10                        |
| 100                            | 20                        |
| 101                            | 30                        |
| 110                            | 45                        |
| 111                            | 60                        |

## 1 3.7.2.3.2.21 Extended Channel Assignment Message

2 MSG\_TAG: ECAM

| <b>Field</b>             | <b>Length (bits)</b>                       |

3

ASSIGN\_MODE - Assignment mode.

4

5

6

7

The base station shall set this field to the value shown in Table 3.7.2.3.2.21-1 corresponding to the assignment mode for this assignment.

8

**Table 3.7.2.3.2.21-1. Assignment Mode**

| Value<br>(binary)              | Assignment Mode                     |
|--------------------------------|-------------------------------------|
| 000                            | Traffic Channel Assignment          |
| 001                            | Paging Channel Assignment           |
| 010                            | Acquire Analog System               |
| 011                            | Analog Voice Channel Assignment     |
| 100                            | Enhanced Traffic Channel Assignment |
| All other values are reserved. |                                     |

9

10

11

12

RESERVED\_2 - Reserved bits.

The base station shall set this field to '00000'.

Additional record fields - Additional record fields.

1                   The additional record fields are determined by the value of  
2                   ASSIGN\_MODE, as described below.

3     If the ASSIGN\_MODE field is set to '000', the base station shall include the following fields:

4        FREQ\_INCL    - Frequency included indicator.

5                   If the BAND\_CLASS and CDMA\_FREQ fields are included in  
6                   this assignment record, the base station shall set this bit to  
7                   '1'. If the BAND\_CLASS and CDMA\_FREQ fields are not  
8                   included in this assignment record, the base station shall set  
9                   this bit to '0'.

10      DEFAULT\_CONFIG - Default Configuration.

11                   If the GRANTED\_MODE field is set to '00', the base station  
12                   shall set this field as specified in Table 3.7.2.3.2.21-2 to  
13                   indicate an initial multiplex option and radio configuration for  
14                   the Forward and Reverse Traffic Channels.

15                   If MOB\_P\_REV is less than six, the base station shall not set  
16                   this field to '100'.

**Table 3.7.2.3.2.21-2. Default Configuration**

| <b>Value<br/>(binary)</b>      | <b>Default Configuration</b>                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000                            | Multiplex Option 1 and Radio Configuration 1 for both the Forward Traffic Channel and the Reverse Traffic Channel                                                                                                                                                                                                                                                                                                                                  |

| 010                            | Multiplex Option 1 and Radio Configuration 1 for the Forward Traffic channel; Multiplex Option 2 and Radio Configuration 2 for the Reverse Traffic channel                                                                                                                                                                                                                                                                                         |
| 011                            | Multiplex Option 2 and Radio Configuration 2 for the Forward Traffic channel; Multiplex Option 1 and Radio Configuration 1 for the Reverse Traffic channel                                                                                                                                                                                                                                                                                         |
| 100                            | FOR_FCH_RC or FOR_RC included in this message for the Forward Fundamental Channel or the Forward Dedicated Control Channel and REV_FCH_RC or REV_RC included in this message for the Reverse Fundamental or the Reverse Dedicated Control Channel. Use 20ms frames. Use Multiplex Option 1 for radio configurations that include the bit rate of 9600 bps; Use Multiplex Option 2 for radio configurations that include the bit rate of 14400 bps. |
| All other values are reserved. |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

2

3

**BYPASS\_ALERT-**

4

**\_ANSWER**

- Bypass alert indicator.

5

6

7

8

9

If the base station has received a *Page Response Message* that specifies a packet data service option, and the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for Mobile Station Answer Substate*, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

10

**RESERVED**

- Reserved bit.

11

The base station shall set this field to '0'.

- 1           NUM\_PILOTS    - Number of pilots in the Active Set.  
 2                          The base station shall set this field to number of pilots that  
 3                          are to be in the mobile station's Active Set on the Traffic  
 4                          Channel minus one. The base station shall set this field to  
 5                          the value in the range 0 to  $N_{6m}-1$  inclusive.
- 6           GRANTED\_MODE   - Granted mode.  
 7                          The base station shall set this field to '00' to indicate that the  
 8                          mobile station is to use an initial service configuration  
 9                          consisting of the multiplex option and radio configuration  
 10                         defined by the DEFAULT\_CONFIG field for the Forward and  
 11                         Reverse Traffic Channels, and to indicate that service  
 12                         negotiation may take place before the base station sends the  
 13                         first *Service Connect Message*.  
 14                          The base station shall set this field to '01' to indicate that the  
 15                          mobile station is to use an initial service configuration  
 16                          consisting of the default multiplex option ~~and transmission~~  
 17                         ~~rates corresponding to the service option requested by the~~  
 18                         ~~that is derived from the radio configuration corresponding to~~  
 19                         ~~Table 3.7.2.3.2.21-7~~  
 20                         ~~mobile station either in the Origination~~  
 21                         ~~Message or Page Response Message~~, and to indicate that  
 22                         service negotiation may take place before the base station  
 23                         sends the first *Service Connect Message*.  
 24                          The base station shall set this field to '10' to indicate that the  
 25                          mobile station is to use an initial service configuration  
 26                          consisting of the default multiplex option ~~and transmission~~  
 27                         ~~that is derived from the radio configuration corresponding to~~  
 28                         ~~Table 3.7.2.3.2.21-7~~  
 29                         ~~rates corresponding to the service option~~  
 30                         ~~requested by the mobile station either in the Origination~~  
 31                         ~~Message or Page Response Message~~, and to indicate that  
 32                         service negotiation is not to take place before the base station  
 33                         sends the first *Service Connect Message*.
- Table 3.7.2.3.2.21-7. Mapping between Multiplex Options and Radio Configurations**
- | <u>Multiplex Option</u>   | <u>Radio Configuration</u>                                                              |
|---------------------------|-----------------------------------------------------------------------------------------|
| <u>Multiplex Option 1</u> | <u>Forward link: RC1, RC3, RC4, RC6, or RC7</u><br><u>Reverse Link: RC1, RC3 or RC5</u> |
| <u>Multiplex Option2</u>  | <u>Forward link: RC2, RC5, RC 8, or RC9</u><br><u>Reverse Link: RC2, RC4 or RC 6</u>    |
- 34           FRAME\_OFFSET   - Frame offset.  
 35                          The Forward and Reverse Traffic Channel frames are delayed  
 36                          FRAME\_OFFSET  $\times$  1.25 ms relative to system timing (see [2]).

The base station shall set this field to the Forward and Reverse Traffic Channel frame offset.

- Message encryption mode.  
The base station shall set this field to the ENCRYPT\_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.

- Band class.

If the FREQ\_INCL bit is set to '1', the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ\_INCL bit is set to '0', the base station shall omit this field.

- Frequency assignment.

If the FREQ\_INCL bit is set to '1', the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ\_INCL bit is set to '0', the base station shall omit this field.

The base station shall include NUM\_PILOTS plus one occurrence of the following three-field record, one for each member of the mobile station's Active Set on the Traffic Channel.

- PILOT\_PN** - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

- Power control symbol combining indicator.

If the Forward Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'. For the first occurrence of this record in the message, the base station shall set this field to '0'.

- CODE\_CHAN** - Code channel index.

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the Forward Traffic Channel associated with this pilot. If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

- Forward Fundamental Channel radio configuration

1                   The base station shall set this field to the radio configuration  
 2                   (see Table 3.7.2.3.2.21-3) to be used by the mobile station on  
 3                   the Forward Fundamental Channel before the first *Service*  
 4                   *Connect Message* is sent to the mobile station.

5                   If GRANTED\_MODE is set to '00', and DEFAULT\_CONFIG is  
 6                   not set to '100' (see Table 3.7.2.3.2.21-2), the base station  
 7                   shall set this field to either '00001' or '00010' (see Table  
 8                   3.7.2.3.2.21-3).

9                   REV\_FCH\_RC - Reverse Fundamental Channel radio configuration

10                  The base station shall set this field to the radio configuration  
 11                  (see Table 3.7.2.3.2.21-3) to be used by the mobile station on  
 12                  the Reverse Fundamental Channel before the first *Service*  
 13                  *Connect Message* is sent to the mobile station.

14                  If GRANTED\_MODE is set to '00', and DEFAULT\_CONFIG is  
 15                  not set to '100' (see Table 3.7.2.3.2.21-2), the base station  
 16                  shall set this field to either '00001' or '00010' (see Table  
 17                  3.7.2.3.2.21-3).

18                  **Table 3.7.2.3.2.21-3. Radio Configurations**

| Value<br>(binary)              | Radio Configuration |
|--------------------------------|---------------------|
| 00001                          | RC 1                |
| 00010                          | RC 2                |
| 00011                          | RC 3                |
| 00100                          | RC 4                |
| 00101                          | RC 5                |
| 00110                          | RC 6                |
| 00111                          | RC 7                |
| 01000                          | RC 8                |
| 01001                          | RC 9                |
| All other values are reserved. |                     |

19                  FPC\_FCH\_INIT\_SETPT - Initial Fundamental Channel outer loop  $E_b/N_t$  setpoint.

20                  The base station shall set this field to initial Fundamental  
 21                  Channel outer loop  $E_b/N_t$  setpoint, in units of 0.125 dB.

22                  FPC\_SUBCHAN\_GAIN - Forward power control subchannel relative gain.

The base station shall set FPC\_SUBCHAN\_GAIN equal to the power level of the forward link power control subchannel relative to the power level of 20 ms frames at a 9600 bps or 14400 bps rate of the Forward Fundamental Channel that the Forward Power Control Subchannel is punctured on. The base station shall set the value in units of 0.25 dB.

- RLGAIN\_ADJ - Reverse Traffic Channel power relative to access power.  
The base station shall set this field to adjust the initial Traffic Channel transmission power relative to the Access Channel or Enhanced Access Channel transmission power. The base station shall set this field as a two's complement signed binary number, in units of 1 dB.

- Fundamental Channel target Frame Error Rate.  
The base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2.

- Minimum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint.  
The base station shall set this field to minimum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint, in units of 0.125 dB.

- Maximum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint.  
The base station shall set this field to maximum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint, in units of 0.125 dB.

REV\_FCH-

- Reverse eighth gating mode indicator.  
The base station shall set this field to ‘1’ if the mobile station is allowed to perform the reverse eighth gating mode where the  $1/8^{\text{th}}$  rate frames on the Reverse Fundamental Channel are gated off for 10 ms per frame (see 2.1.2.3.2 of [2]); otherwise, the base station shall set this field to ‘0’.

The base station shall not set this field to '1' if REV\_FCH\_GATING\_REQ included in the *Origination Message* or *Page Response Message* is set to '0'.

REV\_PWR-

- Reverse power control delay included indicator.  
If REV\_FCH\_GATING\_MODE is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to '1' if REV\_PWR\_CNTL\_DELAY is included in this message; otherwise, the base station shall set this field to '0'.

If the REV\_FCH\_GATING\_MODE field in this message is set to '1' and the REV\_PWR\_CNTL\_DELAY INCL field in the *Extended System Parameters Message* or *MC-RR Parameters Message* is set to '0', the base station shall set this field to '1'.

- 1                   REV\_PWR-
- 2                   \_CNTL\_DELAY - The reverse power control delay.
- 3                   If REV\_PWR\_CNTL\_DELAY\_INCL is set to '0', the base station  
 4                   shall omit this field; otherwise, the base station shall include  
 5                   this field and set it as follows:
- 6                   The base station shall set this field to the closed-loop reverse  
 7                   power control delay minus one (the closed-loop reverse power  
 8                   control delay is the time between the end of a gated-on reverse  
 9                   PCG and the beginning of the reverse PCG where the  
 10                  corresponding feedback is sent on the Forward Power Control  
 11                  Subchannel, see 2.1.2.3.2 of [2]) used by the mobile station  
 12                  after handoff, in units of 1.25 ms.
- 13                  D\_SIG\_ENCRYPT\_MODE - General-Dedicated channel signaling encryption mode indicator.
- 14                  If ENCRYPT\_MODE is set to '11', the base station shall include  
 15                  this field and shall set it to the dedicated channel signaling  
 16                  message encryption mode, as shown in Table 3.7.4.5-1; otherwise  
 17                  the base station shall omit this field.
- 18                  USE\_NEW\_KEY Use new encryption key indication
- 19                  If ENCRYPT\_MODE is set to '10' or '11', the base station shall  
 20                  include this field. If this field is included, the base station shall  
 21                  set this field to '0' to indicate that the stored encryption key to be  
 22                  used by the mobile station. Otherwise, the base station shall set  
 23                  this field to '1' to indicate that the new encryption key to be used  
 24                  by the mobile station.
- 25                  ENC\_KEY\_SIZE - Encryption key size indication.
- 26                  If ENCRYPT\_MODE is set to '10' or '11' USE\_NEW\_KEY is included  
 27                  and is set to '0', the base station shall omit this field; otherwise,  
 28                  the base station shall include this field and shall set it to the  
 29                  encryption key size, as shown in Table 3.7.4.5-2; otherwise, the  
 30                  base station shall omit this field.
- 31                  KEY\_SEQ Encryption key sequence number.
- 32                  If USE\_NEW\_KEY is included and is set to '0', the base station  
 33                  shall include this field; otherwise, the base station shall omit this  
 34                  field. If this field is included, the base station shall set it to the  
 35                  encryption key sequence number to be used by the mobile  
 36                  station.
- 37                  C SIG ENCRYPT
- 38                  MODE INCL - Common channel signaling encryption mode included  
 39                  indicator.
- 40                  If P REV IN USE is less than seven, the base station shall set  
 41                  this field to '0'; otherwise, the base station shall set this field  
 42                  as follows:
- 43                  If common channel signaling encryption information is  
 44                  included in this message, the base station shall set this field  
 45                  to '1'; otherwise, the base station shall set this field to '0'.
- 46                  C SIG ENCRYPT

|    |                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                    |

| 39 |                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                    |

1           NUM\_PILOTS   - Number of pilots whose Paging Channel may be monitored.  
 2                          The base station shall set this field to the number of pilots  
 3                          whose Paging Channel may be monitored by the mobile  
 4                          station minus one. The base station shall set this field to the  
 5                          value in the range 0 to N<sub>8m</sub> – 1 inclusive.

6       The base station shall include NUM\_PILOTS plus one occurrence of the following field  
 7       record for each pilot whose Paging Channel may be monitored by the mobile station.

8           PILOT\_PN   - Pilot PN sequence offset index.  
 9                          The base station shall include one occurrence of this field for  
 10                         each base station whose Paging Channel may be monitored by  
 11                         the mobile station. For each occurrence, the base station  
 12                         shall set this field to the pilot PN sequence offset for a base  
 13                         station, in units of 64 PN chips. The base station having this  
 14                         pilot PN sequence offset should support a Primary Paging  
 15                         Channel with the same Paging Channel rate as the current  
 16                         base station.

17           RESERVED   - Reserved bits.  
 18                          The base station shall add reserved bits as needed in order to  
 19                         make the total length of the fields after the preceding  
 20                         ADD\_RECORD\_LEN field through this RESERVED field equal  
 21                         to an integer number of octets. The base station shall set  
 22                         these bits to '0'.

24       If the ASSIGN\_MODE field is set to '010', the base station shall include the following fields:

25           RESPOND   - Respond on analog control channel indicator.  
 26                          If the mobile station is to retransmit an *Origination Message* or  
 27                         *Page Response Message* on the analog control channel (see [6])  
 28                         after processing this channel assignment, the base station  
 29                         shall set this field to '1'. The base station may set this field to  
 30                         '0' only in response to a *Page Response Message*.

31           ANALOG\_SYS   - System indicator.  
 32                          If USE\_ANALOG\_SYS is equal to '0', the base station shall set  
 33                         this field to '0'; otherwise, the base station shall set this field  
 34                         to '0' if the mobile station is to use analog system A, or to '1' if  
 35                         the mobile station is to use analog system B.

36           USE\_ANALOG\_SYS   - Use analog system indicator.  
 37                          The base station shall set this field to '1' to direct the mobile  
 38                         station to the analog system specified by ANALOG\_SYS; otherwise,  
 39                         the base station shall set this field to '0'.

40           BAND\_CLASS   - Band class.  
 41                          The base station shall set this field according to values defined  
 42                         in [30].

1 If the ASSIGN\_MODE field is set to '011', the base station shall include the following fields:

- 2           SID     - System identification of the analog system.  
3                 The base station shall set this field to the system identification  
4                 of the analog system supporting the assigned voice channel  
5                 for this assignment (see [6]).
  - 6           VMAC    - Voice mobile station attenuation code.  
7                 The base station shall set this field to the mobile station  
8                 power level associated with the assigned voice channel for this  
9                 assignment (see [6]).
  - 10          ANALOG\_CHAN - Voice channel number.  
11                 The base station shall set this field to the voice channel  
12                 number for this assignment (see [6]).
  - 13          SCC      - SAT color code.  
14                 The base station shall set this field to the supervisory audio  
15                 tone color code associated with the assigned voice channel. If  
16                 the assignment is to a narrow analog channel, the base  
17                 station shall set this field to the two least significant bits of  
18                 the DSCC.
  - 19          MEM      - Message encryption mode indicator.  
20                 If analog control message encryption is to be enabled on the  
21                 assigned forward and reverse analog voice channels, the base  
22                 station shall set this bit to '1'; otherwise, the base station  
23                 shall set this bit to '0'.
  - 24          AN\_CHAN\_TYPE - Analog voice channel type.  
25                 The base station shall set this field to the analog channel type  
26                 as specified in Table 3.7.3.3.2.6-1. If the mobile station does  
27                 not have narrow analog capability, the base station shall set  
28                 this field to '00'.
  - 29          DSCC\_MSB   - Digital supervisory audio tone color code most significant bit.  
30                 The base station shall set this field to '0' when directing  
31                 handoff to a wide analog channel. The base station shall set  
32                 this field to the most significant bit of the DSCC when  
33                 directing handoff to a narrow analog channel.
  - 34          BAND\_CLASS - Band class.  
35                 The base station shall set this field according to values defined  
36                 in [30].
- 37 If the ASSIGN\_MODE field is set to '100', the base station shall include the following fields:
- 38          FREQ\_INCL - Frequency included indicator.  
39                 If the BAND\_CLASS and CDMA\_FREQ fields are included in  
40                 this assignment record, the base station shall set this bit to  
41                 '1'. If the BAND\_CLASS and CDMA\_FREQ fields are not  
42                 included in this assignment record, the base station shall set  
43                 this bit to '0'.

- 1           BAND\_CLASS    - Band class.  
 2                         If the FREQ\_INCL bit is set to '1', the base station shall set  
 3                     this field to the CDMA band class, as specified in [30],  
 4                     corresponding to the CDMA frequency assignment for the  
 5                     CDMA Channel containing the Forward Traffic Channel(s) the  
 6                     mobile station is to use. If the FREQ\_INCL bit is set to '0', the  
 7                     base station shall omit this field.
- 8           CDMA\_FREQ    - Frequency assignment.  
 9                         If the FREQ\_INCL bit is set to '0', the base station shall omit  
 10                  this field; otherwise, the base station shall set this field as  
 11                  follows:  
 12                         If FOR\_RC is set to a Radio Configuration associated with  
 13                     Spreading Rate 1, the FREQ\_INCL bit is set to '1', the base  
 14                     station shall set this field to the CDMA Channel number, in  
 15                     the specified CDMA band class, corresponding to the CDMA  
 16                     frequency assignment for the CDMA Channel containing the  
 17                     Forward Traffic Channel(s) the mobile station is to use. If  
 18                     FOR\_RC is set to a Radio Configuration associated with  
 19                     Spreading Rate 3, the base station shall set this field to the  
 20                     center SR3 frequency assignment containing the Forward  
 21                     Traffic Channel(s) the mobile station is to use.
- 22           BYPASS\_ALERT-  
 23                         ANSWER    - Bypass alert indicator.  
 24                         If the base station has received a *Page Response Message* that  
 25                     specifies a packet data service option, and the mobile station  
 26                     is to bypass the *Waiting for Order Substate* and the *Waiting for*  
 27                     *Mobile Station Answer Substate*, the base station shall set this  
 28                     field to '1'; otherwise, the base station shall set this field to '0'.
- 29           GRANTED\_MODE   - Granted mode.  
 30                         The base station shall set this field to '00' to indicate that the  
 31                     mobile station is to use an initial service configuration  
 32                     consisting of the multiplex option and Radio Configuration  
 33                     defined by the DEFAULT\_CONFIG field for the Forward and  
 34                     Reverse Traffic channels, and to indicate that service  
 35                     negotiation may take place before the base station sends the  
 36                     first *Service Connect Message*.  
 37                         The base station shall set this field to '01' to indicate that the  
 38                     mobile station is to use an initial service configuration  
 39                     consisting of the default multiplex option that is derived from  
the radio configuration corresponding to Table 3.7.2.3.2.21-7  
and transmission rates corresponding to the service option  
requested by the mobile station either in the Origination  
Message or Page Response Message, and to indicate that  
 40                     service negotiation may take place before the base station  
 41                     sends the first *Service Connect Message*.

The base station shall set this field to '10' to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-7 and transmission rates corresponding to the service option requested by the mobile station either in the Origination Message or Page Response Message, and to indicate that service negotiation is not to take place before the base station sends the first *Service Connect Message*.

- |    |                  |                                                                                                                                                                                                                                                                                |
|----|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10 | DEFAULT_CONFIG   | - Default Configuration.                                                                                                                                                                                                                                                       |
| 11 |                  | If the GRANTED_MODE field is set to '00', the base station shall set this field as specified in Table 3.7.2.3.2.21-2 to indicate an initial multiplex option and Radio Configuration for the Forward and Reverse Traffic Channels.                                             |
| 12 |                  |                                                                                                                                                                                                                                                                                |
| 13 |                  |                                                                                                                                                                                                                                                                                |
| 14 |                  |                                                                                                                                                                                                                                                                                |
| 15 | FOR_RC           | - Forward Traffic Channel radio configuration.                                                                                                                                                                                                                                 |
| 16 |                  | The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-3) to be used by the mobile station on the Forward Traffic (Fundamental and Dedicated Control) Channel before the first <i>Service Connect Message</i> is sent to the mobile station. |
| 17 |                  |                                                                                                                                                                                                                                                                                |
| 18 |                  |                                                                                                                                                                                                                                                                                |
| 19 |                  |                                                                                                                                                                                                                                                                                |
| 20 |                  |                                                                                                                                                                                                                                                                                |
| 21 |                  | If GRANTED_MODE is set to '00', and DEFAULT_CONFIG is not set to '100' (see Table 3.7.2.3.2.21-2), the base station shall set this field to either '00001' or '00010' (see Table 3.7.2.3.2.21-3).                                                                              |
| 22 |                  |                                                                                                                                                                                                                                                                                |
| 23 |                  |                                                                                                                                                                                                                                                                                |
| 24 |                  |                                                                                                                                                                                                                                                                                |
| 25 | REV_RC           | - Reverse Traffic Channel radio configuration.                                                                                                                                                                                                                                 |
| 26 |                  | The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-3) to be used by the mobile station on the Reverse Traffic (Fundamental and Dedicated Control) Channel before the first <i>Service Connect Message</i> is sent to the mobile station. |
| 27 |                  |                                                                                                                                                                                                                                                                                |
| 28 |                  |                                                                                                                                                                                                                                                                                |
| 29 |                  |                                                                                                                                                                                                                                                                                |
| 30 |                  |                                                                                                                                                                                                                                                                                |
| 31 |                  | If GRANTED_MODE is set to '00', and DEFAULT_CONFIG is not set to '100' (see Table 3.7.2.3.2.21-2), the base station shall set this field to either '0001' or '0010' (see Table 3.7.2.3.2.21-3).                                                                                |
| 32 |                  |                                                                                                                                                                                                                                                                                |
| 33 |                  |                                                                                                                                                                                                                                                                                |
| 34 |                  |                                                                                                                                                                                                                                                                                |
| 35 | FRAME_OFFSET     | - Frame offset.                                                                                                                                                                                                                                                                |
| 36 |                  | The Forward and Reverse Traffic Channel frames are delayed FRAME_OFFSET × 1.25 ms relative to system timing (see [2]).                                                                                                                                                         |
| 37 |                  |                                                                                                                                                                                                                                                                                |
| 38 |                  |                                                                                                                                                                                                                                                                                |
| 39 |                  |                                                                                                                                                                                                                                                                                |
| 40 | ENCRYPT_MODE     | - Message encryption mode.                                                                                                                                                                                                                                                     |
| 41 |                  | The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.                                                                         |
| 42 |                  |                                                                                                                                                                                                                                                                                |
| 43 |                  |                                                                                                                                                                                                                                                                                |
| 44 |                  |                                                                                                                                                                                                                                                                                |
| 45 | FPC_SUBCHAN_GAIN | - Forward Power Control Subchannel relative gain.                                                                                                                                                                                                                              |

The base station shall set FPC\_SUBCHAN\_GAIN equal to the power level of the forward link power control subchannel relative to the power level of 20 ms frames at a 9600 bps or 14400 bps rate on the Forward Fundamental Channel or the Forward Dedicated Control Channel that the Forward Power Control Subchannel is punctured on. The base station shall set the value in units of 0.25 dB.

- RLGAIN\_ADJ** - Reverse Traffic Channel power relative to access power.  
The base station shall set this field to adjust the initial Traffic Channel transmission power relative to the Access Channel or Enhanced Access Channel transmission power. The base station shall set this field as a two's complement signed binary number, in units of 1 dB.

**NUM\_PILOTS** - Number of pilots in the Active Set.  
The base station shall set this field to number of pilots that are to be in the mobile station's Active Set on the Traffic Channel minus one. The base station shall set this field to the value in the range 0 to  $N_{6m}-1$  inclusive.

**CH\_IND** - Channel indicator.  
The base station shall set this field as shown in Table 3.7.2.3.2.21-4.

**Table 3.7.2.3.2.21-4. Channel Indicator**

| <b>Value<br/>(Binary)</b> | <b>Channels Being Assigned</b>                         |
|---------------------------|--------------------------------------------------------|
| 00                        | Reserved                                               |
| 01                        | Fundamental Channel only                               |
| 10                        | Dedicated Control Channel only                         |
| 11                        | Both Fundamental Channel and Dedicated Control Channel |

- |                      |                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| CH_RECORD_LEN        | - Channel record length.<br>The base station shall set this field to the number of octets in the CH_RECORD_FIELDS included in this channel record. |
| CH_RECORD_FIELDS     | - Channel record fields.<br>The channel record fields are determined by the value of CH_IND, as described below.                                   |
| REV_FCH-_GATING_MODE | - Reverse eighth gating mode indicator.                                                                                                            |

The base station shall set this field to '1' if the mobile station is allowed to perform the reverse eighth gating mode where the  $1/8^{\text{th}}$  rate frames on the Reverse Fundamental Channel are gated off for 10 ms per frame (see 2.1.2.3.2 of [2]); otherwise, the base station shall set this field to '0'.

The base station shall not set this field to '1' if REV\_FCH\_GATING\_REQ included in the *Origination Message* or *Page Response Message* is set to '0'.

REV\_PWR-

- Reverse power control delay included indicator.

If REV\_FCH\_GATING\_MODE is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to '1' if REV\_PWR\_CNTL\_DELAY is included in this message; otherwise, the base station shall set this field to '0'.

If the REV\_FCH\_GATING\_MODE field in this message is set to '1' and the REV\_PWR\_CNTL\_INCL field in the *Extended System Parameters Message* is set to '0', the base station shall set this field to '1'.

REV\_PWR-

- The reverse power control delay.

If REV\_PWR\_CNTL\_DELAY\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see 2.1.2.3.2 of [2]) used by the mobile station after handoff, in units of 1.25 ms.

D\_SIG\_ENCRYPT\_MODE - Dedicated channelGeneral encryption mode indicator.

If ENCRYPT\_MODE is set to '11', the base station shall include this field and shall set it to the dedicated channel signaling messageencryption-encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

## USE\_NEW\_KEY

~~Use new encryption key indication~~

If ENCRYPT\_MODE is set to '10' or '11', the base station shall include this field. If this field is included, the base station shall set this field to '0' to indicate that the stored encryption key to be used by the mobile station. Otherwise, the base station shall set this field to '1' to indicate that the new encryption key to be used by the mobile station.

1        **ENC\_KEY\_SIZE** - Encryption key size indication.  
 2        If ENCRYPT\_MODE is set to '10' or '11' USE\_NEW\_KEY is included  
 3        and is set to '0', the base station shall omit this field; otherwise,  
 4        the base station shall include this field and shall set it to the  
 5        encryption key size, as shown in Table 3.7.4.5-2; otherwise, the  
 6        base station shall omit this field.

7        **KEY\_SEQ** Encryption key sequence number.  
 8        If USE\_NEW\_KEY is included and is set to '0', the base station  
 9        shall include this field; otherwise, the base station shall omit this  
 10      field. If this field is included, the base station shall set it to the  
 11      encryption key sequence number to be used by the mobile  
 12      station.

**C SIG ENCRYPT**

14      **MODE\_INCL** - Common channel signaling encryption mode included  
 15      indicator.

16      If P\_REV IN USE is less than seven, the base station shall set  
 17      this field to '0'; otherwise, the base station shall set this field  
 18      as follows:

19      If common channel signaling encryption information is  
 20      included in this message, the base station shall set this field  
 21      to '1'; otherwise, the base station shall set this field to '0'.

**C SIG ENCRYPT**

23      **MODE** - Common channel signaling encryption mode indicator.

24      If C SIG ENCRYPT MODE INCL is set to '1', the base station  
 25      shall include this field and shall set it to the common channel  
 26      signaling encryption mode, as shown in Table 3.7.4.5-1;  
 27      otherwise, the base station shall omit this field.

**3XFL\_1XRL\_INCL** - 3X Forward Link and 1X Reverse Link indicator.

30      The base station shall set this field to '1' if the base station is  
 31      assigning 3X traffic channel on the Forward Link and 1X  
 32      traffic channel on the Reverse Link; otherwise, the base  
 33      station shall set this field to '0'.

**1XRL\_-**

35      **FREQ\_OFFSET** - 1X Reverse Link frequency offset.

36      If 3XFL\_1XRL\_INCL is set to '0', the base station shall omit  
 37      this field; otherwise, the base station shall set this field as  
 38      follows:

39      The base station shall set this field to the value shown in  
 40      Table 3.7.2.3.2.21-5 corresponding to the frequency offset of  
 41      the 1X reverse link.

**Table 3.7.2.3.2.21-5. 1X Reverse Link Frequency Offset**

| <b>1XRL_FREQ_OFFSET<br/>(Binary)</b> | <b>1X Reverse Link<br/>frequency offset</b>      |
|--------------------------------------|--------------------------------------------------|
| 00                                   | The Reverse Link is on the lowest SR3 frequency  |
| 01                                   | The Reverse Link is on the center SR3 frequency  |
| 10                                   | The Reverse Link is on the highest SR3 frequency |
| 11                                   | Reserved                                         |

- RESERVED - Reserved bits.  
The base station shall set all the bits of this field to '0' to make the entire record octet-aligned.
- If the CH\_IND field is set to '01', the base station shall include the following fields:
- FPC\_FCH\_INIT\_SETPT - Initial Fundamental Channel outer loop  $E_b/N_t$  setpoint.  
The base station shall set this field to initial Fundamental Channel outer loop  $E_b/N_t$  setpoint, in units of 0.125 dB.
  - FPC\_FCH\_FER - Fundamental channel target Frame Error Rate.  
The base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2.
  - FPC\_FCH\_MIN\_SETPT - Minimum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint.  
The base station shall set this field to minimum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint, in units of 0.125 dB.
  - FPC\_FCH\_MAX\_SETPT - Maximum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint.  
The base station shall set this field to maximum Fundamental Channel Outer Loop  $E_b/N_t$  setpoint, in units of 0.125 dB.
- The base station shall include NUM\_PILOTS plus one occurrence of the following record, one for each member of the mobile station's Active Set on the Traffic Channel.
- PILOT\_PN - Pilot PN sequence offset index.  
The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

- 1 ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.  
 2 The base station shall set this field to ‘1’ if additional pilot  
 3 information listed in PILOT\_REC\_TYPE and RECORD\_LEN  
 4 fields are included. The base station shall set this field to ‘0’ if  
 5 the corresponding pilot is the common pilot and there is no  
 6 additional pilot information included.
- 7 PILOT\_REC\_TYPE - Pilot record type.  
 8 If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 9 set this field to the PILOT\_REC\_TYPE value shown in Table  
 10 3.7.2.3.2.21-6 corresponding to the type of Pilot Record  
 11 specified by this record.  
 12 If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 13 omit this field.

**Table 3.7.2.3.2.21-6. Pilot Record Types**

| Description                                  | PILOT_REC_TYPE<br>(binary) |
|----------------------------------------------|----------------------------|
| 1X Common Pilot with Transmit Diversity      | 000                        |
| 1X Auxiliary Pilot                           | 001                        |
| 1X Auxiliary Pilot with Transmit Diversity   | 010                        |
| 3X Common Pilot                              | 011                        |
| 3X Auxiliary Pilot                           | 100                        |
| All other PILOT_REC_TYPE values are reserved |                            |

- 16  
 17 RECORD\_LEN - Pilot record length.  
 18 If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 19 set this field to the number of octets in the type-specific fields  
 20 of this pilot record.  
 21 If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 22 omit this field.
- 23 Type-specific fields - Pilot record type-specific fields.  
 24 If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 25 include type-specific fields based on the PILOT\_REC\_TYPE of  
 26 this pilot record as described in 3.7.6.1.  
 27 If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 28 omit this field.
- 29  
 30 PWR\_COMB\_IND - Power control symbol combining indicator.

1                   If the Forward Fundamental Traffic Channel associated with  
 2                   this pilot will carry the same closed-loop power control  
 3                   subchannel bits as that of the previous pilot in this message,  
 4                   the base station shall set this field to '1'; otherwise, the base  
 5                   station shall set this field to '0'. For the first occurrence of  
 6                   this record in the message, the base station shall set this field  
 7                   to '0'.

- 8                   CODE\_CHAN\_FCH     - Code channel index for the Fundamental Channel.  
 9                   If FOR\_RC is set to a Radio Configuration associated with  
 10                  Spreading Rate 1, the base station shall set this field to the  
 11                  code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that  
 12                  the mobile station is to use on the Forward Fundamental  
 13                  Channel associated with this pilot. If FOR\_RC is set to a Radio  
 14                  Configuration associated with Spreading Rate 3, the base  
 15                  station shall set this field to the code channel index that the  
 16                  mobile station is to use on the Forward Fundamental on the  
 17                  center SR3 frequency.

18                  If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is  
 19                  used, the base station shall set this field in the range 1 to 63  
 20                  inclusive. If Radio Configuration 4, 6 or 8 is used, the base  
 21                  station shall set this field in the range 1 to 127 inclusive. If  
 22                  Radio Configuration 7 or 9 is used, the base station shall set  
 23                  this field in the range 1 to 255 inclusive.

- 24                  QOF\_MASK\_ID\_FCH - Quasi-Orthogonal Function Mask Identifier for the  
 25                  Fundamental Channel.  
 26                  If FOR\_RC is set to a Radio Configuration associated with  
 27                  Spreading Rate 1, the base station shall set this field to the  
 28                  quasi-orthogonal function mask identifier (see Table  
 29                  3.1.3.1.12-2 of [2]) that the mobile station is to use on the  
 30                  Forward Fundamental Channel associated with this pilot. If  
 31                  FOR\_RC is set to a Radio Configuration associated with  
 32                  Spreading Rate 3, the base station shall set this field to the  
 33                  quasi-orthogonal function mask identifier that the mobile  
 34                  station is to use on the Forward Fundamental Channel on the  
 35                  center SR3 frequency.

- 36                  3X\_FCH\_INFO\_INCL - 3X FCH information included indicator.  
 37                  If the 3X Fundamental Channel information is included, the  
 38                  base station shall set this field to '1'; otherwise, the base  
 39                  station shall set this field to '0'.

40                  The base station shall include NUM\_PILOTS plus one occurrence of the following record if  
 41                  3X\_FCH\_INFO\_INCL is set to '1'. The base station shall use the same order for the following  
 42                  fields as is used for the PILOT\_PN fields listed in this message.

- 43                  3X\_FCH\_LOW\_INCL - FCH code channel on the lowest SR3 frequency included  
 44                  indicator.  
 45                  If the FCH on the lowest SR3 frequency has a different code  
 46                  channel than the FCH on the center SR3 frequency, the base  
 47                  station shall set this field to '1'; otherwise, the base station  
 48                  shall set this field to '0'.

- 1           QOF\_MASK\_ID-
- 2            \_FCH\_LOW    - QOF index for the FCH on the lowest SR3 frequency.
- 3            If 3X\_FCH\_LOW\_INCL is set to '0', the base station shall omit  
4            this field; otherwise, the base station shall set this field as  
5            follows:
- 6            The base station shall set this field to the index of the Quasi-  
7            orthogonal function (see Table 3.1.3.1.12-2 of [2])  
8            corresponding to the QOF index for the FCH on the lowest  
9            SR3 frequency.
- 10          CODE\_CHAN-
- 11           \_FCH\_LOW    - Code channel for the FCH on the lowest SR3 frequency.
- 12           If 3X\_FCH\_LOW\_INCL is set to '0', the base station shall omit  
13           this field; otherwise, the base station shall set this field as  
14           follows:
- 15           The base station shall set this field to the code channel index  
16           (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
17           to use on the FCH on the lowest SR3 frequency. If Radio  
18           Configuration 6 or 8 is used, the base station shall set this  
19           field in the range 1 to 127 inclusive. If Radio Configuration 7  
20           or 9 is used, the base station shall set this field in the range 1  
21           to 255 inclusive.
- 22          3X\_FCH\_HIGH\_INCL - FCH code channel on the highest SR3 frequency included  
23           indicator.
- 24           If the FCH on the highest SR3 frequency has a different code  
25           channel than the FCH on the center SR3 frequency, the base  
26           station shall set this field to '1'; otherwise, the base station  
27           shall set this field to '0'.
- 28          QOF\_MASK\_ID-
- 29           \_FCH\_HIGH    - QOF index for the FCH on the highest SR3 frequency.
- 30           If 3X\_FCH\_HIGH\_INCL is set to '0', the base station shall omit  
31           this field; otherwise, the base station shall set this field as  
32           follows:
- 33           The base station shall set this field to the index of the Quasi-  
34           orthogonal function (see Table 3.1.3.1.12-2 of [2])  
35           corresponding to the QOF index for the FCH on the highest  
36           SR3 frequency.
- 37          CODE\_CHAN-
- 38           \_FCH\_HIGH    - Code channel for the FCH on the highest SR3 frequency.
- 39           If 3X\_FCH\_HIGH\_INCL is set to '0', the base station shall omit  
40           this field; otherwise, the base station shall set this field as  
41           follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the FCH on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

- RESERVED** - Reserved bits.  
The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding CH\_RECORD\_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to '0'.

If the CH\_IND field is set to '10', the base station shall include the following fields:

- |                     |   |                                                                                                                                                                                                         |
|---------------------|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FPC_DCCH_INIT_SETPT | - | Initial Dedicated Control Channel outer loop $E_b/N_t$ setpoint.<br><br>The base station shall set this field to initial Dedicated Control Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB. |
| FPC_DCCH_FER        | - | Dedicated Control Channel target Frame Error Rate.<br><br>The base station shall set this field to the target Frame Error Rate on the Dedicated Control Channel, as specified in Table 3.7.3.3.2.25-2.  |
| FPC_DCCH_MIN_SETPT  | - | Minimum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint.<br><br>The base station shall set this field to minimum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB. |
| FPC_DCCH_MAX_SETPT  | - | Maximum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint.<br><br>The base station shall set this field to maximum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB. |

The base station shall include NUM\_PILOTS plus one occurrence of the following three-field record for each member of the mobile station's Active Set on the Traffic Channel.

- |                    |                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PILOT_PN           | <ul style="list-style-type: none"> <li>- Pilot PN sequence offset index.</li> </ul> <p>The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.</p>                                                                                                                                                                                                 |
| ADD_PILOT_REC_INCL | <ul style="list-style-type: none"> <li>- Additional pilot information included indicator.</li> </ul> <p>The base station shall set this field to '1' if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.</p> |
| PILOT_REC_TYPE     | <ul style="list-style-type: none"> <li>- Pilot record type.</li> </ul>                                                                                                                                                                                                                                                                                                                                   |

If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall set this field to the PILOT\_REC\_TYPE value shown in Table 3.7.2.3.2.21-6 corresponding to the type of Pilot Record specified by this record.

If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall omit this field.

RECORD\_LEN - Pilot record length.  
If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.  
If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT\_REC\_TYPE of this pilot record.  
If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall omit this field as described in 3.7.6.1.

PWR\_COMB\_IND - Power control symbol combining indicator.  
If the Forward Dedicated Control Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. For the first occurrence of this record in the message, the base station shall set this field to ‘0’.

CODE\_CHAN\_DCCH - Code channel index for the Dedicated Control Channel.  
If FOR\_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the Forward Dedicated Control Channel associated with this pilot. If FOR\_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index that the mobile station is to use on the Forward Dedicated Control Channel on the center SR3 frequency.

If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

QOF\_MASK\_ID\_DCCH - Quasi-Orthogonal Function Mask Identifier for the Dedicated Control Channel.

If FOR\_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the quasi-orthogonal function mask identifier (see Table 3.1.3.1.12-2 of [2]) that the mobile station is to use on the Forward Dedicated Control Channel associated with this pilot. If FOR\_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the quasi-orthogonal function mask identifier (see Table 3.1.3.1.12-2 of [2]) that the mobile station is to use on the Forward Dedicated Control Channel on the center SR3 frequency.

- 12     3X\_DCCH\_INFO\_INCL    – 3X DCCH information included indicator.  
 13                          If the 3X Dedicated Control Channel information is included,  
 14                          the base station shall set this field to ‘1’; otherwise, the base  
 15                          station shall set this field to ‘0’.

16     The base station shall include NUM\_PILOTS plus one occurrence of the following record if  
 17     3X\_DCCH\_INFO\_INCL is set to ‘1’. The base station shall use the same order for the  
 18     following fields as is used for the PILOT\_PN fields listed in this message.

- 19     3X\_DCCH\_LOW\_INCL    – DCCH code channel on the lowest SR3 frequency included  
 20                          indicator.  
 21                          If the DCCH on the lowest SR3 frequencies has a different  
 22                          code channel than the DCCH on the center SR3 frequency,  
 23                          the base station shall set this field to ‘1’; otherwise, the base  
 24                          station shall set this field to ‘0’.

- 25       QOF\_MASK\_ID-  
 26                \_DCCH\_LOW    – QOF index for the DCCH on the lowest SR3 frequency.  
 27                          If 3X\_DCCH\_LOW\_INCL is set to ‘0’, the base station shall  
 28                          omit this field; otherwise, the base station shall set this field  
 29                          as follows:  
 30                          The base station shall set this field to the index of the Quasi-  
 31                          orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 32                          corresponding to the QOF index for the DCCH on the lowest  
 33                          SR3 frequency.

- 34       CODE\_CHAN-  
 35                \_DCCH\_LOW    – Code channel for the DCCH on the lowest SR3 frequency.  
 36                          If 3X\_DCCH\_LOW\_INCL is set to ‘0’, the base station shall  
 37                          omit this field; otherwise, the base station shall set this field  
 38                          as follows:  
 39                          The base station shall set this field to the code channel index  
 40                          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 41                          to use on the DCCH on the lowest SR3 frequency. If Radio  
 42                          Configuration 6 or 8 is used, the base station shall set this  
 43                          field in the range 1 to 127 inclusive. If Radio Configuration 7  
 44                          or 9 is used, the base station shall set this field in the range 1  
 45                          to 255 inclusive.

- 46     3X\_DCCH\_HIGH\_INCL    – DCCH code channel on the highest SR3 frequency included  
 47                          indicator.

If the DCCH on the highest SR3 frequencies has a different code channel than the DCCH on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

## QOF\_MASK\_ID-

- \_DCCH\_HIGH - QOF index for the DCCH on the highest SR3 frequency.  
If 3X\_DCCH\_HIGH\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2] corresponding to the QOF index for the DCCH on the highest SR3 frequency.

## CODE\_CHAN-

- \_DCCH\_HIGH - Code channel for the DCCH on the highest SR3 frequency.  
If 3X\_DCCH\_HIGH\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the DCCH on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

## RESERVED

- Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding CH\_RECORD\_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the CH\_IND field is set to ‘11’, the base station shall include the following fields:

- FPC\_FCH\_INIT\_SETPT - Initial Fundamental Channel outer loop  $E_b/N_t$  setpoint.  
The base station shall set this field to initial Fundamental Channel outer loop  $E_b/N_t$  setpoint, in units of 0.125 dB.
- FPC\_DCCH\_INIT\_SETPT - Initial Dedicated Control Channel outer loop  $E_b/N_t$  setpoint.  
The base station shall set this field to initial Dedicated Control Channel outer loop  $E_b/N_t$  setpoint, in units of 0.125 dB.
- FPC\_PRI\_CHAN - Power Control Subchannel indicator.

The base station shall set this field to '0' if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel and the base station is to multiplex the Power Control Subchannel on the Forward Fundamental Channel. The base station shall set this field to '1' if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel and the base station is to multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

- |    |                                                                                                                                                                                   |   |                                                                                                                                                                                                     |

| <b>CODE_CHAN_FCH</b>  | <ul style="list-style-type: none"> <li>- Code channel index for the Fundamental Channel.</li> </ul> <p>If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the Forward Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index that the mobile station is to use on the Forward Channel on the center SR3 frequency.</p> |

1                   If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is  
 2                   used, the base station shall set this field in the range 1 to 63  
 3                   inclusive. If Radio Configuration 4, 6 or 8 is used, the base  
 4                   station shall set this field in the range 1 to 127 inclusive. If  
 5                   Radio Configuration 7 or 9 is used, the base station shall set  
 6                   this field in the range 1 to 255 inclusive.

7       QOF\_MASK\_ID\_FCH - Quasi-Orthogonal Function Mask Identifier for the  
 8                   Fundamental Channel.

9                   If FOR\_RC is set to a Radio Configuration associated with  
 10                  Spreading Rate 1, the base station shall set this field to the  
 11                  quasi-orthogonal function mask identifier (see Table  
 12                  3.1.3.1.12-2 of [2]) that the mobile station is to use on the  
 13                  Forward Fundamental Channel associated with this pilot. If  
 14                  FOR\_RC is set to a Radio Configuration associated with  
 15                  Spreading Rate 3, the base station shall set this field to the  
 16                  quasi-orthogonal function mask identifier that the mobile  
 17                  station is to use on the Forward Fundamental Channel on the  
 18                  center SR3 frequency.

19       CODE\_CHAN\_DCCH - Code channel index for the Dedicated Control channel.

20                  If FOR\_RC is set to a Radio Configuration associated with  
 21                  Spreading Rate 1, the base station shall set this field to the  
 22                  code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]), in the  
 23                  range of 1 to 255 inclusive, that the mobile station is to use  
 24                  on the Dedicated Control Channel associated with this pilot. If  
 25                  FOR\_RC is set to a Radio Configuration associated with  
 26                  Spreading Rate 3, the base station shall set this field to the  
 27                  code channel index in the range of 1 to 255 inclusive, that the  
 28                  mobile station is to use on the Dedicated Control Channel on  
 29                  the center SR3 frequency.

30                  If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is  
 31                  used, the base station shall set this field in the range 1 to 63  
 32                  inclusive. If Radio Configuration 4, 6 or 8 is used, the base  
 33                  station shall set this field in the range 1 to 127 inclusive. If  
 34                  Radio Configuration 7 or 9 is used, the base station shall set  
 35                  this field in the range 1 to 255 inclusive.

36       QOF\_MASK\_ID\_DCCH - Quasi-Orthogonal Function Mask Identifier for the Dedicated  
 37                  Control Channel.

38                  If FOR\_RC is set to a Radio Configuration associated with  
 39                  Spreading Rate 1, the base station shall set this field to the  
 40                  quasi-orthogonal function mask identifier (see Table  
 41                  3.1.3.1.12-2 of [2]) that the mobile station is to use on the  
 42                  Forward Dedicated Control Channel associated with this pilot. If  
 43                  FOR\_RC is set to a Radio Configuration associated with  
 44                  Spreading Rate 1, the base station shall set this field to the  
 45                  quasi-orthogonal function mask identifier that the mobile  
 46                  station is to use on the Forward Dedicated Control Channel  
 47                  on the center SR3 frequency.

48       3X\_FCH\_INFO\_INCL - 3X FCH information included indicator.

If the 3X Fundamental Channel information is included, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

The base station shall include NUM\_PILOTS plus one occurrence of the following record if 3X\_FCH\_INFO\_INCL is set to '1'. The base station shall use the same order for the following fields as is used for the PILOT\_PN fields listed in this message.

3X\_FCH\_LOW\_INCL - FCH code channel on the lowest SR3 frequency included indicator.

If the FCH on the lowest SR3 frequencies has a different code channel than the FCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

QOF\_MASK\_ID-

\_FCH\_LOW - QOF index for the FCH on the lowest SR3 frequency.

If 3X\_FCH\_LOW\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) corresponding to the QOF index for the FCH on the lowest SR3 frequency.

CODE\_CHAN-

\_FCH\_LOW - Code channel for the FCH on the lowest SR3 frequency.

If 3X\_FCH\_LOW\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the FCH on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X\_FCH\_HIGH\_INCL - FCH code channel on the highest SR3 frequency included indicator.

If the FCH on the highest SR3 frequencies has a different code channel than the FCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

QOF\_MASK\_ID-

\_FCH\_HIGH - QOF index for the FCH on the highest SR3 frequency.

If 3X\_FCH\_HIGH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2] corresponding to the QOF index for the FCH on the highest SR3 frequency.

## CODE\_CHAN-

- Code channel for the FCH on the highest SR3 frequency.  
If 3X\_FCH\_HIGH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the FCH on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

### 3X\_DCCH\_INFO\_INCL

- 3X DCCH information included indicator.  
If the 3X Dedicated Control Channel information is included, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

The base station shall include NUM\_PILOTS plus one occurrence of the following record if 3X\_DCCH\_INFO\_INCL is set to '1'. The base station shall use the same order for the following fields as is used for the PILOT PN fields listed in this message.

### 3X\_DCCH\_LOW\_INCL

- DCCH code channel on the lowest SR3 frequency included indicator.  
If the DCCH on the lowest SR3 frequencies has a different code channel than the DCCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

OOE MASK ID

- QOF index for the DCCH on the lowest SR3 frequency.  
If `3X_DCCH_LOW_INCL` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) corresponding to the QOF index for the DCCH on the lowest SR3 frequency.

CODE CHAN-

- Code channel for the DCCH on the lowest SR3 frequency.  
If `3X_DCCH_LOW_INCL` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the DCCH on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

- 3X\_DCCH\_HIGH\_INCL** – DCCH code channel on the highest SR3 frequency included indicator.

If the DCCH on the highest SR3 frequencies has a different code channel than the DCCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

QOF\_MASK\_ID-

- QOF index for the DCCH on the highest SR3 frequency.  
If 3X\_DCCH\_HIGH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2] corresponding to the QOF index for the DCCH on the highest SR3 frequency.

CODE CHAN-

- Code channel for the DCCH on the highest SR3 frequency.  
If `3X_DCCH_HIGH_INCL` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the DCCH on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**RESERVED**

- Reserved bits.  
The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding CH\_RECORD\_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to '0'.

## 1 3.7.2.3.2.22 General Neighbor List Message

2 MSG\_TAG: GNLM

| Field                | Length (bits) |
|----------------------|---------------|
| PILOT_PN             | 9             |
| CONFIG_MSG_SEQ       | 6             |
| PILOT_INC            | 4             |
| NGHBR_SRCH_MODE      | 2             |
| NGHBR_CONFIG_PN_INCL | 1             |
| FREQ_FIELDS_INCL     | 1             |
| USE_TIMING           | 1             |
| GLOBAL_TIMING_INCL   | 0 or 1        |
| GLOBAL_TX_DURATION   | 0 or 4        |
| GLOBAL_TX_PERIOD     | 0 or 7        |
| NUM_NGHBR            | 6             |

NUM\_NGHBR occurrences of the following record:

|                   |         |
|-------------------|---------|
| NGHBR_CONFIG      | 0 or 3  |
| NGHBR_PN          | 0 or 9  |
| SEARCH_PRIORITY   | 0 or 2  |
| SRCH_WIN_NGHBR    | 0 or 4  |
| FREQ_INCL         | 0 or 1  |
| NGHBR_BAND        | 0 or 5  |
| NGHBR_FREQ        | 0 or 11 |
| TIMING_INCL       | 0 or 1  |
| NGHBR_TX_OFFSET   | 0 or 7  |
| NGHBR_TX_DURATION | 0 or 4  |
| NGHBR_TX_PERIOD   | 0 or 7  |

(continues on next page)

1

| Field            | Length (bits) |
|------------------|---------------|
| NUM_ANALOG_NGHBR | 3             |

NUM\_ANALOG\_NGHBR occurrences of the following record:

|            |   |
|------------|---|
| BAND_CLASS | 5 |
| SYS_A_B    | 2 |

|                  |   |
|------------------|---|
| SRCH_OFFSET_INCL | 1 |
|------------------|---|

NUM\_NGHBR occurrences of the following record:

|                      |                            |
|----------------------|----------------------------|
| ADD_PILOT_REC_INCL   | 1                          |
| NGHBR_PILOT_REC_TYPE | 0 or 3                     |
| RECORD_LEN           | 0 or 3                     |
| Type-specific fields | 0 or $8 \times$ RECORD_LEN |
| SRCH_OFFSET_NGHBR    | 0 or 3                     |

|               |   |
|---------------|---|
| BCCH_IND_INCL | 1 |
|---------------|---|

NUM\_NGHBR occurrences of the following field:

|              |        |
|--------------|--------|
| BCCH_SUPPORT | 0 or 1 |
|--------------|--------|

2

3 PILOT\_PN - Pilot PN sequence offset index.  
 4 The base station shall set this field to the pilot PN sequence  
 5 offset for this base station, in units of 64 PN chips.

6 CONFIG\_MSG\_SEQ - Configuration message sequence number.  
 7 The base station shall set this field to CONFIG\_SEQ  
 8 (see 3.6.2.2).

9 PILOT\_INC - Pilot PN sequence offset index increment.  
 10 A mobile station searches for Remaining Set pilots at pilot PN  
 11 sequence index values that are multiples of this value.

12 The base station shall set this field to the pilot PN sequence  
 13 increment, in units of 64 PN chips, that mobile stations are to  
 14 use for searching the Remaining Set. The base station should  
 15 set this field to the largest increment such that the pilot PN  
 16 sequence offsets of all its neighbor base stations are integer  
 17 multiples of that increment.

18 The base station shall set this field to a value in the range 1 to  
 19 15 inclusive.

20 NGHBR\_SRCH\_MODE - Search mode.

1           The base station shall set this field to the value shown in  
 2           Table 3.7.2.3.2.22-1 corresponding to the search mode.  
 3

**Table 3.7.2.3.2.22-1. Search Mode Field**

| <b>Value<br/>(binary)</b> | <b>Description</b>                     |
|---------------------------|----------------------------------------|
| 00                        | No search priorities or search windows |
| 01                        | Search priorities                      |
| 10                        | Search windows                         |
| 11                        | Search windows and search priorities   |

- 5
- 6           NGHBR\_CONFIG-
- 7            \_PN\_INCL    - Neighbor configuration and PN offset included.  
 8                     If neighbor configuration and PN offset fields are included in  
 9                     this message, the base station shall set this field to '1';  
 10                  otherwise, the base station shall set this field to '0'.
- 11          FREQ\_FIELDS\_INCL - Frequency fields included.  
 12                  If frequency fields are included in this message, the base  
 13                  station shall set this field to '1'; otherwise, the base station  
 14                  shall set this field to '0'.
- 15          USE\_TIMING    - Use timing indicator.  
 16                  If base station timing information is included for neighbor  
 17                  base stations, the base station shall set this field to '1';  
 18                  otherwise, the base station shall set this field to '0'.
- 19          GLOBAL\_TIMING-  
 20            \_INCL      - Global timing included.  
 21                  If USE\_TIMING is set to '1', the base station shall include the  
 22                  field GLOBAL\_TIMING\_INCL and set this field as described  
 23                  below; otherwise, the base station shall omit this field.  
 24                  If base station timing information is included globally for all  
 25                  neighbor base stations with TIMING\_INCL equal to '1', the  
 26                  base station shall set this field to '1'; otherwise, the base  
 27                  station shall set this field to '0'.
- 28          GLOBAL\_TX-  
 29            \_DURATION - Global neighbor transmit time duration.  
 30                  If GLOBAL\_TIMING\_INCL is included and is set to '1', the base  
 31                  station shall include the field GLOBAL\_TX\_DURATION and  
 32                  shall set this field as described below; otherwise, the base  
 33                  station shall omit this field.

The base station shall set this field to the duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

GLOBAL\_TX-

- \_PERIOD** - Global neighbor transmit time period.

If GLOBAL\_TIMING\_INCL is included and is set to '1', the base station shall include the field GLOBAL\_TX\_PERIOD and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the period, in units of 80 ms.

- NUM\_NGHBR** - Number of neighbor pilot PN sequences.

The base station shall set this field to the number of neighbors included in the message.

The base station shall include one occurrence of the following record for each pilot that a mobile station is to place in its Neighbor Set. The base station shall use the same order for the following record in this message as is used for pilots which are listed in the *Neighbor List Message* or *Extended Neighbor List Message*. Specifically, the  $i^{th}$  occurrence of the following record shall correspond the  $i^{th}$  pilot in the *Neighbor List Message* or in the *Extended Neighbor List Message*.

- NGHBR\_CONFIG** - Neighbor configuration.

If NGHBR\_CONFIG\_PN\_INCL = '1', the base station shall set this field to the value shown in Table 3.7.2.3.2.22-2 corresponding to the configuration of this neighbor; otherwise, the base station shall omit this field.

1

**Table 3.7.2.3.2.22-2. Neighbor Configuration Field**

| <b>Value<br/>(binary)</b> | <b>Neighbor Configuration</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000                       | <p>The neighbor base station has the same number of frequencies having Paging Channels as the current base station.</p> <p>The neighbor base station has a CDMA frequency assignment corresponding to this current CDMA frequency assignment with the same number of Paging Channels, and the neighbor CDMA frequency is given as follows:</p> <ul style="list-style-type: none"> <li>• If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.</li> <li>• If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.</li> </ul> <p>The position of the neighbor CDMA frequency assignment in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the current base station.</p>                                                                                                                  |

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 010     | <p>The neighbor base station may have a different number of frequencies having Paging Channels as the current base station.</p> <p>The neighbor base station has a Primary Paging Channel on the following CDMA frequency:</p> <ul style="list-style-type: none"> <li>• If FREQ_INCL equals '0' for this record, the neighbor base station has a Primary Paging Channel on the first CDMA Channel listed in the <i>CDMA Channel List Message</i> or the <i>Extended CDMA Channel List Message</i> transmitted by the current base station.</li> <li>• If FREQ_INCL equals '1' for this record, the neighbor base station has a Primary Paging Channel on the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ.</li> </ul> |
| 011     | <p>The neighbor base station configuration is unknown but the neighbor base station has a Pilot Channel on the following frequency:</p> <ul style="list-style-type: none"> <li>• If FREQ_INCL equals '0' for this record, the neighbor CDMA frequency assignment is the same as the current CDMA frequency assignment and has a Pilot Channel.</li> <li>• If FREQ_INCL equals '1' for this record, the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ has a Pilot Channel.</li> </ul>                                                                                                                                                                                                                                   |
| 100-111 | Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

- 1  
2           NGHBR\_PN    - Neighbor pilot PN sequence offset index.  
3           If NGHBR\_CONFIG\_PN\_INCL = '1', the base station shall set  
4           this field to the pilot PN sequence offset for this neighbor, in  
5           units of 64 PN chips; otherwise, the base station shall omit  
6           this field.  
7           SEARCH\_PRIORITY   - Pilot Channel search priority.  
8           If NGHBR\_SRCH\_MODE = '01' or NGHBR\_SRCH\_MODE = '11',  
9           then the base station shall set this field to the search priority  
10          for the Pilot Channel corresponding to NGHBR\_PN. The base  
11          station shall set the search priority as shown in Table  
12          3.7.2.3.2.22-3. If NGHBR\_SRCH\_MODE is set to any other  
13          value, the base station shall omit this field.  
14

**Table 3.7.2.3.2.22-3. Search Priority Field**

| <b>Value<br/>(binary)</b> | <b>Search Priority</b> |
|---------------------------|------------------------|
| 00                        | Low                    |
| 01                        | Medium                 |
| 10                        | High                   |
| 11                        | Very High              |

- 1
- 2
- 3 SRCH\_WIN\_NGHBR - Neighbor pilot channel search window size.
- 4 If NGHBR\_SRCH\_MODE = '10' or '11', then the base station
- 5 shall set this field to the value shown in Table 2.6.6.2.1-1
- 6 corresponding to the search window size to be used by mobile
- 7 stations for this neighbor. If NGHBR\_SRCH\_MODE is set to
- 8 any other value, the base station shall omit this field.
- 9 FREQ\_INCL - Frequency included indicator.
- 10 If FREQ\_FIELDS\_INCL is set to '0', the base station shall omit
- 11 this field; otherwise, the base station shall set this field as
- 12 follows:
- 13 If the NGHBR\_BAND and NGHBR\_FREQ fields are included
- 14 for this neighbor base station, the base station shall set this
- 15 bit to '1'. If the NGHBR\_BAND and NGHBR\_FREQ fields are
- 16 not included in this assignment record, the base station shall
- 17 set this bit to '0'.
- 18 NGHBR\_BAND - Neighbor band class.
- 19 If the FREQ\_INCL bit is included and is set to '1', the base
- 20 station shall set this field to the CDMA band class, as
- 21 specified in [30], corresponding to the CDMA frequency
- 22 assignment for the CDMA Channel containing the Paging
- 23 Channel the mobile station is to search. If the FREQ\_INCL bit
- 24 is omitted or is set to '0', the base station shall omit this field.
- 25 NGHBR\_FREQ - Neighbor frequency assignment.
- 26 If the FREQ\_INCL bit is omitted or is set to '0', the base
- 27 station shall omit this field.
- 28 If the FREQ\_INCL bit is included and is set to '1' and the
- 29 corresponding neighbor has a 1X neighbor pilot record type,
- 30 the base station shall set this field to the CDMA Channel
- 31 number, in the specified CDMA band class, corresponding to
- 32 the CDMA frequency assignment for the CDMA Channel
- 33 containing the Paging Channel the mobile station is to search.

If the FREQ\_INCL bit is included and is set to ‘1’ and the corresponding neighbor has a 3X neighbor pilot record type, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the center SR3 frequency assignment containing the Paging Channel the mobile station is to search.

TIMING\_INCL - Timing included indicator.  
If USE\_TIMING is set to ‘1’, the base station shall include the field TIMING\_INCL and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included for this neighbor base station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

NGHBR\_TX\_OFFSET - Neighbor transmit time offset.  
If TIMING\_INCL is included and is set to ‘1’, the base station shall include the field NGHBR\_TX\_OFFSET and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the time offset, in units of 80 ms, from the beginning of the neighbor timing period to the beginning of the first base station transmit window within the period. The beginning of the neighbor timing period occurs when  $\lfloor t/4 \rfloor \bmod (16384) = 0$ .

NGHBR\_TX\_DURATION - Neighbor transmit time duration.  
If TIMING\_INCL is included and is set to ‘1’ and GLOBAL\_TIMING\_INCL is set to ‘0’, the base station shall include the field NGHBR\_TX\_DURATION and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

NGHBR\_TX\_PERIOD - Neighbor transmit time period.  
If TIMING\_INCL is included and is set to ‘1’ and GLOBAL\_TIMING\_INCL is set to ‘0’, the base station shall include the field NGHBR\_TX\_PERIOD and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the period, in units of 80 ms.

NUM\_ANALOG\_NGHBR - Number of neighboring analog systems.  
The base station shall set this field to the number of neighboring analog systems included in the message.

1 The base station shall include one occurrence of the following record for each neighboring  
 2 analog system included in the message:

- 3           BAND\_CLASS    - Band class.  
         4                         The base station shall set this field to the CDMA band class,  
         5                         as specified in [30].
- 6           SYS\_A\_B        - System A/B.  
         7                         If BAND\_CLASS is set to '00000' or to '00011', the base station  
         8                         shall set this field to the value shown in Table 3.7.2.3.2.22-4  
         9                         corresponding to the availability of neighboring analog  
 10                         systems; otherwise, the base station shall set this field to '00'.

**Table 3.7.2.3.2.22-4. Cellular System A/B**

| <b>Cellular System A/B</b> | <b>Value</b> |
|----------------------------|--------------|
| RESERVED                   | 00           |
| System A                   | 01           |
| System B                   | 10           |
| System A and B             | 11           |

12  
 13 SRCH\_OFFSET\_INCL   - Neighbor pilot channel search window offset included.  
 14                         If NGHBR\_SRCH\_MODE = '10' or '11' and if the  
 15                         SRCH\_OFFSET\_NGHBR field is included in the following  
 16                         records, the base station shall set this bit to '1'; otherwise, the  
 17                         base station shall set this bit to '0'.

18 The base station shall include one occurrence of the following record for each pilot that a  
 19 mobile station is to place in its Neighbor Set. The base station shall use the same order for  
 20 the following record in this message as is used for pilots which are listed in the *Neighbor*  
 21 *List Message* or *Extended Neighbor List Message*. Specifically, the  $i^{th}$  occurrence of the  
 22 following record shall correspond the  $i^{th}$  pilot in the *Neighbor List Message* or in the  
 23 *Extended Neighbor List Message*.

24 ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.  
 25                         The base station shall set this field to '1' if additional pilot  
 26                         information listed in the NGHBR\_PILOT\_REC\_TYPE and  
 27                         RECORD\_LEN fields are included. The base station shall set  
 28                         this field to '0' if the corresponding pilot is the common pilot  
 29                         and there is no additional pilot information included.

30 NGHBR\_PILOT\_REC\_TYPE - Neighbor Pilot record type  
 31                         If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 32                         set this field to the NGHBR\_PILOT\_REC\_TYPE value shown in  
 33                         Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record  
 34                         specified by this record.

35

**Table 3.7.2.3.2.22-5. Neighbor Pilot Record Types**

| <b>Description</b>                                 | <b>NGHBR_PILOT_REC_TYPE<br/>(binary)</b> |
|----------------------------------------------------|------------------------------------------|
| 1X Common Pilot with Transmit Diversity            | 000                                      |
| 1X Auxiliary Pilot                                 | 001                                      |
| 1X Auxiliary Pilot with Transmit Diversity         | 010                                      |
| 3X Common Pilot                                    | 011                                      |
| 3X Auxiliary Pilot                                 | 100                                      |
| All other NGHBR_PILOT_REC_TYPE values are reserved |                                          |

- If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.
- RECORD\_LEN - Pilot record length.  
If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall set this field to the number of octets in the type-specific fields of this pilot record.  
If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.
- Type-specific fields - Pilot record type-specific fields.  
If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall include type-specific fields based on the NGHBR\_PILOT\_REC\_TYPE of this pilot record.  
If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.

If NGHBR\_PILOT\_REC\_TYPE is equal to '000', the base station shall include the following fields:

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| TD_POWER_LEVEL | 2                    |
| TD_MODE        | 2                    |
| RESERVED       | 4                    |

- TD\_POWER\_LEVEL - TD Transmit Power Level.

The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

- |          |                                                                                                                                                                                              |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TD_MODE  | <ul style="list-style-type: none"> <li>- Transmit Diversity mode.<br/>The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.</li> </ul> |
| RESERVED | <ul style="list-style-type: none"> <li>- Reserved bits.<br/>The base station shall set this field to '0000'.</li> </ul>                                                                      |

9 If NGHBR\_PILOT\_REC\_TYPE is equal to '001', the base station shall include the following  
10 fields:

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| QOF             | 2                    |
| WALSH_LENGTH    | 3                    |
| AUX_PILOT_WALSH | WALSH_LENGTH+6       |
| RESERVED        | 0 to 7 (as needed)   |

- |      |                                                                                                                                                                                                                                                                                   |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QOF  | <ul style="list-style-type: none"><li>- Quasi-orthogonal function index.<br/>The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]).</li></ul>                                                                       |
| NGTH | <ul style="list-style-type: none"><li>- Length of the Walsh Code.<br/>The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary pilot.</li></ul> |

**Table 3.7.2.3.2.22-6. Walsh Code Length**

| <b>WALSH_LENGTH<br/>(binary)</b> | <b>Length of the Walsh<br/>Code</b> |
|----------------------------------|-------------------------------------|
| '000'                            | 64                                  |
| '001'                            | 128                                 |
| '010'                            | 256                                 |
| '011'                            | 512                                 |
| '100' – '111'                    | Reserved                            |

- 22           AUX\_PILOT\_WALSH   -   Walsh Code for the Auxiliary Pilot.  
23                                 The base station shall set this field to the Walsh code  
24                                 corresponding to the Auxiliary pilot.  
25           RESERVED   -   Reserved bits.

1           The base station shall set all the bits of this field to '0' to make  
 2           the entire record octet-aligned.

3       If NGHBR\_PILOT\_REC\_TYPE is equal to '010', the base station shall include the following  
 4       fields:

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| QOF                | 2                    |
| WALSH_LENGTH       | 3                    |
| AUX_WALSH          | WALSH_LENGTH+6       |
| AUX_TD_POWER_LEVEL | 2                    |
| TD_MODE            | 2                    |
| RESERVED           | 0 to 7 (as needed)   |

6  
 7       QOF     - Quasi-orthogonal function index for the Auxiliary Transmit  
 8           Diversity Pilot.

9           The base station shall set this field to the index of the Quasi-  
 10          orthogonal function (see Table 3.1.3.1.12-2 of [2]).

11      WALSH\_LENGTH - Length of the Walsh Code.

12           The base station shall set this field to the WALSH\_LENGTH  
 13          value shown in 3.7.2.3.2.22-6 corresponding to the length of  
 14          the Walsh code for the pilots that are used as Auxiliary pilot  
 15          in the transmit diversity mode.

16      AUX\_WALSH - Walsh Code for the Auxiliary Pilot.

17           The base station shall set this field to the Walsh code  
 18          corresponding to the Auxiliary Pilot.

19      AUX\_TD-  
 20      \_POWER\_LEVEL - Auxiliary Transmit Diversity Pilot Power Level.

21           The base station shall set this field to the Auxiliary Transmit  
 22          Diversity Pilot transmit power level relative to that of the  
 23          Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.

**Table 3.7.2.3.2.22-7. Auxiliary Transmit Diversity Pilot  
Transmit Power Level**

| <b>AUX_TD_POWER_LEVEL</b> | <b>Transmit Power Level</b>                           |
|---------------------------|-------------------------------------------------------|
| 00                        | 9 dB below the Auxiliary Pilot Channel transmit power |
| 01                        | 6 dB below the Auxiliary Pilot Channel transmit power |
| 10                        | 3 dB below the Auxiliary Pilot Channel transmit power |
| 11                        | Same as the Auxiliary Pilot Channel transmit power    |

|          |                                                                                                                                                                                                 |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TD_MODE  | <ul style="list-style-type: none"> <li>- Transmit Diversity mode.</li> </ul> <p>The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.</p> |
| RESERVED | <ul style="list-style-type: none"> <li>- Reserved bits.</li> </ul> <p>The base station shall set all the bits of this field to '0' to make the entire record octet-aligned.</p>                 |

If NGHBR\_PILOT\_REC\_TYPE is equal to '011', the base station shall include the following fields:

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SR3_PRIMARY_PILOT | 2                    |
| SR3_PILOT_POWER1  | 3                    |
| SR3_PILOT_POWER2  | 3                    |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SR3_PRIMARY_PILOT | <ul style="list-style-type: none"><li>- Primary SR3 pilot.<br/>The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.</li></ul>                                                                                                                                                                                                  |
| SR3_PILOT_POWER1  | <ul style="list-style-type: none"><li>- The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.<br/>The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.</li></ul>   |
| SR3_PILOT_POWER2  | <ul style="list-style-type: none"><li>- The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.<br/>The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.</li></ul> |

1 | **RESERVED**      Reserved bits.

2 | ~~The base station shall set this field to '0000000'.~~

- 3 |  
4 | If NGHBR\_PILOT\_REC\_TYPE is equal to '100', the base station shall include the following  
5 | fields:

| <b>Field</b>      | <b>Length (bits)</b>    |
|-------------------|-------------------------|
| SR3_PRIMARY_PILOT | 2                       |
| SR3_PILOT_POWER1  | 3                       |
| SR3_PILOT_POWER2  | 3                       |
| QOF               | 2                       |
| WALSH_LENGTH      | 3                       |
| AUX_PILOT_WALSH   | WALSH_LENGTH+6          |
| ADD_INFO_INCL1    | 1                       |
| QOF1              | 0 or 2                  |
| WALSH_LENGTH1     | 0 or 3                  |
| AUX_PILOT_WALSH1  | 0 or<br>WALSH_LENGTH1+6 |
| ADD_INFO_INCL2    | 1                       |
| QOF2              | 0 or 2                  |
| WALSH_LENGTH2     | 0 or 3                  |
| AUX_PILOT_WALSH2  | 0 or<br>WALSH_LENGTH2+6 |
| RESERVED          | 0 – 7 (as needed)       |

- 6 | SR3\_PRIMARY\_PILOT    - Primary SR3 pilot.  
7 | The base station shall set this field to the value shown in  
8 | Table 3.7.2.3.2.26-5 corresponding to the position of the  
9 | primary SR3 pilot.
- 10 | SR3\_PILOT\_POWER1    - The primary SR3 pilot power level relative to that of the pilot  
11 | on the lower frequency of the two remaining SR3 frequencies.  
12 | The base station shall set this field to the value shown in  
13 | Table 3.7.2.3.2.26-6 corresponding to the power level of the  
14 | primary pilot with respect to the pilot on the lower frequency  
15 | of the two remaining SR3 frequencies.
- 16 | SR3\_PILOT\_POWER2    - The primary SR3 pilot power level relative to that of the pilot  
17 | on the higher frequency of the two remaining SR3 frequencies.  
18 | The base station shall set this field to the value shown in  
19 | Table 3.7.2.3.2.26-6 corresponding to the power level of the  
20 | primary pilot with respect to the pilot on the higher frequency  
21 | of the two remaining SR3 frequencies.

- 1                   QOF     - Quasi-orthogonal function index.  
 2                   The base station shall set this field to the index of the Quasi-  
 3                   orthogonal function (see Table 3.1.3.1.12-2 of [2] on the  
 4                   frequency of the primary pilot.
- 5                   WALSH\_LENGTH     - Length of the Walsh Code.  
 6                   The base station shall set this field to the WALSH\_LENGTH  
 7                   value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 8                   length of the Walsh code for the pilot that is used as the  
 9                   Auxiliary pilot on the frequency of the primary pilot.
- 10                  AUX\_PILOT\_WALSH     - Walsh Code for the Auxiliary Pilot.  
 11                  The base station shall set this field to the Walsh code  
 12                  corresponding to the Auxiliary pilot on the frequency of the  
 13                  primary pilot.
- 14                  ADD\_INFO\_INCL1     - Additional information included for the pilot on the lower  
 15                  frequency of the two remaining SR3 frequencies.  
 16                  If the additional information for the pilot on the lower  
 17                  frequencies of the two remaining SR3 frequencies is the same  
 18                  as pilot on the primary frequency, the base station shall set  
 19                  this field to '0'; otherwise, the base station shall set this field  
 20                  to '1'.
- 21                  QOF1     - Quasi-orthogonal function index for the pilot on the lower  
 22                  frequency of the two remaining SR3 frequencies.  
 23                  If ADD\_INFO\_INCL1 is set to '0', the base station shall omit  
 24                  this field; otherwise, the base station shall set this field as  
 25                  follows:  
 26                  The base station shall set this field to the index of the Quasi-  
 27                  orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the lower  
 28                  frequency of the two remaining SR3 frequencies.
- 29                  WALSH\_LENGTH1     - Length of the Walsh Code for the pilot on the lower frequency  
 30                  of the two remaining SR3 frequencies.  
 31                  If ADD\_INFO\_INCL1 is set to '0', the base station shall omit  
 32                  this field; otherwise, the base station shall set this field as  
 33                  follows:  
 34                  The base station shall set this field to the WALSH\_LENGTH  
 35                  value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 36                  length of the Walsh code for the pilot that is used as the  
 37                  Auxiliary pilot on the lower frequency of the two remaining  
 38                  SR3 frequencies.
- 39                  AUX\_PILOT\_WALSH1     - Walsh Code for the Auxiliary Pilot on the lower frequency of  
 40                  the two remaining SR3 frequencies.  
 41                  If ADD\_INFO\_INCL1 is set to '0', the base station shall omit  
 42                  this field; otherwise, the base station shall set this field as  
 43                  follows:  
 44                  The base station shall set this field to the Walsh code  
 45                  corresponding to the Auxiliary pilot on the lower frequency of  
 46                  the two remaining SR3 frequencies.

- 1           ADD\_INFO\_INCL2   - Additional information included for the pilot on the higher  
 2           frequency of the two remaining SR3 frequencies.
- 3           If the additional information for the pilot on the higher  
 4           frequencies of the two remaining SR3 frequencies is the same  
 5           as pilot on the primary frequency, the base station shall set  
 6           this field to '0'; otherwise, the base station shall set this field  
 7           to '1'.
- 8           QOF2   - Quasi-orthogonal function index for the pilot on the higher  
 9           frequency of the two remaining SR3 frequencies.
- 10          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 11         this field; otherwise, the base station shall set this field as  
 12         follows:
- 13          The base station shall set this field to the index of the Quasi-  
 14           orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the  
 15           higher frequency of the two remaining SR3 frequencies.
- 16          WALSH\_LENGTH2   - Length of the Walsh Code for the pilot on the higher frequency  
 17           of the two remaining SR3 frequencies.
- 18          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 19         this field; otherwise, the base station shall set this field as  
 20         follows:
- 21          The base station shall set this field to the WALSH\_LENGTH  
 22           value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 23           length of the Walsh code for the pilot that is used as the  
 24           Auxiliary pilot on the higher frequency of the two remaining  
 25           SR3 frequencies.
- 26          AUX\_PILOT\_WALSH2   - Walsh Code for the Auxiliary Pilot on the higher frequency of  
 27           the two remaining SR3 frequencies.
- 28          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 29         this field; otherwise, the base station shall set this field as  
 30         follows:
- 31          The base station shall set this field to the Walsh code  
 32           corresponding to the Auxiliary pilot on the higher frequency of  
 33           the two remaining SR3 frequencies.
- 34          RESERVED   - Reserved bits.
- 35          The base station shall set all the bits of this field to '0' to make  
 36           the entire record octet-aligned.
- 37          SRCH\_OFFSET\_NGHBR   - Neighbor pilot channel search window size offset.
- 38          If SRCH\_OFFSET\_INCL equals to '1', then the base station  
 39           shall set this field to the value shown in Table 2.6.6.2.1-2  
 40           corresponding to the search window offset to be used by  
 41           mobile stations for this neighbor; otherwise, the base station  
 42           shall omit this field.
- 43          BCCH\_IND\_INCL   - BCCH support included indicator.
- 44          If the BCCH\_SUPPORT field is included in the following  
 45           records, the base station shall set this field to '1'; otherwise,  
 46           the base station shall set this field to '0'.

1    If BCCH\_IND\_INCL is set to '1', the base station shall include one occurrence of the  
2    following field for each pilot that a mobile station is to place in its Neighbor Set. The base  
3    station shall use the same order for the following record in this message as is used for  
4    pilots which are listed in the *Neighbor List Message* or *Extended Neighbor List Message*.  
5    Specifically, the  $i^{th}$  occurrence of the following record shall correspond the  $i^{th}$  pilot in the  
6    *Neighbor List Message* or in the *Extended Neighbor List Message*.

7            BCCH\_SUPPORT    -    BCCH support indicator.

8                         If this neighbor base station supports Broadcast Control  
9                         Channel, the base station shall set this field to '1'; otherwise,  
10                  the base station shall set this field to '0'. |

## 1    3.7.2.3.2.23 User Zone Identification Message

2    MSG\_TAG: UZIM

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| PILOT_PN       | 9                    |
| CONFIG_MSG_SEQ | 6                    |
| UZ_EXIT        | 4                    |
| NUM_UZID       | 4                    |

NUM\_UZID occurrences of the following record:

|          |    |
|----------|----|
| UZID     | 16 |
| UZ_REV   | 4  |
| TEMP_SUB | 1  |

3

4    PILOT\_PN    -    Pilot PN sequence offset index.  
5                 The base station shall set this field to the pilot PN sequence  
6                 offset for this base station, in units of 64 PN chips.7    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.  
8                 The base station shall set this field to CONFIG\_SEQ  
9                 (see 3.6.2.2).10    UZ\_EXIT    -    User Zone Exit parameter.  
11                 The base station shall set this field to the User Zone exit  
12                 parameter (see 2.6.9.2.1). The base station shall set this field  
13                 to a value (in dB) in the range 0 to 15.14    NUM\_UZID    -    Number of User Zone identifiers.  
15                 The base station shall set this field to the number of user zone  
16                 identifiers included in this message.

17    The base station shall include NUM\_UZID occurrences of the following record.

18                 UZID    -    User Zone identifier.  
19                 The base station shall set this field to the User Zone identifier  
20                 (see 3.6.7) supported by the base station.21                 UZ\_REV    -    User Zone update revision number.  
22                 The base station shall set this field to the User Zone update  
23                 revision number.24                 TEMP\_SUB    -    Temporary subscription flag.  
25                 If the corresponding User Zone allows for temporary  
26                 subscription, the base station shall set this field to '1';  
27                 otherwise, the base station shall set this field to '0'.

## 1    3.7.2.3.2.24 Private Neighbor List Message

2    MSG\_TAG: PNLM

| <b>Field</b>        | <b>Length (bits)</b> |
|---------------------|----------------------|
| PILOT_PN            | 9                    |
| CONFIG_MSG_SEQ      | 6                    |
| NUM_RADIO_INTERFACE | 4                    |

NUM\_RADIO\_INTERFACE occurrences of the following record:

|                                      |                               |
|--------------------------------------|-------------------------------|
| RADIO_INTERFACE_TYPE                 | 4                             |
| RADIO_INTERFACE_LEN                  | 8                             |
| Radio Interface Type-specific fields | 8x<br>RADIO_INTERFACE_L<br>EN |

3

- 4            PILOT\_PN    - Pilot PN sequence offset index.  
 5                         The base station shall set this field to the pilot PN sequence  
 6                         offset for this base station, in units of 64 PN chips.
- 7            CONFIG\_MSG\_SEQ    - Configuration message sequence number.  
 8                         The base station shall set this field to CONFIG\_SEQ  
 9                         (see 3.6.2.2).

- 10          NUM\_RADIO-  
 11                \_INTERFACE    - Number of interface types.  
 12                         The base station shall set this field to the number of radio  
 13                         interface types for which private neighbors are included in  
 14                         this message.

15          The base station shall include NUM\_RADIO\_INTERFACE occurrences of the following  
 16          record, one occurrence for each radio interface for which private neighbors are included in  
 17          this message.

- 18          RADIO-  
 19                \_INTERFACE\_TYPE    - The radio interface type.  
 20                         The base station shall set this field to the radio interface type  
 21                         of this record as specified in Table 3.7.2.3.2.24-1.

**Table 3.7.2.3.2.24-1. Radio Interface Type**

| <b>RAIO_INTERFACE_TYPE<br/>(binary)</b> | <b>Descriptions</b> |
|-----------------------------------------|---------------------|
| 0000                                    | MC system           |
| 0001-1111                               | Reserved            |

- RADIO-  
 \_INTERFACE\_LEN - The length of the Radio Interface Type-specific fields.  
 The base station shall set this field to the number of octets in  
 the Radio Interface Type-specific fields of this record.
- If RADIO\_INTERFACE\_TYPE is equal to '0000', the base station shall [set the radio interface type-specific fields as follows](#) [include the following fields](#):

1

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| COMMON_INCL       | 1                    |
| COMMON_BAND_CLASS | 0 or 5               |
| COMMON_NGHBR_FREQ | 0 or 11              |
| SRCH_WIN_PN       | 4                    |
| NUM_PRI_NGHBR     | 6                    |

NUM\_PRI\_NGHBR occurrences of the following record:

|                      |                    |
|----------------------|--------------------|
| SID                  | 15                 |
| NID                  | 16                 |
| PRI_NGHBR_PN         | 9                  |
| ADD_PILOT_REC_INCL   | 1                  |
| NGHBR_PILOT_REC_TYPE | 0 or 3             |
| RECORD_LEN           | 0 or 3             |
| Type-specific fields | 0 or 8× RECORD_LEN |
| BAND_CLASS           | 0 or 5             |
| NGHBR_FREQ           | 0 or 11            |
| UZID_INCL            | 1                  |
| NUM_UZID             | 0 or 4             |

If UZID\_INCL = 1, NUM\_UZID occurrences of the following subrecord; otherwise, no occurrence of the following subrecord:

|          |         |
|----------|---------|
| UZID     | 0 or 16 |
| UZ_REV   | 0 or 4  |
| TEMP_SUB | 0 or 1  |

|                          |                                   |
|--------------------------|-----------------------------------|
| <a href="#">RESERVED</a> | <a href="#">0 - 7 (as needed)</a> |
|--------------------------|-----------------------------------|

2

3

COMMON\_INCL - Common configuration included indicator.

4

5

6

7

8

If all private neighbor base stations included in this message are on the same CDMA band class and CDMA Channel number as specified in the COMMON\_BAND\_CLASS and COMMON\_NGHBR\_FREQ fields, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

9

COMMON\_BAND\_CLASS - Neighbor band class.

If COMMON\_INCL is set to '1', the base station shall set this field to the CDMA band class as [specified in \[30\] in Table 3.7.2.3.2.8.3](#) corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel or the Forward Common Control Channel for all private neighbors; otherwise, the base station shall omit this field.

COMMON\_NGHBR\_FREQ - Neighbor frequency assignment.

If the COMMON\_INCL bit is set to '1', the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel or the Forward Common Control Channel for all private neighbor base station; otherwise, the base station shall omit this field.

SRCH\_WIN\_N - Search window size for the Private Neighbor Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Private Neighbor Set.

NUM\_PRI\_NGHBR - Number of private neighbor pilot PN sequences.

The base station shall set this field to the number of private neighbors included in the message.

The base station shall include NUM\_PRI\_NGHBR occurrences of the following record.

SID - System Identification.

The base station shall set this field to the system identification number for this private neighbor system (see 2.6.5.2).

NID - Network Identification.

This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the system identification number for this private neighbor network (see 2.6.5.2).

PRI\_NGHBR\_PN - Private neighbor pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this private neighbor, in units of 64 PN chips.

ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.

The base station shall set this field to '1' if additional pilot information listed in the NGHBR\_PILOT\_REC\_TYPE and RECORD\_LEN fields are included. The base station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

NGHBR\_PILOT\_REC\_TYPE - Neighbor Pilot record type

1           If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 2           set this field to the NGHBR\_PILOT\_REC\_TYPE value shown in  
 3           Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record  
 4           specified by this record.

5           If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 6           omit this field.

- 7           RECORD\_LEN     - Pilot record length.  
 8                        If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 9                        set this field to the number of octets in the type-specific fields  
 10                       of this pilot record.

11                       If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 12                       omit this field.

- 13           Type-specific fields     - Pilot record type-specific fields.  
 14                        If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 15                        include type-specific fields based on the  
 16                        NGHBR\_PILOT\_REC\_TYPE of this pilot record.  
 17                        If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 18                        omit this field.

19           If NGHBR\_PILOT\_REC\_TYPE is equal to '000', the base station shall include the following  
 20           fields:

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| TD_POWER_LEVEL | 2                    |
| TD_MODE        | 2                    |
| RESERVED       | 4                    |

- 22  
 23           TD\_POWER\_LEVEL     - TD Transmit Power Level.  
 24                        The base station shall set this field to the TD transmit power  
 25                        level relative to that of the Forward Pilot Channel as specified  
 26                        in Table 3.7.2.3.2.26-4.

- 27           TD\_MODE     - Transmit Diversity mode.  
 28                        The base station shall set this field to the Transmit Diversity  
 29                        mode, as specified in Table 3.7.2.3.2.26-3.

- 30           RESERVED     - Reserved bits.  
 31                        The base station shall set this field to '0000'.

32           If NGHBR\_PILOT\_REC\_TYPE is equal to '001', the base station shall include the following  
 33           fields:

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| QOF             | 2                    |
| WALSH_LENGTH    | 3                    |
| AUX_PILOT_WALSH | WALSH_LENGTH+6       |
| RESERVED        | 0 to 7 (as needed)   |

- 1  
2            QOF    - Quasi-orthogonal function index.  
3            The base station shall set this field to the index of the Quasi-  
4            orthogonal function (see Table 3.1.3.1.12-2 of [2]).  
5            WALSH\_LENGTH - Length of the Walsh Code.  
6            The base station shall set this field to the WALSH\_LENGTH  
7            value shown in Table 3.7.2.3.2.22-6 corresponding to the  
8            length of the Walsh code for the pilot that is used in as the  
9            Auxiliary pilot.  
10          AUX\_PILOT\_WALSH - Walsh Code for the Auxiliary Pilot.  
11          The base station shall set this field to the Walsh code  
12          corresponding to the Auxiliary pilot.  
13          RESERVED - Reserved bits.  
14          The base station shall set all the bits of this field to '0' to make  
15          the entire record octet-aligned.

16        If NGHBR\_PILOT\_REC\_TYPE is equal to '010', the base station shall include the following  
17        fields:

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| QOF                | 2                    |
| WALSH_LENGTH       | 3                    |
| AUX_WALSH          | WALSH_LENGTH+6       |
| AUX_TD_POWER_LEVEL | 2                    |
| TD_MODE            | 2                    |
| RESERVED           | 0 to 7 (as needed)   |

- 19  
20          QOF    - Quasi-orthogonal function index for the Auxiliary Transmit  
21          Diversity Pilot.  
22          The base station shall set this field to the index of the Quasi-  
23          orthogonal function (see Table 3.1.3.1.12-2 of [2]).  
24          WALSH\_LENGTH - Length of the Walsh Code.

1                   The base station shall set this field to the WALSH\_LENGTH  
 2                   value shown in 3.7.2.3.2.22-6 corresponding to the length of  
 3                   the Walsh code for the pilots that are used as Auxiliary pilot  
 4                   in the transmit diversity mode.

- 5                   AUX\_WALSH    - Walsh Code for the Auxiliary Pilot.  
 6                   The base station shall set this field to the Walsh code  
 7                   corresponding to the Auxiliary Pilot.
- 8                   AUX\_TD-  
 9                   \_POWER\_LEVEL - Auxiliary Transmit Diversity Pilot Power Level.  
 10                  The base station shall set this field to the Auxiliary Transmit  
 11                  Diversity Pilot transmit power level relative to that of the  
 12                  Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.
- 13                  TD\_MODE     - Transmit Diversity mode.  
 14                  The base station shall set this field to the Transmit Diversity  
 15                  mode, as specified in Table 3.7.2.3.2.26-3.
- 16                  RESERVED    - Reserved bits.  
 17                  The base station shall set all the bits of this field to '0' to make  
 18                  the entire record octet-aligned.

19                  If NGHBR\_PILOT\_REC\_TYPE is equal to '011', the base station shall include the following  
 20                  fields:

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SR3_PRIMARY_PILOT | 2                    |
| SR3_PILOT_POWER1  | 3                    |
| SR3_PILOT_POWER2  | 3                    |

- 21  
 22                  SR3\_PRIMARY\_PILOT - Primary SR3 pilot.  
 23                  The base station shall set this field to the value shown in  
 24                  Table 3.7.2.3.2.26-5 corresponding to the position of the  
 25                  primary SR3 pilot.
- 26                  SR3\_PILOT\_POWER1 - The primary SR3 pilot power level relative to that of the pilot  
 27                  on the lower frequency of the two remaining SR3 frequencies.  
 28                  The base station shall set this field to the value shown in  
 29                  Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 30                  primary pilot with respect to the pilot on the lower frequency  
 31                  of the two remaining SR3 frequencies.
- 32                  SR3\_PILOT\_POWER2 - The primary SR3 pilot power level relative to that of the pilot  
 33                  on the higher frequency of the two remaining SR3 frequencies.  
 34                  The base station shall set this field to the value shown in  
 35                  Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 36                  primary pilot with respect to the pilot on the higher frequency  
 37                  of the two remaining SR3 frequencies.

38                  **RESERVED**      **Reserved bits.**

1 | The base station shall set this field to '0000000'.

2

3 If NGHBR\_PILOT\_REC\_TYPE is equal to '100', the base station shall include the following  
4 fields:

| <b>Field</b>      | <b>Length (bits)</b>    |
|-------------------|-------------------------|
| SR3_PRIMARY_PILOT | 2                       |
| SR3_PILOT_POWER1  | 3                       |
| SR3_PILOT_POWER2  | 3                       |
| QOF               | 2                       |
| WALSH_LENGTH      | 3                       |
| AUX_PILOT_WALSH   | WALSH_LENGTH+6          |
| ADD_INFO_INCL1    | 1                       |
| QOF1              | 0 or 2                  |
| WALSH_LENGTH1     | 0 or 3                  |
| AUX_PILOT_WALSH1  | 0 or<br>WALSH_LENGTH1+6 |
| ADD_INFO_INCL2    | 1                       |
| QOF2              | 0 or 2                  |
| WALSH_LENGTH2     | 0 or 3                  |
| AUX_PILOT_WALSH2  | 0 or<br>WALSH_LENGTH2+6 |
| RESERVED          | 0 – 7 (as needed)       |

- 5 SR3\_PRIMARY\_PILOT - Primary SR3 pilot.  
6 The base station shall set this field to the value shown in  
7 Table 3.7.2.3.2.26-5 corresponding to the position of the  
8 primary SR3 pilot.
- 9 SR3\_PILOT\_POWER1 - The primary SR3 pilot power level relative to that of the pilot  
10 on the lower frequency of the two remaining SR3 frequencies.  
11 The base station shall set this field to the value shown in  
12 Table 3.7.2.3.2.26-6 corresponding to the power level of the  
13 primary pilot with respect to the pilot on the lower frequency  
14 of the two remaining SR3 frequencies.
- 15 SR3\_PILOT\_POWER2 - The primary SR3 pilot power level relative to that of the pilot  
16 on the higher frequency of the two remaining SR3 frequencies.  
17 The base station shall set this field to the value shown in  
18 Table 3.7.2.3.2.26-6 corresponding to the power level of the  
19 primary pilot with respect to the pilot on the higher frequency  
20 of the two remaining SR3 frequencies.
- 21 QOF - Quasi-orthogonal function index.

- The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the frequency of the primary pilot.

WALSH\_LENGTH - Length of the Walsh Code.  
The base station shall set this field to the WALSH\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

AUX\_PILOT\_WALSH - Walsh Code for the Auxiliary Pilot.  
The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.

ADD\_INFO\_INCL1 - Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.  
If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.

QOF1 - Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.  
If ADD\_INFO\_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the lower frequency of the two remaining SR3 frequencies.

WALSH\_LENGTH1 - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.  
If ADD\_INFO\_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
The base station shall set this field to the WALSH\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

AUX\_PILOT\_WALSH1 - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.  
If ADD\_INFO\_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

- 1           ADD\_INFO\_INCL2   - Additional information included for the pilot on the higher  
 2           frequency of the two remaining SR3 frequencies.
- 3           If the additional information for the pilot on the higher  
 4           frequencies of the two remaining SR3 frequencies is the same  
 5           as pilot on the primary frequency, the base station shall set  
 6           this field to '0'; otherwise, the base station shall set this field  
 7           to '1'.
- 8           QOF2   - Quasi-orthogonal function index for the pilot on the higher  
 9           frequency of the two remaining SR3 frequencies.
- 10          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 11         this field; otherwise, the base station shall set this field as  
 12         follows:
- 13          The base station shall set this field to the index of the Quasi-  
 14           orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the  
 15           higher frequency of the two remaining SR3 frequencies.
- 16          WALSH\_LENGTH2   - Length of the Walsh Code for the pilot on the higher frequency  
 17           of the two remaining SR3 frequencies.
- 18          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 19         this field; otherwise, the base station shall set this field as  
 20         follows:
- 21          The base station shall set this field to the WALSH\_LENGTH  
 22           value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 23           length of the Walsh code for the pilot that is used as the  
 24           Auxiliary pilot on the higher frequency of the two remaining  
 25           SR3 frequencies.
- 26          AUX\_PILOT\_WALSH2   - Walsh Code for the Auxiliary Pilot on the higher frequency of  
 27           the two remaining SR3 frequencies.
- 28          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 29         this field; otherwise, the base station shall set this field as  
 30         follows:
- 31          The base station shall set this field to the Walsh code  
 32           corresponding to the Auxiliary pilot on the higher frequency of  
 33           the two remaining SR3 frequencies.
- 34          RESERVED   - Reserved bits.  
 35          The base station shall set all the bits of this field to '0' to make  
 36           the entire record octet-aligned.
- 37          BAND\_CLASS   - Neighbor band class.  
 38          If COMMON\_INCL is set to '0', the base station shall set this  
 39           field to the CDMA band class as [specified in \[30\] in Table](#)  
 40           [3.7.2.3.2.8-3](#)—corresponding to the CDMA frequency  
 41           assignment for the CDMA Channel containing the Paging  
 42           Channel for the private neighbor; otherwise, the base station  
 43           shall omit this field.
- 44          NGHBR\_FREQ   - Neighbor frequency assignment.

If the COMMON\_INCL bit is set to '0', the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel for the private neighbor base station; otherwise, the base station shall omit this field.

7           UZID\_INCL   - User Zone identifier included indicator.  
 8           If the UZID information is included, the base station shall set  
 9           this field to '1'; otherwise, the base station shall set this field  
 10          to '0'.

11          NUM\_UZID   - Number of User Zone identifiers.  
 12          If UZID\_INCL is set to '1', the base station shall set this field  
 13          to the number of occurrences of UZID supported by the  
 14          private neighbor base station; otherwise, the base station  
 15          shall omit this field.

16          If UZID\_INCL is set to '1', the base station shall include NUM\_UZID occurrences of the  
 17          following three-field subrecord; otherwise, the base station shall omit this subrecord.

18           UZID    - User Zone identifiers.  
 19           The base station shall set this field to the User Zone identifier  
 20           supported by the private neighbor base station.

21           UZ\_REV   - User Zone update revision number.  
 22           The base station shall set this field to the User Zone update  
 23           revision number.

24           TEMP\_SUB   - Temporary subscription flag.  
 25           If the corresponding User Zone allows for temporary  
 26           subscription, the base station shall set this field to '1';  
 27           otherwise, the base station shall set this field to '0'.

28           RESERVED   - Reserved bits.  
 29           The base station shall add reserved bits as needed in order to  
 30           make the length of the entire record equal to an integer  
 31           number of octets. The base station shall set these bits to '0'.

| DS_BLOB              | 0 or 24              |

- 1
- 2           P\_REV    - Protocol revision level.  
3                         The base station shall set this field to '00000111'.
- 4           MIN\_P\_REV - Minimum protocol revision level.  
5                         The base station sets this field to prevent mobile stations  
6                         which cannot be supported by the base station from accessing  
7                         the system.  
8                         The base station shall set this field to the minimum protocol  
9                         revision level that it supports. For Band Class 0 operation,  
10                  the base station should set this field to a value of '00000010'  
11                  or greater. For Band Class 1 or Band Class 4 operation, the  
12                  base station should set this field to a value of '00000001' or  
13                  greater. For Band Class 3 operation, the base station should  
14                  set this field to a value of '00000011' or greater. For Band  
15                  Class 2 or Band Class 5 operation, the base station should set  
16                  this field to '00000101', or greater. For Band Class 6, Band  
17                  Class 7, Band Class 8, ~~or~~-Band Class 9, or Band Class 10  
18                  operation, the base station should set this field to '00000110'  
19                  or greater.
- 20           SID      - System identification.  
21                         The base station shall set this field to the system identification  
22                         number for this system (see 2.6.5.2).
- 23           NID      - Network identification.  
24                         This field serves as a sub-identifier of a system as defined by  
25                         the owner of the SID.  
26                         The base station shall set this field to the network  
27                         identification number for this network (see 2.6.5.2).

- 1 PILOT\_PN - Pilot PN sequence offset index.  
 2 The base station shall set this field to the pilot PN sequence  
 3 offset for this base station, in units of 64 PN chips.
- 4 LC\_STATE - Long code state.  
 5 The base station shall set this field to the long code state at  
 6 the time given by the SYS\_TIME field of this message.
- 7 SYS\_TIME - System time.  
 8 The base station shall set this field to the System Time as of  
 9 four Sync Channel superframes (320 ms) after the end of the  
 10 last superframe containing any part of this *Sync Channel*  
 11 *Message*, minus the pilot PN sequence offset, in units of 80  
 12 ms (see 1.3 of [2]).
- 13 LP\_SEC - The number of leap seconds that have occurred since the start  
 14 of System Time.  
 15 The base station shall set this field to the number of leap  
 16 seconds that have occurred since the start of System Time, as  
 17 of the time given by the SYS\_TIME field of this message.
- 18 LTM\_OFF - Offset of local time from System Time.  
 19 The base station shall set this field to the two's complement  
 20 offset of local time from System Time, in units of 30 minutes.  
 21 The local time of day, in units of 80 ms, as of four Sync  
 22 Channel superframes (320 ms) after the end of the last  
 23 superframe containing any part of this *Sync Channel Message*,  
 24 minus the pilot PN sequence offset, is equal to SYS\_TIME -  
 25 (LP\_SEC × 12.5) + (LTM\_OFF × 22500).
- 26 DAYLT - Daylight savings time indicator.  
 27 If daylight savings time is in effect, the base station shall set  
 28 this field to '1'; otherwise, the base station shall set this field  
 29 to '0'.
- 30 PRAT - Paging Channel data rate.  
 31 The base station shall set this field to the PRAT field value  
 32 shown in Table 3.7.2.3.2.26-1 corresponding to the data rate  
 33 used by the Paging Channels in the system.

**Table 3.7.2.3.2.26-1. Paging Channel Data Rate**

| <b>PRAT Field (binary)</b> | <b>Paging Channel data rate</b> |
|----------------------------|---------------------------------|
| 00                         | 9600 bps                        |
| 01                         | 4800 bps                        |
| 10                         | Reserved                        |
| 11                         | Reserved                        |

- 35  
 36 CDMA\_FREQ - Frequency assignment.

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Primary Paging Channel.<sup>5</sup>

- EXT\_CDMA\_FREQ** - Extended frequency assignment.

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Primary Paging Channel that a mobile station capable of Radio Configurations greater than 2 or capable of supporting Quick Paging Channel will use.

- SR1\_BCCH\_Non TD InclSupported** - Common Channel in non TD mode Spreading Rate 1 supported-information included indicator.

The base station shall set this field to '1' if the base station supports includes common channels (BCCH/F-CCCH/EACH) information in non TD mode; otherwise, the base station shall set this field to '0'.

- SR1\_NON\_TD-\_FREQ\_INCL** - Non Transmit Diversity frequency included indicator.

If SR1\_BCCH\_Non\_TD\_InclSupported is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to '1' if SR1\_CDMA\_FREQ\_NON\_TD is included in the message. The base station shall set this field to '0' if the frequency specified by the EXT\_CDMA\_FREQ field is used for BCCH frequency assignment.

- SR1\_CDMA-\_FREQ\_NON\_TD - Frequency assignment for non-transmit diversity operation

If SR1\_NON\_TD\_FREQ\_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Broadcast Control Channel that does not support the TD operation.

- SR1\_BRAT\_NON\_TD - BCCH data rate in non-TD mode for Spreading Rate 1.

If SR1\_BCCH\_NON\_TD\_INCL\_SUPPORTED is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

<sup>5</sup> If compatibility with IS-95-A mobile stations is desired in a Band Class 0 system, the CDMA\_FREQ field is set to the CDMA frequency assignment containing this Sync Channel.

The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

**Table 3.7.2.3.2.26-2. Broadcast Control Channel Data Rate**

| <b>BRAT Field (binary)</b> | <b>Broadcast Control Channel<br/>data rate</b> |
|----------------------------|------------------------------------------------|
| 00                         | 4800 bps                                       |
| 01                         | 9600 bps                                       |
| 10                         | 19200bps                                       |
| 11                         | Reserved                                       |

**SR1\_CRAT\_NON\_TD** – BCCH code rate in non Transmit Diversity mode for Spreading Rate 1.

If SR1\_BCCH\_<u>NON\_TD\_INCL\_SUPPORTED</u> is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to '0' if the BCCH Code Rate is 1/4 (see 3.1.3.1.2.1 of [2]). The base station shall set this field to '1' if the BCCH code rate is 1/2 (see 3.1.3.1.2.1 of [2]).

## SR1\_BCCH\_CODE- \_CHAN\_NON\_TD

- Walsh code for the Spreading Rate 1 BCCH in non Transmit Diversity mode.

If SR1\_BCCH\_ NON\_TD\_INCL\_SUPPORTED is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Spreading Rate 1 BCCH in non Transmit Diversity mode.

- Spreading Rate 1 Transmit Diversity frequency [information](#) included indicator.

If SR1\_BCCH\_SUPPORTED is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if SR1\_CDMA\_FREQ\_TD, SR1\_BRAT\_TD, SR1\_CRAT\_TD, SR1\_TD\_MODE, and SR1\_TD\_POWER\_LEVEL are included in the message; otherwise, the base station shall set this field to ‘0’.

SR1\_CDMA\_FREOFREQ TD - Spreading Rate 1 frequency assignment for Transmit Diversity operation.

1            If SR1\_TD\_INCL is ~~not included in this message or is included~~  
 2            ~~but is~~ set to '0', the base station shall omit this field;  
 3            otherwise, the base station shall set this field as follows:

4            The base station shall set this field to the CDMA Channel  
 5            number corresponding to the CDMA frequency assignment for  
 6            the CDMA Channel containing a BCCH Channel that supports  
 7            the TD operation.

8            SR1\_BRAT\_TD    - BCCH data rate in Transmit Diversity mode for Spreading  
 9            Rate 1.

10          If SR1\_TD\_INCL is ~~not included in this message or is included~~  
 11          ~~but is~~ set to '0', the base station shall omit this field;  
 12          otherwise, the base station shall set this field as follows:

13          The base station shall set this field to the BRAT field value  
 14          shown in Table 3.7.2.3.2.26-2 corresponding to the data rate  
 15          used by the Primary Broadcast Control Channel in the  
 16          system.

17          SR1\_CRAT\_TD    - BCCH code rate in Transmit Diversity mode for Spreading  
 18          Rate 1.

19          If SR1\_TD\_INCL is ~~not included in this message or is included~~  
 20          ~~but is~~ set to '0', the base station shall omit this field;  
 21          otherwise, the base station shall set this field as follows:

22          The base station shall set this field to '0' if the BCCH Code  
 23          Rate is 1/4 (see 3.1.3.1.2.1 of [2]). The base station shall set  
 24          this field to '1' if the BCCH Code Rate is 1/2 (see 3.1.3.1.2.1 of  
 25          [2]).

26            SR1\_BCCH-  
 27            \_CODE\_CHAN\_TD    - Walsh code for the Spreading Rate 1 BCCH in Transmit  
 28            Diversity mode.

29          If SR1\_TD\_INCL is ~~not included in this message or is included~~  
 30          ~~but is~~ set to '0', the base station shall omit this field;  
 31          otherwise, the base station shall set this field as follows:

32          The base station shall set this field to the Walsh code  
 33          corresponding to the Spreading Rate 1 BCCH in Transmit  
 34          Diversity mode.

35          SR1\_TD\_MODE    - Spreading Rate 1 Transmit Diversity Mode.

36          If SR1\_TD\_INCL is ~~not included in this message or is included~~  
 37          ~~but is~~ set to '0', the base station shall omit this field;  
 38          otherwise, the base station shall set this field as follows:

39          The base station shall set this field corresponding to Table  
 40          3.7.2.3.2.26-3.

**Table 3.7.2.3.2.26-3. TD Mode**

| <b>TD_MODE</b> | <b>Descriptions</b>                      |
|----------------|------------------------------------------|
| 00             | OTD (Orthogonal Transmit Diversity) mode |
| 01             | STS (Space Time Spreading) mode          |
| 10-11          | Reserved                                 |

- 2
- 3                   SR1\_TD-
- 4                   \_POWER\_LEVEL - Spreading Rate 1 TD transmit power level.
- 5                   If SR1\_TD\_INCL is ~~not included in this message or is included~~  
6                   but is set to '0', the base station shall omit this field;  
7                   otherwise, the base station shall set this field as follows:
- 8                   The base station shall set this field to the TD transmit power  
9                   level relative to that of the Forward Pilot Channel, as specified  
10                  in Table 3.7.2.3.2.26-4.

**Table 3.7.2.3.2.26-4. TD Transmit Power Level**

| <b>TD_POWER_LEVEL</b> | <b>Transmit Power Level</b>                         |
|-----------------------|-----------------------------------------------------|
| 00                    | 9 dB below the Forward Pilot Channel transmit power |
| 01                    | 6 dB below the Forward Pilot Channel transmit power |
| 10                    | 3 dB below the Forward Pilot Channel transmit power |
| 11                    | Same as the Forward Pilot Channel transmit power    |

- 12
- 13                  SR3\_INCL - Spreading Rate 3 information included indicator.  
14                  The base station shall set this field to '1' if the Spreading Rate  
15                  3 information is included in this message; otherwise, the base  
16                  station shall set this field to '0'.
- 17                  SR3\_CENTER-  
18                  \_FREQ\_INCL - Center SR3 frequency assignment included.  
19                  If SR3\_INCL is set to '0', the base station shall omit this field;  
20                  otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’, if the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel is different to EXT\_CDMA\_FREQ. Otherwise, the base station shall set this field to ‘0’.

- SR3\_CENTER\_FREQ - Center SR3 frequency assignment.  
 If SR3\_CENTER\_FREQ\_INCL is not included or is included but is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel.

- SR3\_BRAT – Spreading Rate 3 BCCH data rate.

If SR3\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BCCH rate field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

SR3\_BCCH-  
 \_CODE\_CHAN - Spreading Rate 3 BCCH Walsh code.  
 If SR3\_INCL is set to '0', the base station shall omit this field;  
 otherwise, the base station shall set this field as follows:

- The base station shall set this field to the Walsh code corresponding to the Spreading Rate 3 BCCH.
  - Primary SR3 pilot.  
If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

**Table 3.7.2.3.2.26-5. The Position of the Primary SR3 Pilot**

| <b>SR3_PRIMARY_PILOT<br/>(Binary)</b> | <b>Position</b>                                   |
|---------------------------------------|---------------------------------------------------|
| 00                                    | The primary pilot is on the lowest SR3 frequency  |
| 01                                    | The primary pilot is on the center SR3 frequency  |
| 10                                    | The primary pilot is on the highest SR3 frequency |
| 11                                    | Reserved                                          |

SR3\_PILOT\_POWER1 – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

If SR3\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

**Table 3.7.2.3.2.26-6. Pilot Transmission Power**

| <b>SR3_PILOT_POWER1,<br/>SR3_PILOT_POWER2<br/>(Binary)</b> | <b>Relative Transmission Power</b> |
|------------------------------------------------------------|------------------------------------|
| 000                                                        | 0dB                                |
| 001                                                        | 1dB                                |
| 010                                                        | 2dB                                |
| 011                                                        | 3dB                                |
| 100                                                        | 4dB                                |
| 101                                                        | 5dB                                |
| 110                                                        | 6dB                                |
| 111                                                        | 7dB                                |

**SR3\_PILOT\_POWER2** – The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

1           If SR3\_INCL is set to '0', the base station shall omit this field;  
2           otherwise, the base station shall set this field to the value  
3           shown in Table 3.7.2.3.2.26-6 corresponding to the power  
4           level of the primary pilot with respect to the pilot on the  
5           higher frequency of the two remaining SR3 frequencies.

- 6           DS\_INCL - Direct Spread (DS) System and Information Available.  
7           If the base station is a pilot beacon and includes the  
8           DS\_BLOB field (containing information on how to access a DS  
9           system, see [32]), the base station shall set this field to '1';  
10          otherwise the base shall set this field to '0'.  
11          DS\_BLOB - Access Information about a Direct Spread (DS) System.  
12          If DS\_INCL is set to '1', the base station shall include this field  
13          and set it as described in [32].  
14          If DS\_INCL is set to '0', the base station shall omit this field.  
15

## 1    3.7.2.3.2.27 Extended Global Service Redirection Message

2    MSG\_TAG: EGSRDM

3

| <b>Field</b>        | <b>Length (bits)</b> |
|---------------------|----------------------|
| PILOT_PN            | 9                    |
| CONFIG_MSG_SEQ      | 6                    |
| REDIRECT_ACCOLC     | 16                   |
| RETURN_IF_FAIL      | 1                    |
| DELETE_TMSI         | 1                    |
| REDIRECT_P_REV_INCL | 1                    |
| EXCL_P_REV_IND      | 0 or 1               |
| REDIRECT_P_MIN      | 0 or 8               |
| REDIRECT_P_MAX      | 0 or 8               |

One occurrence of the following record:

|                      |                |
|----------------------|----------------|
| RECORD_TYPE          | 8              |
| RECORD_LEN           | 8              |
| Type-specific fields | 8 × RECORD_LEN |

4

- 5    PILOT\_PN    -    Pilot PN sequence offset index.  
      The base station shall set this field to the pilot PN sequence  
      offset for this base station, in units of 64 PN chips.
- 8    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.  
      The base station shall set this field to CONFIG\_SEQ  
      (see 3.6.2.2).
- 11    REDIRECT\_ACCOLC    -    Redirected access overload classes.  
      See REDIRECT\_ACCOLC field defined in 3.7.2.3.2.18.  
      The base station shall set the subfields corresponding to the  
      access overload classes of mobile stations which are to be  
      redirected to '1', and shall set the remaining subfields to '0'.

- 1        RETURN\_IF\_FAIL - Return if fail indicator.  
 2  
 3  
 4  
 5  
 6  
 7        DELETE\_TMSI - Delete TMSI indicator.  
 8  
 9  
 10  
 11      REDIRECT\_P\_REV\_INCL - Redirection mobile protocol revision included.  
 12  
 13  
 14  
 15  
 16      If the redirection specified in this message applies to the mobile stations of some specific protocol revisions, the base station shall set this field to '1'; otherwise, if this redirection applies to all mobile stations, the base station shall set this field to '0'.  
 17      EXCL\_P\_REV\_IND - Excluding mobile protocol revision indicator.  
 18  
 19  
 20      If the REDIRECT\_P\_REV\_INCL is set to '1', the base station shall include this field and set this field as described below; otherwise, the base station shall omit this field.  
 21  
 22  
 23  
 24  
 25  
 26  
 27      If mobile stations with MOB\_P\_REV in the range between REDIRECT\_P\_MIN and REDIRECT\_P\_MAX inclusive are excluded from this Global Service Redirection, the base station shall set this field to '1'. Otherwise, if the mobile stations with MOB\_P\_REV in the protocol revision range specified in DIRECT\_P\_MIN and DIRECT\_P\_MAX are subjected to the redirection, the base station shall set this field to '0'.  
 28      REDIRECT\_P\_MIN - Minimum redirection protocol revision.  
 29  
 30  
 31      If REDIRECT\_P\_REV\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.  
 32  
 33  
 34  
 35  
 36      The base station shall set this field to the minimum protocol revision of which mobile stations are subjected to as specified by the action contained in EXCL\_P\_REV\_IND (i.e., to be redirected or excluded from redirection). The base station shall set this field to a protocol revision equal to or greater than six.  
 37      REDIRECT\_P\_MAX - Maximum direction protocol revision.  
 38  
 39  
 40      If REDIRECT\_P\_REV\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.  
 41  
 42  
 43  
 44  
 45      The base station shall set this field to the maximum protocol revision of which mobile stations are subjected to as specified by the action contained in EXCL\_P\_REV\_IND (i.e., to be redirected or excluded from redirection). The base station shall set this field to a protocol revision equal to or greater than six.

1 The base station shall include one occurrence of the following three-field record:

- 2      RECORD\_TYPE    -    Redirection record type.  
3                  The base station shall set this field to the RECORD\_TYPE  
4                  value shown in Table 3.7.2.3.2.16-2 corresponding to the type  
5                  of redirection specified by this record.
- 6      RECORD\_LEN    -    Redirection record length.  
7                  The base station shall set this field to the number of octets in  
8                  the type-specific fields of this redirection record.
- 9      Type-specific fields    -    Redirection record type-specific fields.  
10                 The base station shall include type-specific fields based on the  
11                 RECORD\_TYPE of this redirection record.

12 If RECORD\_TYPE is equal to '00000001', the base station shall include the following fields:

| Field              | Length (bits) |
|--------------------|---------------|
| EXPECTED_SID       | 15            |
| IGNORE_CDMA        | 1             |
| SYS_ORDERING       | 3             |
| MAX_REDIRECT_DELAY | 5             |

- 15
- 16      EXPECTED\_SID    -    Expected SID.  
17                  If the base station is redirecting the mobile station to a  
18                  specific system, the base station shall set this field to the SID  
19                  of that system; otherwise, the base station shall set this field  
20                  to 0.
- 21      IGNORE\_CDMA    -    Ignore CDMA Available indicator.  
22                  The base station shall set this field to '1' to indicate that the  
23                  mobile station is to ignore the *CDMA Capability Message* on  
24                  the analog system to which it is being redirected. The base  
25                  station shall set this field to '0' to indicate that the mobile  
26                  station may discontinue service on the system to which it is  
27                  being redirected if the mobile station receives a *CDMA Capability Message* with CDMA\_AVAIL equal to '1', and the  
28                  preferred mode of the mobile station is CDMA.
- 30      SYS\_ORDERING    -    System ordering.  
31                  The base station shall set this field to the SYS\_ORDERING  
32                  value shown in Table 3.7.2.3.2.16-3 corresponding to the  
33                  order in which the mobile station is to attempt to obtain  
34                  service on an analog system.
- 35      MAX\_REDIRECT\_DELAY    -    Maximum delay upon redirection.

The base station shall set this field to the maximum delay time, in units of 8 seconds, to be used by mobile stations in the event of a global redirection to analog mode. This operation can be invoked to avoid overloading an underlying analog cell's reverse control channel.

If RECORD\_TYPE is equal to '00000010', the base station shall include the following fields:

| <b>Subfield</b> | <b>Length (bits)</b> |
|-----------------|----------------------|
| BAND_CLASS      | 5                    |
| EXPECTED_SID    | 15                   |
| EXPECTED_NID    | 16                   |
| RESERVED        | 4                    |
| NUM_CHANS       | 4                    |

NUM\_CHANS occurrences of the following field:

|                          |                                   |
|--------------------------|-----------------------------------|
| CDMA_CHAN                | 11                                |
| <a href="#">RESERVED</a> | <a href="#">0 - 7 (as needed)</a> |

- 9
- 10      BAND\_CLASS    -    Band class.  
11                  The base station shall set this field to the CDMA band class,  
12                  as specified in [30].
- 13      EXPECTED\_SID    -    Expected SID.  
14                  If the base station is redirecting the mobile station to a  
15                  specific system, the base station shall set this field to the SID  
16                  of that system; otherwise, the base station shall set this field  
17                  to '0'.
- 18      EXPECTED\_NID    -    Expected NID.  
19                  If the base station is redirecting the mobile station to a  
20                  specific network, the base station shall set this field to the  
21                  NID of that network; otherwise, the base station shall set this  
22                  field to 65535.
- 23      RESERVED        -    Reserved bits.  
24                  The base station shall set this field to '0'
- 25      NUM\_CHANS      -    Number of CDMA Channels.  
26                  The base station shall set this field to the number of  
27                  occurrences of the CDMA\_CHAN field in this record.
- 28      CDMA\_CHAN      -    CDMA Channel number.

1           For each CDMA Channel on which the mobile station is to  
2           attempt to acquire a CDMA system, the base station shall  
3           include one occurrence of this field specifying the associated  
4           CDMA Channel number.

5           RESERVED - Reserved bits.

6           The base station shall add reserved bits as needed in order to  
7           make the length of the entire record equal to an integer  
8           number of octets. The base station shall set these bits to '0'.

9

## 1    3.7.2.3.2.28 Extended CDMA Channel List Message

2    MSG\_TAG: ECCLM

3

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| PILOT_PN       | 9                    |
| CONFIG_MSG_SEQ | 6                    |
| NUM_FREQ       | 4                    |

NUM\_FREQ occurrences of the following field:

|           |    |
|-----------|----|
| CDMA_FREQ | 11 |
|-----------|----|

|                  |   |
|------------------|---|
| RC_QPCH_SEL_INCL | 1 |
|------------------|---|

If RC\_QPCH\_SEL\_INCL is equal to '1', include NUM\_FREQ occurrences of the following field:

|                  |   |
|------------------|---|
| RC_QPCH_HASH_IND | 1 |
|------------------|---|

|             |        |
|-------------|--------|
| TD_SEL_INCL | 1      |
| TD_MODE     | 0 or 2 |

If TD\_SEL\_INCL is equal to '1', include NUM\_FREQ occurrences of the following fields:

|                |        |
|----------------|--------|
| TD_HASH_IND    | 1      |
| TD_POWER_LEVEL | 0 or 2 |

4

5    PILOT\_PN    -    Pilot PN sequence offset index.  
6                 The base station shall set this field to the pilot PN sequence  
7                 offset for this base station, in units of 64 PN chips.8    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.  
9                 The base station shall set this field to CONFIG\_SEQ  
10                (see 3.6.2.2).11    NUM\_FREQ    -    Number of CDMA Frequencies  
12                 The base station shall set this field to the number of  
13                supported CDMA frequencies included in this message.14                 [The base station shall not set this field to '0000'.](#)

15

- 1           CDMA\_FREQ     - CDMA Channel frequency assignment.  
 2                         The base station shall include one occurrence of this field for  
 3                         each CDMA Channel, containing either a Paging Channel, or a  
 4                         Broadcast Control Channel and Forward Common Control  
 5                         Channel.  
 6                         The base station shall set each occurrence of this field to the  
 7                         CDMA channel number corresponding to the CDMA frequency  
 8                         assignment for that CDMA Channel (see [2]).  
 9                         If the base station supports a CDMA frequency assignment  
 10                  without transmit diversity, the base station should not set the  
 11                  first occurrence of this field to a CDMA channel number  
 12                  corresponding to a transmit diversity frequency assignment.
- 13           RC\_QPCH\_SEL\_INCL - RC and QPCH Selection included indicator  
 14                         The base station shall set this field to '1', if NUM\_FREQ  
 15                  occurrences of RC\_QPCH\_HASH\_IND are included; otherwise,  
 16                  it shall set this field to '0'.  
 17                  If the base station sets this field to '1', the base station shall set the RC\_QPCH\_HASH\_IND  
 18                  field to '1' in at least one of the following one-field records:
- 19                         RC\_QPCH-  
 20                         \_HASH\_IND     - RC\_QPCH channel hashing indicator  
 21                         If RC\_QPCH\_SEL\_INCL is set to '1', the base station shall  
 22                  include NUM\_FREQ occurrences of this field and set this field  
 23                  as follow; otherwise, the base station shall omit this field.
- 24                         When the *Extended CDMA Channel List Message is sent on the*  
 25                         *Paging Channel, the base station shall perform the following:*  
 26                         *If the associated CDMA\_FREQ is to be selected for CDMA*  
 27                         *channel hashing by mobile stations capable of RC greater*  
 28                         *than two or capable of supporting Quick Paging Channel, the*  
 29                         *base station shall set the field to '1'; otherwise, the base*  
 30                         *station shall set this field to '0'.*
- 31                         When the *Extended CDMA Channel List Message is sent on the*  
 32                         *Primary Broadcast Control Channel, +The base station shall*  
 33                         *set this field to '1', if the corresponding CDMA channel is to be*  
 34                         *selected for channel hashing by mobile stations capable of*  
 35                         *Radio Configurations greater than two or capable of*  
 36                         *supporting Quick Paging Channel with Quick Paging Channel*  
 37                         *capability.*
- 38           TD\_SEL\_INCL     - Transmit diversity selection indicator included.  
 39                         The base station shall set this field to '1', if the base station  
 40                  includes transmit diversity selection information in this  
 41                  message; otherwise, the base station shall set this field to '0'.  
 42                         When the *Extended CDMA Channel List Message is sent on the*  
 43                         *Paging Channel, the base station shall set this field to '0'.*

- 1  
2       TD\_MODE    -    Transmit diversity mode.  
3                  If the field TD\_SEL\_INCL is set to '0', the base station shall  
4                  omit this field; otherwise, the base station shall include this  
5                  field and set it as follows:  
6                  The base station shall set this field to the Transmit Diversity  
7                  mode, as specified in Table 3.7.2.3.2.26-3.  
8        If the TD\_SEL\_INCL is set to '1', the base station shall include NUM\_FREQ occurrences of  
9        the following two-field record, and shall set the TD\_HASH\_IND field to '1' in at least one of  
10      the records:  
11           TD\_HASH\_IND    -    Transmit diversity hash indicator.  
12                  If the associated CDMA\_FREQ is to be selected for CDMA  
13                  channel hashing by mobile stations capable of supporting  
14                  transmit diversity [TD\_MODE], the base station shall set the  
15                  field to '1'; otherwise, the base station shall set this field to '0'.  
16           TD\_POWER\_LEVEL    -    Transmit diversity power level.  
17                  If TD\_HASH\_IND is set to '0', the base station shall omit this  
18                  field; otherwise, the base station shall include this field and  
19                  set it to the transmit diversity transmission power level  
20                  relative to that of the Forward Pilot Channel, as specified in  
21                  Table 3.7.2.3.2.26-4.

## 1    3.7.2.3.2.29 User Zone Reject Message

2    MSG\_TAG: UZRM

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| REJECT_UZID        | 16                   |
| REJECT_ACTION_INDI | 3                    |
| UZID_ASSIGN_INCL   | 1                    |
| ASSIGN_UZID        | 0 or 16              |

- 3    REJECT\_UZID    -    Rejected User Zone identifier.  
 4                         The base station shall set this field to the User Zone identifier  
 5                         of the User Zone rejected by the base station.
- 6    REJECT\_ACTION\_INDI    -    Rejection action indicator.  
 7                         The base station shall set this field to the value shown in  
 8                         Table 3.7.2.3.2.29-1 corresponding to the User Zone rejection  
 9                         action field to identify the mobile station action.

10                         **Table 3.7.2.3.2.29-1. Rejection Action Indicators**

| <b>Description</b>                               | <b>REJECT_ACTION_INDI<br/>(binary)</b> |
|--------------------------------------------------|----------------------------------------|
| Disable UZID until Next Update                   | 000                                    |
| Disable UZID until next power cycle              | 001                                    |
| Disable UZID until new SID                       | 010                                    |
| Disable UZID until new SID/NID                   | 011                                    |
| Disable UZID until next BASE_ID                  | 100                                    |
| All other REJECT_ACTION_INDI values are reserved |                                        |

- 11  
 12    UZID\_ASSIGN\_INCL    -    User Zone identifier assignment included indicator.  
 13                         If assigned UZID information is included, the base station  
 14                         shall set this field to '1'; otherwise, the base station shall set  
 15                         this field to '0'.

- 1           ASSIGN\_UZID   -   Assigned User Zone identifiers.  
2  
3           The base station shall set this field to the User Zone identifier  
of the User Zone assigned to the mobile station.

## 1 3.7.2.3.2.30 ANSI-41 System Parameters Message

2 MSG\_TAG: A41SPM

3

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| PILOT_PN        | 9                    |
| CONFIG_MSG_SEQ  | 6                    |
| SID             | 15                   |
| NID             | 16                   |

2

- 3 PILOT\_PN - Pilot PN sequence offset index.  
4 The base station shall set this field to the pilot PN sequence  
5 offset for this base station, in units of 64 PN chips.
- 6 CONFIG\_MSG\_SEQ - Configuration message sequence number.  
7 The base station shall set this field to CONFIG\_SEQ  
8 (see 3.6.2.2).
- 9 SID - System identification.  
10 The base station shall set this field to the system identification  
11 number for this system (see 2.6.5.2).
- 12 NID - Network identification.  
13 This field serves as a sub-identifier of a system as defined by  
14 the owner of the SID.  
15 The base station shall set this field to the network  
16 identification number for this network (see 2.6.5.2).
- 17 PACKET\_ZONE\_ID - Packet data services zone identifier.  
18 If the base station supports a packet data service zone, the  
19 base station shall set this field to its non-zero packet data  
20 services zone identifier.

- 1                   If the base station does not support a packet data service  
 2                   zone, the base station shall set this field to '00000000'.
- 3     REG\_ZONE    - Registration zone.  
 4                   The base station shall set this field to its registration zone  
 5                   number (see 2.6.5.1.5).
- 6     TOTAL\_ZONES - Number of registration zones to be retained.  
 7                   The base station shall set this field to the number of  
 8                   registration zones the mobile station is to retain for purposes  
 9                   of zone-based registration (see 2.6.5.1.5).
- 10                  If zone-based registration is to be disabled, the base station  
 11                 shall set this field to '000'.
- 12     ZONE\_TIMER   - Zone timer length.  
 13                  The base station shall set this field to the ZONE\_TIMER value  
 14                  shown in Table 3.7.2.3.2.30-1 corresponding to the length of  
 15                  the zone registration timer to be used by mobile stations.

**Table 3.7.2.3.2.30-1. Value of Zone Timer**

| <b>ZONE_TIMER<br/>Value (binary)</b> | <b>Timer Length<br/>(Minutes)</b> |
|--------------------------------------|-----------------------------------|
| 000                                  | 1                                 |
| 001                                  | 2                                 |
| 010                                  | 5                                 |
| 011                                  | 10                                |
| 100                                  | 20                                |
| 101                                  | 30                                |
| 110                                  | 45                                |
| 111                                  | 60                                |

- 18
- 19     MULT\_SIDS   - Multiple SID storage indicator.  
 20                  If mobile stations may store entries of SID\_NID\_LIST  
 21                  containing different SIDs, the base station shall set this field  
 22                  to '1'; otherwise the base station shall set this field to '0'.
- 23     MULT\_NIDS    - Multiple NID storage indicator.  
 24                  If mobile stations may store multiple entries of SID\_NID\_LIST  
 25                  having the same SID (with different NIDs), the base station  
 26                  shall set this field to '1'; otherwise the base station shall set  
 27                  this field to '0'.

- 1           HOME\_REG    - Home registration indicator.  
 2  
 3  
 4  
 5  
 6  
 7  
 If mobile stations that are not roaming (see 2.6.5.3) and have MOB\_TERM\_HOME equal to '1' are to be enabled for autonomous registrations, the base station shall set this field to '1'. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to '0'.  
 8           FOR\_SID\_REG - SID roamer registration indicator.  
 9  
 10  
 11  
 12  
 13  
 14  
 If mobile stations that are foreign SID roamers (see 2.6.5.3) and have MOB\_TERM\_FOR\_SID equal to '1' are to be enabled for autonomous registration, the base station shall set this field to '1'. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to '0'.  
 15          FOR\_NID\_REG - NID roamer registration indicator.  
 16  
 17  
 18  
 19  
 20  
 21  
 If mobile stations that are foreign NID roamers (see 2.6.5.3) and have MOB\_TERM\_FOR\_NID equal to '1' are to be enabled for autonomous registration, the base station shall set this field to '1'. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to '0'.  
 22          POWER\_UP\_REG - Power-up registration indicator.  
 23  
 24  
 25  
 26  
 If mobile stations enabled for autonomous registration are to register immediately after powering on and receiving the system overhead messages, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.  
 27          POWER\_DOWN\_REG - Power-down registration indicator.  
 28  
 29  
 30  
 31  
 If mobile stations enabled for autonomous registration are to register immediately before powering down, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.  
 32         PARAMETER\_REG - Parameter-change registration indicator.  
 33  
 34  
 35  
 If mobile stations are to register on parameter change events as specified in 2.6.5.1.6, the base station shall set this field to '1'. If not, the base station shall set this field to '0'.  
 36         REG\_PRD      - Registration period.  
 37  
 38  
 39  
 40  
 41  
 If mobile stations are not to perform timer-based registration, the base station shall set this field to '0000000'. If mobile stations are to perform timer-based registration, the base station shall set this field to the value in the range 29 to 85 inclusive, such that the desired timer value is  
 42                     $\lfloor 2\text{REG\_PRD}/4 \rfloor \times 0.08$  seconds.

- 1           DIST\_REG\_INCL    - Distance-Based Registration Information Included.  
 2                             The base station shall set this field to '1' if it includes  
 3                             distance-based registration information in the message and  
 4                             mobile stations are to perform distance-based registration;  
 5                             otherwise the base station shall set this field to '0'.  
 6           REG\_DIST        - Registration distance.  
 7                             If DIST\_REG\_INCL is set to '1', the base station shall include  
 8                             the field REG\_DIST and shall set this field as shown below;  
 9                             otherwise, the base station shall omit this field.  
 10                          The base station shall set this field to the non-zero "distance"  
 11                          beyond which the mobile station is to re-register (see  
 12                          2.6.5.1.4).  
 13           DELETE\_FOR\_TMSI - Delete foreign TMSI.  
 14                          The base station shall set this field to '1' to cause the mobile  
 15                          station to delete its TMSI if the TMSI was assigned in a  
 16                          different TMSI zone from that specified by the TMSI\_ZONE  
 17                          field of this message; otherwise, the base station shall set this  
 18                          field to '0'.  
 19           USE\_TMSI        - Use TMSI indicator.  
 20                          The base station shall set this field to the value shown in  
 21                          Table 3.7.2.3.2.2930-2 corresponding to the type of MSID that  
 22                          the mobile station is to use on the Enhanced Access Channel.  
 23           PREF\_MSID\_TYPE - Preferred Enhanced Access Channel Mobile Station Identifier  
 24                          Type.  
 25                          The base station shall set this field to the value shown in  
 26                          Table 3.7.2.3.2.30-2 corresponding to the type of MSID that  
 27                          the mobile station is to use on the Enhanced Access Channel.

**Table 3.7.2.3.2.30-2. Preferred MSID Types**

| <b>USE_TMSI<br/>(binary)</b>   | <b>PREF_MSID_TYPE<br/>(binary)</b> | <b>Description</b>                                                 |
|--------------------------------|------------------------------------|--------------------------------------------------------------------|
| 0                              | 00                                 | IMSI_S and ESN                                                     |
| 0                              | 10                                 | IMSI                                                               |
| 0                              | 11                                 | IMSI and ESN                                                       |
| 1                              | 10                                 | TMSI (valid TMSI is assigned);<br>IMSI (TMSI not assigned)         |
| 1                              | 11                                 | TMSI (valid TMSI is assigned);<br>IMSI and ESN (TMSI not assigned) |
| All other values are reserved. |                                    |                                                                    |

- 1
- 2       TMSI\_ZONE\_LEN   - TMSI zone length.  
  3                          The base station shall set this field to the number of octets  
  4                          included in the TMSI\_ZONE. The base station shall set this  
  5                          field to a value in the range 1 to 8 inclusive.
- 6       TMSI\_ZONE   - TMSI zone.  
  7                          The base station shall set this field to the TMSI zone number  
  8                          as specified in [27].
- 9       IMSI\_T\_SUPPORTED   - IMSI\_T support indicator.  
 10                         The base station shall set this field to '1' to indicate support  
 11                         for a 15-digit IMSI\_T addressing according to [18].
- 12      MAX\_NUM\_ALT\_SO   - Maximum number of alternative service options.  
 13                         The base station shall set this field to the maximum number  
 14                         of service option numbers defined in [30], corresponding to  
 15                         alternative service options with no service option group  
 16                         number assigned, that the mobile station is allowed to include  
 17                         in the *Origination Message*, and the *Page Response*.
- 18                         If the base station sets this field to a value greater than zero,  
 19                         in addition, the base station shall allow the mobile station to  
 20                         include
- 21                         • a 4-bit or 8-bit service option bitmap in the *Origination*  
  22                         *Message* and the *Page Response Message*;
  - 23                         • alternate service option numbers, not limited to  
  24                         MAX\_ALT\_SO\_NUM, in the *Enhanced Origination Message*.
- 25      AUTO\_MSG-  
 26                         \_SUPPORTED   - Autonomous message supported indicator.  
 27                         If the base station allows the autonomous delivery of the  
 28                         *Device Information Message* on the r-csch, the base station  
 29                         shall set this field to '1'; otherwise, the base station shall set  
 30                         this field to '0'.
- 31      AUTO\_MSG-  
 32                         \_INTERVAL   - Autonomous message interval.  
 33                         If AUTO\_MSG\_SUPPORTED is set to '04', the base station  
 34                         shall omit this field; otherwise, the base station shall include  
 35                         this field and shall set this field to the AUTO\_MSG\_INTERVAL  
 36                         value shown in Table 3.7.2.3.2.13-4 to indicate the minimum  
 37                         time interval between autonomous messages sent by a mobile  
 38                         station to the infrastructure. This parameter is intended to  
 39                         allow the infrastructure to limit the frequency of autonomous  
 40                         messages sent by a mobile station on the r-csch.
- 41      OTHER\_INFO\_INCL   - Other information included indicator.  
 42                         The base station shall set this field to '1' if the MC-RR  
 43                         Parameters Message is not sent; otherwise, the base station  
 44                         shall set this field to '0'.

|    |                    |                                    |                                                                                                                                                                                                                        |

| 38 |                    |                                    | The base station shall set the RESERVED subfield to '000000'.                                                                                                                                                          |
| 39 | STORE_KEY          | <u>Store session key indicator</u> |                                                                                                                                                                                                                        |
| 40 |                    |                                    | <u>If OTHER_INFO_INCL is set to '1', the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.</u>                                                           |
| 41 |                    |                                    |                                                                                                                                                                                                                        |
| 42 |                    |                                    |                                                                                                                                                                                                                        |

1                   The base station shall set this field to '1' to indicate that the  
2                   mobile station is to store the session key; otherwise the base  
3                   station shall set this field to '0'.  
4

5                   CS\_SUPPORTED - Concurrent Services supported indicator.  
6  
7

8                   If the base station supports concurrent services, the base  
9                   station shall set this field to '1'; otherwise, the base station  
10                  shall set this field to '0'.  
11

12                  MS INIT POS LOC - Mobile station initiated position location determination  
13

1                   SUP IND supported indicator.  
2  
3

4                   If the base station supports mobile station initiated position  
5                   determination, the base station shall set this field to '1';  
6                   otherwise, the base station shall set this field to '0'.  
7

- 1  
2            PILOT\_PN    -    Pilot PN sequence offset index.  
3                         The base station shall set this field to the pilot PN sequence  
4                         offset for this base station, in units of 64 PN chips.  
5            CONFIG\_MSG\_SEQ    -    Configuration message sequence number.  
6                         The base station shall set this field to CONFIG\_SEQ  
7                         (see 3.6.2.2).  
8            BASE\_ID    -    Base station identification.  
9                         The base station shall set this field to its identification  
10                  number.  
11            P\_REV    -    Protocol revision level.  
12                         The base station shall set this field to '00000111'.  
13            MIN\_P\_REV    -    Minimum protocol revision level.  
14                         The base station sets this field to prevent mobile stations,  
15                         which cannot be supported by the base station from accessing  
16                  the system.  
17                         The base station shall set this field to the minimum protocol  
18                  revision level that it supports. For Band Class 0 operation,  
19                  the base station should set this field to a value of '00000010'  
20                  or greater. For Band Class 1 or Band Class 4 operation, the  
21                  base station should set this field to a value of '00000001' or  
22                  greater. For Band Class 3 operation, the base station should  
23                  set this field to a value of '00000011' or greater. For Band  
24                  Class 2 or Band Class 5 operation, the base station should set  
25                  this field to '00000101', or greater. For Band Class 6, Band  
26                  Class 7, Band Class 8, ~~or~~-Band Class 9, or Band Class 10  
27                  operation, the base station should set this field to '00000110'  
28                  or greater.  
29            SR3\_INCL    -    Spreading Rate 3 common channel parameters included  
30                  indicator.

The base station shall set this field to '1' if the base station includes SR3 related parameters in this message; otherwise, the base station shall set this field to '0'.

If the base station is operating in SR3 mode, the base station shall set this field to '0'.

SR3\_CENTER-  
\_FREQ\_INCL

- Center SR3 frequency assignment included.

If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’, if the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel is different from the current SR1 frequency assignment. Otherwise, the base station shall set this field to ‘0’.

- Center SR3 frequency assignment.

If SR3\_CENTER\_FREQ\_INCL is not included or is included but is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel.

## SR3\_BRAT

- Spreading Rate 3 BCCH data rate.

If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BCCH rate field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

SR3\_BCCH-  
CODE\_CHAN

- Spreading Rate 3 BCCH Walsh code index.

If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code index corresponding to the Spreading Rate 3 BCCH.

### SR3\_PRIMARY\_PILOT

- Primary SR3 pilot.

If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

### SR3\_PILOT\_POWER1 -

- The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

SR3\_PILOT\_POWER2 - The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

If SR3\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

SRCH\_WIN\_A - Search window size for the Active Set and Candidate Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Active Set and Candidate Set.

SRCH\_WIN\_R - Search window size for the Remaining Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Remaining Set.

T\_ADD - Pilot detection threshold.

This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* initiating the handoff process (see 2.6.6.2.5.2).

The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to  $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .

T\_DROP - Pilot drop threshold.

This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

The base station shall set this field to the pilot drop threshold, expressed as an unsigned binary number equal to  $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .

T\_COMP - Active Set versus Candidate Set comparison threshold.

Mobile stations transmit a *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

The base station shall set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB.

|    |                 |                                                                          |
|----|-----------------|--------------------------------------------------------------------------|
| 1  | T_TDROPO        | - Drop timer value.                                                      |
| 2  |                 | Timer value after which an action is taken by mobile stations            |
| 3  |                 | for a pilot that is a member of the Active Set or Candidate Set,         |
| 4  |                 | and whose strength has not become greater than T_DROP. If                |
| 5  |                 | the pilot is a member of the Active Set, a <i>Pilot Strength</i>         |
| 6  |                 | <i>Measurement Message</i> or <i>Extended Pilot Strength Measurement</i> |
| 7  |                 | <i>Message</i> is issued. If the pilot is a member of the Candidate      |
| 8  |                 | Set, it will be moved to the Neighbor Set.                               |
| 9  |                 | The base station shall set this field to the T_TDROPO value              |
| 10 |                 | shown in Table 2.6.6.2.3-1 corresponding to the drop timer               |
| 11 |                 | value to be used by mobile stations.                                     |
| 12 | NGHBR_MAX_AGE   | - Neighbor Set maximum AGE.                                              |
| 13 |                 | The base station shall set this field to the maximum AGE                 |
| 14 |                 | value beyond which mobile stations are to drop members from              |
| 15 |                 | the Neighbor Set (see 2.6.6.2.6.3).                                      |
| 16 | SOFT_SLOPE      | - The slope in the inequality criterion for adding a pilot to the        |
| 17 |                 | Active Set, or dropping a pilot from the Active Set (see                 |
| 18 |                 | 2.6.6.2.3 and 2.6.6.2.5.2).                                              |
| 19 |                 | The base station shall set this field as an unsigned binary              |
| 20 |                 | number.                                                                  |
| 21 | ADD_INTERCEPT   | - The intercept in the inequality criterion for adding a pilot to        |
| 22 |                 | the Active Set (see 2.6.6.2.5.2).                                        |
| 23 |                 | The base station shall set this field as a two's complement              |
| 24 |                 | signed binary number, in units of dB.                                    |
| 25 | DROP_INTERCEPT  | - The intercept in the inequality criterion for dropping a pilot         |
| 26 |                 | from the Active Set (see 2.6.6.2.3).                                     |
| 27 |                 | The base station shall set this field as a two's complement              |
| 28 |                 | signed binary number, in units of dB.                                    |
| 29 | ENC_SUPPORTED   | - Encryption fields included.                                            |
| 30 |                 | The base station shall set this field to '1' if the encryption           |
| 31 |                 | related fields are included; otherwise the base station shall set        |
| 32 |                 | this field to '0'.                                                       |
| 33 | SIG_ENCRYPT_SUP | - Signaling <del>e</del> Encryption supported indicator.                 |
| 34 |                 | If ENC_SUPPORTED is equal to '1', the base station shall                 |
| 35 |                 | include this field; otherwise, the base station shall omit this          |
| 36 |                 | field. If this field is included, this field indicates which             |
| 37 |                 | signaling encryption algorithms are supported by the base                |
| 38 |                 | station.                                                                 |

1           This field consists of the subfields shown in Table 2.7.1.3.2.1-  
 2           5.

3           If this field is included, the base station shall set the subfields  
 4           as follows:

5           The base station shall set the CMEA subfield to '1'.

6           The base station shall set each other subfield to '1' if the  
 7           corresponding signaling [encryption](#) algorithm is supported by  
 8           the base station; otherwise, the base station shall set the  
 9           subfield to '0'.

10          The base station shall set the RESERVED subfield to '000000'.

11          UI\_ENCRYPT\_SUP - User information [eB](#)ncryption supported indicator.

12          If ENC\_SUPPORTED is equal to '1', the base station shall  
 13           include this field; otherwise, the base station shall omit this  
 14           field. If this field is included, the base station shall set this  
 15           field to indicate the supported user information encryption  
 16           algorithms.

17          This field consists of the subfields shown in Table 2.7.1.3.2.4-  
 18           9.

19          The base station shall set each subfield to '1' if the  
 20           corresponding user information encryption algorithm is  
 21           supported by the base station; otherwise, the base station  
 22           shall set the subfield to '0'.

23          **STORE\_KEY** Store session key indicator

24          If ENC\_SUPPORTED is equal to '1', the base station shall  
 25           include this field; otherwise, the base station shall omit this  
 26           field. If this field is included, the base station shall set this  
 27           field to '1' to indicate that the mobile station is to store the  
 28           session key; otherwise the base station shall set this field to  
 29           '0'.

30          ADD\_FIELDS\_LEN - Additional fields length.

31          The base station shall set this field to the number of octets  
 32           included in the ADD\_FIELDS. The base station shall set this  
 33           field to '00000000'.

34          ADD\_FIELDS - Additional fields.

35          The base station shall include  $8 \times \text{ADD_FIELDS\_LEN}$  bits to  
 36           support additional fields, if any.

37          CCH\_INFO\_INCL - Common Channel information included indicator.

38          If the message is sent on the f-csch and additional information  
 39           is included, the base station shall set this field to '1';  
 40           otherwise, the base station shall set this field to '0'.

41          The base station shall set this field to '1'.

- 1                   MCC     - Mobile Country Code.
- 2                   If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
3                   this field and set it as follows; otherwise, the base station  
4                   shall omit this field.
- 5                   The base station shall set this field to the MCC (see 2.3.1)
- 6                   IMSI\_11\_12 - 11<sup>th</sup> and 12<sup>th</sup> digits of the IMSI.
- 7                   If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
8                   this field and set it as follows; otherwise, the base station  
9                   shall omit this field.
- 10                  The base station shall set this field to the IMSI\_11\_12 (see  
11                  2.3.1).
- 12                  MAX\_SLOT\_CYCLE- - Maximum slot cycle index.
- 13                  \_INDEX    If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
14                  the field MAX\_SLOT\_CYCLE\_INDEX and shall set this field as  
15                  shown below; otherwise, the base station shall omit this field.
- 16                  The base station shall set this field to the SLOT\_CYCLE\_INDEX value corresponding to the maximum  
17                  slot cycle length permitted (see 2.6.2.1.1).
- 18                  PWR REP THRESH - Power control reporting threshold.
- 19                  If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
20                  the field PWR REP THRESH and shall set this field as shown  
21                  below; otherwise, the base station shall omit this field.
- 22                  The base station shall set this field to the number of bad frames (see [2]) to be received in a measurement period on the channel which carries the Power Control Subchannel before mobile stations are to generate a *Power Measurement Report Message* (see 2.6.4.1.1). If the base station sets PWR\_THRESH\_ENABLE to ‘1’, it shall not set this field to ‘00000’.
- 23                  PWR REP FRAMES - Power control reporting frame count.
- 24                  If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
25                  the field PWR REP FRAMES and shall set this field as shown  
26                  below; otherwise, the base station shall omit this field.
- 27                  The base station shall set this field to the value such that the  
28                  number given by  
29                   $\lfloor 2(PWR\_REP\_FRAMES/2) \times 5 \rfloor$  frames
- 30                  is the number of frames over which mobile stations are to  
31                  count frame errors.
- 32                  PWR\_THRESH- - Threshold report mode indicator.
- 33                  \_ENABLE    If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
34                  the field PWR\_THRESH\_ENABLE and shall set this field as  
35                  shown below; otherwise, the base station shall omit this field.

If mobile stations are to generate threshold *Power Measurement Report Messages*, the base station shall set this field to ‘1’. If mobile stations are not to generate threshold *Power Measurement Report Messages*, the base station shall set this field to ‘0’.

PWR\_PERIOD-  
\_ENABLE - Periodic report mode indicator.  
If CCH\_INFO\_INCL is set to ‘1’, the base station shall include the field PWR\_PERIOD\_ENABLE and shall set this field as shown below; otherwise, the base station shall omit this field.

If mobile stations are to generate periodic *Power Measurement Report Messages*, the base station shall set this field to ‘1’. If mobile stations are not to generate periodic *Power Measurement Report Messages*, the base station shall set this field to ‘0’.

PWR REP\_DELAY - Power report delay.  
The period that mobile stations wait following a *Power Measurement Report Message* before restarting frame counting for power control purposes.

If CCH\_INFO\_INCL is set to ‘1’, the base station shall include the field PWR REP\_DELAY and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the power report delay value, in units of 4 frames (see 2.6.4.1.1).

RESELECTINCLUDED - System reselection parameters included.  
If CCH\_INFO\_INCL is set to ‘1’, the base station shall include the field RESELECTINCLUDED and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station is including system reselection parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

EC\_THRESH - Pilot power threshold.  
If RESELECTINCLUDED is included and is set to ‘1’, the base station shall include the field EC\_THRESH and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to:

$$\lceil (pilot\_power\_threshold + 115) \rceil$$

where *pilot\_power\_threshold* is the pilot power,  $E_c$ , in dBm/1.23 MHz, below which the mobile station is to perform system reselection.

EC\_IO\_THRESH - Pilot  $E_c / I_o$  threshold.  
If RESELECTINCLUDED is included and is set to ‘1’, the base station shall include the field EC\_IO\_THRESH and shall set this field as shown below; otherwise, the base station shall omit this field.

1           The base station shall set this field to:

$$2 \quad \lfloor - 20 \times \log_{10} (\text{pilot\_threshold}) \rfloor$$

3           where *pilot\_threshold* is the pilot  $E_c/I_0$  below which the mobile  
4           station is to perform system reselection.

- 5           BASE\_LAT     - Base station latitude.  
6           If CCH\_INFO\_INCL is set to '1', the base station shall include  
7           this field and set it as shown below; otherwise, the base  
8           station shall omit this field.

9           The base station shall set this field to its latitude in units of  
10          0.25 second, expressed as a two's complement signed number  
11          with positive numbers signifying North latitudes. The base  
12          station shall set this field to a value in the range -1296000 to  
13          1296000 inclusive (corresponding to a range of -90° to +90°).

- 14          BASE\_LONG    - Base station longitude.  
15          If CCH\_INFO\_INCL is set to '1', the base station shall include  
16          this field and set it as shown below; otherwise, the base  
17          station shall omit this field.

18          The base station shall set this field to its longitude in units of  
19          0.25 second, expressed as a two's complement signed number  
20          with positive numbers signifying East longitude. The base  
21          station shall set this field to a value in the range -2592000 to  
22          2592000 inclusive (corresponding to a range of -180° to  
23          +180°).

- 24          PILOT\_REPORT - Pilot reporting indicator.  
25          If CCH\_INFO\_INCL is set to '1', the base station shall include  
26          the field PILOT\_REPORT and shall set this field as shown  
27          below; otherwise, the base station shall omit this field.

28          The base station shall set this field to '1' if the mobile station  
29          is to report the additional pilots which have pilot strengths  
30          exceeding T\_ADD in all Enhanced Access Channel messages.  
31          The base station shall set this field to '0' if the mobile station  
32          is to report the additional pilots which have pilot strengths  
33          exceeding T\_ADD only in the *Origination Message* and the  
34          *Page Response Message*.

- 35          ACC\_ENT\_HO\_ORDER - Access entry handoff permitted indicator.  
36          If CCH\_INFO\_INCL is set to '1', the base station shall include  
37          this field and set it as described below; otherwise, the base  
38          station shall omit this field.

39          The base station shall set this field to '1' if the mobile station  
40          is permitted to perform an access entry handoff after receiving  
41          a message while performing the *Mobile Station Order and*  
42          *Message Processing Operation* in the *Mobile Station Idle State*  
43          (see 2.6.2.4); otherwise, the base station shall set this field to  
44          '0'.

- 1           ACCESS\_HO    - Access handoff permitted indicator.  
 2           If CCH\_INFO\_INCL is set to '1', the base station shall include  
 3           this field and set it as described below; otherwise, the base  
 4           station shall omit this field.  
 5           The base station shall set this field to '1' if the mobile station  
 6           is permitted to perform an access handoff (see 2.6.3.1.3.2);  
 7           otherwise, the base station shall set this field to '0'.  
 8   ACCESS\_HO\_MSG\_RSP - Access handoff permitted for message response indicator.  
 9           If ACCESS\_HO is included and set to '1', the base station shall  
 10          include this field and set it as described below; otherwise, the  
 11          base station shall omit this field.  
 12          The base station shall set this field to '1' if the mobile station  
 13          is permitted to perform an access handoff after receiving a  
 14          message and before responding to that message in the *System*  
 15          *Access State*; otherwise, the base station shall set this field to  
 16          '0'.  
 17   ACCESS\_PROBE\_HO   - Access probe handoff permitted indicator.  
 18          If CCH\_INFO\_INCL is set to '1', the base station shall include  
 19          this field and set it as described below; otherwise, the base  
 20          station shall omit this field.  
 21          The base station shall set this field to '1' if the mobile station  
 22          is permitted to perform an access probe handoff (see  
 23          2.6.3.1.3.3); otherwise, the base station shall set this field to  
 24          '0'.  
 25   ACC\_HO\_LIST\_UPD   - Access handoff list update permitted indicator.  
 26          If ACCESS\_PROBE\_HO is included and is set to '1', the base  
 27          station shall include this field and set it as described below;  
 28          otherwise, the base station shall omit this field.  
 29          The base station shall set this field to '1' if the mobile station  
 30          is permitted to update the access handoff list during an  
 31          access attempt (see 2.6.3.1.7.2); otherwise, the base station  
 32          shall set this field to '0'.  
 33   ACC\_PROBE\_HO-  
 34        \_OTHER\_MSG    - Access probe handoff permitted for messages other than the  
 35        *Origination Message* and the *Page Response Message*.  
 36          If ACCESS\_PROBE\_HO is included and set to '1', the base  
 37          station shall include this field and set it as described below;  
 38          otherwise, the base station shall omit this field.  
 39          The base station shall set this field to '1' if the mobile station  
 40          is permitted to perform an access probe handoff for messages  
 41          other than the *Origination Message* and the *Page Response*  
 42          *Message*. The base station shall set this field to '0' if the  
 43          mobile station is permitted to perform an access probe  
 44          handoff only for the *Origination Message* and the *Page*  
 45          *Response Message*. See 2.6.3.1.3.3.  
 46   MAX\_NUM\_PROBE\_HO - Maximum number of times that the mobile station is  
 47          permitted to perform an access probe handoff.

1           If ACCESS\_PROBE\_HO is included and set to ‘1’, the base  
 2           station shall include this field and set it as described below;  
 3           otherwise, the base station shall omit this field.

4           The base station shall set this field to the maximum number  
 5           of times the mobile station is allowed to perform an access  
 6           probe handoff within an access attempt minus one.

- 7           NUM\_FCCCH    - Total number of Forward Common Control Channels.  
 8           If CCH\_INFO\_INCL is set to ‘1’, the base station shall include  
 9           this field and shall set it as shown below; otherwise, the base  
 10          station shall omit this field.  
 11          The base station shall set this field to the total number of  
 12          Forward Common Control Channels on this CDMA Channel.  
 13          If this is not a pilot beacon base station, the base station shall  
 14          set this field to an integer value greater than 0.

- 15          FCCCH\_RATE    - Rate words for the Forward Common Control Channels.  
 16          If CCH\_INFO\_INCL is set to ‘1’and NUM\_FCCCH is not  
 17          equal to ‘0’, the base station shall include this field and shall  
 18          set it as shown below; otherwise, the base station shall omit  
 19          this field.

20          The base station shall set this field to the FCCCH rate field  
 21          value shown in Table 3.7.2.3.2.31-1 corresponding to the data  
 22          rate used on the Forward Common Control Channels in the  
 23          system.

24           **Table 3.7.2.3.2.31-1. Forward Common Control Channel**  
 25           **Rate Words**

| FCCCH Rate Field<br>(binary) | Forward Common Control<br>Channel rate word |
|------------------------------|---------------------------------------------|
| 000                          | 9600 bps, 20 ms frame size                  |
| 001                          | 19200 bps, 20 ms frame size                 |
| 010                          | 19200 bps, 10 ms frame size                 |
| 011                          | 38400 bps, 20 ms frame size                 |
| 100                          | 38400 bps, 10 ms frame size                 |
| 101                          | 38400 bps, 5 ms frame size                  |
| 110 – 111                    | Reserved                                    |

- 26
- 27          FCCCH\_CODE\_RATE    - Code Rate for the Forward Common Control Channels.  
 28          If CCH\_INFO\_INCL is set to ‘1’and NUM\_FCCCH is not  
 29          equal to ‘0’, the base station shall include this field and shall  
 30          set it as shown below; otherwise, the base station shall omit

1                   this field.

2                   If the FCCCH is operating in Spreading Rate 1, the base  
 3                   station shall set this field to '0' if the FCCCH Code Rate is 1/4  
 4                   (see 3.1.3.1.2.1 of [2]). The base station shall set this field to  
 5                   '1' if the FCCCH Code Rate is 1/2 (see 3.1.3.1.2.1 of [2]).

6                   If the FCCCH is operating in Spreading Rate 3, the base  
 7                   station shall set this field to '0'.

8       The base station shall include NUM\_FCCCH occurrences of the following one field record:

9       FCCCH\_CODE\_CHAN - Code channel index for the Forward Common Control  
 10                  Channel.

11                  The base station shall set this field to the code channel index  
 12                  (see [2]) in the range 1 to 256 inclusive that the mobile station  
 13                  is to use on the Forward Common Control Channel.

14       BCAST\_INDEX - Broadcast index.

15                  If CCH\_INFO\_INCL is set to '1', the base station shall include  
 16                  the field BCAST\_INDEX and shall set this field as shown  
 17                  below; otherwise, the base station shall omit this field.

18                  If Periodic Enhanced Broadcast Paging is disabled, the base  
 19                  station shall set this field to '000'; otherwise, the base station  
 20                  shall set this field to the Broadcast Index (see  
 21                  2.6.2.1.1.3.3.[24](#)).

22       NUM\_BCCH\_BCAST - The number of Broadcast Control Channels used for  
 23                  transmitting broadcast messages.

24                  If CCH\_INFO\_INCL is set to '1', the base station shall include  
 25                  this field and set it as shown below; otherwise, the base  
 26                  station shall omit this field.

27                  If the base station supports transmission of broadcast  
 28                  messages, the base station shall set this field to the number of  
 29                  Broadcast Control Channels used for transmitting broadcast  
 30                  messages. If the base station supports transmission of  
 31                  broadcast messages, the base station shall not set this field to  
 32                  '000'.

33       If the NUM\_BCCH\_BCAST field is included, the base station shall set NUM\_BCCH\_BCAST  
 34       occurrences of the following three-field record, where the ith occurrence corresponds to a  
 35       BCCH indexed by BCN of i+1:

36       BCCH\_CODE\_CHAN - The Walsh Code index for the Broadcast Control Channel  
 37                  specified by BCCH\_ID.

38                  The base station shall set this field to the Walsh code  
 39                  corresponding to the Broadcast Control Channel specified by  
 40                  BCCH\_ID.

41       BRAT - BCCH data rate.

42                  The base station shall set this field to the BRAT field value  
 43                  shown in Table 3.7.2.3.2.31-2 corresponding to the data rate  
 44                  used by the Broadcast Control Channel to which the mobile  
 45                  station is being directed.

**Table 3.7.2.3.2.31-2. Broadcast Control Channel Data Rate**

| <b>BRAT Field (binary)</b> | <b>Broadcast Control Channel data rate</b> |
|----------------------------|--------------------------------------------|
| 00                         | 4800 bps                                   |
| 01                         | 9600 bps                                   |
| 10                         | 19200 bps                                  |
| 11                         | Reserved                                   |

- BCCH\_CODE\_RATE - BCCH code rate.  
For spreading rate 1, the base station shall set this field to '0' if the BCCH Code Rate is 1/4 (see 3.1.3.1.2.1 of [2]). For spreading rate 1, the base station shall set this field to '1' if the BCCH code rate is 1/2 (see 3.1.3.1.2.1 of [2]). For spreading rate 3, the base station shall set this field to '0'.
- QPCH\_SUPPORTED - Quick Paging Channel Supported Indication.  
If CCH\_INFO\_INCL is set to '1', the base station shall include the field QPCH\_SUPPORTED and shall set this field as shown below; otherwise, the base station shall omit this field.  
If the base station supports Quick Paging Channel operation, the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.
- NUM\_QPCH - Number of Quick Paging Channels.  
If QPCH\_SUPPORTED is included and set to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.  
The base station shall set this field to the number of Quick Paging Channels on this CDMA Channel. The base station shall not set this field to '00'.
- QPCH\_RATE - Quick Paging Channel indicator rate.  
If QPCH\_SUPPORTED is included and set to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.  
The base station shall set this field to the QPCH\_RATE field value shown in Table 3.7.2.3.2.13-2 corresponding to the indicator rate used by the Quick Paging Channel in the system.
- QPCH\_POWER-  
\_LEVEL\_PAGE - Quick Paging Channel paging indicator transmit power level.  
If QPCH\_SUPPORTED is included and set to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel paging indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.31-3.

**Table 3.7.2.3.2.31-3. Quick Paging Channel Transmit Power Level**

| <b>QPCH_POWER_LEVEL_PAGE</b><br><b>QPCH_POWER_LEVEL_CONFIG</b><br><b>QPCH_POWER_LEVEL_BCAST</b><br><b>(binary)</b> | <b>Transmit Power Level</b>                 |
|--------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| 000                                                                                                                | 5 dB below the Pilot Channel Transmit Power |
| 001                                                                                                                | 4 dB below the Pilot Channel Transmit Power |
| 010                                                                                                                | 3 dB below the Pilot Channel Transmit Power |
| 011                                                                                                                | 2 dB below the Pilot Channel Transmit Power |
| 100                                                                                                                | 1 dB below the Pilot Channel Transmit Power |
| 101                                                                                                                | Same as the Pilot Channel Transmit Power    |
| 110                                                                                                                | 1 dB above the Pilot Channel Transmit Power |
| 111                                                                                                                | 2 dB above the Pilot Channel Transmit Power |

**QPCH\_CCI\_SUPPORTED** - Quick Paging Channel configuration change indicator supported.

If QPCH\_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

If the base station supports configuration change indicators on the Quick Paging Channel, the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.

**QPCH\_POWER\_LEVEL\_CONFIG** - Quick Paging Channel configuration change indicator transmit power level.

If QPCH\_CCI\_SUPPORTED is included and set to '1', the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

1                   The base station shall set this field to the Quick Paging  
 2                   Channel configuration change indicator transmit power level  
 3                   relative to that of the Pilot Channel as specified in Table  
 4                   3.7.2.3.2.31-3.

5                   If the base station is operating in Spreading Rate 3 BCCH channel, the base station shall  
 6                   include NUM\_QPCH occurrences of the following one field record:

7                   QPCH\_CODE\_CHAN - Code channel index of the Quick Paging Channel for  
 8                   Spreading Rate 3.

9                   The base station shall set this field to the code channel index  
 10                  (see [2]) in the range 1 to 256 inclusive that the mobile station  
 11                  is to use on the Quick Paging Channel for Spreading Rate 3.

12  
 13                  QPCH BI\_SUPPORTED - Quick Paging Channel broadcast indicator supported.  
 14                  If QPCH\_SUPPORTED is included and set to '1', the base  
 15                  station shall include this field and set it as described below;  
 16                  otherwise, the base station shall omit this field.  
 17                  If the base station supports broadcast indicators on the Quick  
 18                  Paging Channel, the base station shall set this field to '1';  
 19                  otherwise the base station shall set this field to '0'.

20                  QPCH\_POWER\_LEVEL- - Quick Paging Channel broadcast indicator  
 21                  \_BCAST transmit power level.  
 22                  If QPCH BI\_SUPPORTED is included and set to '1', the base  
 23                  station shall include this field and set it as described below;  
 24                  otherwise, the base station shall omit this field.

25                  The base station shall set this field to the Quick Paging  
 26                  Channel broadcast indicator transmit power level relative to  
 27                  that of the Pilot Channel as specified in Table 3.7.2.3.2.31-3.

28                  SDB\_SUPPORTED - Short Data Burst supported indicator.  
 29                  If CCH\_INFO\_INCL is set to '1', the base station shall include  
 30                  the field SDB\_SUPPORTED and shall set this field as shown  
 31                  below; otherwise, the base station shall omit this field.

32                  The base station shall set this field to '1' if the mobile station  
 33                  is permitted to send a Short Data Burst; otherwise, the base  
 34                  station shall set this field to '0'.

35                  BROADCAST\_GPS\_ASST - Broadcast GPS Assist Indicator.  
 36                  If CCH\_INFO\_INCL is set to '1', the base station shall include  
 37                  the field BROADCAST\_GPS\_ASST and shall set this field as  
 38                  shown below; otherwise, the base station shall omit this field.

39                  The base station shall set this field to '1' if it supports  
 40                  Broadcast GPS Assist capability; otherwise, the base station  
 41                  shall set this field to '0'.

42                  RLGAIN\_TRAFFIC\_PILOT - Gain adjustment of the Reverse Traffic Channel relative to the  
 43                  Reverse Pilot Channel for Radio Configurations greater than 2.

If CCH\_INFO\_INCL is set to ‘1’, the base station shall include the field RLGAIN\_TRAFFIC\_PILOT and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the correction factor to be used by mobile stations in setting the power of a reverse traffic channel, expressed as a two’s complement value in units of 0.125 dB (see 2.1.2.3.3 of [2]).

- REV\_PWR-CNTL\_DELAY\_INCL - Reverse Power Control Delay included indicator.  
If CCH\_INFO\_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.  
The base station shall set this field to ‘1’ if the base station includes the REV\_PWR\_CNTL\_DELAY field in this message; otherwise, the base station shall set this field to ‘0’.
- REV\_PWR-CNTL\_DELAY - The reverse power control delay.  
If REV\_PWR\_CNTL\_DELAY\_INCL is included and set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.  
The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see 2.1.2.3.2 of [2]), in units of 1.25 ms.
- MOB\_QOS - Indicator granting permission to the mobile station to request QoS parameter settings in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message*.  
If CCH\_INFO\_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.  
The base station shall set this field to ‘1’, if the mobile station is allowed to include a QoS record in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message*; or to ‘0’, otherwise, the base station shall set this field to ‘0’.
- USE\_SYNC\_ID - Sync ID supported indicator.  
If CCH\_INFO\_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.  
The base station shall set this field to ‘1’ to indicate that the mobile station is permitted to include the SYNC\_ID field in the *Page Response Message* and the *Origination Message*. Otherwise, the base station shall set this field to ‘0’.

- 1           NUM\_OPT\_MSG     - Number of optional overhead messages to be sent.  
 2                           If CCH\_INFO\_INCL is set to '1', the base station shall include  
 3                           this field and shall set this field as shown below; otherwise,  
 4                           the base station shall omit this field.  
 5                           The base station shall set this field to the number of optional  
 6                           overhead messages to be sent.
- 7           SENDING\_RAND     - ANSI-41 RAND Message indicator.  
 8                           If NUM\_OPT\_MSG is included and is equal to or greater than  
 9                           1, the base station shall include the field SENDING\_RAND and  
 10                          shall set this field as shown below; otherwise, the base station  
 11                          shall omit this field.  
 12                           If the base station is sending the *ANSI-41 RAND Message* on  
 13                          the Primary Broadcast Control Channel, it shall set this field  
 14                          to '1'; otherwise, it shall set this field to '0'.
- 15           PRI\_NGHBR\_LIST     - *Private Neighbor List Message* indicator.  
 16                           If NUM\_OPT\_MSG is included and is equal to or greater than  
 17                           2, the base station shall include the field PRI\_NGHBR\_LIST and  
 18                          shall set this field as shown below; otherwise, the base station  
 19                          shall omit this field.  
 20                           If the base station is sending the *Private Neighbor List Message*  
 21                          on the Primary Broadcast Control Channel, it shall set this field to  
 22                          '1'; otherwise, it shall set this field to '0'.
- 23           USER\_ZONE\_ID     - *User Zone Identification Message* indicator.  
 24                           If NUM\_OPT\_MSG is included and is equal to or greater than  
 25                           3, the base station shall include the field USER\_ZONE\_ID and  
 26                          shall set this field as shown below; otherwise, the base station  
 27                          shall omit this field.  
 28                           If the base station is sending the *User Zone Identification  
 29                          Message* on the Primary Broadcast Control Channel, it shall set this field  
 30                          to '1'; otherwise, it shall set this field to '0'.
- 31           EXT\_GLOBAL-  
 32                           \_REDIRECT     - Extended Global Service Redirection Message indicator.  
 33                           If NUM\_OPT\_MSG is included and is equal to or greater than  
 34                           4, the base station shall include the field  
 35                           EXT\_GLOBAL\_REDIRECT and shall set this field as shown  
 36                          below; otherwise, the base station shall omit this field.  
 37                           If the base station is sending the *Extended Global Service  
 38                          Redirection Message* on the Primary Broadcast Control  
 39                          Channel, it shall set this field to '1'; otherwise, the base  
 40                          station shall set this field to '0'.
- 41           RESERVED     - Reserved bits.  
 42                           If NUM\_OPT\_MSG is included and is equal to or greater than  
 43                           5, the base station shall include the field RESERVED and  
 44                          shall set this field as shown below; otherwise, the base station  
 45                          shall omit this field.

1                   The base station shall add (NUM\_OPT\_MSG – 4) reserved bits.  
2                   The base station shall set these bits to '0'.

3                   PILOT INFO REQ

4                   SUPPORTED - Pilot information request supported indicator.

5                   If CCH INFO INCL is set to '1', the base station shall include  
6                   this field and set it as shown below; otherwise, the base  
7                   station shall omit this field.

8                   If the base station supports mobile station request for pilot  
9                   information using the "Pilot Information" record in the *Base*  
10                  *Station Status Request Message*, the base station shall set this  
11                  field to '1'; otherwise, the base station shall set this field to '0'.

## 1    3.7.2.3.2.32 ANSI-41 RAND Message

2    MSG\_TAG: A41RANDM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| PILOT_PN     | 9                    |
| RESERVED     | 6                    |
| RAND         | 32                   |

4

- 5            PILOT\_PN    -    Pilot PN sequence offset index.  
                The base station shall set this field to the pilot PN sequence  
                offset for this base station, in units of 64 PN chips.
- 6            RESERVED    -    Reserved bits.  
                The base station shall set this field to '000000'.
- 7            RAND        -    Random challenge value.  
                The base station shall set this field to the random challenge  
                value to be used by mobile stations for authentication.

1                   If a mobile station in access overload class 11 is permitted to  
 2 transmit requests on the Enhanced Access Channel, the base  
 3 station shall set this field to the persistence value to be used.  
 4 If such a mobile station is not permitted to transmit requests  
 5 on the Enhanced Access Channel, the base station shall set  
 6 this field to '111'.

- 7           PSIST(12)\_EACH     - Persistence value for access overload class 12.  
 8                   If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 9 this field; otherwise, the base station shall set this field as  
 10 follows:

11                  If a mobile station in access overload class 12 is permitted to  
 12 transmit requests on the Enhanced Access Channel, the base  
 13 station shall set this field to the persistence value to be used.  
 14 If such a mobile station is not permitted to transmit requests  
 15 on the Enhanced Access Channel, the base station shall set  
 16 this field to '111'.

- 17           PSIST(13)\_EACH     - Persistence value for access overload class 13.  
 18                   If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 19 this field; otherwise, the base station shall set this field as  
 20 follows:

21                  If a mobile station in access overload class 13 is permitted to  
 22 transmit requests on the Enhanced Access Channel, the base  
 23 station shall set this field to the persistence value to be used.  
 24 If such a mobile station is not permitted to transmit requests  
 25 on the Enhanced Access Channel, the base station shall set  
 26 this field to '111'.

- 27           PSIST(14)\_EACH     - Persistence value for access overload class 14.  
 28                   If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 29 this field; otherwise, the base station shall set this field as  
 30 follows:

31                  If a mobile station in access overload class 14 is permitted to  
 32 transmit requests on the Enhanced Access Channel, the base  
 33 station shall set this field to the persistence value to be used.  
 34 If such a mobile station is not permitted to transmit requests  
 35 on the Enhanced Access Channel, the base station shall set  
 36 this field to '111'.

- 37           PSIST(15)\_EACH     - Persistence value for access overload class 15.  
 38                   If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 39 this field; otherwise, the base station shall set this field as  
 40 follows:

41                  If a mobile station in access overload class 15 is permitted to  
 42 transmit requests on the Enhanced Access Channel, the base  
 43 station shall set this field to the persistence value to be used.  
 44 If such a mobile stations is not permitted to transmit requests  
 45 on the Enhanced Access Channel, the base station shall set  
 46 this field to '111'.

1           PSIST\_EMG    - Persistence value for emergency call for access overload  
 2           classes 0 through 9.

3           If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 4           this field; otherwise, the base station shall set this field as  
 5           follows:

6           If a mobile station in access overload classes 0 through 9 is  
 7           permitted to transmit emergency requests on the Enhanced  
 8           Access Channel, the base station shall set this field to the  
 9           persistence value to be used for the emergency calls. If such a  
 10          mobile station is not permitted to transmit emergency  
 11          requests on the Enhanced Access Channel, the base station  
 12          shall set this field to '111'.

13          MSG\_PSIST\_EACH    - Persistence modifier for Enhanced Access Channel attempts  
 14          for message transmissions.

15          If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 16          this field; otherwise, the base station shall set this field to the  
 17          persistence modifier for Enhanced Access Channel attempts  
 18          for message transmissions.

19          REG\_PSIST\_EACH    - Persistence modifier for Enhanced Access Channel attempts  
 20          for registrations which are not responses to the *Registration  
 21          Request Order*.

22          If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 23          this field; otherwise, the base station shall set this field to the  
 24          persistence modifier for Enhanced Access Channel attempts  
 25          for registrations which are not responses to the *Registration  
 26          Request Order*.

27          RESERVED    - Reserved bits.

28          If PSIST\_PARMS\_INCL is set to '0', the base station shall omit  
 29          this field; otherwise, the base station shall include as many  
 30          bits as required to make the length of the persistence  
 31          parameters record an integral number of octets. If this field is  
 32          included, the base station shall set each of these bits to '0'.

34          LAC\_PARMS\_LEN    - Length of Link Access Control parameter fields.

35          The base station shall set this field to the total length, in  
 36          octets, of Link Access Control parameters included in the  
 37          message, including the LAC\_PARMS\_LEN and RESERVED  
 38          fields.

39          ACC\_TMO    - Acknowledgment timeout.

40          The base station shall set this field to one less than the length  
 41          of time, in units of 20 ms, that a mobile station is to wait to  
 42          receive a Layer 2 acknowledgment after the end of an  
 43          Enhanced Access Channel transmission.

44          PROBE\_PN\_RAN    Time randomization for Enhanced Access Channel probes.

1                   The base station shall set this field to the value in the range 0  
 2                   to 9 inclusive, so that the time randomization range to be  
 3                   used by a mobile station is 0 to  $2^{\text{PROBE\_PN\_RAN\_EACH}} - 1$  PN  
 4                   chips.

5            RESERVED\_1    -    The reserved bits

6                   The base station shall set this field to '0000'

7            MAX\_REQ\_SEQ   -    Maximum number of access probe sequences for an Enhanced  
 8                   Access Channel request.

9                   The base station shall set this field to the maximum number  
 10                  of access probe sequences a mobile station is to transmit for  
 11                  an Enhanced Access Channel request. The base station shall  
 12                  set this field to a value greater than 0.

13            MAX\_RSP\_SEQ   -    Maximum number of access probe sequences for an Enhanced  
 14                  Access Channel response.

15                   The base station shall set this field to the maximum number  
 16                  of access probe sequences a mobile station is to transmit for  
 17                  an Enhanced Access Channel response. The base station shall  
 18                  set this field to a value greater than 0.

19            RESERVED      -    Reserved Bits.

20                   The base station shall include as many bits as required to  
 21                  make the length of the Link Access Control parameters record  
 22                  an integral number of octets. The base station shall set each  
 23                  of these bits to '0'.

24            NUM\_MODE\_

25            SELECTION\_ENTRIES   -    Number of entries of the Mode Selection Table.

26                   The base station shall set this field to the number of entries of  
 27                  the Mode Selection Table, minus one.

28                   The base station shall include NUM\_MODE\_SELECTION\_ENTRIES + 1 occurrences of the  
 29                  following three-field record:

30            ACCESS\_MODE      -    Access Mode used for the Enhanced Access Channel.

31                   The base station shall set this field to the Access Mode value  
 32                  shown in Table 3.7.2.3.2.33-1 corresponding to the Access  
 33                  Mode used.

34                   **Table 3.7.2.3.2.33-1. Enhanced Access Modes**

| <b>ACCESS_MODE (binary)</b> | <b>Access Mode</b>      |
|-----------------------------|-------------------------|
| 000                         | Basic Access Mode       |
| 001                         | Reservation Access Mode |
| 010 – 011                   | Reserved                |

36            ACCESS\_MODE\_MIN-

- 1            \_DURATION    - The minimum message duration for the corresponding Access  
2            Mode.  
3            The base station shall set this field to the minimum message  
4            duration for the corresponding Access Mode, in units of 5 ms.  
5            See [3].
- 6    ACCESS\_MODE\_MAX-  
7            \_DURATION    - The maximum message duration for the corresponding Access  
8            Mode.  
9            The base station shall set this field to the maximum message  
10          duration for the corresponding Access Mode, in units of 5 ms.  
11          See [3].
- 12    RLGAIN\_COMMON-  
13            \_PILOT        - Gain adjustment of the Enhanced Access Channel or Reverse  
14            Common Control Channel relative to the Reverse Pilot  
15            Channel.  
16            The base station shall set this field to the correction factor to  
17            be used by mobile stations in setting the power of a code  
18            channel, expressed as a two's complement value in units of  
19            0.125 dB (see 2.1.2.3.3 of [2]).
- 20    IC\_THRESH        - Interference correction threshold.  
21            The threshold level at which the interference correction begins  
22            to be applied.  
23            The base station shall set this field to the negative of the  
24            interference correction threshold to be used by mobile stations  
25            to determine the interference correction, in units of 1 dB  
26            (see 2.1.2.3.1.2 of [2]).
- 27    IC\_MAX          - The maximum interference correction that can be applied.  
28            The base station shall set this field to the maximum  
29            interference correction that can be applied, in units of 1 dB  
30            (see 2.1.2.3.1.2 of [2]).
- 31    NUM\_MODE\_PARM-  
32            \_REC         - The number of mode-specific parameter records.  
33            The base station shall set this field to the number of mode-  
34            specific parameter records included in the message, minus  
35            one.
- 36            The base station shall include NUM\_MODE\_PARM\_REC + 1 occurrences of the following  
37            record:
- 38    EACH\_PARM\_REC-  
39            \_LEN        - Length of the mode-specific parameters record.  
40            The base station shall set this field to the total length, in  
41            octets, of the mode-specific parameters record, including the  
42            EACH\_PARM\_REC\_LEN and RESERVED fields.
- 43    APPLICABLE\_MODES    - Access modes to which the access parameters specified in this  
44            record apply.

The base station shall set each subfield of the APPLICABLE\_MODES field as follows: the base station shall set the subfield to '1' if the access parameters included in this record are applicable to the corresponding Access Mode in Table 3.7.2.3.2.33-2; otherwise, the base station shall set the subfield to '0'.

**Table 3.7.2.3.2.33-2. Applicable Modes**

| <b>Subfield</b> | <b>Length (bits)</b> | <b>Subfield Description</b> |
|-----------------|----------------------|-----------------------------|
| ACC_MODE_1      | 1                    | Basic Access Mode           |
| ACC_MODE_2      | 1                    | Reservation Access Mode     |
| RESERVED        | 6                    |                             |

- EACH\_NOM\_PWR - Nominal transmit power offset for the Enhanced Access Channels.
- EACH\_INIT\_PWR - Initial power offset for the Enhanced Access Channels.
- EACH\_PWR\_STEP - Power increment for the Enhanced Access Channels.
- EACH\_NUM\_STEP - Number of access probes.
- EACH\_PREAMBLE-  
\_ENABLED - Preamble enabled indicator for the Enhanced Access Channel. The base station shall set this field to '1' if EACH preamble related information is included in this message; otherwise, the base station shall set this field to '0'.
- EACH\_PREAMBLE-  
\_NUM\_FRAC - The number of fractional preambles on the Enhanced Access Channels.

If EACH\_PREAMBLE\_ENABLED is set to ‘1’, the base station shall set this field to the number of fractional preambles minus one on the Enhanced Access Channels; otherwise, the base station shall omit this field.

EACH\_PREAMBLE-

- \_FRAC\_DURATION - Fractional preamble duration on the Enhanced Access Channels.

If EACH\_PREAMBLE\_ENABLED is set to ‘1’, the base station shall set this field to the fractional preamble duration minus one on an Enhanced Access Channel, in units of 1.25 ms; otherwise, the base station shall omit this field.

EACH\_PREAMBLE-

\_OFF\_DURATION

- Fractional preamble gated-off duration on the Enhanced Access Channels.

If EACH\_PREAMBLE\_ENABLED is set to ‘1’, the base station shall set this field to the fractional preamble gated-off duration (in units of 1.25 ms) after the transmission of each fractional preamble on an Enhanced Access Channel; otherwise, the base station shall omit this field.

EACH\_PREAMBLE-

\_ADD\_DURATION

- Additional preamble duration on the Enhanced Access Channels.

If EACH\_PREAMBLE\_ENABLED is set to ‘1’, the base station shall set this field to the additional preamble duration on an Enhanced Access Channel, in units of 1.25 ms; otherwise, the base station shall omit this field.

EACH\_ACCESS

\_THRESH

Pilot  $E_e/I_o$  threshold for transmission on the Enhanced Access Channels.

The base station shall set this field to:

$$\lceil 20 \times \log_{10} \text{pilot\_threshold} \rceil$$

where *pilot\_threshold* is the pilot  $E_e/I_o$  threshold below which the mobile station is not to transmit a probe on an Enhanced Access Channel.

RESERVED

- Reserved bits.

The base station shall set this field to ‘000000’.

EACH\_PROBE\_BKOFF

- Enhanced Access Channel probe backoff range.

The base station shall set this field to one less than the maximum number of slots a mobile station is to delay due to random backoff between consecutive enhanced access probes.

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                     |
|---|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | EACH_BKOFF        | - Enhanced Access Channel probe sequence backoff range.<br>The base station shall set this field to one less than the maximum number of slots a mobile station is to delay due to random backoff between successive enhanced access probe sequences and before the first enhanced access probe sequence of a response access.                                                                       |
| 2 | EACH_SLOT         | - Slot duration for the Enhanced Access Channels.<br>The base station shall set this field to N where the slot duration of the Enhanced Access Channel is $(N+1) \times 1.25$ ms. The base station shall set this field to a value between 0 and 63.                                                                                                                                                |
| 3 | EACH_SLOT_OFFSET1 | - First slot offset for the Enhanced Access Channels.<br>The base station shall set this field so that the Enhanced Access Channel has a slot offset equal to $(EACH_ID \times EACH_SLOT_OFFSET2 + EACH_SLOT_OFFSET1) \bmod (EACH_SLOT+1)$ , where EACH_ID is the Enhanced Access Channel Index. The base station shall set this field to a value between 0 and 63, <u>in units of 1.25 ms</u> .    |
| 4 | EACH_SLOT_OFFSET2 | - Relative slot offset for the Enhanced Access Channels.<br>The base station shall set this field so that the Enhanced Access Channel has a slot offset equal to $(EACH_ID \times EACH_SLOT_OFFSET2 + EACH_SLOT_OFFSET1) \bmod (EACH_SLOT+1)$ , where EACH_ID is the Enhanced Access Channel Index. The base station shall set this field to a value between 0 and 63, <u>in units of 1.25 ms</u> . |
| 5 | RESERVED          | - Reserved bits.<br>The base station shall include as many bits as required to make the length of the mode-specific parameters record an integral number of octets. The base station shall set each of these bits to '0'.                                                                                                                                                                           |
| 6 | BA_PARMS_LEN      | - Length of Basic Access Mode parameter record.<br>The base station shall set this field to the total length, in octets, of Basic Access Mode parameters record included in the message, <u>excluding</u> the BA_PARMS_LEN <u>and but including the</u> RESERVED fields. <u>If there are no fields other than the BA PARMS LEN in this record, the base station shall set this field to '000'</u> . |
| 7 | NUM_EACH_BA       | - Number of Enhanced Access Channels used for the Basic Access Mode.<br><u>If BA PARMS LEN is equal to '000', the base station shall omit this field; otherwise, The base station shall include this field and set this field to the number of Enhanced Access Channels used for the Basic Access mode minus one.</u>                                                                               |
| 8 | EACH_BA_RATES-    |                                                                                                                                                                                                                                                                                                                                                                                                     |

1            \_SUPPORTED    -    Supported rate words for the Basic Access mode on the  
 2            Enhanced Access Channels.

3            If BA\_PARMS\_LEN is equal to '000', the base station shall  
 4            omit this field; otherwise, The base station shall include this  
 5            field and set each subfield of the EACH\_BA\_RATES\_SUPPORTED field as follows: the base  
 6            station shall set the subfield to '1' if the corresponding mode  
 7            in Table 3.7.2.3.2.33-3 is allowed; otherwise the base station  
 8            shall set the subfield to '0'.  
 9

10            **Table 3.7.2.3.2.33-3. EACH and RCCCH Data Rate and Frame Size**

| Subfield    | Length (bits) | Subfield Description        |
|-------------|---------------|-----------------------------|
| RATE_SIZE_1 | 1             | 9600 bps, 20 ms frame size  |
| RATE_SIZE_2 | 1             | 19200 bps, 20 ms frame size |
| RATE_SIZE_3 | 1             | 19200 bps, 10 ms frame size |
| RATE_SIZE_4 | 1             | 38400 bps, 20 ms frame size |
| RATE_SIZE_5 | 1             | 38400 bps, 10 ms frame size |
| RATE_SIZE_6 | 1             | 38400 bps, 5 ms frame size  |
| RESERVED    | 2             | Reserved                    |

12            RESERVED    -    Reserved bits.

13            If BA\_PARMS\_LEN is equal to '000', the base station shall  
 14            omit this field; otherwise, The base station shall include as  
 15            many bits as required to make the length of the Basic Access  
 16            Mode record (excluding the BA\_PARMS\_LEN field but  
 17            including the RESERVED field) an integral number of octets.  
 18            The base station shall set each of these bits to '0'.  
 19

20            RA\_PARMS\_LEN    -    Length of Reservation Access Mode parameters record.

21            The base station shall set this field to the total length, in  
 22            octets, of Reservation Access Mode parameters record  
 23            included in the message, including the RA\_PARMS\_LEN  
 24            andbut including the RESERVED fields.

25            NUM\_EACH\_RA    -    Number of Enhanced Access Channels used for the  
 26            Reservation Access Mode.

27            If RA\_PARMS\_LEN is equal to '00000', the base station shall  
 28            omit this field; otherwise, The base station shall include this  
 29            field and set this field to the number of Enhanced Access  
 30            Channels used for the Reservation Access mode minus one.  
 31

32            NUM\_CACH    -    Number of Common Assignment Channels.

1           **If RA\_PARMS\_LEN is equal to '00000', the base station shall  
2           omit this field; otherwise, the base station shall include this  
3           field and set this field to the number of Common Assignment  
4           Channels supported by the system minus one.**

5       CACH\_CODE\_RATE - Code Rate for the Common Assignment Channels.

6           **If RA\_PARMS\_LEN is equal to '00000', the base station shall  
7           omit this field; otherwise, the base station shall include this  
8           field and set it as follows:**

9           If the CACH is operating in Spreading Rate 1, the base station  
10          shall set this field to '0' if the CACH Code Rate is 1/4 (see  
11          3.1.3.1.2.1 of [2]). The base station shall set this field to '1' if  
12          the CACH Code Rate is 1/2 (see 3.1.3.1.2.1 of [2]).

13          If the CACH is operating in Spreading Rate 3, the base station  
14          shall set this field to '0'.

15          **If RA\_PARMS\_LEN is not equal to '00000', the base station shall include (NUM\_CACH + 1)  
16          occurrences of the following one field record:**

17       CACH\_CODE\_CHAN - Code channel index for the Common Assignment Channel.

18           The base station shall set this field to the code channel index  
19           (see [2]) in the range 1 to 256 inclusive that the mobile station  
20           is to use on the Common Assignment Channel.

22       NUM\_RCCCH - Number of Reverse Common Control Channels used for the  
23           Reservation Mode.

24           **If RA\_PARMS\_LEN is equal to '00000', the base station shall  
25           omit this field; otherwise, the base station shall include this  
26           field and set this field to the number of Reverse Common  
27           Control Channels used for the Reservation mode minus one.**

28       RCCCH\_RATES-

29        \_SUPPORTED - Supported rate words on the Reverse Common Control  
30           Channels.

31           **If RA\_PARMS\_LEN is equal to '00000', the base station shall  
32           omit this field; otherwise, the base station shall include this  
33           field and set each bit of the RCCCH\_RATES\_SUPPORTED field  
34           as follows: the base station shall set the bit to '1' if the  
35           corresponding mode in Table 3.7.2.3.2.3-3 is allowed;  
36           otherwise the base station shall set the bit to '0'.**

37       RCCCH\_PREAMBLE-

38        \_ENABLED - Preamble enabled indicator for the Reverse Common Control  
39           Channel.

40           **If RA\_PARMS\_LEN is equal to '00000', the base station shall  
41           omit this field; otherwise, the base station shall include this  
42           field and set this field as follows:**

43           **to '1' If RCCCH preambles related information is included in  
44           this message, the base station shall set this field to '1';  
45           otherwise, the base station shall set this field to '0'.**

|    |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 18 |                    |   | <u>If RA PARMs LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set this field to</u> the correction factor to be used by a mobile station in the open loop power estimate for the initial transmission on a Reverse Common Control Channel, expressed as a two's complement value in units of 1 dB (see [2]).                                                                                                                           |
| 25 | RA_PC_DELAY        | - | Power control delay for the Reverse Common Control Channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 26 |                    |   | <u>If RA PARMs LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set this field to</u> the number of power control bits the mobile is to disregard after initiating transmission on a Reverse Common Control Channel.                                                                                                                                                                                                                     |
| 31 | EACAM_CACH_DELAY   | - | Maximum time after an Enhanced Access Channel header transmission for receiving a response on the Common Assignment Channel when Reverse Common Control Channel soft handoff has not been requested.                                                                                                                                                                                                                                                                                                              |
| 35 |                    |   | <u>If RA PARMs LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set this field to</u> the number of complete Common Assignment Channel frames minus one, from the end of the <i>R-EACH Header</i> , for which a mobile station is to wait for the <i>Early Acknowledgement Channel Assignment Message</i> if the mobile station has not requested Reverse Common Control Channel soft handoff.                                           |
| 43 | RCCCH_HO-          |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 44 | _SUPPORTED         | - | Reverse Common Control Channel handoff supported indicator.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 45 |                    |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

1           If RA\_PARMS\_LEN is equal to '00000', the base station shall  
 2           omit this field; otherwise, the base station shall include this  
 3           field and set it as follows:

4           The base station shall set this field to '1' if Reverse Common  
 5           Control Channel handoff is supported by the base station;  
 6           otherwise, the base station shall set this field to '0'.

7       RCCCH\_HO\_THRESHOLD

- Reverse Common Control Channel soft handoff threshold.  
 8           If RCCCH\_HO\_SUPPORTED is included and is set to '1', the  
 9           base station shall include this field; otherwise the base station  
 10          shall omit this field. set to '0', the base station shall omit this  
 11          field; otherwise, the base station shall set this field to:

12          If included, the base station shall set this field to:

$$\lfloor -20 \times \log_{10} \text{pilot\_threshold} \rfloor$$

14          where *pilot\_threshold* is the pilot  $E_c/I_o$  threshold used to  
 15          determine whether the mobile station requests Reverse  
 16          Common Control Channel in soft handoff.

17          This is a positive value in units of 0.5 dB.

18       EACAM\_PCCAM\_DELAY

- Maximum time after an Enhanced Access Channel header transmission for receiving a response on the Common Assignment Channel when Reverse Common Control Channel soft handoff has been requested.

22          If RCCCH\_HO\_SUPPORTED is included and is set to '1', the  
 23          base station shall include this field; otherwise the base station  
 24          shall omit this field. set to '0', the base station shall omit this  
 25          field; otherwise;

26          If included, the base station shall set this field to the number  
 27          of complete Common Assignment Channel frames minus one,  
 28          from the end of the *R-EACH Header*, for which a mobile  
 29          station is to wait for the *Early Acknowledgement Channel*  
 30          *Assignment Message* and *Power Control Channel Assignment*  
 31          *Message* if the mobile station has requested Reverse Common  
 32          Control Channel soft handoff (see [3]).

33       NUM\_CPCCH

- Number of Common Power Control Channels.  
 34           If RA\_PARMS\_LEN is equal to '00000', the base station shall  
 35           omit this field; otherwise, the base station shall include this  
 36           field and set this field to the number of Common Power  
 37           Channels supported minus one.

38       CPCCH\_RATE

- Power control rate for the Common Power Control Channels.  
 39           If RA\_PARMS\_LEN is equal to '00000', the base station shall  
 40           omit this field; otherwise, the base station shall include this  
 41           field and set this field to the value shown in Table  
 42           3.7.2.3.2.33-4 corresponding to the power control rate for the  
 43           Common Power Control Channels.

**Table 3.7.2.3.2.33-4. CPCCH Power Control Rate**

| CPCCH_RATE (Binary) | Power Control Rate |
|---------------------|--------------------|
| 00                  | 200 bps            |
| 01                  | 400 bps            |
| 10                  | 800 bps            |
| 11                  | Reserved           |

If RA\_PARMS\_LEN is not equal to '00000', the base station shall include (NUM\_CPCCH + 1) occurrences of the following one field record:

CPCCH\_CODE\_CHAN - Code channel index for the Common Power Control Channel. The base station shall set this field to the code channel index (see [2]) in the range 1 to 128 inclusive that the mobile station is to use on the Common Power Control Channel.

NUM\_PCSCH\_RA - Number of Power Control Subchannels used for the Reservation Access Mode.

If RA\_PARMS\_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set this field to the number of Power Control Subchannels used for the Reservation Access Mode minus one.

RESERVED - Reserved bits.

If RA\_PARMS\_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include as many bits as required to make the length of the Reservation Access Mode record (excluding the RA\_PARMS\_LEN but including the RESERVED field) an integral number of octets. The base station shall set each of these bits to '0'.

ACCT\_INCL - Access Control based on Call Type (ACCT) information included indicator.

If the base station enables ACCT for at least one service option, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

If the base station sets this field to '1', then the base station shall also set at least one of ACCT\_SO\_INCL or ACCT\_SO\_GRP\_INCL to '1'.

ACCT\_INCL\_EMG - Access Control based on Call Type (ACCT) includes emergency calls indicator.

If ACCT\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

1                   The base station shall set this field to '0' if the mobile station  
 2                   is not to apply ACCT to a call that is recognized by the mobile  
 3                   station to be an emergency call; otherwise, the base station  
 4                   shall set this field to '1'.

5                   **ACCT AOC**

6                   BITMAP INCL - Access Control based on Call Type (ACCT) access overload  
 7                   class bitmap included indicator.

8                   If ACCT INCL is set to '0', the base station shall omit this  
 9                   field; otherwise, the base station shall include this field and  
 10                  set it as follows:

11                  The base station shall set this field to '0' if all mobile stations  
 12                  are to apply ACCT regardless of their access overload classes;  
 13                  otherwise, the base station shall set this field to '1' to indicate  
 14                  that the mobile station is to apply ACCT according to its  
 15                  access overload class.

16                  ACCT SO INCL - Access Control based on Call Type (ACCT) service option  
 17                  included indicator.

18                  If ACCT INCL is set to '0', the base station shall omit this  
 19                  field; otherwise, the base station shall include this field and  
 20                  set it as follows:

21                  The base station shall set this field to '1' if at least one  
 22                  occurrence of the ACCT SO field is included in this message;  
 23                  otherwise, the base station shall set this field to '0'.

24                  NUM ACCT SO - Number of service options for Access Control based on Call  
 25                  Type (ACCT).

26                  If ACCT SO INCL is not included, or is included and set to '0',  
 27                  then the base station shall omit this field; otherwise, the base  
 28                  station shall include this field and set it to one less than the  
 29                  number of occurrences of the ACCT SO field included in this  
 30                  message.

31                  If ACCT SO INCL is included and set to '1', then the base station shall include  
 32                  NUM ACCT SO + 1 occurrences of the following variable-field record:

33                  ACCT AOC BITMAP1 - Access Control based on Call Type (ACCT) access overload  
 34                  class bitmap.

35                  If ACCT AOC BITMAP1 INCL is set to '0', then the base station  
 36                  shall omit this field; otherwise, the base station shall include  
 37                  this field and set it as follows:

38                  This field consists of the subfields defined in Table  
 39                  3.7.2.3.2.2-1.

40                  The base station shall set a subfield to '1' to indicate that  
 41                  mobile stations having the corresponding access overload  
 42                  class are not permitted to perform access attempts using the  
 43                  associated service option ACCT SO; otherwise, the base  
 44                  station shall set the subfield to '0'.

|    |                         |                                                                                                                                                                                                                                                                                                                                                                                 |
|----|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | <u>ACCT SO</u>          | - Access Control based on Call Type (ACCT) service option number.                                                                                                                                                                                                                                                                                                               |
| 2  |                         | The base station shall set this field to the value of the service option number (as specified in [30]) that has ACCT enabled.                                                                                                                                                                                                                                                   |
| 3  | <u>ACCT SO GRP INCL</u> | - Access Control based on Call Type (ACCT) service option group included indicator.                                                                                                                                                                                                                                                                                             |
| 4  |                         | If ACCT INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:                                                                                                                                                                                                                                 |
| 5  |                         | The base station shall set this field to '1' if at least one occurrence of the ACCT SO GRP field is included in this message; otherwise, the base station shall set this field to '0'.                                                                                                                                                                                          |
| 6  | <u>NUM ACCT SO GRP</u>  | - Number of service option groups for Access Control based on Call Type (ACCT).                                                                                                                                                                                                                                                                                                 |
| 7  |                         | If ACCT SO GRP INCL is not included, or is included and set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it to one less than the number of occurrences of the ACCT SO GRP field included in this message.                                                                                                  |
| 8  |                         | If ACCT SO GRP INCL is included and set to '1', then the base station shall include NUM ACCT SO GRP + 1 occurrences of the following variable-field record:                                                                                                                                                                                                                     |
| 9  | <u>ACCT AOC_BITMAP2</u> | - Access Control based on Call Type (ACCT) access overload class bitmap.                                                                                                                                                                                                                                                                                                        |
| 10 |                         | If ACCT AOC_BITMAP INCL is set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:                                                                                                                                                                                                                 |
| 11 |                         | This field consists of the subfields defined in Table 3.7.2.3.2.2-1. The base station shall set a subfield to '1' to indicate that mobile stations having the corresponding access overload class are not permitted to perform access attempts using a service option specified by the associated ACCT SO GRP field; otherwise, the base station shall set the subfield to '0'. |
| 12 | <u>ACCT SO GRP</u>      | - Access Control based on Call Type (ACCT) service option group number.                                                                                                                                                                                                                                                                                                         |
| 13 |                         | The base station shall set this field to the value of the service option group number (as specified in [30]) whose members all have ACCT enabled.                                                                                                                                                                                                                               |

## 1    3.7.2.3.2.34 Universal Neighbor List Message

2    MSG\_TAG: UNLM

| <b>Field</b>        | <b>Length (bits)</b> |
|---------------------|----------------------|
| PILOT_PN            | 9                    |
| CONFIG_MSG_SEQ      | 6                    |
| NUM_RADIO_INTERFACE | 4                    |

NUM\_RADIO\_INTERFACE occurrences of the following record:

|                                      |                            |
|--------------------------------------|----------------------------|
| RADIO_INTERFACE_TYPE                 | 4                          |
| RADIO_INTERFACE_LEN                  | 8                          |
| Radio Interface Type-specific fields | 8<br>× RADIO_INTERFACE_LEN |

3

4    PILOT\_PN    -    Pilot PN sequence offset index.  
 5                 The base station shall set this field to the pilot PN sequence  
 6                 offset for this base station, in units of 64 PN chips.

7    CONFIG\_MSG\_SEQ    -    Configuration message sequence number.  
 8                 The base station shall set this field to CONFIG\_SEQ (see  
 9                 3.6.2.2).

10      NUM\_RADIO-  
 11        \_INTERFACE    -    Number of interface types.  
 12                 The base station shall set this field to the number of radio  
 13                 interface types for which neighbors are included in this  
 14                 message.

15      The base station shall include NUM\_RADIO\_INTERFACE occurrences of the following  
 16                 record, one occurrence for each radio interface for which neighbors are included in this  
 17                 message.

18      RADIO-  
 19        \_INTERFACE\_TYPE    -    The radio interface type.  
 20                 The base station shall set this field to the radio interface type  
 21                 of this record as specified in Table 3.7.2.3.2.34-1.

**Table 3.7.2.3.2.34-1. Radio Interface Type**

| <b>RADIO_INTERFACE_TYPE<br/>(binary)</b> | <b>Descriptions</b> |
|------------------------------------------|---------------------|
| 0000                                     | MC system           |
| 0001                                     | Analog system       |
| 0010-1111                                | Reserved            |

- 2
- 3                   RADIO-
- 4     \_INTERFACE\_LEN    -   The length of the Radio Interface Type-specific fields.
- 5                   The base station shall set this field to the number of octets in
- 6                   the Radio Interface Type-specific fields of this record.
- 7     If RADIO\_INTERFACE\_TYPE is equal to '0000', the base station shall include the following
- 8     fields:

| <b>Field</b>          | <b>Length (bits)</b> |
|-----------------------|----------------------|
| PILOT_INC             | 4                    |
| NGHBR_SRCH_MODE       | 2                    |
| SRCH_WIN_N            | 0 or 4               |
| SRCH_OFFSET_INCL      | 1                    |
| FREQ_FIELDS_INCL      | 1                    |
| USE_TIMING            | 1                    |
| GLOBAL_TIMING_INCL    | 0 or 1               |
| GLOBAL_TX_DURATION    | 0 or 4               |
| GLOBAL_TX_PERIOD      | 0 or 7               |
| NGHBR_SET_ENTRY_INFO  | 1                    |
| NGHBR_SET_ACCESS_INFO | 1                    |
| NUM_NGHBR             | 6                    |

NUM\_NGHBR occurrences of the following subrecord:

|                      |                                    |
|----------------------|------------------------------------|
| NGHBR_CONFIG         | 3                                  |
| NGHBR_PN             | 9                                  |
| BCCH_SUPPORT         | 0 or 1                             |
| ADD_PILOT_REC_INCL   | 1                                  |
| NGHBR_PILOT_REC_TYPE | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |

(continues on next page)

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SEARCH_PRIORITY   | 0 or 2               |
| SRCH_WIN_NGHBR    | 0 or 4               |
| SRCH_OFFSET_NGHBR | 0 or 3               |
| FREQ_INCL         | 0 or 1               |
| NGHBR_BAND        | 0 or 5               |
| NGHBR_FREQ        | 0 or 11              |
| TIMING_INCL       | 0 or 1               |
| NGHBR_TX_OFFSET   | 0 or 7               |
| NGHBR_TX_DURATION | 0 or 4               |
| NGHBR_TX_PERIOD   | 0 or 7               |
| ACCESS_ENTRY_HO   | 0 or 1               |
| ACCESS_HO_ALLOWED | 0 or 1               |

|          |                   |
|----------|-------------------|
| RESERVED | 0 – 7 (as needed) |
|----------|-------------------|

- 1
- 2      PILOT\_INC    -    Pilot PN sequence offset index increment.
- 3                  A mobile station searches for Remaining-Set pilots at pilot PN
- 4                  sequence index values that are multiples of this value.
- 5                  The base station shall set this field to the pilot PN sequence
- 6                  increment, in units of 64 PN chips, that mobile stations are to
- 7                  use for searching the Remaining Set. The base station should
- 8                  set this field to the largest increment such that the pilot PN
- 9                  sequence offsets of all its neighbor base stations are integer
- 10                 multiples of that increment.
- 11                 The base station shall set this field to a value in the range 1 to
- 12                 15 inclusive.
- 13      NGHBR\_SRCH\_MODE    -    Search mode.
- 14                 The base station shall set this field to the value shown in
- 15                 Table 3.7.2.3.2.34-2 corresponding to the search mode.
- 16

**Table 3.7.2.3.2.34-2. Search Mode Field**

| <b>Value<br/>(binary)</b> | <b>Description</b>                     |
|---------------------------|----------------------------------------|
| 00                        | No search priorities or search windows |
| 01                        | Search priorities                      |
| 10                        | Search windows                         |
| 11                        | Search windows and search priorities   |

- 1
- 2
- 3      SRCH\_WIN\_N    -    Search window size for the Neighbor Set.
- 4                 If NGHBR\_SRCH\_MODE = '00' or NGHBR\_SRCH\_MODE = '01',  
5                 the base station shall include the field SRCH\_WIN\_N and shall  
6                 set this field as described below; otherwise, the base station  
7                 shall omit this field.
- 8                 The base station shall set this field to the value shown in  
9                 Table 2.6.6.2.1-1 corresponding to the search window size to  
10          be used by mobile stations for the Neighbor Set.
- 11     SRCH\_OFFSET\_INCL    -    Neighbor pilot channel search window offset included.  
12                 If NGHBR\_SRCH\_MODE = '10' or '11' and if the  
13                 SRCH\_OFFSET\_NGHBR field is included in the following  
14                 records, the base station shall set this bit to '1'; otherwise, the  
15                 base station shall set this bit to '0'.
- 16     FREQ\_FIELDS\_INCL    -    Frequency fields included.  
17                 If frequency fields are included in this message, the base  
18                 station shall set this field to '1'; otherwise, the base station  
19                 shall set this field to '0'.
- 20     USE\_TIMING    -    Use timing indicator.  
21                 If base station timing information is included for neighbor  
22                 base stations, the base station shall set this field to '1';  
23                 otherwise, the base station shall set this field to '0'.
- 24     GLOBAL\_TIMING-  
25                 \_INCL    -    Global timing included.  
26                 If USE\_TIMING is set to '1', the base station shall include the  
27                 field GLOBAL\_TIMING\_INCL and shall set this field as  
28                 described below; otherwise, the base station shall omit this  
29                 field.
- 30                 If base station timing information is included globally for all  
31                 neighbor base stations with TIMING\_INCL equal to '1', the  
32                 base station shall set this field to '1'; otherwise, the base  
33                 station shall set this field to '0'.
- 34     GLOBAL\_TX-  
35                 \_DURATION    -    Global neighbor transmit time duration.

1           If GLOBAL\_TIMING\_INCL is included and is set to ‘1’, the base  
 2           station shall include the field GLOBAL\_TX\_DURATION and  
 3           shall set this field as described below; otherwise, the base  
 4           station shall omit this field.

5           The base station shall set this field to the duration of the base  
 6           station transmit window, during each period, in units of 80  
 7           ms. The base station should set this field to a value of 3 or  
 8           greater.

9           **GLOBAL\_TX-**

10          **\_PERIOD**

- Global neighbor transmit time period.

11         If GLOBAL\_TIMING\_INCL is included and is set to ‘1’, the base  
 12         station shall include the field GLOBAL\_TX\_PERIOD and shall  
 13         set this field as described below; otherwise, the base station  
 14         shall omit this field.

15         The base station shall set this field to duration of the period,  
 16         in units of 80 ms.

17          **NGHBR\_SET-**

18          **\_ENTRY\_INFO**

- Neighbor Set access entry handoff information included indicator.

20         If the base station is including information on the Neighbor  
 21         Set access entry handoff, the base station shall set this field  
 22         to ‘1’; otherwise, the base station shall set this field to ‘0’.

23          **NGHBR\_SET-**

24          **\_ACCESS\_INFO**

- Neighbor Set access handoff included indicator.

25         If the base station is including information on the Neighbor  
 26         Set access handoff or access probe handoff, the base station  
 27         shall set this field to ‘1’, otherwise, the base station shall set  
 28         this field to ‘0’.

29          **NUM\_NGHBR**

- Number of neighbor pilot PN sequences.

30         The base station shall set this field to the number of  
 31         neighbors included in the message.

33         The base station shall include one occurrence of the following subrecord for each pilot that  
 34         a mobile station is to place in its Neighbor Set.

35

- 1           NGHBR\_CONFIG    -    Neighbor configuration.  
 2  
 3  
 4           The base station shall set this field to the value shown in  
              Table 3.7.2.3.2.34-3 corresponding to the configuration of this  
              neighbor.

5           **Table 3.7.2.3.2.34-3. Neighbor Configuration Field**

| <b>Value<br/>(binary)</b> | <b>Neighbor Configuration</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 100     | <p>The neighbor base station has the same number of frequencies having Primary Broadcast Control Channel/Forward Common Control Channel as the current base station.</p> <p>The neighbor base station has a CDMA frequency assignment corresponding to this CDMA frequency assignment with a Primary Broadcast Control Channel, and the neighbor CDMA frequency is given as follows:</p> <ul style="list-style-type: none"> <li>• If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.</li> <li>• If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.</li> </ul> <p>The position of the neighbor CDMA frequency assignment in the <i>Extended CDMA Channel List Message</i> transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the <i>Extended CDMA Channel List Message</i> transmitted by the current base station.</p> <p>The rate, code rate, and code channel of the Primary Broadcast Control Channel on this corresponding CDMA frequency are the same values as the current ones.</p> |
| 101-111 | Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

- 1  
2           NGHBR\_PN   - Neighbor pilot PN sequence offset index.  
3                         The base station shall set this field to the pilot PN sequence  
4                         offset for this neighbor, in units of 64 PN chips.  
5           BCCH\_SUPPORT   - BCCH support indicator.  
6                         If the NGHBR\_CONFIG field is not set to ‘011’, the base  
7                         station shall omit this field; otherwise, the base station shall  
8                         include this field and set it as follows:

- 1                   If this neighbor base station supports Broadcast Control  
 2                   Channel, the base station shall set this field to '1'; otherwise,  
 3                   the base station shall set this field to '0'.
- 4 ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.  
 5                   The base station shall set this field to '1' if additional pilot  
 6                   information listed in the NGHBR\_PILOT\_REC\_TYPE and  
 7                   RECORD\_LEN fields are included. The base station shall set  
 8                   this field to '0' if the corresponding pilot is the common pilot  
 9                   and there is no additional pilot information included.
- 10 NGHBR\_PILOT\_REC\_TYPE - Neighbor Pilot record type  
 11                  If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 12                  set this field to the NGHBR\_PILOT\_REC\_TYPE value shown in  
 13                  Table 3.7.2.3.2.34-4 corresponding to the type of Pilot Record  
 14                  specified by this record.
- 15

**Table 3.7.2.3.2.34-4. Neighbor Pilot Record Types**

| Description                                        | NGHBR_PILOT_REC_TYPE<br>(binary) |
|----------------------------------------------------|----------------------------------|
| 1X Common Pilot with Transmit Diversity            | 000                              |
| 1X Auxiliary Pilot                                 | 001                              |
| 1X Auxiliary Pilot with Transmit Diversity         | 010                              |
| 3X Common Pilot                                    | 011                              |
| 3X Auxiliary Pilot                                 | 100                              |
| All other NGHBR_PILOT_REC_TYPE values are reserved |                                  |

- 17
- 18                  If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 19                  omit this field.
- 20 RECORD\_LEN - Pilot record length.  
 21                  If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 22                  set this field to the number of octets in the type-specific fields  
 23                  of this pilot record.
- 24                  If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 25                  omit this field.
- 26 Type-specific fields - Pilot record type-specific fields.  
 27                  If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 28                  include type-specific fields based on the  
 29                  NGHBR\_PILOT\_REC\_TYPE of this pilot record.
- 30                  If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 31                  omit this field.

If NGHBR\_PILOT\_REC\_TYPE is equal to '000', the base station shall include the following fields:

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| TD_POWER_LEVEL | 2                    |
| TD_MODE        | 2                    |
| RESERVED       | 4                    |

TD\_POWER\_LEVEL - TD Transmit Power Level.

The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

TD\_MODE - Transmit Diversity mode.

The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

RESERVED - Reserved bits.

The base station shall set this field to '0000'.

If NGHBR\_PILOT\_REC\_TYPE is equal to '001', the base station shall include the following fields:

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| QOF             | 2                    |
| WALSH_LENGTH    | 3                    |
| AUX_PILOT_WALSH | WALSH_LENGTH+6       |
| RESERVED        | 0 to 7 (as needed)   |

QOF - Quasi-orthogonal function index.

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]).

WALSH\_LENGTH - Length of the Walsh Code.

The base station shall set this field to the WALSH\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary pilot.

AUX\_PILOT\_WALSH - Walsh Code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot.

RESERVED - Reserved bits.

1           The base station shall set all the bits of this field to '0' to make  
 2           the entire record octet-aligned.

3       If NGHBR\_PILOT\_REC\_TYPE is equal to '010', the base station shall include the following  
 4       fields:

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| QOF                | 2                    |
| WALSH_LENGTH       | 3                    |
| AUX_WALSH          | WALSH_LENGTH+6       |
| AUX_TD_POWER_LEVEL | 2                    |
| TD_MODE            | 2                    |
| RESERVED           | 0 to 7 (as needed)   |

6  
 7           QOF     - Quasi-orthogonal function index for the Auxiliary Transmit  
 8                   Diversity Pilot.

9           The base station shall set this field to the index of the Quasi-  
 10                   orthogonal function (see Table 3.1.3.1.12-2 of [2]).

11          WALSH\_LENGTH - Length of the Walsh Code.

12           The base station shall set this field to the WALSH\_LENGTH  
 13                   value shown in 3.7.2.3.2.22-6 corresponding to the length of  
 14                   the Walsh code for the pilots that are used as Auxiliary pilot  
 15                   in the transmit diversity mode.

16          AUX\_WALSH - Walsh Code for the Auxiliary Pilot.

17           The base station shall set this field to the Walsh code  
 18                   corresponding to the Auxiliary Pilot.

19           AUX\_TD-  
 20           \_POWER\_LEVEL - Auxiliary Transmit Diversity Pilot Power Level.

21           The base station shall set this field to the Auxiliary Transmit  
 22                   Diversity Pilot transmit power level relative to that of the  
 23                   Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.

24          TD\_MODE - Transmit Diversity mode.

25           The base station shall set this field to the Transmit Diversity  
 26                   mode, as specified in Table 3.7.2.3.2.26-3.

27          RESERVED - Reserved bits.

28           The base station shall set all the bits of this field to '0' to make  
 29                   the entire record octet-aligned.

30       If NGHBR\_PILOT\_REC\_TYPE is equal to '011', the base station shall include the following  
 31       fields:

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SR3_PRIMARY_PILOT | 2                    |
| SR3_PILOT_POWER1  | 3                    |
| SR3_PILOT_POWER2  | 3                    |

- 1
- 2 SR3\_PRIMARY\_PILOT – Primary SR3 pilot.  
3 The base station shall set this field to the value shown in  
4 Table 3.7.2.3.2.26-5 corresponding to the position of the  
5 primary SR3 pilot.
- 6 SR3\_PILOT\_POWER1 – The primary SR3 pilot power level relative to that of the pilot  
7 on the lower frequency of the two remaining SR3 frequencies.  
8 The base station shall set this field to the value shown in  
9 Table 3.7.2.3.2.26-6 corresponding to the power level of the  
10 primary pilot with respect to the pilot on the lower frequency  
11 of the two remaining SR3 frequencies.
- 12 SR3\_PILOT\_POWER2 – The primary SR3 pilot power level relative to that of the pilot  
13 on the higher frequency of the two remaining SR3 frequencies.  
14 The base station shall set this field to the value shown in  
15 Table 3.7.2.3.2.26-6 corresponding to the power level of the  
16 primary pilot with respect to the pilot on the higher frequency  
17 of the two remaining SR3 frequencies.

18 ~~RESERVED~~ ~~Reserved bits.~~

19 ~~The base station shall set this field to '0000000'.~~

- 20
- 21 If NGHBR\_PILOT\_REC\_TYPE is equal to '100', the base station shall include the following  
22 fields:

| <b>Field</b>      | <b>Length (bits)</b>    |
|-------------------|-------------------------|
| SR3_PRIMARY_PILOT | 2                       |
| SR3_PILOT_POWER1  | 3                       |
| SR3_PILOT_POWER2  | 3                       |
| QOF               | 2                       |
| WALSH_LENGTH      | 3                       |
| AUX_PILOT_WALSH   | WALSH_LENGTH+6          |
| ADD_INFO_INCL1    | 1                       |
| QOF1              | 0 or 2                  |
| WALSH_LENGTH1     | 0 or 3                  |
| AUX_PILOT_WALSH1  | 0 or<br>WALSH_LENGTH1+6 |
| ADD_INFO_INCL2    | 1                       |
| QOF2              | 0 or 2                  |
| WALSH_LENGTH2     | 0 or 3                  |
| AUX_PILOT_WALSH2  | 0 or<br>WALSH_LENGTH2+6 |
| RESERVED          | 0 – 7 (as needed)       |

- 1      SR3\_PRIMARY\_PILOT    - Primary SR3 pilot.  
 2      The base station shall set this field to the value shown in  
 3      Table 3.7.2.3.2.26-5 corresponding to the position of the  
 4      primary SR3 pilot.
- 5      SR3\_PILOT\_POWER1    - The primary SR3 pilot power level relative to that of the pilot  
 6      on the lower frequency of the two remaining SR3 frequencies.  
 7      The base station shall set this field to the value shown in  
 8      Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 9      primary pilot with respect to the pilot on the lower frequency  
 10     of the two remaining SR3 frequencies.
- 11     SR3\_PILOT\_POWER2    - The primary SR3 pilot power level relative to that of the pilot  
 12     on the higher frequency of the two remaining SR3 frequencies.  
 13     The base station shall set this field to the value shown in  
 14     Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 15     primary pilot with respect to the pilot on the higher frequency  
 16     of the two remaining SR3 frequencies.
- 17     QOF    - Quasi-orthogonal function index.  
 18     The base station shall set this field to the index of the Quasi-  
 19     orthogonal function (see Table 3.1.3.1.12-2 of [2] on the  
 20     frequency of the primary pilot).
- 21     WALSH\_LENGTH    - Length of the Walsh Code.

The base station shall set this field to the WALS\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

- AUX\_PILOT\_WALSH - Walsh Code for the Auxiliary Pilot.  
The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the auxiliary pilot.

The base station shall set this

corresponding to the Auxiliary pilot on the frequency of the primary pilot.

- ADD\_INFO\_INCL1** - Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.

- QOF1** - Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD\_INFO\_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2] on the lower frequency of the two remaining SR3 frequencies.

- WALSH\_LENGTH1** - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD\_INFO\_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALS\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

- AUX\_PILOT\_WALSH1** - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD\_INFO\_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

- ADD\_INFO\_INCL2** - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.

1                   If the additional information for the pilot on the higher  
 2 frequencies of the two remaining SR3 frequencies is the same  
 3 as pilot on the primary frequency, the base station shall set  
 4 this field to '0'; otherwise, the base station shall set this field  
 5 to '1'.

6                   **QOF2** - Quasi-orthogonal function index for the pilot on the higher  
 7 frequency of the two remaining SR3 frequencies.

8                   If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 9 this field; otherwise, the base station shall set this field as  
 10 follows:

11                  The base station shall set this field to the index of the Quasi-  
 12 orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the  
 13 higher frequency of the two remaining SR3 frequencies.

14                  **WALSH\_LENGTH2** - Length of the Walsh Code for the pilot on the higher frequency  
 15 of the two remaining SR3 frequencies.

16                  If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 17 this field; otherwise, the base station shall set this field as  
 18 follows:

19                  The base station shall set this field to the WALSH\_LENGTH  
 20 value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 21 length of the Walsh code for the pilot that is used as the  
 22 Auxiliary pilot on the higher frequency of the two remaining  
 23 SR3 frequencies.

24                  **AUX\_PILOT\_WALSH2** - Walsh Code for the Auxiliary Pilot on the higher frequency of  
 25 the two remaining SR3 frequencies.

26                  If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 27 this field; otherwise, the base station shall set this field as  
 28 follows:

29                  The base station shall set this field to the Walsh code  
 30 corresponding to the Auxiliary pilot on the higher frequency of  
 31 the two remaining SR3 frequencies.

32                  **RESERVED** - Reserved bits.

33                  The base station shall set all the bits of this field to '0' to make  
 34 the entire record octet-aligned.

36                  **SEARCH\_PRIORITY** - Pilot Channel search priority.

37                  If NGHBR\_SRCH\_MODE = '01' or NGHBR\_SRCH\_MODE = '11',  
 38 the base station shall include the field SEARCH\_PRIORITY  
 39 and shall set this field as described below; otherwise, the base  
 40 station shall omit this field.

41                  The base station shall set this field to the search priority for  
 42 the Pilot Channel corresponding to NGHBR\_PN. The base  
 43 station shall set the search priority as shown in Table  
 44 3.7.2.3.2.34-4.

**Table 3.7.2.3.2.34-4. Search Priority Field**

| <b>Value<br/>(binary)</b> | <b>Search Priority</b> |
|---------------------------|------------------------|
| 00                        | Low                    |
| 01                        | Medium                 |
| 10                        | High                   |
| 11                        | Very High              |

- SRCH\_WIN\_NGHBR - Neighbor pilot channel search window size.  
 If NGHBR\_SRCH\_MODE = '10' or NGHBR\_SRCH\_MODE = '11', the base station shall include the field SRCH\_WIN\_NGHBR and shall set this field as described below; otherwise, the base station shall omit this field.  
 The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for this neighbor.
- SRCH\_OFFSET\_NGHBR - Neighbor pilot channel search window size offset.  
 If SRCH\_OFFSET\_INCL equals to '1', then the base station shall include the field SRCH\_OFFSET\_NGHBR and shall set this field as described below; otherwise, the base station shall omit this field.  
 The base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by mobile stations for this neighbor.
- FREQ\_INCL - Frequency included indicator.  
 If FREQ\_FIELDS\_INCL is set to '1', the base station shall include the field FREQ\_INCL and shall set this field as described below; otherwise, the base station shall omit this field.  
 If the NGHBR\_BAND and NGHBR\_FREQ fields are included for this neighbor base station, the base station shall set this bit to '1'. If the NGHBR\_BAND and NGHBR\_FREQ fields are not included in this assignment record, the base station shall set this bit to '0'.
- NGHBR\_BAND - Neighbor band class.  
 If the FREQ\_INCL field is included and is set to '1', the base station shall include the field NGHBR\_BAND and shall set this field as described below; otherwise, the base station shall omit this field.

1                   The base station shall set this field to the CDMA band class,  
 2                   as specified in [30], corresponding to the CDMA frequency  
 3                   assignment for the CDMA Channel containing the Broadcast  
 4                   Control Channel/Forward Common Control Channel the  
 5                   mobile station is to search.

- 6                   **NGHBR\_FREQ** - Neighbor frequency assignment.  
 7                   If the FREQ\_INCL field is omitted or is set to '0', the base  
 8                   station shall omit this field.  
 9                   If the FREQ\_INCL field is included and is set to '1' and the  
 10                  corresponding neighbor has a 1X neighbor pilot record type,  
 11                  the base station shall set this field to the CDMA Channel  
 12                  number, in the specified CDMA band class, corresponding to  
 13                  the CDMA frequency assignment for the CDMA Channel  
 14                  containing the Broadcast Control Channel/Forward Common  
 15                  Control Channel the mobile station is to search.  
 16                  If the FREQ\_INCL field is included and is set to '1' and the  
 17                  corresponding neighbor has a 3X neighbor pilot record type,  
 18                  the base station shall set this field to the CDMA Channel  
 19                  number, in the specified CDMA band class, corresponding to  
 20                  the center SR3 frequency assignment containing the  
 21                  Broadcast Control Channel/Forward Common Control  
 22                  Channel the mobile station is to search.  
 23                  **TIMING\_INCL** - Timing included indicator.  
 24                  If USE\_TIMING is set to '1', the base station shall include the  
 25                  field TIMING\_INCL and set this field as described below;  
 26                  otherwise, the base station shall omit this field.  
 27                  If base station timing information is included for this neighbor  
 28                  base station, the base station shall set this field to '1';  
 29                  otherwise, the base station shall set this field to '0'.  
 30                  **NGHBR\_TX\_OFFSET** - Neighbor transmit time offset.  
 31                  If TIMING\_INCL is included and is set to '1', the base station  
 32                  shall include the field NGHBR\_TX\_OFFSET and shall set this  
 33                  field as described below; otherwise, the base station shall omit  
 34                  this field.  
 35                  The base station shall set this field to the time offset, in units  
 36                  of 80 ms, from the beginning of the neighbor timing period to  
 37                  the beginning of the first base station transmit window within  
 38                  the period. The beginning of the neighbor timing period  
 39                  occurs when  $\lfloor t/4 \rfloor \bmod (16384) = 0$ .  
 40                  **NGHBR\_TX\_DURATION** - Neighbor transmit time duration.  
 41                  If TIMING\_INCL is included and is set to '1' and  
 42                  GLOBAL\_TIMING\_INCL is set to '0', the base station shall  
 43                  include the field NGHBR\_TX\_DURATION and shall set this  
 44                  field as described below; otherwise, the base station shall omit  
 45                  this field.

1                   The base station shall set this field to duration of the base  
 2                   station transmit window, during each period, in units of  
 3                   80 ms. The base station should set this field to a value of 3 or  
 4                   greater.

- 5     **NGHBR\_TX\_PERIOD** - Neighbor transmit time period.  
 6                   If TIMING\_INCL is included and is set to '1' and  
 7                   GLOBAL\_TIMING\_INCL is set to '0', the base station shall  
 8                   include the field NGHBR\_TX\_PERIOD and shall set this field  
 9                   as described below; otherwise, the base station shall omit this  
 10                  field.

11                  The base station shall set this field to duration of the period,  
 12                  in units of 80 ms.

- 13     **ACCESS\_ENTRY\_HO** - Access entry handoff permitted when entering the System  
 14                  Access State.  
 15                  If NGHBR\_SET\_ENTRY\_INFO is equal to '1', the base station  
 16                  shall include the field ACCESS\_ENTRY\_HO and shall set this  
 17                  field as described below; otherwise, the base station shall omit  
 18                  this field.

19                  The base station shall set this field to '1' if the mobile station  
 20                  is permitted to perform an access entry handoff to the base  
 21                  station associated with the corresponding pilot between the  
 22                  time it receives a message on the Paging Channel when in the  
 23                  *Mobile Station Idle State* and it enters the *System Access State*  
 24                  to respond to the message; otherwise, the base station shall  
 25                  set this field to '0'.

- 26     **ACCESS\_HO\_ALLOWED** - Access handoff and access probe handoff permitted for the  
 27                  corresponding pilot while in the *System Access State*.

28                  If NGHBR\_SET\_ACCESS\_INFO is equal to '1', the base station  
 29                  shall include the field ACCESS\_HO\_ALLOWED and shall set  
 30                  this field as described below; otherwise, the base station shall  
 31                  omit this field.

32                  The base station shall set this field to '1' if the mobile station  
 33                  is permitted to perform an access handoff or access probe  
 34                  handoff to the base station associated with the corresponding  
 35                  pilot when the mobile station is in the *System Access State*  
 36                  (see 2.6.3.1.8 and 2.6.3.1.9); otherwise, the base station shall  
 37                  set this field to '0'.

- 38     **RESERVED** - Reserved bits.

39                  The base station shall add reserved bits as needed in order to  
 40                  make the length of the entire RADIO\_INTERFACE\_TYPE  
 41                  record equal to an integer number of octets. The base station  
 42                  shall set these bits to '0'.

43     If RADIO\_INTERFACE\_TYPE is equal to '0001', the base station shall include the following  
 44                  fields:

| <b>Field</b>     | <b>Length (bits)</b> |
|------------------|----------------------|
| NUM_ANALOG_NGHBR | 3                    |

NUM\_ANALOG\_NGHBR occurrences of the following subrecord:

|            |   |
|------------|---|
| BAND_CLASS | 5 |
| SYS_A_B    | 2 |

|          |                   |
|----------|-------------------|
| RESERVED | 0 – 7 (as needed) |
|----------|-------------------|

1

2 NUM\_ANALOG\_NGHBR - Number of neighboring analog systems.

3  
4 The base station shall set this field to the number of  
neighboring analog systems included in the message.

5

6 The base station shall include one occurrence of the following subrecord for each  
7 neighboring analog system included in the message:

8 BAND\_CLASS - Band class.

9 The base station shall set this field to the CDMA band class,  
10 as specified in [30].

11 SYS\_A\_B - System A/B.

12 If BAND\_CLASS is set to '00000' or to '00011', the base station  
13 shall set this field to the value shown in Table 3.7.2.3.2.34-5  
14 corresponding to the availability of neighboring analog  
15 systems; otherwise, the base station shall set this field to '00'.

16

**Table 3.7.2.3.2.34-5. Cellular System A/B**

| <b>Cellular System A/B</b> | <b>Value (Binary)</b> |
|----------------------------|-----------------------|
| RESERVED                   | 00                    |
| System A                   | 01                    |
| System B                   | 10                    |
| System A and B             | 11                    |

17

RESERVED - Reserved bits.

18 The base station shall add reserved bits as needed in order to  
19 make the length of the entire RADIO\_INTERFACE\_TYPE  
20 record equal to an integer number of octets. The base station  
21 shall set these bits to '0'.  
22

## 1    3.7.2.3.2.35 Security Mode Command Message

2    MSG\_TAG: SMCM

| Field                     | Length (bits) |
|---------------------------|---------------|
| <u>C_SIG_ENCRYPT_MODE</u> | 3             |
| <u>USE_NEW_KEY</u>        | 0 or 1        |
| <u>ENC_KEY_SIZE</u>       | 0 or 3        |
| <u>KEY_SEQ</u>            | 0 or 4        |

- 3
- 4    C\_SIG\_ENCRYPT\_MODE - Common channel encryption mode indicator.  
 5                 The base station shall set it this field to the common channel  
 6                 signaling message-encryption mode, as shown in Table 3.7.4.5-1.
- 7    USE\_NEW\_KEY      Use new encryption key indication  
 8                 If SIG\_ENCRYPT\_MODE is equal to '001', the base station shall  
 9                 include this field; otherwise, the base station shall omit this field.  
 10                If this field is included, the base station shall set this field to '0' to  
 11                indicate that the stored encryption key is to be used by the mobile  
 12                station, and to '1' to indicate that the new encryption key is to be  
 13                used by the mobile station.
- 14    ENC\_KEY\_SIZE - Key sSize used for user information and signaling encryption  
 15                 If C\_SIG\_ENCRYPT\_MODE is equal to '001', USE\_NEW\_KEY is  
 16                 included and is set to '0', the base station shall omit this field;  
 17                 otherwise, the base station shall include this field and set this  
 18                 field to the encryption key-size for user information  
 19                 encryption and signaling encryption according to as shown in  
 20                 Table 3.7.4.5-2; otherwise, the base station shall omit this  
 21                 field.
- 22    KEY\_SEQ      Encryption key sequence number.  
 23                 If USE\_NEW\_KEY is included and is set to '0', the base station  
 24                 shall include this field; otherwise, the base station shall omit this  
 25                 field. If this field is included, the base station shall set it to the  
 26                 encryption key sequence number to be used by the mobile  
 27                 station.

1    3.7.2.3.2.36 Universal Page Message

2    MSG\_TAG: UPM

3    When Layer 3 at the base station sends a PDU corresponding to the *Universal Page Message*  
 4    to Layer 2, it also sends the UPM Common fields to Layer 2. These UPM Common fields  
 5    and PDUs are used by Layer 2 to assemble the Layer 2 PDU or PDUs corresponding to the  
 6    *Universal Page Message* (see 3.1.2.3 of [4]).

7    UPM Common Fields:

8

| Field                | Length (bits) |
|----------------------|---------------|
| CONFIG_MSG_SEQ       | 6             |
| ACC_MSG_SEQ          | 6             |
| READ_NEXT_SLOT       | 1             |
| READ_NEXT_SLOT_BCAST | 1             |

9

10   PDU Format for a mobile station-addressed page:

11

| Field          | Length (bits)                                         |
|----------------|-------------------------------------------------------|
| SERVICE_OPTION | 16                                                    |
| ADD_MS_RECORD  | 0 or $8 \times \text{EXT\_MS\_SDU\_LENGTH}$ (see [4]) |

12

13   PDU Format for a mobile station-directed message announcement:

14

| Field | Length (bits) |
|-------|---------------|
| -     | 0             |

15

16   PDU Format for an enhanced broadcast page:

17

| <b>Field</b>                         | <b>Length (bits)</b>                                    |
|--------------------------------------|---------------------------------------------------------|
| <a href="#"><u>BCCH_INDEXBCN</u></a> | 3                                                       |
| TIME_OFFSET                          | 10                                                      |
| REPEAT_TIME_OFFSET                   | 0 or 5                                                  |
| ADD_BCAST_RECORD                     | 0 or $8 \times \text{EXT_BCAST\_SDU\_LENGTH}$ (see [4]) |

- 1
- 2     CONFIG\_MSG\_SEQ     - Configuration message sequence number.  
3                         The base station shall set this field to CONFIG\_SEQ  
4                         (see 3.6.2.2).
- 5     ACC\_MSG\_SEQ     - Access parameters message sequence number.  
6                         The base station shall set this field to ACC\_CONFIG\_SEQ  
7                         (see 3.6.2.2).
- 8     READ\_NEXT\_SLOT     - Pages carried into next slot indicator.  
9                         If all messages and records directed to mobile stations  
10                         operating in the slotted mode and active in this slot, are  
11                         included in this slot, the base station shall set this field to '0';  
12                         otherwise, the base station shall set this field to '1'.
- 13     READ\_NEXT-  
14         \_SLOT\_BCAST     - Enhanced Broadcast Pages carried into next slot indicator.  
15                         If all enhanced broadcast pages directed to mobile stations  
16                         operating in the slotted mode and active in this slot to receive  
17                         enhanced broadcast pages are included in this slot, the base  
18                         station shall set this field to '0'; otherwise, the base station  
19                         shall set this field to '1'.
- 20     SERVICE\_OPTION     - Service option.  
21                         The base station shall set this field to the service option code  
22                         shown in [\[30\]TSB58-B](#), corresponding to the requested service  
23                         option.
- 24     ADD\_MS\_RECORD     - Additional mobile station-addressed information record.  
25                         The base station shall omit this field if  
26                         EXT\_MS\_SDU\_LENGTH\_INCL (see 3.1.2.3.1.8 of [4]) is set to  
27                         '0'; otherwise, the base station shall include  
28                         EXT\_MS\_SDU\_LENGTH (see 3.1.2.3.1.8 of [4]) octets in this  
29                         field.
- 30     [BCCH\\_INDEX\\_BCN](#)     - [BCCH time index Broadcast Control Channel Number](#).  
31                         The base station shall set this field to the index of the BCCH  
32                         to which the mobile station is being redirected.
- 33     TIME\_OFFSET     - BCCH offset.

The base station shall set this field to one less than the time offset, in units of 40 ms, from the beginning of the slot in which this message began to the beginning of the Broadcast Control Channel slot to which the mobile station is being directed.

## REPEAT\_TIME-

## \_OFFSET

- BCCH offset of repeat.

If EXT BCAST SDU LENGTH IND (see [4]) is set to '01' or '11'

this field is included, the base station shall set this field to one less than the time offset, in units of 40 ms, from the time specified by TIME\_OFFSET to the beginning of the Broadcast Control Channel slot to which the mobile station is being directed for a repeat of the broadcast message. Otherwise, the base station shall omit this field.

## ADD\_BCAST\_RECORD

- Additional broadcast information record.

The base station shall omit this field if EXT\_BCAST\_SDU\_LENGTH\_IND (see 3.1.2.3.1.8 of [4]) is set to '00' or '01'; otherwise, the base station shall include EXT\_BCAST\_SDU\_LENGTH (see 3.1.2.3.1.8 of [4]) octets in this field.

- 1    3.7.3 f-dsch
- 2    During Traffic Channel operation, the base station sends signaling messages to the mobile
- 3    station using the f-dsch.
- 4    3.7.3.1 Reserved
- 5    3.7.3.2 Reserved

1    3.7.3.3 PDU Formats on the f-dsch

2    The signaling messages sent over the f-dsch are summarized in Table 3.7.3.3-1.

3

4    **Table 3.7.3.3-1. f-dsch Messages (Part 1 of 2)**

| <b>Message Name</b>                            | <b>MSG_TAG</b> | <b>Section Number</b> |

3 3.7.3.3.2 Message Body Contents

4 The following sections specify the contents of the message body for each message that may  
5 be sent on the f-dsch.

## 1    3.7.3.3.2.1 Order Message

2    MSG\_TAG: ORDRM

3

| <b>Field</b>                    | <b>Length (bits)</b>               |
|---------------------------------|------------------------------------|
| USE_TIME                        | 1                                  |
| ACTION_TIME                     | 6                                  |
| ORDER                           | 6                                  |
| ADD_RECORD_LEN                  | 3                                  |
| Order-specific fields (if used) | $8 \times \text{ADD\_RECORD\_LEN}$ |
| CON_REF_INCL                    | 0 or 1                             |
| CON_REF                         | 0 or 8                             |

4

- 5    USE\_TIME    -    Use action time indicator.  
 6    This field indicates whether an explicit action time is specified  
 7    in this order.  
 8    If an explicit action time can be specified for this order code,  
 9    as shown in Table 3.7.4-1, the base station may set this field  
 10   to '1'; otherwise, the base station shall set this field to '0'.
- 11    ACTION\_TIME    -    Action time.  
 12    If the USE\_TIME field is set to '1', the base station shall set  
 13    this field to the System Time, in units of 80 ms (modulo 64),  
 14    at which the order is to take effect. If the USE\_TIME field is  
 15    set to '0' the base station shall set this field to '000000'.
- 16    ORDER    -    Order code.  
 17    The base station shall set this field to the ORDER code for this  
 18    type of *Order Message* (see 3.7.4).
- 19    ADD\_RECORD\_LEN    -    Additional record length.  
 20    The base station shall set this field to the number of octets in  
 21    the order-specific fields included in this message.
- 22    Order-specific fields    -    Order-specific fields.  
 23    The base station shall include order-specific fields as specified  
 24    in 3.7.4.
- 25    CON\_REF\_INCL    -    Connection reference included indicator.  
 26    If the order carried by this message is not a Call Control order  
 27    (see 3.6.8), the base station shall omit this field; otherwise,  
 28    the base station shall include this field and set it as follows:

1                   The base station shall set this field to '1' if the connection  
2                   reference field is included in this message; otherwise, it shall  
3                   set this field to '0'.  
4

CON\_REF – Connection reference.

5                   If the CON\_REF\_INCL field is not included or is included but  
6                   is set to '0', the base station shall omit this field; otherwise,  
7                   the base station shall include this field and shall set it to the  
8                   value of the connection reference assigned to the service  
9                   option connection of the call, to which this message  
10                  corresponds.

## 1    3.7.3.3.2.2 Authentication Challenge Message

2    MSG\_TAG: AUCM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| RANDU        | 24                   |

4

5    RANDU    -    Random challenge data.

6                 The base station shall set this field as specified in 2.3.12.1.4.

## 1    3.7.3.3.2.3 Alert With Information Message

2    MSG\_TAG: AWIM

3

| <b>Field</b>                                      | <b>Length (bits)</b>          |
|---------------------------------------------------|-------------------------------|
| Zero or more occurrences of the following record: |                               |
| RECORD_TYPE                                       | 8                             |
| RECORD_LEN                                        | 8                             |
| Type-specific fields                              | $8 \times \text{RECORD\_LEN}$ |

4

5    The base station shall include occurrences of the following three-field record as specified in  
6    3.7.5.

7       RECORD\_TYPE    -    Information record type.

8                      The base station shall set this field as specified in 3.7.5.

9       RECORD\_LEN    -    Information record length.

10                     The base station shall set this field to the number of octets in  
11                     the type-specific fields included in this record.

12       Type-specific fields    -    Type-specific fields.

13                     The base station shall include type-specific fields as specified  
14                     in 3.7.5.

## 1    3.7.3.3.2.4 Data Burst Message

2    MSG\_TAG: DBM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| MSG_NUMBER   | 8                    |
| BURST_TYPE   | 6                    |
| NUM_MSGS     | 8                    |
| NUM_FIELDS   | 8                    |

4    NUM\_FIELDS occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

5

MSG\_NUMBER    -    Message number.  
 6                 The base station shall set this field to the number of this  
 7                 message within the data burst stream.

8

BURST\_TYPE    -    Data burst type.  
 9                 The base station shall set the value of this field for the type of  
 10                this data burst as defined in [30]. If the base station sets this  
 11                field equal to '111110', it shall set the first two CHARi fields of  
 12                this message equal to the EXTENDED\_BURST\_TYPE\_INTERNATIONAL field as described  
 13                in the definition of CHARi below. If the base station sets this  
 14                field equal to '111111', it shall set the first two CHARi fields of  
 15                this message equal to the EXTENDED\_BURST\_TYPE as described in the definition of CHARi below.  
 16

17

NUM\_MSGS    -    Number of messages in the data burst stream.  
 19                 The base station shall set this field to the number of messages  
 20                 in this data burst stream.

21

NUM\_FIELDS    -    Number of characters in this message.  
 22                 The base station shall set this field to the number of  
 23                 occurrences of the CHARi field included in this message.

24

CHARi    -    Character.  
 25                 The base station shall include NUM\_FIELDS occurrences of  
 26                 this field. The base station shall set these fields to the  
 27                 corresponding octet of the data burst stream.

If the BURST\_TYPE field of this message is equal to '111110', the first two CHARi octets shall represent a 16 bit EXTENDED\_BURST\_TYPE\_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC) associated with the national standards organization administering the use of the remaining octets of the message. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED\_BURST\_TYPE\_INTERNATIONAL field shall specify the COUNTRY\_BURST\_TYPE. The base station shall set the value of the COUNTRY\_BURST\_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

| <b>Field</b>           | <b>Length (bits)</b>               |
|------------------------|------------------------------------|
| Mobile Country Code    | 10                                 |
| COUNTRY_BURST_TYPE     | 6                                  |
| Remaining CHARi fields | $8 \times (\text{NUM_FIELDS} - 2)$ |

If the BURST\_TYPE field of this message is equal to '111111', the first two CHARi octets shall represent a single, 16 bit, EXTENDED\_BURST\_TYPE field, as shown below. The base station shall set the value of the EXTENDED\_BURST\_TYPE field according to the type of this data burst as defined in [30].

| <b>Field</b>                                    | <b>Length (bits)</b>               |
|-------------------------------------------------|------------------------------------|
| EXTENDED_BURST_TYPE<br>(first two CHARi fields) | 16                                 |
| Remaining CHARi fields                          | $8 \times (\text{NUM_FIELDS} - 2)$ |

## 1    3.7.3.3.2.6 Analog Handoff Direction Message

2    MSG\_TAG: AHDM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| USE_TIME     | 1                    |
| ACTION_TIME  | 6                    |
| SID          | 15                   |
| VMAC         | 3                    |
| ANALOG_CHAN  | 11                   |
| SCC          | 2                    |
| MEM          | 1                    |
| AN_CHAN_TYPE | 2                    |
| DSCC_MSB     | 1                    |
| BAND_CLASS   | 5                    |
| CON_REF_INCL | 1                    |
| CON_REF      | 0 or 8               |

4

5    USE\_TIME    -    Use action time indicator.

6                 This field indicates whether an explicit action time is specified  
7                 in this message.8                 If an explicit action time is specified in this message, the base  
9                 station shall set this field to '1'; otherwise, the base station  
10                shall set this field to '0'.

11                ACTION\_TIME    -    Action time.

12                 If the USE\_TIME field is set to '1', the base station shall set  
13                 this field to the System Time, in units of 80 ms (modulo 64),  
14                 at which the handoff is to take effect. If the USE\_TIME field is  
15                 set to '0' the base station shall set this field to '000000'.

16                 SID    -    System identification of the analog system.

17                 The base station shall set this field to the system identification  
18                 number for the analog system (see [6]).

19                 VMAC    -    Voice mobile station attenuation code.

20                 This field indicates the mobile station's power level associated  
21                 with the designated voice channel.22                 The base shall set this field to the MAC value shown in Table  
23                 2.1.2-1 of [12] corresponding to the nominal power for this  
24                 mobile station.

- 1 ANALOG\_CHAN - Analog voice channel number.  
 2 The base station shall set this field to the channel number of  
 3 the analog voice channel, as specified in Table 2.1.1-1 of [12].  
 4 SCC - SAT color code.  
 5 This indicates the supervisory audio tone associated with the  
 6 designated analog voice channel.  
 7 The base station shall set this field to the SAT value shown in  
 8 Table 3.7.1-2 of [12] and 2.4.1 of [12].  
 9 If the assignment is to a narrow analog channel, the base station  
 10 shall set this field to the two least significant bits of the DSCH.  
 11 MEM - Message encryption mode indicator.  
 12 To enable analog control message encryption on the assigned  
 13 forward and reverse analog voice channels, the base station  
 14 shall set this bit to '1'. To disable analog control message  
 15 encryption, the base station shall set this bit to '0'.  
 16 AN\_CHAN\_TYPE - Analog voice channel type.  
 17 The base station shall set this field to the analog channel type  
 18 as specified in Table 3.7.3.3.2.6-1. If the mobile station does  
 19 not have narrow analog capability, the base station shall set  
 20 this field to '00'.  
 21

**Table 3.7.3.3.2.6-1. Analog Channel Type**

| Description                             | Analog Ch | AN_CHAN_TYPE (Binary) |
|-----------------------------------------|-----------|-----------------------|
| Wide channel on ANALOG_CHAN             | N         | 00                    |
| Narrow channel 10 kHz below ANALOG_CHAN | NL        | 01                    |
| Narrow channel 10 kHz above ANALOG_CHAN | NU        | 10                    |
| Narrow channel centered on ANALOG_CHAN  | NM        | 11                    |

- 23  
 24 DSCC\_MSB - Digital supervisory audio tone color code most significant bit.  
 25 The base station shall set this field to '0' when directing  
 26 handoff to a wide analog channel. The base station shall set  
 27 this field to the most significant bit of the DSCH when  
 28 directing handoff to a narrow analog channel.  
 29 BAND\_CLASS - Band class.  
 30 The base station shall set this field according to values defined  
 31 in [30].

- 1           CON\_REF\_INCL – Connection reference included indicator.
- 2                             The base station shall set this field to ‘1’ if the connection  
3                             reference field is included in this message; otherwise, it shall  
4                             set this field to ‘0’.
- 5           CON\_REF – Connection reference.
- 6                             If the CON\_REF\_INCL field is set to ‘0’, the base station shall  
7                             omit this field; otherwise, the base station shall include this  
8                             field and shall set it to the value of the connection reference  
9                             assigned to the service option connection of the call which is  
10                            to be transferred to the analog system.

4

5    SID - System identification.

6    The base station shall set this field to the system identification  
7    number for this cellular system (see 2.6.5.2).

|  |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | NID        | - Network identification.<br>This field serves as a sub-identifier of a system as defined by the owner of the SID.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|  |            | The base station shall set this field to the network identification number for this network (see 2.6.5.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|  | SRCH_WIN_A | - Search window size for the Active Set and Candidate Set.<br>The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Active Set and Candidate Set.                                                                                                                                                                                                                                                                         |
|  | SRCH_WIN_N | - Search window size for the Neighbor Set.<br>The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Neighbor Set.                                                                                                                                                                                                                                                                                                         |
|  | SRCH_WIN_R | - Search window size for the Remaining Set.<br>The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Remaining Set.                                                                                                                                                                                                                                                                                                       |
|  | T_ADD      | - Pilot detection threshold.<br>This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the <i>Pilot Strength Measurement Message</i> or <i>Extended Pilot Strength Measurement Message</i> initiating the handoff process (see 2.6.6.2.5.2).<br>The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ . |
|  | T_DROP     | - Pilot drop threshold.<br>This value is used by the mobile station to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).<br>The base station shall set this field to the pilot drop threshold, expressed as an unsigned binary number equal to $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .                                                                                                                                                                                                            |
|  | T_COMP     | - Active Set versus Candidate Set comparison threshold.<br>The mobile station transmits a <i>Pilot Strength Measurement Message</i> or an <i>Extended Pilot Strength Measurement Message</i> when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).<br>The base station shall set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB.                                                                                                          |

|    |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | T_TDROPOFF     | - Drop timer value.<br>Timer value after which an action is taken by the mobile station for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROPOFF. If the pilot is a member of the Active Set, a <i>Pilot Strength Measurement Message</i> or an <i>Extended Pilot Strength Measurement Message</i> is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set. |

| 34 | 35             | 36                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 37 | EXTENSION      | - Indicator that extension fields are present.<br>If Reverse Supplemental Code Channel or Reverse Supplemental Channel system parameters are included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.                                                                                                                                                                                       |
| 40 | 41             | 42                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 43 | 44             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

1           T\_MULCHAN   - *Supplemental Channel Request Message* pilot strength  
 2           reporting offset.

3           If EXTENSION is set to '1', the base station shall include this  
 4           field and set this field to the threshold offset that the mobile  
 5           station is to use when reporting neighbor pilot strength  
 6           measurements in a *Supplemental Channel Request Message*.  
 7           The mobile station is to interpret this field as an offset to  
 8           T\_ADD ranging from 0.5 dB (corresponding to T\_MULCHAN =  
 9           '000') to 4.0 dB (corresponding to T\_MULCHAN = '111') in 0.5  
 10          dB increments.

11          BEGIN\_PREAMBLE - Number of preamble frames on Reverse Supplemental Code  
 12           Channels at the beginning of transmission on Reverse  
 13           Supplemental Code Channel.

14          If EXTENSION is set to '1', the base station shall include this  
 15           field and set this field to the number of Reverse Supplemental  
 16           Code Channel preamble frames that the mobile station is to  
 17           send when beginning transmission on Reverse Supplemental  
 18           Code Channels.

19          RESUME\_PREAMBLE - Number of preamble frames on Reverse Supplemental Code  
 20           Channels at the resumption of transmission.

21          If EXTENSION is set to '1', the base station shall include this  
 22           field and set this field to the number of Reverse Supplemental  
 23           Code Channel preamble frames that the mobile station is to  
 24           send when resuming transmission on a Reverse Supplemental  
 25           Code Channel following an autonomous suspension of  
 26           transmission on an allocated Supplemental Code Channel.

27          T\_SLOTTED\_INCL - Slotted timer value included indicator.

28          The base station shall set this field to '1' if the slotted timer  
 29           value is included; otherwise, the base station shall set this  
 30           field to '0'.

31          T\_SLOTTED - Slotted timer value

32          If T\_SLOTTED\_INCL is set to '1', the base station shall include  
 33           this field and set this field to the value of the  $T_{MS\_Slotted}$   
 34           timer to be used by the mobile station in units of 80 ms.  
[otherwise, the base station shall omit this field.](#)

36          ENC\_SUPPORTED - Encryption fields included.

37          The base station shall set this field to '1' in the encryption  
 38           related fields are included; otherwise the base station shall set  
 39           this field to '0'.

40          SIG\_ENCRYPT\_SUP - Signaling Encryption supported indicator.

41          If ENC\_SUPPORTED is equal to '1', the base station shall  
 42           include this field; otherwise, the base station shall omit this  
 43           field. If this field is included, this field indicates which  
 44           signaling encryption algorithms are supported by the base  
 45           station.

1           This field consists of the subfields shown in Table 2.7.1.3.2.1-  
 2           5.

3           If this field is included, the base station shall set the subfields  
 4           as follows:

5           The base station shall set the CMEA subfield to '1'.

6           The base station shall set each other subfield to '1' if the  
 7           corresponding signaling algorithm is supported by the base  
 8           station; otherwise, the base station shall set the subfield to '0'.

9           The base station shall set the RESERVED subfield to '000000'.

10          UI\_ENCRYPT\_SUP    - User information Encryption supported indicator.

11           If ENC\_SUPPORTED is equal to '1', the base station shall  
 12           include this field; otherwise, the base station shall omit this  
 13           field. If this field is included, the base station shall set this  
 14           field to indicate the supported user information encryption  
 15           algorithms.

16           This field consists of the subfields shown in Table 2.7.1.3.2.4-  
 17           9.

18           The base station shall set each subfield to '1' if the  
 19           corresponding user information encryption algorithm is  
 20           supported by the base station; otherwise, the base station  
 21           shall set the subfield to '0'.

22          CS\_SUPPORTED    - Concurrent Services supported indicator.

23           If the base station supports concurrent services, the base  
 24           station shall set this field to '1'; otherwise, the base station  
 25           shall set this field to '0'.

## 1    3.7.3.3.2.8 Neighbor List Update Message

2    MSG\_TAG: NLUM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| PILOT_INC    | 4                    |

One to 20 occurrences of the following field:

|          |   |
|----------|---|
| NGHBR_PN | 9 |
|----------|---|

4

5    PILOT\_INC    -    Pilot PN sequence offset index increment.

6                 The mobile station searches for Remaining Set pilots at pilot  
7                 PN sequence offset index values that are multiples of this  
8                 value.9                 The base station shall set this field to the pilot PN sequence  
10          increment, in units of 64 PN chips, that the mobile station is  
11          to use for searching the Remaining Set. The base station  
12          should set this field to the largest increment such that the  
13          pilot PN sequence offsets of all its neighbor base stations are  
14          integer multiples of that increment.

15          NGHBR\_PN    -    Neighbor pilot PN sequence offset index.

16                 The base station shall include one occurrence of this field for  
17                 each pilot in its neighbor list. The base station shall set this  
18                 field to the pilot's PN sequence offset, in units of 64 PN chips.  
19                 The base station shall include no more than 20 occurrences of  
20                 this field.

## 1    3.7.3.3.2.9 Send Burst DTMF Message

2    MSG\_TAG: BDTMFM

3

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| NUM_DIGITS      | 8                    |
| DTMF_ON_LENGTH  | 3                    |
| DTMF_OFF_LENGTH | 3                    |

NUM\_DIGITS occurrences of the following field:

|        |   |
|--------|---|
| DIGITi | 4 |
|--------|---|

|              |        |
|--------------|--------|
| CON_REF_INCL | 1      |
| CON_REF      | 0 or 8 |

4

- 5    NUM\_DIGITS    - Number of DTMF digits.  
                           The base station shall set this field to the number of DTMF  
                           digits included in this message.
- 6    DTMF\_ON\_LENGTH    - DTMF pulse width code.  
                           The base station shall set this field to the DTMF\_ON\_LENGTH  
                           value shown in Table 2.7.2.3.2.7-1 corresponding to the  
                           requested pulse width of the DTMF pulse to be generated by  
                           the mobile station.
- 7    DTMF\_OFF\_LENGTH    - DTMF interdigit interval code.  
                           The base station shall set this field to the  
                           DTMF\_OFF\_LENGTH value shown in Table 2.7.2.3.2.7-2  
                           corresponding to the requested minimum interdigit interval  
                           between DTMF pulses to be generated by the mobile station.
- 8    DIGITi    - DTMF digit.  
                           The base station shall include one occurrence of this field for  
                           each DTMF digit to be generated by the mobile station. The  
                           base station shall set each occurrence of this field to the code  
                           value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed  
                           digit.
- 9    CON\_REF\_INCL    - Connection reference included indicator.  
                           The base station shall set this field to '1' if the connection  
                           reference field is included in this message; otherwise, it shall  
                           set this field to '0'.

1 CON\_REF – Connection reference.

2 If the CON\_REF\_INCL field is set to '0', the base station shall  
3 omit this field; otherwise, the base station shall include this  
4 field and shall set it to the value of the connection reference  
5 assigned to the service option connection of the call, to which  
6 this message corresponds.

## 1    3.7.3.3.2.10 Power Control Parameters Message

2    MSG\_TAG: PCNPM

3

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| PWR_REP_THRESH    | 5                    |
| PWR_REP_FRAMES    | 4                    |
| PWR_THRESH_ENABLE | 1                    |
| PWR_PERIOD_ENABLE | 1                    |
| PWR_REP_DELAY     | 5                    |

4

5    PWR\_REP\_THRESH    -    Power control reporting threshold.

6                         The base station shall set this field to the number of bad  
7                         frames (see [2]) to be received in a measurement period on the  
8                         channel which carries the Power Control Subchannel before  
9                         the mobile station is to generate a *Power Measurement Report*  
10                      Message (see 2.6.4.1.1). If the base station sets  
11                      PWR\_THRESH\_ENABLE to '1', it shall not set this field to  
12                      '00000'.

13                      PWR\_REP\_FRAMES    -    Power control reporting frame count.

14                         The base station shall set this field to the value such that the  
15                         number given by

16                          $\lfloor 2(\text{PWR\_REP\_FRAMES}/2) \times 5 \rfloor$  frames

17                         is the number of frames over which the mobile station is to  
18                         count frame errors.

19                         PWR\_THRESH-    -    Threshold report mode indicator.

20                         \_ENABLE             If the mobile station is to generate threshold *Power*  
21                         *Measurement Report Messages*, the base station shall set this  
22                         field to '1'. If the mobile station is not to generate threshold  
23                         *Power Measurement Report Messages*, the base station shall  
24                         set this field to '0'.

25                         PWR\_PERIOD-    -    Periodic report mode indicator.

26                         \_ENABLE             If the mobile station is to generate periodic *Power*  
27                         *Measurement Report Messages*, the base station shall set this  
28                         field to '1'. If the mobile station is not to generate periodic  
29                         *Power Measurement Report Messages*, the base station shall  
30                         set this field to '0'.

31                         PWR\_REP\_DELAY    -    Power report delay.

32                         The period that the mobile station waits following a *Power*  
33                         *Measurement Report Message* before restarting frame counting  
34                         for power control purposes.

1           The base station shall set this field to the power report delay  
2           value, in units of 4 frames (see 2.6.4.1.1).

## 1    3.7.3.3.2.11 Retrieve Parameters Message

2    MSG\_TAG: RTPM

3

| Field                                           | Length (bits) |
|-------------------------------------------------|---------------|
| One or more occurrences of the following field: |               |
| PARAMETER_ID                                    | 16            |

4

5    PARAMETER\_ID    -    Parameter identification.

6                      The base station can request the mobile station to report any  
7                      parameter specified in Table E-1.8                      The base station shall include one occurrence of this field for  
9                      each parameter requested. The base station shall set this  
10                     field to the parameter identification number specified in  
11                     Table E-1 corresponding to the parameter requested.

## 1    3.7.3.3.2.12 Set Parameters Message

2    MSG\_TAG: STPM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
|--------------|----------------------|

One or more occurrences of the following record:

|               |                   |
|---------------|-------------------|
| PARAMETER_ID  | 16                |
| PARAMETER_LEN | 10                |
| PARAMETER     | PARAMETER_LEN + 1 |

4

5    The base station shall include one occurrence of the following three-field record for each  
6    parameter to be set.

7        PARAMETER\_ID    -    Parameter identification.

8                          The base station shall set this field to the identification shown  
9                          in Table E-1 corresponding to the settable parameter to be set.

10      PARAMETER\_LEN    -    Parameter length.

11                          The base station shall set this field to the length shown in  
12                          Table E-1 corresponding to the parameter to be set.

13      PARAMETER    -    Parameter value.

14                          The base station shall set this field to the value of the  
15                          parameter specified by the PARAMETER\_ID field.

## 1    3.7.3.3.2.13 SSD Update Message

2    MSG\_TAG: SSDUM

3

| Field   | Length (bits) |
|---------|---------------|
| RANDSSD | 56            |

4

5    RANDSSD    -    Random data.

6                      The base station shall set this field as specified in 2.3.12.1.5.

## 1    3.7.3.3.2.14 Flash With Information Message

2    MSG\_TAG: FWIM

3

| <b>Field</b>                                     | <b>Length (bits)</b>          |
|--------------------------------------------------|-------------------------------|
| One or more occurrences of the following record: |                               |
| RECORD_TYPE                                      | 8                             |
| RECORD_LEN                                       | 8                             |
| Type-specific fields                             | $8 \times \text{RECORD\_LEN}$ |

4

5    The base station shall include occurrences of the following three-field record as specified in  
6    3.7.5.

7       RECORD\_TYPE    -    Information record type.

8                      The base station shall set this field as specified in 3.7.5.

9       RECORD\_LEN    -    Information record length.

10                     The base station shall set this field to the number of octets in  
11                     the type-specific fields included in this record.

12       Type-specific fields    -    Type-specific fields.

13                     The base station shall include type-specific fields as specified  
14                     in 3.7.5.

## 1    3.7.3.3.2.15 Mobile Station Registered Message

2    MSG\_TAG: MSRM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| SID          | 15                   |
| NID          | 16                   |
| REG_ZONE     | 12                   |
| TOTAL_ZONES  | 3                    |
| ZONE_TIMER   | 3                    |
| MULT_SIDS    | 1                    |
| MULT_NIDS    | 1                    |
| BASE_LAT     | 22                   |
| BASE_LONG    | 23                   |
| REG_DIST     | 11                   |

4

5    SID    - System identification.

6    The base station shall set this field to the system identification  
7    number for this system.

8    NID    - Network identification.

9    This field serves as a sub-identifier of a system as defined by  
10   the owner of the SID.11   The base station shall set this field to the network  
12   identification number for this network. The NID value of  
13   65,535 is reserved.

14   REG\_ZONE    - Registration zone.

15   The base station shall set this field to its registration zone  
16   number (see 2.6.5.1.5).

17   TOTAL\_ZONES    - Number of registration zones to be retained.

18   The base station shall set this field to the number of  
19   registration zones the mobile station is to retain for purposes  
20   of zone-based registration (see 2.6.5.1.5).21   If zone-based registration is to be disabled, the base station  
22   shall set this field to '000'.

23   ZONE\_TIMER    - Zone timer length.

24   The base station shall set this field to the ZONE\_TIMER value  
25   shown in Table 3.7.2.3.2.1-1 corresponding to the length of  
26   the zone registration timer to be used by mobile stations.

- 1           MULT\_SIDS    -    Multiple SID storage indicator.  
2  
3  
4  
5           MULT\_NIDS    -    Multiple NID storage indicator.  
6  
7  
8  
9  
10          BASE\_LAT     -    Base station latitude.  
11  
12  
13  
14  
15  
16          BASE\_LONG    -    Base station longitude.  
17  
18  
19  
20  
21  
22  
23          REG\_DIST     -    Registration distance.  
24  
25  
26  
27  
28
- If mobile stations may store entries of SID\_NID\_LIST containing different SIDs, the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.  
If mobile stations may store multiple entries of SID\_NID\_LIST having the same SID (with different NIDs), the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.  
The base station shall set this field to its latitude in units of 0.25 second, expressed as a two's complement signed number with positive numbers signifying North latitudes. The base station shall set this field to a value in the range -1296000 to 1296000 inclusive (corresponding to a range of -90° to +90°).  
The base station shall set this field to its longitude in units of 0.25 second, expressed as a two's complement signed number with positive numbers signifying East longitude. The base station shall set this field to a value in the range -2592000 to 2592000 inclusive (corresponding to a range of -180° to +180°).  
If mobile stations are to perform distance-based registration, the base station shall set this field to the non-zero "distance" beyond which the mobile station is to re-register (see 2.6.5.1.4). If mobile stations are not to perform distance-based registration, the base station shall set this field to 0.

## 1    3.7.3.3.2.16 Status Request Message

2    MSG\_TAG: STRQM

3

| <b>Field</b>         | <b>Length (bits)</b>              |
|----------------------|-----------------------------------|
| QUAL_INFO_TYPE       | 8                                 |
| QUAL_INFO_LEN        | 3                                 |
| Type-specific fields | $8 \times \text{QUAL\_INFO\_LEN}$ |
| NUM_FIELDS           | 4                                 |

NUM\_FIELDS occurrences of the following field:

|             |   |
|-------------|---|
| RECORD_TYPE | 8 |
|-------------|---|

4

- 5    QUAL\_INFO\_TYPE    - Qualification information type.  
 6                         The base station shall set this field to the value shown in  
 7                         Table 3.7.2.3.2.15-1 to show the inclusion of qualification  
 8                         information in the type-specific fields.
- 9    QUAL\_INFO\_LEN    - Qualification information length.  
 10                       The base station shall set this field to the number of octets  
 11                       included in the type-specific fields of the qualification  
 12                       information.
- 13   Type-specific fields    - Type-specific fields.  
 14                         The base station shall set these fields to the qualification  
 15                       information according to the QUAL\_INFO\_TYPE field.  
 16                       If QUAL\_INFO\_TYPE is equal to '00000000', the type-specific  
 17                       fields are omitted.  
 18                       If QUAL\_INFO\_TYPE is equal to '00000001', the base station  
 19                       shall use the following fixed-length format for the type-specific  
 20                       fields:

| <b>Type-specific Field</b> | <b>Length (bits)</b> |
|----------------------------|----------------------|
| BAND_CLASS                 | 5                    |
| RESERVED                   | 3                    |

21

22                       If QUAL\_INFO\_TYPE is equal to '00000010', the base station  
 23                       shall use the following fixed-length format for the type-specific  
 24                       fields:

| Type-specific Field | Length (bits) |
|---------------------|---------------|
| BAND_CLASS          | 5             |
| OP_MODE             | 8             |
| RESERVED            | 3             |

- 1  
2        BAND\_CLASS - Band class.  
3                  The base station shall set this field to the CDMA band class,  
4                  as specified in [30].  
5        OP\_MODE - Operating mode.  
6                  The base station shall set this field as shown in  
7                  Table 3.7.2.3.2.15-3 to specify the operating mode  
8                  qualification information.  
9        RESERVED - Reserved bits.  
10                 The base station shall set this field to '000'.  
11       NUM\_FIELDS - Number of requested record fields in this message.  
12                 The base station shall set this field to the number of  
13                 occurrences of RECORD\_TYPE in this message.  
14       The base station shall only request the status information records qualified by the included  
15       qualification information in this message. The base station shall include one occurrence of  
16       the following field for each information record that is requested:  
17       RECORD\_TYPE - Information record type.  
18                 The base station shall set this field to the record type value  
19                 shown in Table 3.7.2.3.2.15-2 corresponding to the  
20                 information record requested.

## 1 3.7.3.3.2.17 Extended Handoff Direction Message

2 MSG\_TAG: EHDM

3

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| USE_TIME        | 1                    |
| ACTION_TIME     | 6                    |
| HDM_SEQ         | 2                    |
| SEARCH_INCLUDED | 1                    |
| SRCH_WIN_A      | 0 or 4               |
| T_ADD           | 0 or 6               |
| T_DROP          | 0 or 6               |
| T_COMP          | 0 or 4               |
| T_TDROPOFF      | 0 or 4               |
| HARD_INCLUDED   | 1                    |
| FRAME_OFFSET    | 0 or 4               |
| PRIVATE_LCM     | 0 or 1               |
| RESET_L2        | 0 or 1               |
| RESET_FPC       | 0 or 1               |
| SERV_NEG_TYPE   | 0 or 1               |
| ENCRYPT_MODE    | 0 or 2               |
| NOM_PWR_EXT     | 0 or 1               |
| NOM_PWR         | 0 or 4               |
| NUM_PREAMBLE    | 0 or 3               |
| BAND_CLASS      | 0 or 5               |
| CDMA_FREQ       | 0 or 11              |

(continues on next page)

1

| Field             | Length (bits)                 |
|-------------------|-------------------------------|
| ADD_LENGTH        | 3                             |
| Additional fields | $8 \times \text{ADD\_LENGTH}$ |

One or more occurrences of the following record:

|              |   |
|--------------|---|
| PILOT_PN     | 9 |
| PWR_COMB_IND | 1 |
| CODE_CHAN    | 8 |

2

- 3            USE\_TIME    -    Use action time indicator.  
 4                         This field indicates whether an explicit action time is specified  
 5                         in this message.  
 6                         If an explicit action time is specified in this message, the base  
 7                         station shall set this field to '1'; otherwise, the base station  
 8                         shall set this field to '0'.  
 9            ACTION\_TIME    -    Action time.  
 10                  If the USE\_TIME field is set to '1', the base station shall set  
 11                  this field to the System Time, in units of 80 ms (modulo 64),  
 12                  at which the handoff is to take effect. If the USE\_TIME field is  
 13                  set to '0' the base station shall set this field to '000000'.  
 14            HDM\_SEQ    -    *Extended Handoff Direction Message* sequence number.  
 15                  This field is used by the mobile station in the *Power*  
 16                  *Measurement Report Message* to identify the order in which  
 17                  the reported pilot strengths are sent.  
 18                  The base station shall set this field as specified in 2.6.6.2.2.2.  
 19            SEARCH\_INCLUDED    -    Pilot search parameters included.  
 20                  If the mobile station is to change its pilot search parameters,  
 21                  the base station shall set this field to '1'; otherwise, the base  
 22                  station shall set this field to '0'.  
 23            SRCH\_WIN\_A    -    Search window size for the Active Set and Candidate Set.  
 24                  If SEARCH\_INCLUDED is set to '1', the base station shall  
 25                  include the field SRCH\_WIN\_A and set this field to the window  
 26                  size parameter shown in Table 2.6.6.2.1-1 corresponding to  
 27                  the number of PN chips that the mobile station is to search for  
 28                  pilots in the Active Set and Candidate Set; otherwise, the base  
 29                  station shall omit this field.  
 30            T\_ADD    -    Pilot detection threshold.

1           This value is used by the mobile station to trigger the transfer  
 2           of a pilot from the Neighbor Set or Remaining Set to the  
 3           Candidate Set (see 2.6.6.2.6) and to trigger the sending of the  
 4           *Pilot Strength Measurement Message* or *Extended Pilot Strength*  
 5           *Measurement Message* initiating the handoff process (see  
 6           2.6.6.2.5.2).

7           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 8           include the field T\_ADD and set this field to the pilot detection  
 9           threshold, expressed as an unsigned binary number equal to  
 10           $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ ; otherwise, the base station shall omit  
 11          this field.

12          T\_DROP   - Pilot drop threshold.

13           This value is used by mobile stations to start a handoff drop  
 14           timer for pilots in the Active Set and the Candidate Set (see  
 15           2.6.6.2.3).

16           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 17           include the field T\_DROP and set this field to the pilot drop  
 18           threshold, expressed as an unsigned binary number equal to  
 19            $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ ; otherwise, the base station shall omit  
 20           this field.

21          T\_COMP   - Active Set versus Candidate Set comparison threshold.

22           The mobile station transmits a *Pilot Strength Measurement*  
 23           *Message* or an *Extended Pilot Strength Measurement Message*  
 24           when the strength of a pilot in the Candidate Set exceeds that  
 25           of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

26           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 27           include the field T\_COMP and set this field to the threshold  
 28           Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB;  
 29           otherwise, the base station shall omit this field.

30          T\_TDROP   - Drop timer value.

31           Timer value after which an action is taken by the mobile  
 32           station for a pilot that is a member of the Active Set or  
 33           Candidate Set, and whose strength has not become greater  
 34           than T\_DROP. If the pilot is a member of the Active Set, a  
 35           *Pilot Strength Measurement Message* or an *Extended Pilot*  
 36           *Strength Measurement Message* is issued. If the pilot is a  
 37           member of the Candidate Set, it will be moved to the Neighbor  
 38           Set.

39           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 40           include the field T\_TDROP and set this field to the T\_TDROP  
 41           value shown in Table 2.6.6.2.3-1 corresponding to the drop  
 42           timer value to be used by the mobile station; otherwise, the  
 43           base station shall omit this field.

44          HARD\_INCLUDED   - Hard handoff parameters included.

If the mobile station is to change FRAME\_OFFSET, PRIVATE\_LCM, ENCRYPT\_MODE, SERV\_NEG\_TYPE, NOM\_PWR\_EXT, NUM\_PREAMBLE, NOM\_PWR, BAND\_CLASS, or CDMA\_FREQ, or the mobile station is to perform a reset of the acknowledgment procedures, or the mobile station is to reset Forward Traffic Channel power control counters, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9        FRAME_OFFSET | - Frame offset.<br><br>The Forward and Reverse Traffic Channel frames are delayed $\text{FRAME\_OFFSET} \times 1.25$ ms relative to system timing (see [2]).<br><br>If HARD_INCLUDED is set to '1', the base station shall include the field FRAME_OFFSET and set it to the Forward and Reverse Traffic Channel frame offset; otherwise, the base station shall omit this field.                                                                                                                                                                                                                        |
| 16      PRIVATE_LCM   | - Private long code mask indicator.<br><br>This field is used to change the long code mask after a hard handoff.<br><br>If HARD_INCLUDED is set to '1', the base station shall include the field PRIVATE_LCM and set it as described below; otherwise, the base station shall omit this field.<br><br>If the private long code mask is to be used after the handoff, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.                                                                                                                             |
| 25      RESET_L2      | - Reset acknowledgment procedures command.<br><br>This field is used to reset acknowledgment processing in the mobile station.<br><br>If HARD_INCLUDED is set to '1', the base station shall include the field RESET_L2 and set it as described below; otherwise, the base station shall omit this field.<br><br>If the field is included and the mobile station is to reset its acknowledgment procedures, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.                                                                                      |
| 34      RESET_FPC     | - Reset Forward Traffic Channel power control.<br><br>This field is used to reset the Forward Traffic Channel power control counters.<br><br>If HARD_INCLUDED is set to '1', the base station shall include the field RESET_FPC and set it as described below; otherwise, the base station shall omit this field.<br><br>The base station shall set this field to '0' if the Forward Traffic Channel power control counters are to be maintained after completion of the handoff. If the counters are to be initialized as specified in 2.6.4.1.1.1, then the base station shall set this field to '1'. |

- 1           SERV\_NEG\_TYPE    - Service negotiation type.
- 2           If HARD\_INCLUDED is set to '1', the base station shall include  
 3           the field SERV\_NEG\_TYPE and set it as described below;  
 4           otherwise, the base station shall omit this field.
- 5           If the mobile station is to use service negotiation, the base  
 6           station shall set this field to '1'. If the mobile station is to use  
 7           service option negotiation, the base station shall set this field  
 8           to '0'.
- 9           ENCRYPT\_MODE     - Message encryption mode.
- 10          If HARD\_INCLUDED is set to '1', the base station shall include  
 11         the field ENCRYPT\_MODE and set it to the ENCRYPT\_MODE  
 12         value shown in Table 3.7.2.3.2.8-2 corresponding to the  
 13         encrypting mode that is to be used for messages sent on the  
 14         Forward and Reverse Traffic Channels, as specified  
 15         in 2.3.12.2; otherwise, the base station shall omit this field.
- 16          NOM\_PWR\_EXT      - Extended nominal transmit power.
- 17          If HARD\_INCLUDED is set to '1', the base station shall include  
 18         this field and set it as described below; otherwise, the base  
 19         station shall omit this field.
- 20          If this field is included and the mobile station is being handed  
 21         off to a base station operating in Band Class 0 or Band Class  
 22         3, the base station shall set this field to '0'; otherwise,-
- 23          If this field is included and the mobile station is being handed  
 24         off to a base station operating in a band class other than  
 25         Band Class 0 or Band Class 3, the base station shall set this  
 26         field to '1' if the correction factor to be used by the mobile  
 27         station in the open loop power estimate is between -24 dB and  
 28         -9 dB inclusive; otherwise (the correction factor is in the  
 29         range -8 dB to 7 dB inclusive), the base station shall set this  
 30         field to '0'.
- 31          NOM\_PWR           - Nominal transmit power offset.
- 32          If HARD\_INCLUDED is set to '1', the base station shall include  
 33         the field NOM\_PWR and set it to the correction factor to be  
 34         used by the mobile station in the open loop power estimate,  
 35         expressed as a two's complement value in units of 1 dB  
 36         (see [2]); otherwise, the base station shall omit this field.
- 37          NUM\_PREAMBLE     - Traffic Channel preamble length.
- 38          If HARD\_INCLUDED is set to '0', the base station shall omit  
 39         the NUM\_PREAMBLE field; otherwise, the base station shall  
 40         include this field and set it to the length of Traffic Channel  
 41         preamble that the mobile station is to send when performing a  
 42         handoff; as follows:

If, after the handoff, radio configuration 1 or radio configuration 2 is to be used, the base station shall set NUM\_PREAMBLE to the Traffic Channel preamble length in 20 ms units; otherwise, the base station shall set NUM\_PREAMBLE to the value shown in Table 3.7.3.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

**Table 3.7.3.3.2.17-1. Traffic Channel Preamble Length**

| <b>NUM_PREAMBLE<br/>(binary)</b> | <b>Preamble Length in 1.25 ms<br/>Increments</b> |
|----------------------------------|--------------------------------------------------|
| 000                              | 0                                                |
| 001                              | 2                                                |
| 010                              | 4                                                |
| 011                              | 6                                                |
| 100                              | 8                                                |
| 101                              | 10                                               |
| 110                              | 12                                               |
| 111                              | 16                                               |

- 9
- 10      BAND\_CLASS    -    Band class.  
 11      If HARD\_INCLUDED is set to '1', the base station shall include  
 12      the field BAND\_CLASS and set it to the CDMA band class  
 13      corresponding to the CDMA frequency assignment for the  
 14      CDMA Channel as specified in [30]; otherwise, the base  
 15      station shall omit this field.
- 16      CDMA\_FREQ    -    Frequency assignment.  
 17      If HARD\_INCLUDED is set to '1', the base station shall include  
 18      the field CDMA\_FREQ and set it to the CDMA Channel  
 19      number, in the specified CDMA band class, corresponding to  
 20      the CDMA frequency assignment for the CDMA Channel as  
 21      specified in [2]; otherwise, the base station shall omit this  
 22      field.
- 23      ADD\_LENGTH    -    Number of octets in the additional fields.  
 24      The base station shall set this field to the number of octets  
 25      included in the Additional fields. If Additional fields are not  
 26      included in this message, the base station shall set this field  
 27      to '000'.
- 28
- 29      Additional fields    -    Additional fields.  
 30      If the ADD\_LENGTH field is not equal to '000', the base station  
 31      shall include the following fields as additional fields.

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| P_REV        | 8                    |

1

2 P\_REV - Protocol revision level.

3 The base station shall set this field to the base station protocol  
4 revision level that the mobile station is to use after completion of  
5 the handoff.

6

7 The base station shall include one occurrence of the following three-field record for each  
8 member of the mobile station's new Active Set.

9 PILOT\_PN - Pilot PN sequence offset index.

10 The base station shall set this field to the pilot PN sequence  
11 offset for this pilot in units of 64 PN chips.

12 PWR\_COMB\_IND - Power control symbol combining indicator.

13 If the Forward Traffic Channel associated with this pilot will  
14 carry the same closed-loop power control subchannel bits as  
15 that of the previous pilot in this message, the base station  
16 shall set this field to '1'; otherwise, the base station shall set  
17 this field to '0'. For the first occurrence of this record in the  
18 message, the base station shall set this field to '0'.

19 CODE\_CHAN - Code channel index.

20 The base station shall set this field to the code channel index (see  
21 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use as  
22 the Forward Fundamental Channel associated with this pilot. If  
23 Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is used, the  
24 base station shall set this field in the range 1 to 63 inclusive. If  
25 Radio Configuration 4, 6 or 8 is used, the base station shall set  
26 this field in the range 1 to 127 inclusive. If Radio Configuration 7  
27 or 9 is used, the base station shall set this field in the range 1 to  
28 255 inclusive.

## 1    3.7.3.3.2.18 Service Request Message

2    MSG\_TAG: SRQM

3

| Field        | Length (bits) |
|--------------|---------------|
| SERV_REQ_SEQ | 3             |
| REQ_PURPOSE  | 4             |

Zero or one occurrence of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    SERV\_REQ\_SEQ - Service request sequence number.

6                         The base station shall set this field to the service request  
7                         sequence number pertaining to this request message as  
8                         specified in 3.6.4.1.2.1.1.

9    REQ\_PURPOSE - Request purpose.

10                        The base station shall set this field to the appropriate  
11                        REQ\_PURPOSE code from Table 3.7.3.3.2.18-1 to indicate the  
12                        purpose of the message.

13

14                        **Table 3.7.3.3.2.18-1. REQ\_PURPOSE Codes**

| REQ_PURPOSE<br>(binary)                   | Meaning                                                                                   |
|-------------------------------------------|-------------------------------------------------------------------------------------------|
| 0001                                      | Indicates that the purpose of this message is to reject a proposed service configuration. |
| 0010                                      | Indicates that the purpose of this message is to propose a service configuration.         |
| All other REQ_PURPOSE codes are reserved. |                                                                                           |

15

16    If the REQ\_PURPOSE code is set to '0010', the base station shall include one occurrence of  
17                        the following three-field record to specify the proposed service configuration; otherwise, the  
18                        base station shall not include the following record.

19    RECORD\_TYPE - Information record type.

1                   The base station shall set this field to the record type value  
2                   shown in Table 3.7.5-1 corresponding to the Service  
3                   Configuration information record.

- 4           RECORD\_LEN     - Information record length.  
5                   The base station shall set this field to the number of octets  
6                   included in the type-specific fields of the Service Configuration  
7                   information record.
- 8       Type-specific fields     - Type-specific fields.  
9                   The base station shall set these fields as specified in 3.7.5.7  
10                  for the Service Configuration information record.

## 1    3.7.3.3.2.19 Service Response Message

2    MSG\_TAG: SRPM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| SERV_REQ_SEQ | 3                    |
| RESP_PURPOSE | 4                    |

Zero or one occurrence of the following record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    SERV\_REQ\_SEQ    -    Service request sequence number.

6                         The base station shall set this field to the value of the  
7                         SERV\_REQ\_SEQ field in the *Service Request Message* to which  
8                         it is responding.

9    RESP\_PURPOSE    -    Response purpose.

10                        The base station shall set this field to the appropriate  
11                         RESP\_PURPOSE code from Table 3.7.3.3.2.19-1 to indicate  
12                         the purpose of the message.

13

14                         **Table 3.7.3.3.2.19-1. RESP\_PURPOSE Codes**

| <b>RESP_PURPOSE<br/>(binary)</b>           | <b>Meaning</b>                                                                           |
|--------------------------------------------|------------------------------------------------------------------------------------------|
| 0001                                       | Indicates that the purpose of the message is to reject a proposed service configuration. |
| 0010                                       | Indicates that the purpose of the message is to propose a service configuration.         |
| All other RESP_PURPOSE codes are reserved. |                                                                                          |

15

16    If the RESP\_PURPOSE code is set to '0010', the base station shall include one occurrence of  
17                         the following three-field record to specify the proposed service configuration; otherwise, the  
18                         base station shall not include the following record.

19    RECORD\_TYPE    -    Information record type.

1                   The base station shall set this field to the record type value  
2                   shown in Table 3.7.5-1 corresponding to the Service  
3                   Configuration information record.

- 4           RECORD\_LEN    - Information record length.  
5                   The base station shall set this field to the number of octets  
6                   included in the type-specific fields of the Service Configuration  
7                   information record.
- 8       Type-specific fields    - Type-specific fields.  
9                   The base station shall set these fields as specified in 3.7.5.7  
10                  for the Service Configuration information record.

1 3.7.3.3.2.20 Service Connect Message

2 MSG\_TAG: SCM

3

| Field               | Length (bits)                 |
|---------------------|-------------------------------|
| USE_TIME            | 1                             |
| ACTION_TIME         | 6                             |
| SERV_CON_SEQ        | 3                             |
| RESERVED            | <u>42</u>                     |
| USE_OLD_SERV_CONFIG | <u>42</u>                     |
| <u>SYNC ID INCL</u> | <u>1</u>                      |
| <u>SYNC ID LEN</u>  | <u>0 or 4</u>                 |
| <u>SYNC ID</u>      | <u>0 or (8 x SYNC ID LEN)</u> |

Zero or one occurrence of the following three-field record:

|                      |                |
|----------------------|----------------|
| RECORD_TYPE          | 8              |
| RECORD_LEN           | 8              |
| Type-specific fields | 8 × RECORD_LEN |

Zero or one occurrence of the following three-field record:

|                      |                |
|----------------------|----------------|
| RECORD_TYPE          | 8              |
| RECORD_LEN           | 8              |
| Type-specific fields | 8 × RECORD_LEN |

|                  |        |
|------------------|--------|
| CC_INFO_INCL     | 0 or 1 |
| NUM_CALLS_ASSIGN | 0 or 8 |

NUM\_CALLS\_ASSIGN occurrences of the following variable length record:

|                     |        |
|---------------------|--------|
| CON_REF             | 8      |
| RESPONSE_IND        | 1      |
| TAG                 | 0 or 4 |
| BYPASS_ALERT_ANSWER | 0 or 1 |

4

5 USE\_TIME - Use action time indicator.

1           This field indicates whether an explicit action time is specified  
 2           in this message.

3           If an explicit action time is specified in this message, the base  
 4           station shall set this field to '1'; otherwise, the base station  
 5           shall set this field to '0'.

6           ACTION\_TIME    - Action time.  
 7                         If the USE\_TIME field is set to '1', the base station shall set  
 8                         this field to the System Time, in units of 80 ms (modulo 64),  
 9                         at which the specified service configuration is to take effect. If  
 10                  the USE\_TIME field is set to '0' the base station shall set this  
 11                  field to '000000'.

12           SERV\_CON\_SEQ - Connect sequence number.  
 13                         The base station shall set this field to the connect sequence  
 14                         number pertaining to this connect message as specified in  
 15                  3.6.4.1.2.1.2.

16           RESERVED      - Reserved bits.  
 17                         The base station shall set this field to '~~00~~00'.

18           USE\_OLD-  
 19            \_SERV\_CONFIG - Use stored service configuration indicator.

20           This field may be used by the base station to instruct the  
 21           mobile station to use the stored service configuration (that is,  
 22           both the Service Configuration information record and the  
 23           Non-negotiable Service Configuration information record)  
 24           if based on the value of the 16-bit CRC computed over the new  
 25           service configuration (see 2.6.11) matches the SYNC\_ID that  
 26           the mobile station has reported in the Origination Message or  
 27           Page Response Message.

28           If MOB\_P\_REV is less than seven, the base station shall set  
 29           this field to '00'.

---

30           or if a service configuration has been sent successfully to the  
 31           mobile station upon entering the *Traffic Channel Substate*, the  
 32           base station shall set this field to '00'; otherwise, the base  
 33           station shall set this field according to Table 3.7.3.3.2.20-1 as  
 34           follows:

**Table 3.7.3.3.2.20-1. USE OLD SERV CONFIG values**

| <u>USE OLD SERV CONFIG Field<br/>(binary)</u> | <u>Description</u>                                                                                                                                  |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>00</u>                                     | <u>Mobile Station is to use the SCR and NNSCR included in this message</u>                                                                          |
| <u>01</u>                                     | <u>Mobile Station is to use the stored service configuration</u>                                                                                    |
| <u>10</u>                                     | <u>Mobile Station is to use the stored service configuration but with the modifications specified by the SCR and NNSCR included in this message</u> |
| <u>11</u>                                     | <u>Reserved</u>                                                                                                                                     |

If the base station is to direct the mobile station to use the stored service configuration (that is, both the Service Configuration information record and the Non-negotiable Service Configuration information record), the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.

SYNC\_ID\_INCL - Service Configuration synchronization identifier included indicator.

If MOB\_P\_REV is less than seven or USE\_OLD\_SERV\_CONFIG field is set to '01', the base station shall set this field to '0'. The base station shall set this field to '1' if the SYNC\_ID field is included in this message; otherwise, the base station shall set this field to '0'.

SYNC\_ID\_LEN - Service Configuration synchronization identifier length.

If the SYNC\_ID\_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

1                   The base station shall set this field to the length (in octets) of  
 2                   the SYNC ID field included in this message. The base station  
 3                   shall set this field to a value larger than zero.

4                   **SYNC\_ID** - Service Configuration synchronization identifier.

5                   If the SYNC ID INCL field is set to '0', the base station shall  
 6                   omit this field; otherwise, the base station shall include this  
 7                   field and set it as follows:

8                   The base station shall set this field to the synchronization  
 9                   identifier corresponding to the service configuration conveyed  
 10                  by this message.

11                  If USE\_OLD\_SERV\_CONFIG is equal to 'Q1', the base station shall omit the following record;  
 12                  otherwise the base station shall include one occurrence of the following three-field record to  
 13                  specify the service configuration.

14                  **RECORD\_TYPE** - Information record type.

15                  The base station shall set this field to the record type value  
 16                  shown in Table 3.7.5-1 corresponding to the Service  
 17                  Configuration information record.

18                  **RECORD\_LEN** - Information record length.

19                  The base station shall set this field to the number of octets  
 20                  included in the type-specific fields of the Service Configuration  
 21                  information record.

22                  **Type-specific fields** - Type-specific fields.

23                  The base station shall set these fields as specified in 3.7.5.7  
 24                  for the Service Configuration information record.

25                  If USE\_OLD\_SERV\_CONFIG is equal to 'Q1', the base station shall omit the following record;  
 26                  otherwise the base station shall include one occurrence of the following three-field record to  
 27                  specify the non-negotiable service configuration parameters.

29                  **RECORD\_TYPE** - Information record type.

30                  The base station shall set this field to the record type value  
 31                  shown in Table 3.7.5-1 corresponding to the Non-Negotiable  
 32                  Service Configuration information record.

33                  **RECORD\_LEN** - Information record length.

34                  The base station shall set this field to the number of octets  
 35                  included in the type-specific fields of the Non-Negotiable  
 36                  Service Configuration information record.

37                  **Type-specific fields** - Type-specific fields.

38                  The base station shall set these fields as specified in 3.7.5.20  
 39                  for the Non-Negotiable Service Configuration information  
 40                  record.

- 1           CC\_INFO\_INCL   - Call Control information included indicator.
- 2           |           If the USE\_OLD\_SERV\_CONFIG field is set to '['01'](#) or '['10'](#)', the  
3           |           base station shall omit this field; otherwise, the base station  
4           |           shall include this field and set it as follows:
- 5           |           The base station shall set this field to '1' if Call Control related  
6           |           parameters (to assign new call(s)) are included in this  
7           |           message; otherwise, the base station shall set this field to '0'.
- 8           NUM\_CALLS\_ASSIGN   - Number of call assignments.
- 9           |           If the CC\_INFO\_INCL field is not included or is included but is  
10          |           set to '0', the base station shall omit this field; otherwise, the  
11          |           base station shall include this field and set it as follows:
- 12          |           The base station shall set this field to the number of new call  
13          |           assignments included in this message.
- 14          The base station shall include NUM\_CALLS\_ASSIGN occurrences of the following variable  
15          length record.
- 16           CON\_REF   - Connection reference.
- 17           |           The base station shall set this field to the connection reference  
18           |           of the service option connection corresponding to this call.
- 19           RESPONSE\_IND   - Response indicator.
- 20           |           The base station shall set this field to '1' if this call  
21           |           assignment is a response to an *Enhanced Origination Message*  
22           |           from the mobile station; otherwise, the base station shall set  
23           |           this field to '0'.
- 24           TAG   - Transaction identifier.
- 25           |           If the RESPONSE\_IND field is set to '0', the base station shall  
26           |           omit this field; otherwise, the base station shall include this  
27           |           field and set it as follows:
- 28           |           The base station shall set this field to the value of the TAG  
29           |           field received in the *Enhanced Origination Message* to which  
30           |           this call assignment is the response.
- 31           BYPASS\_ALERT-
- 32           |           ANSWER   - Bypass alert indicator.

1       If the RESPONSE\_IND field is set to ‘1’, the base station shall  
2       omit this field; otherwise, the base station shall include this  
3       field and set it as follows:

4       If the mobile station is to bypass the *Waiting for Order*  
5       *Substate* and the *Waiting for Mobile Station Answer Substate*  
6       for this call, the base station shall set this field to ‘1’;  
7       otherwise, the base station shall set this field to ‘0’.

## 1    3.7.3.3.2.21 Service Option Control Message

2    MSG\_TAG: SOCM

3

| <b>Field</b>         | <b>Length (bits)</b>            |
|----------------------|---------------------------------|
| USE_TIME             | 1                               |
| ACTION_TIME          | 6                               |
| CON_REF              | 8                               |
| SERVICE_OPTION       | 16                              |
| CTL_REC_LEN          | 8                               |
| Type-specific fields | $8 \times \text{CTL\_REC\_LEN}$ |

4

5    USE\_TIME    -    Use action time indicator.

6                 This field indicates whether an explicit action time is specified  
7                 in this message.8                 If an explicit action time is specified in this message, the base  
9                 station shall set this field to '1'; otherwise, the base station  
10                shall set this field to '0'.

11                ACTION\_TIME    -    Action time.

12                 If the USE\_TIME field is set to '1', the base station shall set  
13                 this field to the System Time, in units of 80 ms (modulo 64),  
14                 at which the message is to take effect. If the USE\_TIME field  
15                 is set to '0' the base station shall set this field to '000000'.

16                 CON\_REF    -    Service option connection reference.

17                 The base station shall set this field to the reference for the  
18                 service option connection.

19                 SERVICE\_OPTION    -    Service option.

20                 The base station shall set this field to the service option in use  
21                 with the service option connection.

22                 CTL\_REC\_LEN    -    Service option control record length.

23                 The base station shall set this field to the number of octets  
24                 included in the type-specific fields of this service option  
25                 control record.

26                 Type-specific fields    -    Type-specific fields.

27                 The base station shall set these fields as specified by the  
28                 requirements for the service option, which are defined  
29                 external to this specification. See relevant service option  
30                 specification.

## 1    3.7.3.3.2.22 TMSI Assignment Message

2    MSG\_TAG: TASM

3

| <b>Field</b>  | <b>Length (bits)</b>              |
|---------------|-----------------------------------|
| TMSI_ZONE_LEN | 4                                 |
| TMSI_ZONE     | $8 \times \text{TMSI\_ZONE\_LEN}$ |
| TMSI_CODE     | 32                                |
| TMSI_EXP_TIME | 24                                |

4

5    TMSI\_ZONE\_LEN    -    TMSI zone length.

6                         The base station shall set this field to the number of octets  
7                         included in the TMSI\_ZONE. The base station shall set this  
8                         field to a value in the range 1 to 8 inclusive.

9    TMSI\_ZONE    -    TMSI zone.

10                        The base station shall set this field to the TMSI zone number,  
11                         as specified in [27].

12    TMSI\_CODE    -    Temporary mobile station identity code.

13                        The base station shall set this field to the 32-bit TMSI code  
14                         assigned to the mobile station.15                        If the base station is to deassign the TMSI, the base station  
16                         shall set all the bits in this field to '1'.

17    TMSI\_EXP\_TIME    -    TMSI expiration time.

18                        The base station shall set this field to the System Time in the  
19                         units of  $80 \text{ ms} \times 2^{12}$  when the TMSI is to expire.

## 1    3.7.3.3.2.23 Service Redirection Message

2    MSG\_TAG: SRDM

3

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| RETURN_IF_FAIL | 1                    |
| DELETE_TMSI    | 1                    |
| REDIRECT_TYPE  | 1                    |

One or more occurrences of the following field:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    RETURN\_IF\_FAIL    -    Return if fail indicator.

6    The base station shall set this field to ‘1’ if the mobile station  
7    is required to return to the system from which it is being  
8    redirected upon failure to obtain service using the redirection  
9    criteria specified in this message; otherwise, the base station  
10   shall set this field to ‘0’.

11    DELETE\_TMSI    -    Delete TMSI indicator.

12    The base station shall set this field to ‘1’ if the mobile station  
13   is required to delete the TMSI assigned to the mobile station;  
14   otherwise, the base station shall set this field to ‘0’.

15    REDIRECT\_TYPE    -    Redirect indicator.

16    The base station shall set this field to the REDIRECT\_TYPE value  
17   shown in Table 3.7.2.3.2.16-1 corresponding to the redirection  
18   type.

20    The base station shall include one occurrence of the following record:

21    RECORD\_TYPE    -    Redirection record type.

22    The base station shall set this field to the RECORD\_TYPE value  
23   shown in Table 3.7.2.3.2.16-2 corresponding to the type of  
24   redirection specified by this record.

25    RECORD\_LEN    -    Redirection record length.

26    If RECORD\_TYPE equals to ‘00000000’, the base station shall  
27   set this field to ‘00000000’; otherwise, the base station shall  
28   set this field to the number of octets in the type-specific fields  
29   of this redirection record.

30    Type-specific fields    -    Redirection record type-specific fields.

1           The base station shall include type-specific fields based on the  
 2           RECORD\_TYPE of this redirection record.

3       If RECORD\_TYPE is equal to '00000000', the base station shall not include the type-specific  
 4       fields.

5       If RECORD\_TYPE is equal to '00000001', the base station shall include the following fields:

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| EXPECTED_SID | 15                   |
| IGNORE_CDMA  | 1                    |
| SYS_ORDERING | 3                    |
| RESERVED     | 5                    |

7  
 8       EXPECTED\_SID    -    Expected SID.  
 9                         If the base station is redirecting the mobile station to a  
 10                        specific system, the base station shall set this field to the SID  
 11                        of that system; otherwise, the base station shall set this field  
 12                        to 0.

13       IGNORE\_CDMA    -    Ignore CDMA Available indicator.  
 14                         The base station shall set this field to '1' to indicate that the  
 15                        mobile station is to ignore the *CDMA Capability Message* on  
 16                        the analog system to which it is being redirected. The base  
 17                        station shall set this field to '0' to indicate that the mobile  
 18                        station may discontinue service on the system to which it is  
 19                        being redirected if the mobile station receives a *CDMA Capability Message* with  
 20                        CDMA\_AVAIL equal to '1', and the preferred mode of the mobile station is CDMA.  
 21

22       SYS\_ORDERING   -    System ordering.  
 23                         The base station shall set this field to the SYS\_ORDERING  
 24                        value shown in Table 3.7.2.3.2.16-3 corresponding to the  
 25                        order in which the mobile station is to attempt to obtain  
 26                        service on an analog system.

27       RESERVED        -    Reserved bits.  
 28                         The base station shall set this field to '00000'.

29       If RECORD\_TYPE is equal to '00000010', the base station shall include the following fields:

30

| <b>Subfield</b> | <b>Length (bits)</b> |
|-----------------|----------------------|
| BAND_CLASS      | 5                    |
| EXPECTED_SID    | 15                   |
| EXPECTED_NID    | 16                   |
| RESERVED        | 4                    |
| NUM_CHANS       | 4                    |

NUM\_CHANS occurrences of the following field:

|           |    |
|-----------|----|
| CDMA_CHAN | 11 |
|-----------|----|

|          |                 |
|----------|-----------------|
| RESERVED | 0-7 (as needed) |
|----------|-----------------|

- 1
- 2        BAND\_CLASS    - Band class.  
3                      The base station shall set this field to the CDMA band class, as  
4                      specified in [30].
- 5        EXPECTED\_SID    - Expected SID.  
6                      If the base station is redirecting the mobile station to a  
7                      specific system, the base station shall set this field to the SID  
8                      of that system; otherwise, the base station shall set this field  
9                      to 0.
- 10      EXPECTED\_NID    - Expected NID.  
11                     If the base station is redirecting the mobile station to a  
12                     specific network, the base station shall set this field to the  
13                     NID of that network; otherwise, the base station shall set this  
14                     field to 65535.
- 15      RESERVED        - Reserved bits.  
16                     The base station shall set this field to '0000'.
- 17      NUM\_CHANS      - Number of CDMA Channels.  
18                     The base station shall set this field to the number of  
19                     occurrences of the CDMA\_CHAN field in this record.
- 20      CDMA\_CHAN      - CDMA Channel number.  
21                     For each CDMA Channel on which the mobile station is to  
22                     attempt to acquire a CDMA system, the base station shall  
23                     include one occurrence of this field specifying the associated  
24                     CDMA Channel number.
- 25      RESERVED        - Reserved bits.  
26                     The base station shall add reserved bits as needed in order to  
27                     make the length of the entire record equal to an integer  
28                     number of octets. The base station shall set these bits to '0'.

## 1    3.7.3.3.2.24 Supplemental Channel Assignment Message

2    MSG\_TAG: SCAM

3

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| USE_RETRY_DELAY | 1                    |
| RETRY_DELAY     | 0 or 8               |
| REV_INCLUDED    | 1                    |

Include the following record only if REV\_INCLUDED is set to '1':

|                     |        |
|---------------------|--------|
| REV_DTX_DURATION    | 4      |
| EXPL_REV_START_TIME | 1      |
| REV_START_TIME      | 0 or 6 |
| USE_REV_DURATION    | 1      |
| REV_DURATION        | 0 or 8 |
| USE_REV_HDM_SEQ     | 1      |
| REV_LINKED_HDM_SEQ  | 0 or 2 |
| NUM_REV_CODES       | 3      |
| USE_T_ADD_ABORT     | 1      |
| USE_SCRM_SEQ_NUM    | 1      |
| SCRM_SEQ_NUM        | 0 or 4 |
| REV_PARMS_INCLUDED  | 1      |
| T_MULCHAN           | 0 or 3 |
| BEGIN_PREAMBLE      | 0 or 3 |
| RESUME_PREAMBLE     | 0 or 3 |

|              |   |
|--------------|---|
| FOR_INCLUDED | 1 |
|--------------|---|

4

(continues on next page)

1

| Field | Length (bits) |
|-------|---------------|
|-------|---------------|

Include the following record only if FOR\_INCLUDED is set to '1':

|                     |                        |
|---------------------|------------------------|
| FOR_SUP_CONFIG      | 2                      |
| EXPL_FOR_START_TIME | <a href="#">0 or 1</a> |
| FOR_START_TIME      | 0 or 6                 |
| USE_FOR_DURATION    | 1                      |
| FOR_DURATION        | 0 or 8                 |
| USE_FOR_HDM_SEQ     | <a href="#">0 or 1</a> |
| FOR_LINKED_HDM_SEQ  | 0 or 2                 |

Include the following fields and records only if

FOR\_INCLUDED is set to '1' and

FOR\_SUP\_CONFIG is set to '10' or '11':

|                |   |
|----------------|---|
| NUM_SUP_PILOTS | 3 |
| NUM_FOR_SUP    | 3 |

Include NUM\_SUP\_PILOTS occurrences of the following

record only if FOR\_INCLUDED is set to '1' and

FOR\_SUP\_CONFIG is set to '10' or '11':

|                |   |
|----------------|---|
| PILOT_PN       | 9 |
| EXPL_CODE_CHAN | 1 |

If EXPL\_CODE\_CHAN is set to '1', for each PILOT\_PN

include NUM\_FOR\_SUP occurrences of the following field:

|               |        |
|---------------|--------|
| SUP_CODE_CHAN | 0 or 8 |
|---------------|--------|

If EXPL\_CODE\_CHAN is set to '0', the following field is

included:

|                |        |
|----------------|--------|
| BASE_CODE_CHAN | 0 or 8 |
|----------------|--------|

2

- 3 USE\_RETRY\_DELAY - Assign or Retry Indicator.  
 4 The base station shall set this field to '1' to indicate that this  
 5 message contains a retry delay time; otherwise, the base  
 6 station shall set this field to '0' to indicate that no  
 7 RETRY\_DELAY has been included.  
 8 RETRY\_DELAY - *Supplemental Channel Request Message* retry delay.

1                   If USE\_RETRY\_DELAY is set to ‘1’, the base station shall  
 2                   include and set this field to the duration of the delay interval  
 3                   in units of 320 ms (4 frames) from the next 80 ms system time  
 4                   boundary during which the mobile station is not permitted to  
 5                   send a *Supplemental Channel Request Message*. The base  
 6                   station shall set RETRY\_DELAY to ‘11111111’ to indicate that  
 7                   the mobile station is to refrain from sending *Supplemental*  
 8                   *Channel Request Messages* indefinitely.

- 9           REV\_INCLUDED    - Reverse Supplemental Code Channel configuration indicator.  
 10                  The base station shall set this field to ‘1’ to indicate that this  
 11                  message contains assignment information for Reverse  
 12                  Supplemental Code Channels; otherwise, the base station  
 13                  shall set this field to ‘0’.

14                  If REV\_INCLUDED is set to ‘1’, then the base station shall include the following fields,  
 15                  otherwise the base station shall omit the following fields:

- 16           REV\_DTX\_DURATION    - Reverse Discontinuous Transmission Duration.  
 17                  The base station shall set this field to the maximum duration  
 18                  of time in units of 20 ms that the mobile station is allowed to  
 19                  stop transmission on a Reverse Supplemental Code Channel  
 20                  within the reverse assignment duration. The base station  
 21                  shall set this field to ‘0000’ if the mobile station is to stop  
 22                  using a Reverse Supplemental Code Channel once it has  
 23                  stopped transmitting on that Reverse Supplemental [Code](#) |  
 24                  Channel. The base station shall set this field to ‘1111’ if the  
 25                  mobile station is allowed to resume transmission on a Reverse  
 26                  Supplemental Code Channel at any time within the reverse  
 27                  assignment duration.
- 28           EXPL\_REV\_START\_TIME - Explicit Reverse Supplemental Code Channel assignment start  
 29                  time indicator.  
 30                  This field indicates whether a start time for the specified  
 31                  Reverse Supplemental Channel Assignment is specified in this  
 32                  message. If a REV\_START\_TIME is specified in this message,  
 33                  the base station shall set this field to ‘1’; otherwise, the base  
 34                  station shall set this field to ‘0’. If EXPL\_REV\_START\_TIME is  
 35                  set to ‘1’, then the base station shall set USE\_REV\_HDM\_SEQ  
 36                  to ‘0’.
- 37           REV\_START\_TIME    - Explicit start time for Reverse Supplemental Code Channel  
 38                  assignment.  
 39                  If EXPL\_REV\_START\_TIME is included and set to ‘1’, the base  
 40                  station shall include and set this field to the System Time, in  
 41                  units of 80 ms (modulo 64), at which the mobile station may  
 42                  start transmitting on the specified number of Reverse  
 43                  Supplemental Code Channels. If EXPL\_REV\_START\_TIME is  
 44                  omitted or set to ‘0’, the base station shall omit this field.
- 45           USE\_REV\_DURATION    - Use reverse duration indicator.

The base station shall set this field to '1' if the REV\_DURATION field is included in the message; otherwise, the base station shall set this field to '0'. If the mobile station is granted permission to transmit on Reverse Supplemental Code Channels (i.e., NUM\_REV\_CODES is not '000) then a value of '0' for this field indicates an infinite Reverse Supplemental Code Channel assignment duration (i.e., the mobile station may transmit on Reverse Supplemental Code Channels until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies an updated REV\_DURATION or an updated value of NUM\_REV\_CODES).

- |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REV_DURATION        | <ul style="list-style-type: none"> <li>- Duration of Reverse Supplemental Code Channel assignment.<br/>The base station shall include this field only if the USE_REV_DURATION field is included and set to '1'. If this field is included, this field indicates the allocated duration, in units of 80 ms, during which the mobile station may transmit on Reverse Supplemental Code Channels.</li> </ul>                                                                                                      |
| USE_REV_HDM_SEQ     | <ul style="list-style-type: none"> <li>- Use Reverse <i>General Handoff Direction Message</i> sequence number indicator.<br/>The base station shall set this field to '1' to indicate that this Reverse Supplemental Code Channel assignment shall take effect at the same time as a corresponding <i>General Handoff Direction Message</i>; otherwise, the base station shall set this field to '0'. If USE_REV_HDM_SEQ is set to '1', then the base station shall set EXPL_REV_START_TIME to '0'.</li> </ul> |
| LINKED_HDM_SEQ      | <ul style="list-style-type: none"> <li>- Sequence number of the reverse linked <i>General Handoff Direction Message</i>.<br/>If USE_REV_HDM_SEQ is included and set to '1', then the base station shall set this field to the sequence number of the <i>General Handoff Direction Message</i> (HDM_SEQ) to which this Reverse Supplemental Code Channel assignment is linked.</li> </ul>                                                                                                                       |

| SCRM_SEQ_NUM        | <ul style="list-style-type: none"> <li>- <i>Supplemental Channel Request Message</i> sequence number.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                               |

- 1                   If USE\_SCRM\_SEQ\_NUM is set to ‘1’, the base station shall  
 2                   set this field to the sequence number corresponding to the  
 3                   SCRM\_SEQ\_NUM field in a *Supplemental Channel Request*  
 4                   *Message* to which the mobile station is to match this message;  
 5                   otherwise, the base station shall omit this field.
- 6   REV\_PARMS\_INCLUDED - Reverse additional parameters included flag.  
 7                   The base station shall set this field to ‘1’ if the following three  
 8                   fields (T\_MULCHAN, BEGIN\_PREAMBLE, and  
 9                   RESUME\_PREAMBLE) are included in this message;  
 10                  otherwise, the base station shall set this field to ‘0’.
- 11   T\_MULCHAN - *Supplemental Channel Request Message* pilot strength  
 12                  reporting offset.  
 13                  If REV\_PARMS\_INCLUDED is set to ‘1’, the base station shall  
 14                  include this field and set this field to the threshold offset that  
 15                  the mobile station is to use when reporting neighbor pilot  
 16                  strength measurements in a *Supplemental Channel Request*  
 17                  *Message*. The mobile station is to interpret this field as an  
 18                  offset to T\_ADD ranging from 0.5 dB (corresponding to  
 19                  T\_MULCHAN = ‘000’) to 4.0 dB (corresponding to T\_MULCHAN  
 20                  = ‘111’) in 0.5 dB increments.
- 21   BEGIN\_PREAMBLE - Number of preamble frames on Reverse Supplemental Code  
 22                  Channels at the beginning of transmission on Reverse  
 23                  Supplemental Code Channel.  
 24                  If REV\_PARMS\_INCLUDED is set to ‘1’, the base station shall  
 25                  include this field and set this field to the number of Reverse  
 26                  Supplemental Code Channel preamble frames that the mobile  
 27                  station is to send when beginning transmission on Reverse  
 28                  Supplemental Code Channels.
- 29   RESUME\_PREAMBLE - Number of preamble frames on Reverse Supplemental Code  
 30                  Channels at the resumption of transmission.  
 31                  If REV\_PARMS\_INCLUDED is set to ‘1’, the base station shall  
 32                  include this field and set this field to the number of Reverse  
 33                  Supplemental Code Channel preamble frames that the mobile  
 34                  station is to send when resuming transmission on a Reverse  
 35                  Supplemental Code Channel following an autonomous  
 36                  suspension of transmission on an allocated Supplemental  
 37                  Code Channel.
- 38   FORINCLUDED - Forward Supplemental Code Channel configuration indicator.  
 39                  The base station shall set this field to ‘1’ to indicate that this  
 40                  message contains assignment information for Forward  
 41                  Supplemental Code Channels; otherwise, the base station  
 42                  shall set this field to ‘0’.  
 43                  If FORINCLUDED is set to ‘1’, then the base station shall  
 44                  include the remaining fields in this message, otherwise the  
 45                  base station shall omit all of the following except for  
 46                  RESERVED.
- 47   FOR\_SUP\_CONFIG - Forward Supplemental Code Channel configuration indicator.

1           The base station shall set this field to '00' to indicate that the  
 2           mobile station is to stop processing the Forward Supplemental  
 3           Code Channels at the implicit action time of the message.

4           The base station shall set this field to '01' to indicate that the  
 5           mobile station is to start processing the Forward  
 6           Supplemental Code Channels in the Code Channel List at the  
 7           implicit, explicit, or linked start time specified by this message  
 8           (see 2.6.6.2.5.1).

9           The base station shall set this field to '10' if the Forward  
 10          Supplemental Code Channels are specified in the message and  
 11          the mobile station is to update its Code Channel List and stop  
 12          processing the Forward Supplemental Code Channels at the  
 13          implicit action time of the message.

14          The base station shall set this field to '11' if the Forward  
 15          Supplemental Code Channels are specified in the message and  
 16          the mobile station is to start processing the Forward  
 17          Supplemental Code Channels at the implicit, explicit, or  
 18          linked start time specified by this message (see 2.6.6.2.5.1).

19          EXPL\_FOR\_START\_TIME - Explicit forward start time indicator.

20           This field indicates whether an explicit Forward Supplemental  
 21           Code Channel start time is specified in this message.

22          The base station shall include this field only if  
 23          FOR\_SUP\_CONFIG is set to '01' or '11'. If a FOR\_START\_TIME  
 24          is specified in this message, the base station shall set this  
 25          field to '1'; otherwise, the base station shall set this field to '0'.  
 26          If EXPL\_FOR\_START\_TIME is set to '1', then the base station  
 27          shall set USE\_FOR\_HDM\_SEQ to '0'.

28          The following field is included only if EXPL\_FOR\_START\_TIME is included and set to '1':

29          FOR\_START\_TIME - Start time of the Forward Supplemental Code Channel  
 30           assignment.

31           The base station shall include this field only if  
 32          FOR\_SUP\_CONFIG is set to '01' or '11'. If the  
 33          EXPL\_FOR\_START\_TIME field is set to '1', the base station  
 34          shall set this field to the System Time, in units of 80 ms  
 35          (modulo 64), at which the mobile station is to start processing  
 36          the Forward Supplemental Code Channels. If  
 37          EXPL\_FOR\_START\_TIME is set to '0' the base station shall  
 38          omit this field.

39          USE\_FOR\_DURATION - Use forward duration indicator.

40           The base station shall set this field to '1' if FOR\_DURATION is  
 41          included in the message; otherwise, the base station shall set  
 42          this field to '0'.

If FOR\_SUP\_CONFIG is set to ‘01’ or ‘11’, then the base station may set this field to ‘0’ to indicate that the mobile station is to be assigned an infinite Forward Supplemental Code Channel assignment duration (i.e., the mobile station is to continue processing Forward Supplemental Code Channels until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies an updated FOR\_DURATION). Otherwise, the base station may set this field to ‘1’ to indicate that the mobile station is to be given a Forward Supplemental Code Channel assignment for the duration specified by the FOR\_DURATION field.

If FOR\_SUP\_CONFIG is set to ‘00’ or ‘10’, then the base station shall set USE\_FOR\_DURATION to ‘0’.

- |    |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15 | FOR_DURATION       | - Duration of Forward Supplemental Code Channel assignment.<br><br>The base station shall include this field only if USE_FOR_DURATION is included and set to ‘1’. If this field is included, this field indicates allocated duration, in units of 80 ms, during which the mobile station is to process the Forward Supplemental Code Channels.                                                                                                                                                                                                                                                                                                                 |
| 21 | USE_FOR_HDM_SEQ    | - Use Forward <i>General Handoff Direction Message</i> sequence number indicator.<br><br>This field indicates whether processing of the Forward Supplemental Code Channels shall take effect at the same time as a corresponding <i>General Handoff Direction Message</i> .<br><br>The base station shall include this field only if FOR_SUP_CONFIG is equal to ‘01’ or ‘11’. If this message is linked with a <i>General Handoff Direction Message</i> , the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. If USE_FOR_HDM_SEQ is set to ‘1’, then the base station shall set EXPL_FOR_START_TIME to ‘0’. |
| 32 | FOR_LINKED_HDM_SEQ | - Sequence number of the <i>General Handoff Direction Message</i> .<br><br>If the USE_FOR_HDM_SEQ field is included and set to ‘1’, the base station shall set this field to the sequence number of the <i>General Handoff Direction Message</i> (HDM_SEQ) to which this Forward Supplemental Code Channel assignment is linked; otherwise, if USE_FOR_HDM_SEQ is not included or is set to ‘0’, then base station shall omit this field.                                                                                                                                                                                                                      |
| 39 | NUM_SUP_PILOTS     | - Number of pilots in the Active Set which have at least one associated Supplemental Code Channel.<br><br>If FOR_SUP_CONFIG is included and is set to ‘10’ or ‘11’, the base station shall include this field and shall set this field to the number of pilots for which there is at least one associated Supplemental Code Channel. This field shall not be included if FOR_SUP_CONFIG is omitted or is set to ‘01’ or ‘00’.                                                                                                                                                                                                                                  |
| 46 | NUM_FOR_SUP        | - Number of Forward Supplemental Code Channels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

If FOR\_SUP\_CONFIG is included and is set to ‘10’ or ‘11’, the base station shall include this field and shall set this field to the number of Forward Supplemental Code Channels assigned to the mobile station. NUM\_FOR\_SUP shall not exceed the maximum number of Forward Supplemental Code Channels for the negotiated multiplex option. This field shall not be included if FOR\_SUP\_CONFIG is omitted or is set to ‘01’ or ‘00’.

If FOR\_SUP\_CONFIG is included and is set to ‘10’ or ‘11’, the base station shall include NUM\_SUP\_PILOTS occurrences of the following record, one for each pilot for which there is at least one associated Supplemental Code Channel:

PILOT\_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

EXPL\_CODE\_CHAN - Explicit code channel indicator

The base station shall set this field to ‘1’ to indicate explicit assignment of each Forward Supplemental Code Channel. The base station shall set this field to ‘0’ if the mobile station is to use NUM\_FOR\_SUP successive code channels beginning with index BASE\_CODE\_CHAN (i.e., BASE\_CODE\_CHAN through BASE\_CODE\_CHAN + NUM\_FOR\_SUP – 1). In both cases (i.e., the explicit code channel list format and range format), the order of the code channel indices is the same for all the pilots specified in this message (i.e., the  $i^{th}$  code channel index in the list for each pilot PN sequence offset indicates the appropriate code channel to be used for the  $i^{th}$  Forward Supplemental Code Channel).

If EXPL\_CODE\_CHAN is set to ‘1’, then the base station shall include NUM\_FOR\_SUP occurrences of the following field, one for each pilot which has been included:

SUP\_CODE\_CHAN - Supplemental Code Channel index.

The base station shall set this field to the code channel index (see [2]) in the range 1 to 63 inclusive of the Supplemental Code Channel associated with this pilot.

If EXPL\_CODE\_CHAN is set to ‘0’ then the base station shall include the following field:

BASE\_CODE\_CHAN - Base code channel index.

If EXPL\_CODE\_CHAN is equal to ‘0’ the base station shall include this field and set it to the base code channel index (see [2]) in the range of 1 to (63 – NUM\_FOR\_SUP + 1), inclusive, that the mobile station is to use as the first Forward Supplemental Code Channel associated with this pilot. The mobile station is to use NUM\_FOR\_SUP successive code channels beginning with index BASE\_CODE\_CHAN (i.e., BASE\_CODE\_CHAN through BASE\_CODE\_CHAN + NUM\_FOR\_SUP – 1) for the Forward Supplemental Code Channels associated with this pilot.

1           The base station shall not include this field if  
2           EXPL\_CODE\_CHAN is equal to '1' or if EXPL\_CODE\_CHAN is  
3           not included.

## 1 3.7.3.3.2.25 Power Control Message

2 MSG\_TAG: PCNM

| RPC_NUM_REC          | 0 or 2               |

If RPC\_INCL is set to '1', RPC\_NUM\_REC occurrences of the following record:

|                      |                   |
|----------------------|-------------------|
| RPC_ADJ_REC_TYPE     | 4                 |
| RPC_ADJ_REC_LEN      | 5                 |
| Type-specific fields | 8×RPC_ADJ_REC_LEN |

2

3

- PWR\_CNTL\_STEP - Power control step size

4

5

6

7

8

The base station shall set this field to the closed loop power control step size parameter shown in Table 3.7.3.3.2.25-1 corresponding to the power control step size that the mobile station is to use for closed loop power control.

9

10

**Table 3.7.3.3.2.25-1. Closed Loop Power Control Step Size**

| <b>PWR_CNTL_STEP<br/>(binary)</b>            | <b>Power Control Step Size<br/>(dB nominal)</b> |
|----------------------------------------------|-------------------------------------------------|
| 000                                          | 1                                               |
| 001                                          | 0.5                                             |
| 010                                          | 0.25                                            |
| All other PWR_CNTL_STEP values are reserved. |                                                 |

11

12

13

- USE\_TIME - Use action time indicator.

This field indicates whether an ACTION\_TIME is specified in this message.

14

15

16

If an ACTION\_TIME is specified in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

17

18

19

20

21

- ACTION\_TIME - Action time.

If the USE\_TIME field is set to '1', the base station shall set this field to the System Time, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE\_TIME field is set to '0' the base station shall omit this field.

- 1           FPC\_INCL    - Forward Link Power Control parameter included indicator.  
 2                         If the forward power control related information is included in  
 3                         this message, the base station shall set this field to '1';  
 4                         otherwise, the base station shall set this field to '0'.  
 5           FPC\_MODE    - Forward Power Control Operation Mode Indicator  
 6                         If FPC\_INCL is set to '0' the base station shall omit this field;  
 7                         otherwise, the base station shall set this field as follows:  
 8                         The base station shall set the value to the forward power  
 9                         control operation mode (see [2]).  
 10          FPC\_PRI\_CHAN - Power Control Subchannel indicator.  
 11                         If FPC\_INCL is set to '0' the base station shall omit this field;  
 12                         otherwise, the base station shall set this field as follows:  
 13                         The base station shall set this field to '0' if the mobile station  
 14                         is to perform the primary inner loop estimation on the  
 15                         received Forward Fundamental Channel and the base station  
 16                         is to multiplex the Power Control Subchannel on the Forward  
 17                         Fundamental Channel. The base station shall set this field to  
 18                         '1' if the mobile station is to perform the primary inner loop  
 19                         estimation on the received Forward Dedicated Control  
 20                         Channel and the base station is to multiplex the Power  
 21                         Control Subchannel on the Forward Dedicated Control  
 22                         Channel.  
 23                         If only the Fundamental Channel is assigned, the base station  
 24                         shall set this field to '0'. If only the Dedicated Control  
 25                         Channel is assigned, the base station shall set this field to '1'.  
 26          FPC\_OLPC\_FCH\_INCL - Fundamental Channel Outer Loop Power Control parameter  
 27                         included indicator.  
 28                         If FPC\_INCL is set to '0' the base station shall omit this field;  
 29                         otherwise, the base station shall set this field as follows:  
 30                         If the forward link fundamental channel outer loop power  
 31                         control parameters are included in this message, the base  
 32                         station shall set this field to '1'; otherwise, the base station  
 33                         shall set this field to '0'.  
 34          FPC\_FCH\_FER   - Fundamental channel target Frame Error Rate.  
 35                         If FPC\_OLPC\_FCH\_INCL is included and set to '1', the base  
 36                         station shall set this field to the target Frame Error Rate on  
 37                         the Forward Fundamental Channel, as specified in Table  
 38                         3.7.3.3.2.25-2; otherwise, the base station shall omit this  
 39                         field.

**Table 3.7.3.3.2.25-2. Target Frame Error Rate**

| <b>FER<br/>(Binary)</b> | <b>Frame Error Rate</b>      |
|-------------------------|------------------------------|
| 00000                   | 0.2%                         |
| 00001-10100             | 0.5% -10% (in units of 0.5%) |
| 10101-11001             | 11% - 15% (in units of 1.0%) |
| 11010-11110             | 18% - 30% (in units of 3.0%) |
| 11111                   | Reserved                     |

- 1 FPC\_FCH\_MIN\_SETPT - Minimum Fundamental Channel Outer Loop Eb/Nt setpoint  
 2 If FPC\_OLPC\_FCH\_INCL is included and set to '1', the base station shall set this field to minimum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.  
 3  
 4  
 5  
 6  
 7 The base station shall set this field to '11111111', when it  
 8 directs the mobile station to set this Eb/No setpoint to the  
 9 current setpoint used at the mobile station on this channel.
- 10 FPC\_FCH\_MAX\_SETPT - Maximum Fundamental Channel Outer Loop Eb/Nt setpoint  
 11 If FPC\_OLPC\_FCH\_INCL is included and set to '1', the base station shall set this field to maximum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.  
 12  
 13  
 14  
 15 The base station shall set this field to '11111111', when it  
 16 directs the mobile station to set this Eb/No setpoint to the  
 17 current setpoint used at the mobile station on this channel.
- 18 FPC\_OLPC\_DCCH\_INCL - Dedicated Control Channel Outer Loop Power Control  
 19 parameter included indicator.  
 20 If FPC\_INCL is set to '0' the base station shall omit this field;  
 21 otherwise, the base station shall set this field as follows:  
 22 If the forward link Dedicated Control Channel outer loop  
 23 power control parameters are included in this message, the  
 24 base station shall set this field to '1'; otherwise, the base  
 25 station shall set this field to '0'.  
 26 FPC\_DCCH\_FER - Dedicated Control Channel target Frame Error Rate.  
 27 If FPC\_OLPC\_DCCH\_INCL is included and set to '1', the base  
 28 station shall set this field to the target Frame Error Rate on  
 29 the Forward Dedicated Control Channel, as specified in Table  
 30 3.7.3.3.2.25-2; otherwise, the base station shall omit this  
 31 field.  
 32 FPC\_DCCH\_MIN\_SETPT - Minimum Dedicated Control Channel Outer Loop Eb/Nt  
 33 setpoint.

If FPC\_OLPC\_DCCH\_INCL is included and set to '1', the base station shall set this field to minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.

The base station shall set this field to '11111111', when it directs the mobile station to set this Eb/No setpoint to the current setpoint used at the mobile station on this channel.

FPC\_DCCH\_MAX\_SETPT - Maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If FPC\_OLPC\_DCCH\_INCL is included and set to '1', the base station shall set this field to maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.

The base station shall set this field to '11111111', when it directs the mobile station to set this Eb/No setpoint to the current setpoint used at the mobile station on this channel.

FPC\_SEC\_CHAN - Master Supplemental channel index.

If FPC\_INCL is set to '1' and FPC\_MODE is set to '001', '010', '101', or '110', the base station shall set this field to the master Supplemental Channel index; otherwise, the base station shall omit this field.

NUM\_SUP - Number of Supplemental Channels.

If FPC\_INCL is set to '0' the base station shall omit this field; otherwise, the base station shall set this field to the total number of the Supplemental Channels.

The base station shall include NUM\_SUP occurrences of the following record:

SCH\_ID - Supplemental channel index.

The base station shall set this field to the Supplemental Channel index.

FPC\_SCH\_FER - Supplemental channel target Frame Error Rate.

The base station shall set this field to the target Frame Error Rate on the Supplemental Channel, as specified in Table 3.7.3.3.2.25-2.

FPC\_MIN\_SCH\_SETPT - Minimum Supplemental Channel outer loop Eb/Nt setpoint.

The base station shall set this field to minimum Supplemental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

The base station shall set this field to '11111111', when it directs the mobile station to set this Eb/No setpoint to the current setpoint used at the mobile station on this channel.

FPC\_MAX\_SCH\_SETPT - Maximum Supplemental Channel outer loop Eb/Nt setpoint.

The base station shall set this field to maximum Supplemental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

The base station shall set this field to '11111111', when it directs the mobile station to set this Eb/No setpoint to the current setpoint used at the mobile station on this channel.

- FPC\_THRESH\_INCL - Setpoint Report Threshold included indicator.  
If FPC\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
If FPC\_SETPT\_THRESH is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

10 FPC\_SETPT\_THRESH - Setpoint Report Threshold.

- If FPC\_THRESH\_INCL is set to '1', the base station shall set the value to FPC\_SETPT\_THRESH (in units of 0.125 dB) above which the outer loop report message will be sent by the mobile station; otherwise, the base station shall omit this field.

15 FPC\_THRESH\_SCH\_INCL - SCH Setpoint Report Threshold included indicator.

- If FPC\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

18 If FPC\_SETPT\_THRESH\_SCH is included in this message, the  
19 base station shall set this field to '1'; otherwise, the base  
20 station shall set this field to '0'.

FPC\_SETPT-

## \_THRESH\_SCH

- SCH Setpoint Report Threshold.

If FPC\_THRESH\_SCH\_INCL is set to '1', the base station shall set the value to FPC\_SETPT\_THRESH\_SCH (in units of 0.125 dB) above which the outer loop report message will be sent by the mobile station; otherwise, the base station shall omit this field.

28           RPC INCL - Reverse Link Power Control parameter included indicator.

- If the reverse power control related information is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

<sup>32</sup> RPC NUM REC - Number of records for Reverse Link Power Control

- If RPC INCL is set to '0' the base station shall omit

otherwise, the base station shall set this field to one less than the number of records included in this message.

36 If `RPC_NUM_REC` is included in this message, the base station shall include  
37 `RPC_NUM_REC` occurrences of the following record:

38       RPC\_ADJ\_REC\_TYPE - Reverse Link Power Control adjustment record type.

The base station shall set this field to the value shown in Table 3.7.2.3.2.25-3 corresponding to the type of adjustment that is to be used.

1  
2      **Table 3.7.3.3.2.25-3. RPC\_ADJ\_REC\_TYPE and**  
      **RPC\_ADJ\_REC\_LEN fields**

| <b>Description</b>                         | <b>RPC_ADJ_REC_TYPE<br/>(binary)</b> | <b>RPC_ADJ_REC_LEN</b> |
|--------------------------------------------|--------------------------------------|------------------------|
| Reverse Channel Adjustment Gain            | 0000                                 | 2-5                    |
| Attribute Adjustment Gain for Basic Rates  | 0001                                 | 2-26                   |
| Attribute Adjustment Gain for Higher Rates | 0010                                 | 2-31                   |
| All other values are reserved.             |                                      |                        |

- 3
- 4     RPC\_ADJ\_REC\_LEN    -    Reverse Link Power Control adjustment record length.  
5                          The base station shall set this field to the number of octets in  
6                          the type-specific fields of this adjustment record as given in  
7                          Table 3.7.2.3.2.25-3.
- 8     Type-specific fields    -    Reverse Link Power Control adjustment record type-specific  
9                          fields.  
10                          The base station shall include type-specific fields based on the  
11                          RPC\_ADJ\_REC\_TYPE of this adjustment record, as specified  
12                          as below.

1 If RPC\_ADJ\_REC\_TYPE is equal to '0000', the base station shall set type-specific fields as  
 2 specified in Table 3.7.2.3.2.25-4.

3 **Table 3.7.2.3.2.25-4. Type Specific Fields for**  
 4 **RECORD\_TYPE = '0000'**

| Fields             | Length (Bits) |
|--------------------|---------------|
| FCH_INCL           | 1             |
| FCH_CHAN_ADJ_GAIN  | 0 or 8        |
| DCCH_INCL          | 1             |
| DCCH_CHAN_ADJ_GAIN | 0 or 8        |
| SCH0_INCL          | 1             |
| SCH0_CHAN_ADJ_GAIN | 0 or 8        |
| SCH1_INCL          | 1             |
| SCH1_CHAN_ADJ_GAIN | 0 or 8        |

|          |                 |
|----------|-----------------|
| RESERVED | 0-7 (if needed) |
|----------|-----------------|

- 5
- 6
- 7 FCH\_INCL - FCH channel adjustment gain included indicator.  
 8 If FCH\_CHAN\_ADJ\_GAIN is included in this message, the base  
 9 station shall set this field to '1'; otherwise, the base station  
 10 shall set this field to '0'.
- 11 FCH\_CHAN\_ADJ\_GAIN - Channel adjustment gain for Reverse Fundamental Channel.  
 12 If FCH\_INCL is set to '0', the base station shall omit this field;  
 13 otherwise, the base station shall set each field to the value of  
 14 the gain adjustment that the mobile station is to make for the  
 15 Reverse Fundamental Channel. The base station shall set  
 16 this field to the correction factor expressed as a two's  
 17 complement value in units of 0.125 dB. The base station  
 18 shall set the value in the range from -48 to 48 inclusive.
- 19 DCCH\_INCL - DCCH channel adjustment gain included indicator.  
 20 If DCCH\_CHAN\_ADJ\_GAIN is included in this message, the base  
 21 station shall set this field to '1'; otherwise, the base  
 22 station shall set this field to '0'.
- 23 DCCH\_CHAN\_ADJ\_GAIN - Channel adjustment gain for the Reverse Dedicated Control  
 24 Channel.

If DCCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Dedicated Control Channel. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB. The base station shall set the value in the range from -48 to 48 inclusive.

SCH0\_INCL - SCH0 channel adjustment gain included indicator.

If SCH0\_CHAN\_ADJ\_GAIN is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

SCH0\_CHAN\_ADJ\_GAIN - Channel adjustment gain for Reverse Supplemental Channel 0.

If SCH0\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Supplemental Channel 0. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB. The base station shall set the value in the range from -48 to 48 inclusive.

SCH1\_INCL - SCH1 channel adjustment gain included indicator.

If SCH1\_CHAN\_ADJ\_GAIN is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

SCH1\_CHAN\_ADJ\_GAIN - Channel adjustment gain for Reverse Supplemental Channel 1.

If SCH1\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Supplemental Channel 1. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB. The base station shall set the value in the range from -48 to 48 inclusive.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to '0'.

If RPC\_ADJ\_REC\_TYPE is equal to '0001', the base station shall set type-specific fields as specified in Table 3.7.2.3.2.25-5.

1  
2**Table 3.7.2.3.2.25-5. Type Specific Fields for  
RECORD\_TYPE = '0001'**

| <b>Fields</b>              | <b>Length (Bits)</b> |

- 14        RC3\_RC5-
- 15        \_20MS\_INCL    - Reverse Link Attribute Adjustment Gain for Radio
- 16             Configuration 3 or 5 of 20 ms frame included indicator.
- 17              If Reverse Link Attribute adjustment Gain for Radio
- 18              Configuration 3 or 5 of 20 ms frame is included in this
- 19              message, the base station shall set this field to '1'; otherwise,
- 20              the base station shall set this field to '0'.
- 21        RL\_ATT\_ADJ\_GAIN\_1500 - Reverse Link Attribute Adjustment Gain for the transmission
- 22             rate 1500 bits/s.
- 23              If RC3\_RC5\_20MS\_INCL is set to '0', the base station shall
- 24              omit this field.
- 25              If RC3\_RC5\_20MS\_INCL is set to '1' and
- 26              RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall
- 27              set this field to the value of the nominal attribute gain
- 28              adjustment that the mobile station is to make for the
- 29              transmission attributes with transmission rate 1500 bits/s,
- 30              convolutional code and 20ms frame. The base station shall
- 31              set the value in the range from -48 to 48 inclusive.

1       If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 2       RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 3       set this field to the value of the pilot reference level  
 4       adjustment that the mobile station is to make for the  
 5       transmission attributes with transmission rate 1500 bits/s,  
 6       convolutional code and 20ms frame. ~~The base station shall~~  
 7       ~~set the value in the range from 0 to 63 inclusive.~~

8           The base station shall set this field to the correction factor  
 9           expressed as a two’s complement value in units of 0.125 dB.

10      RL\_ATT\_ADJ\_GAIN\_2700 -  
 11       Reverse Link Attribute Adjustment Gain for the transmission  
          rate 2700 bits/s.

12       If RC3\_RC5\_20MS\_INCL is set to ‘0’, the base station shall  
 13       omit this field.

14       If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 15       RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 16       set this field to the value of the nominal attribute gain  
 17       adjustment that the mobile station is to make for the  
 18       transmission attributes with transmission rate 2700 bits/s,  
 19       convolutional code and 20ms frame. The base station shall  
 20       set the value in the range from –48 to 48 inclusive.

21       If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 22       RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 23       set this field to the value of the pilot reference level  
 24       adjustment that the mobile station is to make for the  
 25       transmission attributes with transmission rate 2700 bits/s,  
 26       convolutional code and 20ms frame. ~~The base station shall~~  
 27       ~~set the value in the range from 0 to 63 inclusive.~~

28           The base station shall set this field to the correction factor  
 29           expressed as a two’s complement value in units of 0.125 dB.

30      RL\_ATT\_ADJ\_GAIN\_4800 -  
 31       Reverse Link Attribute Gain Adjustment for the transmission  
          rate 4800 bits/s.

32       If RC3\_RC5\_20MS\_INCL is set to ‘0’, the base station shall  
 33       omit this field.

34       If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 35       RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 36       set this field to the value of the nominal attribute gain  
 37       adjustment that the mobile station is to make for the  
 38       transmission attributes with transmission rate 4800 bits/s,  
 39       convolutional code and 20ms frame. The base station shall  
 40       set the value in the range from –48 to 48 inclusive.

41       If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 42       RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 43       set this field to the value of the pilot reference level  
 44       adjustment that the mobile station is to make for the  
 45       transmission attributes with transmission rate 4800 bits/s,  
 46       convolutional code and 20ms frame. ~~The base station shall~~  
 47       ~~set the value in the range from 0 to 63 inclusive.~~

1                   The base station shall set this field to the correction factor  
 2                   expressed as a two's complement value in units of 0.125 dB.

3    RL\_ATT\_ADJ\_GAIN\_9600 - Reverse Link Attribute Gain Adjustment for the transmission  
 4                   rate 9600 bits/s.

5                   If RC3\_RC5\_20MS\_INCL is set to '0', the base station shall  
 6                   omit this field.

7                   If RC3\_RC5\_20MS\_INCL is set to '1' and  
 8                   RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 9                   set this field to the value of the nominal attribute gain  
 10                  adjustment that the mobile station is to make for the  
 11                  transmission attributes with transmission rate 9600 bits/s,  
 12                  convolutional code and 20ms frame. The base station shall  
 13                  set the value in the range from -48 to 48 inclusive.

14                  If RC3\_RC5\_20MS\_INCL is set to '1' and  
 15                  RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 16                  set this field to the value of the pilot reference level  
 17                  adjustment that the mobile station is to make for the  
 18                  transmission attributes with transmission rate 9600 bits/s,  
 19                  convolutional code and 20ms frame. ~~The base station shall~~  
 20                  set the value in the range from 0 to 63 inclusive.

21                  The base station shall set this field to the correction factor  
 22                  expressed as a two's complement value in units of 0.125 dB.

#### 23                  RC4\_RC6-

24    \_20MS\_INCL - Reverse Link Attribute Adjustment Gain for Radio  
 25                  Configuration 4 or 6 of 20ms frame included indicator.

26                  If Reverse Link Attribute Adjustment Gain for Radio  
 27                  Configuration 4 or 6 of 20ms frame is included in this  
 28                  message, the base station shall set this field to '1'; otherwise,  
 29                  the base station shall set this field to '0'.

30    RL\_ATT\_ADJ\_GAIN\_1800 - Reverse Link Attribute Gain Adjustment for the transmission  
 31                  rate 1800 bits/s.

32                  If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 33                  omit this field.

34                  If RC4\_RC6\_20MS\_INCL is set to '1' and  
 35                  RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 36                  set this field to the value of the nominal attribute gain  
 37                  adjustment that the mobile station is to make for the  
 38                  transmission attributes with transmission rate 1800 bits/s,  
 39                  convolutional code and 20ms frame. The base station shall  
 40                  set the value in the range from -48 to 48 inclusive.

41                  If RC4\_RC6\_20MS\_INCL is set to '1' and  
 42                  RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 43                  set this field to the value of the pilot reference level  
 44                  adjustment that the mobile station is to make for the  
 45                  transmission attributes with transmission rate 1800 bits/s,  
 46                  convolutional code and 20ms frame. ~~The base station shall~~  
 47                  set the value in the range from 0 to 63 inclusive.

1                   The base station shall set this field to the correction factor  
 2                   expressed as a two's complement value in units of 0.125 dB.

3        RL\_ATT\_ADJ\_GAIN\_3600 -           Reverse Link Attribute Adjustment Gain for the transmission  
 4                   rate 3600 bits/s.

5                   If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 6                   omit this field.

7                   If RC4\_RC6\_20MS\_INCL is set to '1' and  
 8                   RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 9                   set this field to the value of the nominal attribute gain  
 10                  adjustment that the mobile station is to make for the  
 11                  transmission attributes with transmission rate 3600 bits/s,  
 12                  convolutional code and 20ms frame. The base station shall  
 13                  set the value in the range from -48 to 48 inclusive.

14                  If RC4\_RC6\_20MS\_INCL is set to '1' and  
 15                  RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 16                  set this field to the value of the pilot reference level  
 17                  adjustment that the mobile station is to make for the  
 18                  transmission attributes with transmission rate 3600 bits/s,  
 19                  convolutional code and 20ms frame. **The base station shall  
 20                  set the value in the range from 0 to 63 inclusive.**

21                   The base station shall set this field to the correction factor  
 22                   expressed as a two's complement value in units of 0.125 dB.

23        RL\_ATT\_ADJ\_GAIN\_7200 -           Reverse Link Attribute Adjustment Gain for the transmission  
 24                   rate 7200 bits/s.

25                   If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 26                   omit this field.

27                  If RC4\_RC6\_20MS\_INCL is set to '1' and  
 28                  RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 29                  set this field to the value of the nominal attribute gain  
 30                  adjustment that the mobile station is to make for the  
 31                  transmission attributes with transmission rate 7200 bits/s,  
 32                  convolutional code and 20ms frame. The base station shall  
 33                  set the value in the range from -48 to 48 inclusive.

34                  If RC4\_RC6\_20MS\_INCL is set to '1' and  
 35                  NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 36                  this field to the value of the pilot reference level adjustment  
 37                  that the mobile station is to make for the transmission  
 38                  attributes with transmission rate 7200 bits/s, convolutional  
 39                  code and 20ms frame. **The base station shall set the value in  
 40                  the range from 0 to 63 inclusive.**

41                   The base station shall set this field to the correction factor  
 42                   expressed as a two's complement value in units of 0.125 dB.

43        RL\_ATT\_ADJ\_GAIN\_14400-           Reverse Link Attribute Adjustment Gain for the transmission  
 44                   rate 14400 bits/s.

45                   If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 46                   omit this field.

1           If RC4\_RC6\_20MS\_INCL is set to '1' and  
 2        RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 3        set this field to the value of the nominal gain adjustment that  
 4        the mobile station is to make for the transmission attributes  
 5        with transmission rate 14400 bits/s, convolutional code and  
 6        20ms frame. The base station shall set the value in the range  
 7        from -48 to 48 inclusive.

8           If RC4\_RC6\_20MS\_INCL is set to '1' and  
 9        RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 10       set this field to the value of the pilot reference level  
 11       adjustment that the mobile station is to make for the  
 12       transmission attributes with transmission rate 14400 bits/s,  
 13       convolutional code and 20ms frame. ~~The base station shall  
 14       set the value in the range from 0 to 63 inclusive.~~

15       The base station shall set this field to the correction factor  
 16       expressed as a two's complement value in units of 0.125 dB.

17       5MS\_INCL    - 5ms frame Reverse Link Attribute Adjustment Gain included  
 18        indicator.

19       If Reverse Link Attribute Adjustment Gain for 5ms frame is  
 20        included in this message, the base station shall set this field  
 21        to '1'; otherwise, the base station shall set this field to '0'.

22       RL\_ATT\_ADJ\_GAIN-  
 23                 \_9600\_5MS - Reverse Link Attribute Adjustment Gain for the transmission  
 24                rate 9600 bits/s with 5ms frame.

25       If 5MS\_INCL is set to '0', the base station shall omit this field.

26       If 5MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set  
 27        to '0', the base station shall set this field to the value of the  
 28        nominal attribute gain adjustment that the mobile station is  
 29        to make for the transmission attributes with transmission rate  
 30        9600 bits/s, convolutional code and 5ms frame. The base  
 31        station shall set the value in the range from -48 to 48  
 32        inclusive.

33       If 5MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set  
 34        to '1', the base station shall set this field to the value of the  
 35        pilot reference level adjustment that the mobile station is to  
 36        make for the transmission attributes with transmission rate  
 37        9600 bits/s, convolutional code and 5ms frame. ~~The base  
 38        station shall set the value in the range from 0 to 63 inclusive.~~

39       The base station shall set this field to the correction factor  
 40        expressed as a two's complement value in units of 0.125 dB.

41       RC3\_RC5\_40MS\_INCL - Reverse Link Attribute Adjustment Gain for Radio  
 42        Configuration 3 or 5 of 40 ms frame included indicator.

43       If Reverse Link Attribute adjustment Gain for Radio  
 44        Configuration 3 or 5 of 40 ms frame is included in this  
 45        message, the base station shall set this field to '1'; otherwise,  
 46        the base station shall set this field to '0'.

47       RL\_ATT\_ADJ\_GAIN-

- 1           \_1350\_40MS    - Reverse Link Attribute Adjustment Gain for the transmission  
 2                          rate 1350 bits/s.  
 3                          If RC3\_RC5\_40MS\_INCL is set to '0', the base station shall  
 4                          omit this field.  
 5                          If RC3\_RC5\_40MS\_INCL is set to '1' and  
 6                          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 7                          set this field to the value of the nominal attribute gain  
 8                          adjustment that the mobile station is to make for the  
 9                          transmission attributes with transmission rate 1350 bits/s,  
 10                         convolutional code and 40ms frame. The base station shall  
 11                         set the value in the range from -48 to 48 inclusive.  
 12                          If RC3\_RC5\_40MS\_INCL is set to '1' and  
 13                          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 14                          set this field to the value of the pilot reference level  
 15                          adjustment that the mobile station is to make for the  
 16                          transmission attributes with transmission rate 1350 bits/s,  
 17                         convolutional code and 40ms frame. ~~The base station shall  
 18                         set the value in the range from 0 to 63 inclusive.~~  
 19                          The base station shall set this field to the correction factor  
 20                          expressed as a two's complement value in units of 0.125 dB.  
 21            RL\_ATT\_ADJ\_GAIN-  
 22                \_2400\_40MS    - Reverse Link Attribute Adjustment Gain for the transmission  
 23                          rate 2400 bits/s.  
 24                          If RC3\_RC5\_40MS\_INCL is set to '0', the base station shall  
 25                          omit this field.  
 26                          If RC3\_RC5\_40MS\_INCL is set to '1' and  
 27                          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 28                          set this field to the value of the nominal attribute gain  
 29                          adjustment that the mobile station is to make for the  
 30                          transmission attributes with transmission rate 2400 bits/s,  
 31                         convolutional code and 40ms frame. The base station shall  
 32                         set the value in the range from -48 to 48 inclusive.  
 33                          If RC3\_RC5\_40MS\_INCL is set to '1' and  
 34                          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 35                          set this field to the value of the pilot reference level  
 36                          adjustment that the mobile station is to make for the  
 37                          transmission attributes with transmission rate 2400 bits/s,  
 38                         convolutional code and 40ms frame. ~~The base station shall  
 39                         set the value in the range from 0 to 63 inclusive.~~  
 40                          The base station shall set this field to the correction factor  
 41                          expressed as a two's complement value in units of 0.125 dB.  
 42            RL\_ATT\_ADJ\_GAIN-  
 43                \_4800\_40MS    - Reverse Link Attribute Gain Adjustment for the transmission  
 44                          rate 4800 bits/s.  
 45                          If RC3\_RC5\_40MS\_INCL is set to '0', the base station shall  
 46                          omit this field.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 40ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### RL\_ATT\_ADJ\_GAIN-

\_9600\_40MS

- Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.

If RC3\_RC5\_40MS\_INCL is set to ‘0’, the base station shall omit this field.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 40ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### RC4\_RC6\_40MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

#### RL\_ATT\_ADJ\_GAIN-

\_1800\_40MS

- Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

1           If RC4\_RC6\_40MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC4\_RC6\_40MS\_INCL is set to '1' and  
 4           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5           set this field to the value of the nominal attribute gain  
 6           adjustment that the mobile station is to make for the  
 7           transmission attributes with transmission rate 1800 bits/s,  
 8           convolutional code and 40ms frame. The base station shall  
 9           set the value in the range from -48 to 48 inclusive.

10          If RC4\_RC6\_40MS\_INCL is set to '1' and  
 11         RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 12         set this field to the value of the pilot reference level  
 13         adjustment that the mobile station is to make for the  
 14         transmission attributes with transmission rate 1800 bits/s,  
 15         convolutional code and 40ms frame. ~~The base station shall~~  
 16         ~~set the value in the range from 0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19         RL\_ATT\_ADJ\_GAIN-

20            \_3600\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

22          If RC4\_RC6\_40MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC4\_RC6\_40MS\_INCL is set to '1' and  
 25          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 26          set this field to the value of the nominal attribute gain  
 27          adjustment that the mobile station is to make for the  
 28          transmission attributes with transmission rate 3600 bits/s,  
 29          convolutional code and 40ms frame. The base station shall  
 30          set the value in the range from -48 to 48 inclusive.

31          If RC4\_RC6\_40MS\_INCL is set to '1' and  
 32          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 33          set this field to the value of the pilot reference level  
 34          adjustment that the mobile station is to make for the  
 35          transmission attributes with transmission rate 3600 bits/s,  
 36          convolutional code and 40ms frame. ~~The base station shall~~  
 37          ~~set the value in the range from 0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40         RL\_ATT\_ADJ\_GAIN-

41            \_7200\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

43          If RC4\_RC6\_40MS\_INCL is set to '0', the base station shall  
 44          omit this field.

If RC4\_RC6\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC4\_RC6\_40MS\_INCL is set to ‘1’ and NORM\_ATT\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 40ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### 17        RL\_ATT\_ADJ\_GAIN-

##### 18            \_14400\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4\_RC6\_40MS\_INCL is set to ‘0’, the base station shall omit this field.

If RC4\_RC6\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC4\_RC6\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 40ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### 38        RC3\_RC5\_80MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80 ms frame included indicator.

If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 80 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

#### 44        RL\_ATT\_ADJ\_GAIN-

##### 45            \_1200\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 1200 bits/s.

1           If RC3\_RC5\_80MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC3\_RC5\_80MS\_INCL is set to '1' and  
 4           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5           set this field to the value of the nominal attribute gain  
 6           adjustment that the mobile station is to make for the  
 7           transmission attributes with transmission rate 1200 bits/s,  
 8           convolutional code and 80ms frame. The base station shall  
 9           set the value in the range from -48 to 48 inclusive.

10          If RC3\_RC5\_80MS\_INCL is set to '1' and  
 11         RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 12         set this field to the value of the pilot reference level  
 13         adjustment that the mobile station is to make for the  
 14         transmission attributes with transmission rate 1200 bits/s,  
 15         convolutional code and 80ms frame. ~~The base station shall~~  
 16         ~~set the value in the range from 0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19         RL\_ATT\_ADJ\_GAIN-

20            \_2400\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 2400 bits/s.

22          If RC3\_RC5\_80MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC3\_RC5\_80MS\_INCL is set to '1' and  
 25          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 26          set this field to the value of the nominal attribute gain  
 27          adjustment that the mobile station is to make for the  
 28          transmission attributes with transmission rate 2400 bits/s,  
 29          convolutional code and 80ms frame. The base station shall  
 30          set the value in the range from -48 to 48 inclusive.

31          If RC3\_RC5\_80MS\_INCL is set to '1' and  
 32          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 33          set this field to the value of the pilot reference level  
 34          adjustment that the mobile station is to make for the  
 35          transmission attributes with transmission rate 2400 bits/s,  
 36          convolutional code and 80ms frame. ~~The base station shall~~  
 37          ~~set the value in the range from 0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40         RL\_ATT\_ADJ\_GAIN-

41            \_4800\_80MS

- Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

43          If RC3\_RC5\_80MS\_INCL is set to '0', the base station shall  
 44          omit this field.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC3\_RC5\_80MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 840ms 80ms frame. The base station shall set the value in the range from 0 to 63 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### RL\_ATT\_ADJ\_GAIN-

\_9600\_80MS

- Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.

If RC3\_RC5\_80MS\_INCL is set to ‘0’, the base station shall omit this field.

If RC3\_RC5\_80MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC3\_RC5\_80MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from 0 to 63 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### RC4\_RC6\_80MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

#### RL\_ATT\_ADJ\_GAIN-

\_1800\_80MS

- Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

1           If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC4\_RC6\_80MS\_INCL is set to '1' and  
 4           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5           set this field to the value of the nominal attribute gain  
 6           adjustment that the mobile station is to make for the  
 7           transmission attributes with transmission rate 1800 bits/s,  
 8           convolutional code and 80ms frame. The base station shall  
 9           set the value in the range from -48 to 48 inclusive.

10          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 11         RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 12         set this field to the value of the pilot reference level  
 13         adjustment that the mobile station is to make for the  
 14         transmission attributes with transmission rate 1800 bits/s,  
 15         convolutional code and 80ms frame. ~~The base station shall~~  
 16         ~~set the value in the range from 0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19         RL\_ATT\_ADJ\_GAIN-

20            \_3600\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

22          If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 25          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 26          set this field to the value of the nominal attribute gain  
 27          adjustment that the mobile station is to make for the  
 28          transmission attributes with transmission rate 3600 bits/s,  
 29          convolutional code and 80ms frame. The base station shall  
 30          set the value in the range from -48 to 48 inclusive.

31          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 32          RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 33          set this field to the value of the pilot reference level  
 34          adjustment that the mobile station is to make for the  
 35          transmission attributes with transmission rate 3600 bits/s,  
 36          convolutional code and 80ms frame. ~~The base station shall~~  
 37          ~~set the value in the range from 0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40         RL\_ATT\_ADJ\_GAIN-

41            \_7200\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

43          If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 44          omit this field.

If RC4\_RC6\_80MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC4\_RC6\_80MS\_INCL is set to '1' and NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 80ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

#### 17        RL\_ATT\_ADJ\_GAIN-

18            \_14400\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall omit this field.

If RC4\_RC6\_80MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC4\_RC6\_40MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 80ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

#### 38        RESERVED

- Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to '0'.

If RPC\_ADJ\_REC\_TYPE is equal to '0010', the base station shall set type-specific fields as specified in Table 3.7.2.3.2.25-6.

1  
2**Table 3.7.2.3.2.25-6. Type Specific Fields for  
RECORD\_TYPE = '0010'**

| <b>Fields</b>               | <b>Length (Bits)</b> |
|-----------------------------|----------------------|
| CODE_TYPE                   | 1                    |
| RL_ATT_ADJ_GAIN_TYPE        | 1                    |
| RC3_RC5_20MS_INCL           | 1                    |
| RL_ATT_ADJ_GAIN_19200       | 0 or 8               |
| RL_ATT_ADJ_GAIN_38400       | 0 or 8               |
| RL_ATT_ADJ_GAIN_76800       | 0 or 8               |
| RL_ATT_ADJ_GAIN_153600      | 0 or 8               |
| RL_ATT_ADJ_GAIN_307200      | 0 or 8               |
| RL_ATT_ADJ_GAIN_614400      | 0 or 8               |
| RC4_RC6_20MS_INCL           | 1                    |
| RL_ATT_ADJ_GAIN_28800       | 0 or 8               |
| RL_ATT_ADJ_GAIN_57600       | 0 or 8               |
| RL_ATT_ADJ_GAIN_115200      | 0 or 8               |
| RL_ATT_ADJ_GAIN_230400      | 0 or 8               |
| RL_ATT_ADJ_GAIN_460800      | 0 or 8               |
| RL_ATT_ADJ_GAIN_1036800     | 0 or 8               |
| RC3_RC5_40MS_INCL           | 1                    |
| RL_ATT_ADJ_GAIN_19200_40MS  | 0 or 8               |
| RL_ATT_ADJ_GAIN_38400_40MS  | 0 or 8               |
| RL_ATT_ADJ_GAIN_76800_40MS  | 0 or 8               |
| RL_ATT_ADJ_GAIN_153600_40MS | 0 or 8               |
| RL_ATT_ADJ_GAIN_307200_40MS | 0 or 8               |
| RC4_RC6_40MS_INCL           | 1                    |
| RL_ATT_ADJ_GAIN_28800_40MS  | 0 or 8               |
| RL_ATT_ADJ_GAIN_57600_40MS  | 0 or 8               |

2

- 3           CODE\_TYPE     - Coding type indicator.  
 4                         If the following corresponding gain adjustment fields apply for  
 5                         the convolutional code, the base station shall set this field to  
 6                         ‘0’. If the following corresponding gain adjustment fields apply  
 7                         for the Turbo code, the base station shall set this field to ‘1’.
- 8           RL\_ATT\_ADJ-  
 9               \_GAIN\_TYPE - Reverse Link Attribute adjustment Gain value type indicator.  
 10                  If the following corresponding gain adjustment fields are set to  
 11                  the value of the nominal attribute gain adjustment that the  
 12                  mobile station is to make for the corresponding transmission  
 13                  attributes (relative to Nominal\_Attribute\_Gain specified in  
 14                  Table 2.1.2.3.3-1 of [2]), the base station shall set this field to  
 15                  ‘0’. If the following corresponding gain adjustment fields are  
 16                  set to the value of the pilot reference level adjustment that the  
 17                  mobile station is to use for the corresponding transmission  
 18                  attributes (relative to Pilot\_Reference\_Level specified in Table  
 19                  2.1.2.3.3-1 of [2]), the base station shall set this field to ‘1’.
- 20           RC3\_RC5-  
 21               \_20MS\_INCL - Reverse Link Attribute Adjustment Gain for Radio  
 22                  Configuration 3 or 5 of 20ms frame included indicator.  
 23                  If Reverse Link Attribute Adjustment Gain for Radio  
 24                  Configuration 3 or 5 of 20ms frame is included in this  
 25                  message, the base station shall set this field to ‘1’; otherwise,  
 26                  the base station shall set this field to ‘0’.

### RL\_ATT\_ADJ\_GAIN-

-19200

- Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

If RC3\_RC5\_20MS\_INCL is set to '0', the base station shall omit this field.

If `RC3_RC5_20MS_INCL` is set to '1' and `RL_ATT_ADJ_GAIN_TYPE` is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 20ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC3\_RC5\_20MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 20ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

## RL\_ATT\_ADJ\_GAIN-

\_38400

- Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If RC3\_RC5\_20MS\_INCL is set to '0', the base station shall omit this field.

If RC3\_RC5\_20MS\_INCL is set to '1' and RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 20ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC3\_RC5\_20MS\_INCL is set to '1' and NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 20ms frame. The base station shall set the value in the range from 0 to 63 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

## RL\_ATT\_ADJ\_GAIN-

-76800

- Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If RC3\_RC5\_20MS\_INCL is set to '0', the base station shall omit this field.

1           If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 2           RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 3           set this field to the value of the nominal attribute gain  
 4           adjustment that the mobile station is to make for the  
 5           transmission attributes with transmission rate 76800 bits/s,  
 6           and 20ms frame. The base station shall set the value in the  
 7           range from –48 to 48 inclusive.

8           If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 9           RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 10          set this field to the value of the pilot reference level  
 11          adjustment that the mobile station is to make for the  
 12          transmission attributes with transmission rate 76800 bits/s  
 13          and 20ms frame. ~~The base station shall set the value in the  
 14          range from 0 to 63 inclusive.~~

15          The base station shall set this field to the correction factor  
 16          expressed as a two’s complement value in units of 0.125 dB.

17        **RL\_ATT\_ADJ\_GAIN-**

18        **\_153600** - Reverse Link Attribute Adjustment Gain for the transmission  
 19           rate 153600 bits/s.

20          If RC3\_RC5\_20MS\_INCL is set to ‘0’, the base station shall  
 21          omit this field.

22          If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 23           NORM\_ATT\_GAIN\_TYPE is set to ‘0’, the base station shall set  
 24           this field to the value of the nominal attribute gain adjustment  
 25           that the mobile station is to make for the transmission  
 26           attributes with transmission rate 153600 bits/s, and 20ms  
 27           frame. The base station shall set the value in the range from  
 28           –48 to 48 inclusive.

29          If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 30           NORM\_ATT\_GAIN\_TYPE is set to ‘1’, the base station shall set  
 31           this field to the value of the pilot reference level adjustment  
 32           that the mobile station is to make for the transmission  
 33           attributes with transmission rate 153600 bits/s and 20ms  
 34           frame. ~~The base station shall set the value in the range from  
 35           0 to 63 inclusive.~~

36          The base station shall set this field to the correction factor  
 37          expressed as a two’s complement value in units of 0.125 dB.

38        **RL\_ATT\_ADJ\_GAIN-**

39        **\_307200** - Reverse Link Attribute Adjustment Gain for the transmission  
 40           rate 307200 bits/s.

41          If RC3\_RC5\_20MS\_INCL is set to ‘0’, the base station shall  
 42          omit this field.

1           If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 2           RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 3           set this field to the value of the nominal attribute gain  
 4           adjustment that the mobile station is to make for the  
 5           transmission attributes with transmission rate 307200 bits/s,  
 6           and 20ms frame. The base station shall set the value in the  
 7           range from -48 to 48 inclusive.

8           If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 9           RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 10          set this field to the value of the pilot reference level  
 11          adjustment that the mobile station is to make for the  
 12          transmission attributes with transmission rate 307200 bits/s  
 13          and 20ms frame. ~~The base station shall set the value in the~~  
 14          ~~range from 0 to 63 inclusive.~~

15          The base station shall set this field to the correction factor  
 16          expressed as a two’s complement value in units of 0.125 dB.

17        **RL\_ATT\_ADJ\_GAIN-**

18           **\_614400**

- Reverse Link Attribute Adjustment Gain for the transmission rate 614400 bits/s.

20          If RC3\_RC5\_20MS\_INCL is set to ‘0’, the base station shall  
 21          omit this field.

22          If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 23           RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 24           set this field to the value of the nominal attribute gain  
 25           adjustment that the mobile station is to make for the  
 26           transmission attributes with transmission rate 614400 bits/s,  
 27           and 20ms frame. The base station shall set the value in the  
 28           range from -48 to 48 inclusive.

29          If RC3\_RC5\_20MS\_INCL is set to ‘1’ and  
 30           RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 31           set this field to the value of the pilot reference level  
 32           adjustment that the mobile station is to make for the  
 33           transmission attributes with transmission rate 614400 bits/s  
 34           and 20ms frame. ~~The base station shall set the value in the~~  
 35           ~~range from 0 to 63 inclusive.~~

36          The base station shall set this field to the correction factor  
 37          expressed as a two’s complement value in units of 0.125 dB.

38        **RC4\_RC6-**

39           **\_20MS\_INCL**

- Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame included indicator.

41          If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

45        **RL\_ATT\_ADJ\_GAIN-**

46           **\_28800**

- Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

1           If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC4\_RC6\_20MS\_INCL is set to '1' and  
 4           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5           set this field to the value of the nominal attribute gain  
 6           adjustment that the mobile station is to make for the  
 7           transmission attributes with transmission rate 28800 bits/s,  
 8           and 20ms frame. The base station shall set the value in the  
 9           range from -48 to 48 inclusive.

10          If RC4\_RC6\_20MS\_INCL is set to '1' and  
 11          NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 12          this field to the value of the pilot reference level adjustment  
 13          that the mobile station is to make for the transmission  
 14          attributes with transmission rate 28800 bits/s and 20ms  
 15          frame. ~~The base station shall set the value in the range from~~  
 16          ~~0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19        **RL\_ATT\_ADJ\_GAIN-**

20        **\_57600**    - Reverse Link Attribute Adjustment Gain for the transmission  
 21           rate 57600 bits/s.

22          If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC4\_RC6\_20MS\_INCL is set to '1' and  
 25          NORM\_ATT\_GAIN\_TYPE is set to '0', the base station shall set  
 26          this field to the value of the nominal attribute gain adjustment  
 27          that the mobile station is to make for the transmission  
 28          attributes with transmission rate 57600 bits/s, and 20ms  
 29          frame. The base station shall set the value in the range from  
 30          -48 to 48 inclusive.

31          If RC4\_RC6\_20MS\_INCL is set to '1' and  
 32          NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 33          this field to the value of the pilot reference level adjustment  
 34          that the mobile station is to make for the transmission  
 35          attributes with transmission rate 57600 bits/s and 20ms  
 36          frame. ~~The base station shall set the value in the range from~~  
 37          ~~0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40        **RL\_ATT\_ADJ\_GAIN-**

41        **\_115200**    - Reverse Link Attribute Adjustment Gain for the transmission  
 42           rate 115200 bits/s.

43          If RC4\_RC6\_20MS\_INCL is set to '0', the base station shall  
 44          omit this field.

1        If RC4\_RC6\_20MS\_INCL is set to ‘1’ and  
 2        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 3        set this field to the value of the nominal attribute gain  
 4        adjustment that the mobile station is to make for the  
 5        transmission attributes with transmission rate 115200 bits/s,  
 6        and 20ms frame. The base station shall set the value in the  
 7        range from -48 to 48 inclusive.

8        If RC4\_RC6\_20MS\_INCL is set to ‘1’ and  
 9        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 10      set this field to the value of the pilot reference level  
 11      adjustment that the mobile station is to make for the  
 12      transmission attributes with transmission rate 115200 bits/s  
 13      and 20ms frame. ~~The base station shall set the value in the~~  
 14      ~~range from 0 to 63 inclusive.~~

15      The base station shall set this field to the correction factor  
 16      expressed as a two’s complement value in units of 0.125 dB.

17      RL\_ATT\_ADJ\_GAIN-

18                  \_230400

- Reverse Link Attribute Adjustment Gain for the transmission rate 230400 bits/s.

20      If RC4\_RC6\_20MS\_INCL is set to ‘0’, the base station shall  
 21      omit this field.

22      If RC4\_RC6\_20MS\_INCL is set to ‘1’ and  
 23      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 24      set this field to the value of the nominal attribute gain  
 25      adjustment that the mobile station is to make for the  
 26      transmission attributes with transmission rate 230400 bits/s,  
 27      and 20ms frame. The base station shall set the value in the  
 28      range from -48 to 48 inclusive.

29      If RC4\_RC6\_20MS\_INCL is set to ‘1’ and  
 30      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 31      set this field to the value of the pilot reference level  
 32      adjustment that the mobile station is to make for the  
 33      transmission attributes with transmission rate 230400 bits/s  
 34      and 20ms frame. ~~The base station shall set the value in the~~  
 35      ~~range from 0 to 63 inclusive.~~

36      The base station shall set this field to the correction factor  
 37      expressed as a two’s complement value in units of 0.125 dB.

38      RL\_ATT\_ADJ\_GAIN-

39                  \_460800

- Reverse Link Attribute Adjustment Gain for the transmission rate 460800 bits/s.

41      If RC4\_RC6\_20MS\_INCL is set to ‘0’, the base station shall  
 42      omit this field.

If RC4\_RC6\_20MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 460800 bits/s, and 20ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC4\_RC6\_20MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 460800 bits/s and 20ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### RL\_ATT\_ADJ\_GAIN-

\_1036800

- Reverse Link Attribute Adjustment Gain for the transmission rate 1036800 bits/s.

If RC4\_RC6\_20MS\_INCL is set to ‘0’, the base station shall omit this field.

If RC4\_RC6\_20MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1036800 bits/s, and 20ms frame. The base station shall set the value in the range from -48 to 48 inclusive.

If RC4\_RC6\_20MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1306800 bits/s and 20ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### RC3\_RC5\_40MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

#### RL\_ATT\_ADJ\_GAIN-

\_19200\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

1 If RC3\_RC5\_40MS\_INCL is set to '0', the base station shall  
 2 omit this field.

3 If RC3\_RC5\_40MS\_INCL is set to '1' and  
 4 RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5 set this field to the value of the nominal attribute gain  
 6 adjustment that the mobile station is to make for the  
 7 transmission attributes with transmission rate 19200 bits/s,  
 8 and 40ms frame. The base station shall set the value in the  
 9 range from -48 to 48 inclusive.

10 If RC3\_RC5\_40MS\_INCL is set to '1' and  
 11 RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 12 set this field to the value of the pilot reference level  
 13 adjustment that the mobile station is to make for the  
 14 transmission attributes with transmission rate 19200 bits/s  
 15 and 40ms frame. ~~The base station shall set the value in the~~  
 16 ~~range from 0 to 63 inclusive.~~

17 The base station shall set this field to the correction factor  
 18 expressed as a two's complement value in units of 0.125 dB.

19    RL\_ATT\_ADJ\_GAIN-

20        \_38400\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

22 If RC3\_RC5\_40MS\_INCL is set to '0', the base station shall  
 23 omit this field.

24 If RC3\_RC5\_40MS\_INCL is set to '1' and  
 25 RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 26 set this field to the value of the nominal attribute gain  
 27 adjustment that the mobile station is to make for the  
 28 transmission attributes with transmission rate 38400 bits/s,  
 29 and 40ms frame. The base station shall set the value in the  
 30 range from -48 to 48 inclusive.

31 If RC3\_RC5\_20MS\_INCL is set to '1' and  
 32 NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 33 this field to the value of the pilot reference level adjustment  
 34 that the mobile station is to make for the transmission  
 35 attributes with transmission rate 38400 bits/s and 40ms  
 36 frame. ~~The base station shall set the value in the range from~~  
 37 ~~0 to 63 inclusive.~~

38 The base station shall set this field to the correction factor  
 39 expressed as a two's complement value in units of 0.125 dB.

40    RL\_ATT\_ADJ\_GAIN-

41        \_76800\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

43 If RC3\_RC5\_40MS\_INCL is set to '0', the base station shall  
 44 omit this field.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 40ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### 17        RL\_ATT\_ADJ\_GAIN-

18            \_153600\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If RC3\_RC5\_40MS\_INCL is set to ‘0’, the base station shall omit this field.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and NORM\_ATT\_GAIN\_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3\_RC5\_40MS\_INCL is set to ‘1’ and NORM\_ATT\_GAIN\_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 40ms frame. ~~The base station shall set the value in the range from 0 to 63 inclusive.~~

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

#### 38        RL\_ATT\_ADJ\_GAIN-

39            \_307200\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 307200 bits/s.

If RC3\_RC5\_40MS\_INCL is set to ‘0’, the base station shall omit this field.

1        If RC3\_RC5\_40MS\_INCL is set to ‘1’ and  
 2        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 3        set this field to the value of the nominal attribute gain  
 4        adjustment that the mobile station is to make for the  
 5        transmission attributes with transmission rate 307200 bits/s,  
 6        and 40ms frame. The base station shall set the value in the  
 7        range from -48 to 48 inclusive.

8        If RC3\_RC5\_40MS\_INCL is set to ‘1’ and  
 9        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 10      set this field to the value of the pilot reference level  
 11      adjustment that the mobile station is to make for the  
 12      transmission attributes with transmission rate 307200 bits/s  
 13      and 40ms frame. ~~The base station shall set the value in the~~  
 14      ~~range from 0 to 63 inclusive.~~

15      The base station shall set this field to the correction factor  
 16      expressed as a two’s complement value in units of 0.125 dB.

17      RC4\_RC6\_40MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame included indicator.

19      If Reverse Link Attribute Adjustment Gain for Radio  
 20      Configuration 4 or 6 of 40ms frame is included in this  
 21      message, the base station shall set this field to ‘1’; otherwise,  
 22      the base station shall set this field to ‘0’.

23      RL\_ATT\_ADJ\_GAIN-

24      \_28800\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

26      If RC4\_RC6\_40MS\_INCL is set to ‘0’, the base station shall  
 27      omit this field.

28      If RC4\_RC6\_40MS\_INCL is set to ‘1’ and  
 29      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 30      set this field to the value of the nominal attribute gain  
 31      adjustment that the mobile station is to make for the  
 32      transmission attributes with transmission rate 28800 bits/s,  
 33      and 40ms frame. The base station shall set the value in the  
 34      range from -48 to 48 inclusive.

35      If RC4\_RC6\_40MS\_INCL is set to ‘1’ and  
 36      NORM\_ATT\_GAIN\_TYPE is set to ‘1’, the base station shall set  
 37      this field to the value of the pilot reference level adjustment  
 38      that the mobile station is to make for the transmission  
 39      attributes with transmission rate 28800 bits/s and 40ms  
 40      frame. ~~The base station shall set the value in the range from~~  
 41      ~~0 to 63 inclusive.~~

42      The base station shall set this field to the correction factor  
 43      expressed as a two’s complement value in units of 0.125 dB.

44      RL\_ATT\_ADJ\_GAIN-

45      \_57600\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

1           If RC4\_RC6\_40MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC4\_RC6\_40MS\_INCL is set to '1' and  
 4           NORM\_ATT\_GAIN\_TYPE is set to '0', the base station shall set  
 5           this field to the value of the nominal attribute gain adjustment  
 6           that the mobile station is to make for the transmission  
 7           attributes with transmission rate 57600 bits/s, and 40ms  
 8           frame. The base station shall set the value in the range from  
 9           -48 to 48 inclusive.

10          If RC4\_RC6\_40MS\_INCL is set to '1' and  
 11         NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 12         this field to the value of the pilot reference level adjustment  
 13         that the mobile station is to make for the transmission  
 14         attributes with transmission rate 57600 bits/s and 40ms  
 15         frame. ~~The base station shall set the value in the range from~~  
 16         ~~0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19         RL\_ATT\_ADJ\_GAIN-

20         \_115200\_40MS - Reverse Link Attribute Adjustment Gain for the transmission  
 21           rate 115200 bits/s.

22          If RC4\_RC6\_40MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC4\_RC6\_40MS\_INCL is set to '1' and  
 25           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 26           set this field to the value of the nominal attribute gain  
 27           adjustment that the mobile station is to make for the  
 28           transmission attributes with transmission rate 115200 bits/s,  
 29           and 40ms frame. The base station shall set the value in the  
 30           range from -48 to 48 inclusive.

31          If RC4\_RC6\_40MS\_INCL is set to '1' and  
 32           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 33           set this field to the value of the pilot reference level  
 34           adjustment that the mobile station is to make for the  
 35           transmission attributes with transmission rate 115200 bits/s  
 36           and 40ms frame. ~~The base station shall set the value in the~~  
 37           ~~range from 0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40         RL\_ATT\_ADJ\_GAIN-

41         \_230400\_40MS - Reverse Link Attribute Adjustment Gain for the transmission  
 42           rate 230400 bits/s.

43          If RC4\_RC6\_40MS\_INCL is set to '0', the base station shall  
 44          omit this field.

1        If RC4\_RC6\_40MS\_INCL is set to ‘1’ and  
 2        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 3        set this field to the value of the nominal attribute gain  
 4        adjustment that the mobile station is to make for the  
 5        transmission attributes with transmission rate 230400 bits/s,  
 6        and 40ms frame. The base station shall set the value in the  
 7        range from -48 to 48 inclusive.

8        If RC4\_RC6\_40MS\_INCL is set to ‘1’ and  
 9        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 10      set this field to the value of the pilot reference level  
 11      adjustment that the mobile station is to make for the  
 12      transmission attributes with transmission rate 230400 bits/s  
 13      and 40ms frame. ~~The base station shall set the value in the~~  
 14      ~~range from 0 to 63 inclusive.~~

15      The base station shall set this field to the correction factor  
 16      expressed as a two’s complement value in units of 0.125 dB.

17      RL\_ATT\_ADJ\_GAIN-

18      \_518400\_40MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 518400 bits/s.

20      If RC4\_RC6\_40MS\_INCL is set to ‘0’, the base station shall  
 21      omit this field.

22      If RC4\_RC6\_40MS\_INCL is set to ‘1’ and  
 23      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 24      set this field to the value of the nominal attribute gain  
 25      adjustment that the mobile station is to make for the  
 26      transmission attributes with transmission rate 518400 bits/s,  
 27      and 40ms frame. The base station shall set the value in the  
 28      range from -48 to 48 inclusive.

29      If RC4\_RC6\_40MS\_INCL is set to ‘1’ and  
 30      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 31      set this field to the value of the pilot reference level  
 32      adjustment that the mobile station is to make for the  
 33      transmission attributes with transmission rate 518400 bits/s  
 34      and 40ms frame. ~~The base station shall set the value in the~~  
 35      ~~range from 0 to 63 inclusive.~~

36      The base station shall set this field to the correction factor  
 37      expressed as a two’s complement value in units of 0.125 dB.

38      RC3\_RC5\_80MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80ms frame included indicator.

40      If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

44      RL\_ATT\_ADJ\_GAIN-

45      \_19200\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

1           If RC3\_RC5\_80MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC3\_RC5\_80MS\_INCL is set to '1' and  
 4           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5           set this field to the value of the nominal attribute gain  
 6           adjustment that the mobile station is to make for the  
 7           transmission attributes with transmission rate 19200 bits/s,  
 8           and 80ms frame. The base station shall set the value in the  
 9           range from -48 to 48 inclusive.

10          If RC3\_RC5\_80MS\_INCL is set to '1' and  
 11         RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 12         set this field to the value of the pilot reference level  
 13         adjustment that the mobile station is to make for the  
 14         transmission attributes with transmission rate 19200 bits/s  
 15         and 80ms frame. ~~The base station shall set the value in the~~  
 16         ~~range from 0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19        **RL\_ATT\_ADJ\_GAIN-**

20        **\_38400\_80MS**    - Reverse Link Attribute Adjustment Gain for the transmission  
 21           rate 38400 bits/s.

22          If RC3\_RC5\_80MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC3\_RC5\_80MS\_INCL is set to '1' and  
 25           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 26           set this field to the value of the nominal attribute gain  
 27           adjustment that the mobile station is to make for the  
 28           transmission attributes with transmission rate 38400 bits/s,  
 29           and 80ms frame. The base station shall set the value in the  
 30           range from -48 to 48 inclusive.

31          If RC3\_RC5\_80MS\_INCL is set to '1' and  
 32           NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 33           this field to the value of the pilot reference level adjustment  
 34           that the mobile station is to make for the transmission  
 35           attributes with transmission rate 38400 bits/s and 80ms  
 36           frame. ~~The base station shall set the value in the range from~~  
 37           ~~0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40        **RL\_ATT\_ADJ\_GAIN-**

41        **\_76800\_80MS**    - Reverse Link Attribute Adjustment Gain for the transmission  
 42           rate 76800 bits/s.

43          If RC3\_RC5\_80MS\_INCL is set to '0', the base station shall  
 44          omit this field.

1        If RC3\_RC5\_80MS\_INCL is set to ‘1’ and  
 2        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 3        set this field to the value of the nominal attribute gain  
 4        adjustment that the mobile station is to make for the  
 5        transmission attributes with transmission rate 76800 bits/s,  
 6        and 80ms frame. The base station shall set the value in the  
 7        range from -48 to 48 inclusive.

8        If RC3\_RC5\_80MS\_INCL is set to ‘1’ and  
 9        RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 10      set this field to the value of the pilot reference level  
 11      adjustment that the mobile station is to make for the  
 12      transmission attributes with transmission rate 76800 bits/s  
 13      and 80ms frame. ~~The base station shall set the value in the~~  
 14      ~~range from 0 to 63 inclusive.~~

15      The base station shall set this field to the correction factor  
 16      expressed as a two’s complement value in units of 0.125 dB.

17      RL\_ATT\_ADJ\_GAIN-

18      \_153600\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

20      If RC3\_RC5\_80MS\_INCL is set to ‘0’, the base station shall  
 21      omit this field.

22      If RC3\_RC5\_80MS\_INCL is set to ‘1’ and  
 23      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘0’, the base station shall  
 24      set this field to the value of the nominal attribute gain  
 25      adjustment that the mobile station is to make for the  
 26      transmission attributes with transmission rate 153600 bits/s,  
 27      and 80ms frame. The base station shall set the value in the  
 28      range from -48 to 48 inclusive.

29      If RC3\_RC5\_80MS\_INCL is set to ‘1’ and  
 30      RL\_ATT\_ADJ\_GAIN\_TYPE is set to ‘1’, the base station shall  
 31      set this field to the value of the pilot reference level  
 32      adjustment that the mobile station is to make for the  
 33      transmission attributes with transmission rate 153600 bits/s  
 34      and 80ms frame. ~~The base station shall set the value in the~~  
 35      ~~range from 0 to 63 inclusive.~~

36      The base station shall set this field to the correction factor  
 37      expressed as a two’s complement value in units of 0.125 dB.

38      RC4\_RC6\_80MS\_INCL

- Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame included indicator.

40      If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

44      RL\_ATT\_ADJ\_GAIN-

45      \_28800\_80MS

- Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

1           If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 2           omit this field.

3           If RC4\_RC6\_80MS\_INCL is set to '1' and  
 4           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 5           set this field to the value of the nominal attribute gain  
 6           adjustment that the mobile station is to make for the  
 7           transmission attributes with transmission rate 28800 bits/s,  
 8           and 80ms frame. The base station shall set the value in the  
 9           range from -48 to 48 inclusive.

10          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 11          NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 12          this field to the value of the pilot reference level adjustment  
 13          that the mobile station is to make for the transmission  
 14          attributes with transmission rate 28800 bits/s and 80ms  
 15          frame. ~~The base station shall set the value in the range from~~  
 16          ~~0 to 63 inclusive.~~

17          The base station shall set this field to the correction factor  
 18          expressed as a two's complement value in units of 0.125 dB.

19        **RL\_ATT\_ADJ\_GAIN-**

20        **\_57600\_80MS**

21          - Reverse Link Attribute Adjustment Gain for the transmission  
           rate 57600 bits/s.

22          If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 23          omit this field.

24          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 25          NORM\_ATT\_GAIN\_TYPE is set to '0', the base station shall set  
 26          this field to the value of the nominal attribute gain adjustment  
 27          that the mobile station is to make for the transmission  
 28          attributes with transmission rate 57600 bits/s, and 80ms  
 29          frame. The base station shall set the value in the range from  
 30          -48 to 48 inclusive.

31          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 32          NORM\_ATT\_GAIN\_TYPE is set to '1', the base station shall set  
 33          this field to the value of the pilot reference level adjustment  
 34          that the mobile station is to make for the transmission  
 35          attributes with transmission rate 57600 bits/s and 80ms  
 36          frame. ~~The base station shall set the value in the range from~~  
 37          ~~0 to 63 inclusive.~~

38          The base station shall set this field to the correction factor  
 39          expressed as a two's complement value in units of 0.125 dB.

40        **RL\_ATT\_ADJ\_GAIN-**

41        **\_115200\_80MS**

42          - Reverse Link Attribute Adjustment Gain for the transmission  
           rate 115200 bits/s.

43          If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 44          omit this field.

1           If RC4\_RC6\_80MS\_INCL is set to '1' and  
 2           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 3           set this field to the value of the nominal attribute gain  
 4           adjustment that the mobile station is to make for the  
 5           transmission attributes with transmission rate 115200 bits/s,  
 6           and 80ms frame. The base station shall set the value in the  
 7           range from -48 to 48 inclusive.

8           If RC4\_RC6\_80MS\_INCL is set to '1' and  
 9           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 10          set this field to the value of the pilot reference level  
 11          adjustment that the mobile station is to make for the  
 12          transmission attributes with transmission rate 115200 bits/s  
 13          and 80ms frame. ~~The base station shall set the value in the~~  
 14          ~~range from 0 to 63 inclusive.~~

15          The base station shall set this field to the correction factor  
 16          expressed as a two's complement value in units of 0.125 dB.

17        **RL\_ATT\_ADJ\_GAIN-**

18        **\_259200\_80MS**

- Reverse Link Attribute Adjustment Gain for the transmission rate 259200 bits/s.

20          If RC4\_RC6\_80MS\_INCL is set to '0', the base station shall  
 21          omit this field.

22          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 23           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '0', the base station shall  
 24           set this field to the value of the nominal attribute gain  
 25           adjustment that the mobile station is to make for the  
 26           transmission attributes with transmission rate 259200 bits/s,  
 27           and 80ms frame. The base station shall set the value in the  
 28           range from -48 to 48 inclusive.

29          If RC4\_RC6\_80MS\_INCL is set to '1' and  
 30           RL\_ATT\_ADJ\_GAIN\_TYPE is set to '1', the base station shall  
 31           set this field to the value of the pilot reference level  
 32           adjustment that the mobile station is to make for the  
 33           transmission attributes with transmission rate 259200 bits/s  
 34           and 80ms frame. ~~The base station shall set the value in the~~  
 35           ~~range from 0 to 63 inclusive.~~

36          The base station shall set this field to the correction factor  
 37          expressed as a two's complement value in units of 0.125 dB.

38        **RESERVED**

- Reserved bits.

39          The base station shall add reserved bits as needed in order to  
 40          make the length of the entire record equal to an integer  
 41          number of octets. The base station shall set these bits to '0'.

## 1 3.7.3.3.2.26 Extended Neighbor List Update Message

2 MSG\_TAG: ENLUM

3

| Field              | Length (bits) |
|--------------------|---------------|
| PILOT_INC          | 4             |
| NGHBR_SRCH_MODE    | 2             |
| SRCH_WIN_N         | 4             |
| USE_TIMING         | 1             |
| GLOBAL_TIMING_INCL | 0 or 1        |
| GLOBAL_TX_DURATION | 0 or 4        |
| GLOBAL_TX_PERIOD   | 0 or 7        |
| NUM_NGHBR          | 6             |

NUM\_NGHBR occurrences of the following field:

|                   |        |
|-------------------|--------|
| NGHBR_PN          | 9      |
| SEARCH_PRIORITY   | 0 or 2 |
| SRCH_WIN_NGHBR    | 0 or 4 |
| TIMING_INCL       | 0 or 1 |
| NGHBR_TX_OFFSET   | 0 or 7 |
| NGHBR_TX_DURATION | 0 or 4 |
| NGHBR_TX_PERIOD   | 0 or 7 |

|                  |   |
|------------------|---|
| SRCH_OFFSET_INCL | 1 |
|------------------|---|

NUM\_NGHBR occurrences of the following record:

|                      |                            |
|----------------------|----------------------------|
| ADD_PILOT_REC_INCL   | 1                          |
| NGHBR_PILOT_REC_TYPE | 0 or 3                     |
| RECORD_LEN           | 0 or 3                     |
| Type-specific fields | 0 or $8 \times$ RECORD_LEN |
| SRCH_OFFSET_NGHBR    | 0 or 3                     |

4

- 5 PILOT\_INC - Pilot PN sequence offset index increment.  
 6 A mobile station searches for Remaining Set pilots at pilot PN  
 7 sequence index values that are multiples of this value.

The base station shall set this field to the pilot PN sequence increment, in units of 64 PN chips, that mobile stations are to use for searching the Remaining Set. The base station should set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

The base station shall set this field to a value in the range 1 to 15 inclusive.

- NGHBR\_SRCH\_MODE - Search mode.

The base station shall set this field to the value specified in Table 3.7.3.3.2.26-1 corresponding to the search mode.

**Table 3.7.3.3.2.26-1. NGHBR SRCH MODE Field**

| <b>Value<br/>(binary)</b> | <b>Description</b>                     |
|---------------------------|----------------------------------------|
| 00                        | No search priorities or search windows |
| 01                        | Search priorities                      |
| 10                        | Search windows                         |
| 11                        | Search windows and search priorities   |

- SRCH\_WIN\_N** - Default search window size for the Neighbor Set.

The base station shall set this field to the value specified in Table 2.6.6.2.1-1 corresponding to the default search window size to be used by the mobile station for its Neighbor Set. The mobile station uses the default search window size for all pilots in its Neighbor Set when the search window is not specified for each pilot individually (NGHBR\_SRCH\_MODE is set to a value other than '10' and '11').

- USE\_TIMING** - Use timing indicator.

If base station timing information is included for neighbor base stations, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- GLOBAL TIMING-

- \_INCL - Global timing included.

If USE\_TIMING is set to '1', the base station shall include the field GLOBAL\_TIMING\_INCL and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included globally for all neighbor base stations with TIMING\_INCL equal to '1', the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- GLOBAL TX-

- 1            \_DURATION    -    Global neighbor transmit time duration.  
2  
3  
4  
5  
If GLOBAL\_TIMING\_INCL is included and is set to '1', the base  
station shall include the field GLOBAL\_TX\_DURATION and  
shall set this field as described below; otherwise, the base  
station shall omit this field.
- 6            The base station shall set this field to the duration of the base  
7            station transmit window, during each period, in units of 80  
8            ms. The base station should set this field to a value of 3 or  
9            greater.
- 10          GLOBAL\_TX-  
11          \_PERIOD    -    Global neighbor transmit time period.  
12  
13  
14  
15  
If GLOBAL\_TIMING\_INCL is included and is set to '1', the base  
station shall include the field GLOBAL\_TX\_PERIOD and shall  
set this field as described below; otherwise, the base station  
shall omit this field.
- 16          The base station shall set this field to duration of the period,  
17            in units of 80 ms.
- 18          NUM\_NGHBR    -    Number of neighbor pilot PN sequences.  
19  
20          The base station shall set this field to the number of  
neighbors included in the message.
- 21          The base station shall include one occurrence of the following record for each pilot that a  
22            mobile station is to place in its Neighbor Set
- 23          NGHBR\_PN    -    Neighbor pilot PN sequence offset index.  
24  
25  
26  
The base station shall include one occurrence of this field for  
each pilot in its neighbor list. The base station shall set this  
field to the pilot's PN sequence offset, in units of 64 PN chips.
- 27          SEARCH\_PRIORITY    -    Pilot Channel search priority.  
28  
29  
30  
31  
32  
33  
If NGHBR\_SRCH\_MODE is set to '01' or '11', then the base  
station shall set this field to the search priority for this  
neighbor. The base station shall set the search priority as  
specified in Table 3.7.3.3.2.26-2. If NGHBR\_SRCH\_MODE is  
set to any other value, the base station shall omit this field.

**Table 3.7.3.3.2.26-2. SEARCH\_PRIORITY Field**

| <b>Value<br/>(binary)</b> | <b>Search Priority</b> |
|---------------------------|------------------------|
| 00                        | Low                    |
| 01                        | Medium                 |
| 10                        | High                   |
| 11                        | Very High              |

- 1
- 2
- 3      SRCH\_WIN\_NGHBR    - Neighbor pilot channel search window size.  
4  
5      If NGHBR\_SRCH\_MODE is set to '10' or '11', then the base  
6      station shall set this field to the value specified in Table  
7      2.6.6.2.1-1 corresponding to the search window size to be  
8      used by the mobile stations for this neighbor. If  
9      NGHBR\_SRCH\_MODE is set to any other value, the base  
station shall omit this field.
- 10     TIMING\_INCL       - Timing included indicator.  
11     If USE\_TIMING is set to '1', the base station shall include the  
12    field TIMING\_INCL and set this field as described below;  
13    otherwise, the base station shall omit this field.  
14    If base station timing information is included for this neighbor  
15    base station, the base station shall set this field to '1';  
16    otherwise, the base station shall set this field to '0'.
- 17     NGHBR\_TX\_OFFSET   - Neighbor transmit time offset.  
18     If TIMING\_INCL is included and is set to '1', the base station  
19    shall include the field NGHBR\_TX\_OFFSET and set this field  
20    as described below; otherwise, the base station shall omit this  
field.  
21  
22    The base station shall set this field to the time offset, in units  
23    of 80 ms, from the beginning of the neighbor timing period to  
24    the beginning of the first base station transmit window within  
25    the period. The beginning of the neighbor timing period  
26    occurs when  $\lfloor t/4 \rfloor \bmod (16384) = 0$ .
- 27     NGHBR\_TX\_DURATION - Neighbor transmit time duration.  
28     If TIMING\_INCL is included and is set to '1' and  
29    GLOBAL\_TIMING\_INCL is set to '0', the base station shall  
30    include the field NGHBR\_TX\_DURATION and set this field as  
31    described below; otherwise, the base station shall omit this  
field.  
32  
33    The base station shall set this field to duration of the base  
34    station transmit window, during each period, in units of  
35    80 ms. The base station should set this field to a value of 3 or  
36    greater.
- 37     NGHBR\_TX\_PERIOD   - Neighbor transmit time period.

1                   If TIMING\_INCL is included and is set to ‘1’ and  
 2                   GLOBAL\_TIMING\_INCL is set to ‘0’, the base station shall  
 3                   include the field NGHBR\_TX\_PERIOD and set this field as  
 4                   described below; otherwise, the base station shall omit this  
 5                   field.

6                   The base station shall set this field to duration of the period,  
 7                   in units of 80 ms.

8     SRCH\_OFFSET\_INCL - Neighbor pilot channel search window offset included.

9                   If NGHBR\_SRCH\_MODE = ‘10’ or ‘11’ and if the  
 10                  SRCH\_OFFSET\_NGHBR field is included in the following  
 11                  records, the base station shall set this bit to ‘1’; otherwise, the  
 12                  base station shall set this bit to ‘0’.

13                  The base station shall include one occurrence of the following record for each pilot that a  
 14                  mobile station is to place in its Neighbor Set. The base station shall use the same order for  
 15                  the following record as is used for previous pilots which are listed in this message.  
 16                  Specifically, the  $i^{th}$  occurrence of the following record shall correspond the  $i^{th}$  pilot in this  
 17                  message.

18     ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.

19                  The base station shall set this field to ‘1’ if additional pilot  
 20                  information listed in NGHBR\_PILOT\_REC\_TYPE and  
 21                  RECORD\_LEN fields are included. The base station shall set  
 22                  this field to ‘0’ if the corresponding pilot is the common pilot  
 23                  and there is no additional pilot information included.

24     NGHBR\_PILOT-

25        \_REC\_TYPE - Neighbor Pilot record type

26                  If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 27                  set this field to the NGHBR\_PILOT\_REC\_TYPE value shown in  
 28                  Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record  
 29                  specified by this record.

30                  If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 31                  omit this field.

32        RECORD\_LEN - Pilot record length.

33                  If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 34                  set this field to the number of octets in the type-specific fields  
 35                  of this pilot record.

36                  If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 37                  omit this field.

38     Type-specific fields - Pilot record type-specific fields.

39                  If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 40                  include type-specific fields based on the  
 41                  NGHBR\_PILOT\_REC\_TYPE of this pilot record.

42                  If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 43                  omit this field.

1 If NGHBR\_PILOT\_REC\_TYPE is equal to '000', the base station shall include the following  
 2 fields:

3

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| TD_POWER_LEVEL | 2                    |
| TD_MODE        | 2                    |
| RESERVED       | 4                    |

4

- 5 TD\_POWER\_LEVEL - TD Transmit Power Level.  
 6 The base station shall set this field to the TD transmit power  
 7 level relative to that of the Forward Pilot Channel as specified  
 8 in Table 3.7.2.3.2.26-4.
- 9 TD\_MODE - Transmit Diversity mode.  
 10 The base station shall set this field to the Transmit Diversity  
 11 mode, as specified in Table 3.7.2.3.2.26-3.
- 12 RESERVED - Reserved bits.  
 13 The base station shall set this field to '0000'.

14 If NGHBR\_PILOT\_REC\_TYPE is equal to '001', the base station shall include the following  
 15 fields:

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| QOF             | 2                    |
| WALSH_LENGTH    | 3                    |
| AUX_PILOT_WALSH | WALSH_LENGTH+6       |
| RESERVED        | 0 to 7 (as needed)   |

16

- 17 QOF - Quasi-orthogonal function index.  
 18 The base station shall set this field to the index of the Quasi-  
 19 orthogonal function (see Table 3.1.3.1.12-2 of [2]).
- 20 WALSH\_LENGTH - Length of the Walsh code.  
 21 The base station shall set this field to the WALSH\_LENGTH  
 22 value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 23 length of the Walsh code for the pilot that is used in as the  
 24 Auxiliary Pilot.
- 25 AUX\_PILOT\_WALSH - Walsh code for the Auxiliary Pilot.  
 26 The base station shall set this field to the Walsh code  
 27 corresponding to the Auxiliary Pilot.
- 28 RESERVED - Reserved bits.

1                   The base station shall set all the bits of this field to '0' to make  
 2                   the entire record octet-aligned.

3       If NGHBR\_PILOT\_REC\_TYPE is equal to '010', the base station shall include the following  
 4       fields:

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| QOF                | 2                    |
| WALSH_LENGTH       | 3                    |
| AUX_WALSH          | WALSH_LENGTH+6       |
| AUX_TD_POWER_LEVEL | 2                    |
| TD_MODE            | 2                    |
| RESERVED           | 0 to 7 (as needed)   |

6  
 7                   QOF     - Quasi-orthogonal function index for the Auxiliary Transmit  
 8                   Diversity Pilot.

9                   The base station shall set this field to the index of the Quasi-  
 10                  orthogonal function (see Table 3.1.3.1.12-2 of [2]).

11                  WALSH\_LENGTH - Length of the Walsh code.

12                  The base station shall set this field to the WALSH\_LENGTH  
 13                  value shown in 3.7.2.3.2.22-6 corresponding to the length of  
 14                  the Walsh code for the pilots that are used as Auxiliary pilot  
 15                  in the transmit diversity mode.

16                  AUX\_WALSH - Walsh code for the Auxiliary Pilot.

17                  The base station shall set this field to the Walsh code  
 18                  corresponding to the Auxiliary Pilot.

19                  AUX\_TD-  
 20                  \_POWER\_LEVEL - Auxiliary Transmit Diversity Pilot power level.

21                  The base station shall set this field to the Auxiliary Transmit  
 22                  Diversity Pilot transmit power level relative to that of the  
 23                  Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.

24                  TD\_MODE - Transmit Diversity mode.

25                  The base station shall set this field to the Transmit Diversity  
 26                  mode, as specified in Table 3.7.2.3.2.26-3.

27                  RESERVED - Reserved bits.

28                  The base station shall set all the bits of this field to '0' to make  
 29                  the entire record octet-aligned.

30       If NGHBR\_PILOT\_REC\_TYPE is equal to '011', the base station shall include the following  
 31       fields:

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SR3_PRIMARY_PILOT | 2                    |
| SR3_PILOT_POWER1  | 3                    |
| SR3_PILOT_POWER2  | 3                    |
| <b>RESERVED</b>   | <b>7</b>             |

- 1
- 2    SR3\_PRIMARY\_PILOT    – Primary SR3 pilot.  
   3    The base station shall set this field to the value shown in  
   4    Table 3.7.2.3.2.26-5 corresponding to the position of the  
   5    primary SR3 pilot.
- 6    SR3\_PILOT\_POWER1    – The primary SR3 pilot power level relative to that of the pilot  
   7    on the lower frequency of the two remaining SR3 frequencies.  
   8    The base station shall set this field to the value shown in  
   9    Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 10   primary pilot with respect to the pilot on the lower frequency  
 11   of the two remaining SR3 frequencies.
- 12   SR3\_PILOT\_POWER2    – The primary SR3 pilot power level relative to that of the pilot  
 13   on the higher frequency of the two remaining SR3 frequencies.  
 14   The base station shall set this field to the value shown in  
 15   Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 16   primary pilot with respect to the pilot on the higher frequency  
 17   of the two remaining SR3 frequencies.
- 18   **RESERVED**    Reserved bits.  
 19   **The base station shall set this field to '0000000'.**
- 20
- 21   If NGHBR\_PILOT\_REC\_TYPE is equal to '100', the base station shall include the following  
 22   fields:

| <b>Field</b>      | <b>Length (bits)</b>    |
|-------------------|-------------------------|
| SR3_PRIMARY_PILOT | 2                       |
| SR3_PILOT_POWER1  | 3                       |
| SR3_PILOT_POWER2  | 3                       |
| QOF               | 2                       |
| WALSH_LENGTH      | 3                       |
| AUX_PILOT_WALSH   | WALSH_LENGTH+6          |
| ADD_INFO_INCL1    | 1                       |
| QOF1              | 0 or 2                  |
| WALSH_LENGTH1     | 0 or 3                  |
| AUX_PILOT_WALSH1  | 0 or<br>WALSH_LENGTH1+6 |
| ADD_INFO_INCL2    | 1                       |
| QOF2              | 0 or 2                  |
| WALSH_LENGTH2     | 0 or 3                  |
| AUX_PILOT_WALSH2  | 0 or<br>WALSH_LENGTH2+6 |
| RESERVED          | 0 – 7 (as needed)       |

- 1      SR3\_PRIMARY\_PILOT      - Primary SR3 pilot.  
 2  
 3  
 4      The base station shall set this field to the value shown in  
       Table 3.7.2.3.2.26-5 corresponding to the position of the  
       primary SR3 pilot.
- 5      SR3\_PILOT\_POWER1      - The primary SR3 pilot power level relative to that of the pilot  
 6      on the lower frequency of the two remaining SR3 frequencies.  
 7  
 8      The base station shall set this field to the value shown in  
       Table 3.7.2.3.2.26-6 corresponding to the power level of the  
       primary pilot with respect to the pilot on the lower frequency  
       of the two remaining SR3 frequencies.
- 9  
 10     SR3\_PILOT\_POWER2     - The primary SR3 pilot power level relative to that of the pilot  
       on the higher frequency of the two remaining SR3 frequencies.  
 11  
 12     The base station shall set this field to the value shown in  
       Table 3.7.2.3.2.26-6 corresponding to the power level of the  
       primary pilot with respect to the pilot on the higher frequency  
       of the two remaining SR3 frequencies.
- 13  
 14     QOF      - Quasi-orthogonal function index.  
 15  
 16     The base station shall set this field to the index of the Quasi-  
       orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the  
       frequency of the primary pilot.
- 17  
 18     WALSH\_LENGTH     - Length of the Walsh Code.

The base station shall set this field to the WALSH\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

- |                  |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUX_PILOT_WALSH  | - | Walsh Code for the Auxiliary Pilot.<br><br>The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.                                                                                                                                                                                                                                                                                                                                     |
| ADD_INFO_INCL1   | - | Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.<br><br>If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.                                                                                                                                  |
| QOF1             | - | Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.<br><br>If ADD_INFO_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:<br><br>The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the lower frequency of the two remaining SR3 frequencies.                                                                    |
| WALSH_LENGTH1    | - | Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.<br><br>If ADD_INFO_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:<br><br>The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies. |
| AUX_PILOT_WALSH1 | - | Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.<br><br>If ADD_INFO_INCL1 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:<br><br>The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.                                                                                                      |
| ADD_INFO_INCL2   | - | Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.                                                                                                                                                                                                                                                                                                                                                                                                        |

If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.

- QOF2 - Quasi-orthogonal function index for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD\_INFO\_INCL2 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the higher frequency of the two remaining SR3 frequencies.

- WALSH\_LENGTH2 - Length of the Walsh Code for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD\_INFO\_INCL2 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH\_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

- AUX\_PILOT\_WALSH2 - Walsh Code for the Auxiliary Pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD\_INFO\_INCL2 is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

- RESERVED - Reserved bits.

The base station shall set all the bits of this field to '0' to make the entire record octet-aligned.

- SRCH\_OFFSET\_NGHBR - Neighbor pilot channel search window offset.

If SRCH\_OFFSET\_INCL equals to '1', then the base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this neighbor; otherwise, the base station shall omit this field.

## 1    3.7.3.3.2.27 Candidate Frequency Search Request Message

2    MSG\_TAG: CFSRQM

3

| <b>Field</b>         | <b>Length (bits)</b>     |
|----------------------|--------------------------|
| USE_TIME             | 1                        |
| ACTION_TIME          | 6                        |
| RESERVED_1           | 4                        |
| CFSRM_SEQ            | 2                        |
| SEARCH_TYPE          | 2                        |
| SEARCH_PERIOD        | 4                        |
| SEARCH_MODE          | 4                        |
| MODE_SPECIFIC_LEN    | 8                        |
| Mode-specific fields | 8 ×<br>MODE_SPECIFIC_LEN |
| ALIGN_TIMING         | 1                        |
| SEARCH_OFFSET        | 0 or 6                   |

4

5    USE\_TIME    -    Use action time indicator.

6    This field indicates whether an explicit action time is specified  
7    in this message.8    If an explicit action time is specified in this message, the base  
9    station shall set this field to '1'; otherwise, the base station  
10   shall set this field to '0'.11   If the base station requests the mobile station to perform an  
12   aligned search (see 2.6.6.2.8.3), the base station shall specify  
13   an explicit action time for the message.

14   ACTION\_TIME    -    Action time.

15   If the USE\_TIME field is set to '1', the base station shall set  
16   this field to the System Time, in units of 80 ms (modulo 64),  
17   at which the message is to take effect. If the USE\_TIME field  
18   is set to '0' the base station shall set this field to '000000'.

19   RESERVED\_1    -    Reserved bits.

20   The base station shall set this field to '0000'.

21   CFSRM\_SEQ    -    *Candidate Frequency Search Request Message* sequence  
22   number.23   The base station shall set this field to the *Candidate*  
24   *Frequency Search Request Message* sequence number, as  
25   specified in 2.6.6.2.2.3.

- 1           SEARCH\_TYPE   -   Search command.  
 2  
 3  
 4  
 5  
 The base station shall set this field to the appropriate  
 SEARCH\_TYPE code from Table 3.7.3.3.2.27-1 to indicate the  
 purpose of the message.

**Table 3.7.3.3.2.27-1. SEARCH\_TYPE Codes**

| <b>SEARCH_TYPE<br/>(binary)</b> | <b>Meaning</b>                                                                                          |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| 00                              | Directs the mobile station to stop any periodic search in progress (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4) |
| 01                              | Directs the mobile station to perform a single search (see 2.6.6.2.8.3.1 and 2.6.6.2.10.1).             |
| 11                              | Directs the mobile station to perform a periodic search (see 2.6.6.2.8.3.2 and 2.6.6.2.10.2).           |
| 10                              | Reserved.                                                                                               |

- 7  
 8           SEARCH\_PERIOD   -   Time between successive searches on the Candidate  
 9           Frequency for periodic searches.

10  
 11           The base station shall set this field to the SEARCH\_PERIOD  
 12           value shown in Table 2.6.6.2.8.3.2-1 corresponding to the  
 13           search period to be used by the mobile station, i.e., the time  
 14           between the beginning of successive searches on the  
 Candidate Frequency.

- 15           SEARCH\_MODE   -   Search mode.

16  
 17           The base station shall set this field to the SEARCH\_MODE  
 18           value specified in Table 3.7.3.3.2.27-2 corresponding to the  
 19           type of search specified by this message.

**Table 3.7.3.3.2.27-2. SEARCH\_MODE Types**

| <b>SEARCH_MODE<br/>(binary)</b> | <b>Description</b>                                 |
|---------------------------------|----------------------------------------------------|
| 0000                            | Searches for CDMA pilots on a Candidate Frequency. |
| 0001                            | Searches for analog channels.                      |
| 0010                            | Searches for Direct Spread (DS) neighbor cell.     |
| 0011-1111                       | Reserved                                           |

- 1    MODE\_SPECIFIC\_LEN    -    Length of mode-specific fields.  
 2                             The base station shall set this field to the number of octets in  
 3                             the mode-specific fields of this message.  
 4    Mode-specific fields    -    Search mode-specific fields.  
 5                             The base station shall include mode-specific fields based on  
 6                             the SEARCH\_MODE field.

7    If SEARCH\_MODE is equal to '0000', the base station shall include the following fields:

8

| <b>Field</b>          | <b>Length (bits)</b> |
|-----------------------|----------------------|
| BAND_CLASS            | 5                    |
| CDMA_FREQ             | 11                   |
| SF_TOTAL_EC_THRESH    | 5                    |
| SF_TOTAL_EC_IO_THRESH | 5                    |
| DIFF_RX_PWR_THRESH    | 5                    |
| MIN_TOTAL_PILOT_EC_IO | 5                    |
| CF_T_ADD              | 6                    |
| TF_WAIT_TIME          | 4                    |
| CF_PILOT_INC          | 4                    |
| CF_SRCH_WIN_N         | 4                    |
| CF_SRCH_WIN_R         | 4                    |
| RESERVED_2            | 5                    |
| PILOT_UPDATE          | 1                    |

If PILOT\_UPDATE is set to '1' the base station shall include the following record:

|                    |   |
|--------------------|---|
| NUM_PILOTS         | 6 |
| CF_NGHBR_SRCH_MODE | 2 |

If PILOT\_UPDATE is set to '1', the base station shall include NUM\_PILOTS occurrences of the following record:

|                 |        |
|-----------------|--------|
| NGHBR_PN        | 9      |
| SEARCH_SET      | 1      |
| SEARCH_PRIORITY | 0 or 2 |
| SRCH_WIN_NGHBR  | 0 or 4 |

If PILOT\_UPDATE is set to '1', the base station shall include the following field:

|                     |   |
|---------------------|---|
| CF_SRCH_OFFSET_INCL | 1 |
|---------------------|---|

9

(continues on next page)

1

| Field | Length (bits) |
|-------|---------------|
|-------|---------------|

If PILOT\_UPDATE is set to '1', the base station shall include NUM\_PILOTS occurrences of the following record:

|                      |                                    |
|----------------------|------------------------------------|
| ADD_PILOT_REC_INCL   | 1                                  |
| NGHBR_PILOT_REC_TYPE | 0 or 3                             |
| RECORD_LEN           | 0 or 3                             |
| Type-specific fields | 0 or $8 \times \text{RECORD\_LEN}$ |
| SRCH_OFFSET_NGHBR    | 0 or 3                             |

|            |                   |
|------------|-------------------|
| RESERVED_3 | 0 - 7 (as needed) |
|------------|-------------------|

2

- 3            BAND\_CLASS    - Band class.  
4                 The base station shall set this field to the CDMA band class of  
5                 the Candidate Frequency.
- 6            CDMA\_FREQ    - Frequency assignment.  
7                 The base station shall set this field to the CDMA frequency  
8                 assignment for the Candidate Frequency.
- 9            SF\_TOTAL\_EC-  
10            \_THRESH    - Serving Frequency total pilot  $E_c$  threshold.  
11                 If the mobile station is not to use the measurement of total  $E_c$   
12                 of the pilots in the Serving Frequency Active Set in the  
13                 Candidate Frequency periodic search procedure, the base  
14                 station shall set this field to '11111'; otherwise, the base  
15                 station shall set this field to  
16                  $\lceil (10 \times \log_{10} (\text{total\_ec\_thresh}) + 120) / 2 \rceil$   
17                 where *total\_ec\_thresh* is defined by the following rule: The  
18                 mobile station is not to visit the CDMA Candidate Frequency  
19                 to search for pilots if the total  $E_c$  of the pilots in the Serving  
20                 Frequency Active Set is greater than *total\_ec\_thresh*.
- 21            SF\_TOTAL\_EC-  
22            \_IO\_THRESH    - Serving Frequency total pilot  $E_c/I_o$  threshold.  
23                 If the mobile station is not to use the measurement of total  
24                  $E_c/I_o$  of the pilots in the Serving Frequency Active Set in the  
25                 Candidate Frequency periodic search procedure, the base  
26                 station shall set this field to '11111'; otherwise, the base  
27                 station shall set this field to  
28                  $\lfloor -20 \times \log_{10} (\text{total\_ec\_io\_thresh}) \rfloor$

1 where *total\_ec\_io\_thresh* is defined by the following rule: The  
 2 mobile station is not to visit the CDMA Candidate Frequency  
 3 to search for pilots if the total  $E_c/I_o$  of the pilots in the  
 4 Serving Frequency Active Set is greater than  
 5 *total\_ec\_io\_thresh*.

## 6 DIFF\_RX\_PWR-

- 7        \_THRESH    - Minimum difference in received power.  
 8        If this message is used for the Candidate Frequency single or  
 9        periodic search procedure:

10 If the mobile station is to search for pilots on the CDMA  
 11 Candidate Frequency irrespective of the received power on  
 12 the Candidate Frequency, the base station shall set this  
 13 field to '00000'; otherwise, the base station shall set this  
 14 field to

$$\lceil (minimum\_power\_diff + 30) / 2 \rceil$$

15 where *minimum\_power\_diff* is determined by the following  
 16 rule: The mobile station is not to search for pilots on the  
 17 CDMA Candidate Frequency if  $(cand\_freq\_pwr -$   
 18 *serving\_freq\_pwr*) is less than *minimum\_power\_diff* (in dB),  
 19 where *cand\_freq\_pwr* is the received power on the CDMA  
 20 Candidate Frequency, in dBm / 1.23 MHz, and  
 21 *serving\_freq\_pwr* is the received power on the Serving  
 22 Frequency, in dBm / 1.23 MHz.

- 23  
 24        If this message is used for the Hard Handoff with Return on  
 25        Failure procedure:

26        If the mobile station is to continue hard handoff  
 27        procedures irrespective of the received power on the Target  
 28        Frequency, the base station shall set this field to '00000';  
 29        otherwise, the base station shall set this field to

$$\lceil (minimum\_power\_diff + 30) / 2 \rceil$$

30  
 31        where *minimum\_power\_diff* is determined by the following  
 32        rule: The mobile station is to declare the handoff attempt  
 33        to be unsuccessful if  $(target\_freq\_pwr - serving\_freq\_pwr)$  is  
 34        less than *minimum\_power\_diff* (in dB), where  
 35        *target\_freq\_pwr* is the received power on the CDMA Target  
 36        Frequency, in dBm / 1.23 MHz, and *serving\_freq\_pwr* is  
 37        the received power on the Serving Frequency, in dBm /  
 38        1.23 MHz.

## 39 MIN\_TOTAL\_PILOT-

- 40        \_EC\_IO    - Minimum total pilot  $E_c/ I_o$ .

- 41        If this message is used for the Candidate Frequency periodic  
 42        search procedure:

1                   If the mobile station is to search for pilots on the CDMA  
 2                   Candidate Frequency irrespective of the strength of pilots  
 3                   in the Candidate Frequency Search Set, the base station  
 4                   shall set this field to '00000'; otherwise, the base station  
 5                   shall set this field to

$$\lfloor -20 \times \log_{10} \text{total pilot threshold} \rfloor$$

7                   where *total pilot threshold* is defined by the following rule:  
 8                   The mobile station is not to send the *Candidate Frequency*  
 9                   *Search Report Message* if the sum of  $E_c/I_o$  of all pilots in  
 10                  the mobile station's Candidate Frequency Search Set that  
 11                  measure above CF\_T\_ADD is less than  
 12                  *total pilot threshold*.

13                  If this message is used for the Hard Handoff with Return on  
 14                  Failure procedure:

15                  If the mobile station is to attempt to demodulate the  
 16                  Forward Traffic Channels irrespective of the strength of  
 17                  pilots in the Active Set, the base station shall set this field  
 18                  to '00000'; otherwise, the base station shall set this field to

$$\lfloor -20 \times \log_{10} \text{total pilot threshold} \rfloor$$

20                  where *total pilot threshold* is defined by the following rule:  
 21                  The mobile station is not to attempt to demodulate the  
 22                  Forward Traffic Channels if the sum of  $E_c/I_o$  of all pilots  
 23                  in the mobile station's Active Set is less than  
 24                  *total pilot threshold*.

- |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 25 | CF_T_ADD     | - Pilot detection threshold for the CDMA Candidate Frequency.<br><br>This value is used by the mobile station to trigger the sending of the <i>Candidate Frequency Search Report Message</i> during a periodic search of the CDMA Candidate Frequency (see 2.6.6.2.8.3.2).<br><br>The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ . |
| 33 | TF_WAIT_TIME | - The total maximum wait time on the CDMA Target Frequency.<br><br>The base station shall set this field to the maximum wait time, in units of 80 ms, that the mobile station is to spend waiting for a period of ( $N_{11m} \times 20$ ) ms with sufficient signal quality (e.g. good frames) on the CDMA Target Frequency.                                                                                                                                        |
| 38 | CF_PILOT_INC | - Pilot PN sequence offset index increment to be used on the CDMA Candidate Frequency after handoff.                                                                                                                                                                                                                                                                                                                                                                |

The base station shall set this field to the pilot PN sequence increment, in units of 64 PN chips, that the mobile station is to use for searching the Remaining Set, after a handoff to the CDMA Candidate Frequency is successfully completed. The base station should set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

- Default search window size for the Candidate Frequency Search Set.

The base station shall set this field to the value specified in Table 2.6.6.2.1-1 corresponding to the default search window size to be used by the mobile station for its Candidate Frequency Neighbor\_Search Set. The mobile station uses the default search window size for all pilots in its Candidate Frequency Neighbor\_Search Set when the search window has not been specified for each pilot individually.

- Search window size for the Remaining Set on the CDMA Candidate Frequency.

The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Remaining Set on the CDMA Candidate Frequency after a handoff is successfully completed.

- Reserved bits.

The base station shall set this field to '00000'.

- Pilot search parameter update indicator.

If the mobile station is to change its pilot search parameters, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- Number of pilots included in the message.

The base station shall set this field to the number of the CDMA Candidate Frequency pilots included in this message. The base station shall set this field to a value from 0 to N8m, inclusive.

- Search made for Candidate Frequency Search Set

The base station shall set this field to the value shown in Table 3.7.3.3.2.27.3 corresponding to the search mode.

1  
Table 3.7.3.3.2.27-3. CF\_NGHBR\_SRCH\_MODE Field

| Value<br>(binary) | Description                                      |
|-------------------|--------------------------------------------------|
| 00                | No search priorities or search windows specified |
| 01                | Search priorities specified                      |
| 10                | Search windows specified                         |
| 11                | Search windows and search priorities specified   |

2  
3 The base station shall include NUM\_PILOTS occurrences of the following four-field record,  
4 one for each included CDMA Candidate Frequency pilot.

5 NGHBR\_PN - Neighbor pilot PN sequence offset index.  
6 The base station shall set this field to the pilot's PN sequence  
7 offset, in units of 64 PN chips.

8 SEARCH\_SET - Flag to indicate if the corresponding pilot is to be searched.  
9 The base station shall set this field to '1' if the mobile station  
10 should add the corresponding pilot to its Candidate Frequency  
11 Search Set; otherwise, the base station shall set this field to  
12 '0'.

13 SEARCH\_PRIORITY - Pilot Channel search priority.  
14 If CF\_NGHBR\_SRCH\_MODE is set to '01' or '11', then the base  
15 station shall set this field to the search priority for this  
16 neighbor. The base station shall set the search priority as  
17 specified in Table 3.7.3.3.2.26-2. If CF\_NGHBR\_SRCH\_MODE  
18 is set to any other value, the base station shall omit this field.

19 SRCH\_WIN\_NGHBR - Neighbor pilot channel search window size.  
20 If CF\_NGHBR\_SRCH\_MODE is set to '10' or '11', then the base  
21 station shall set this field to the value specified in  
22 Table 2.6.6.2.1-1 corresponding to the search window size to  
23 be used by mobile stations for this neighbor. If the  
24 CF\_NGHBR\_SRCH\_MODE is set to any other value, the base  
25 station shall omit this field.

26 CF\_SRCH\_OFFSET\_INCL - Neighbor pilot channel search window offset included.  
27 If PILOT\_UPDATE is set to '0', the base station shall omit this  
28 field; otherwise, the base station shall include this field and  
29 set it as follows:

30 If CF\_NGHBR\_SRCH\_MODE is set to '10' or '11' and if  
31 SRCH\_OFFSET\_NGHBR is included in the message, the base  
32 station shall set this bit to '1'; otherwise, the base station  
33 shall set this bit to '0'.

34 If PILOT\_UPDATE is set to '1', the base station shall include NUM\_PILOTS occurrences of  
35 the following four-field record, one for each included CDMA Candidate Frequency Pilot.

36 ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.

The base station shall set this field to '1' if additional pilot information listed in NGHBR\_PILOT\_REC\_TYPE and RECORD\_LEN fields are included. The base station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

NGHBR\_PILOT-

\_REC\_TYPE

- Neighbor Pilot record type

If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall set this field to the NGHBR\_PILOT\_REC\_TYPE value shown in Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record specified by this record.

If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.

14 RECORD\_LEN

- Pilot record length.

If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.

20 Type-specific fields

- Pilot record type-specific fields.

If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall include type-specific fields based on the NGHBR\_PILOT\_REC\_TYPE of this pilot record.

If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.

If NGHBR\_PILOT\_REC\_TYPE is equal to '000', the base station shall include the following fields:

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| TD_POWER_LEVEL | 2                    |
| TD_MODE        | 2                    |
| RESERVED       | 4                    |

29

### TD POWER LEVEL

- TD Transmit Power Level.

The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

34 TD\_MODE

- Transmit Diversity mode.

The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

37 RESERVED

- Reserved bits.

1                   The base station shall set these bits to '0000'.

2       If NGHBR\_PILOT\_REC\_TYPE is equal to '001', the base station shall include the following  
3       fields:

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| QOF             | 2                    |
| WALSH_LENGTH    | 3                    |
| AUX_PILOT_WALSH | WALSH_LENGTH+6       |
| RESERVED        | 0 to 7 (as needed)   |

4

5       QOF     - Quasi-orthogonal function index.

6                   The base station shall set this field to the index of the Quasi-  
7                   orthogonal function (see Table 3.1.3.1.12-2 of [2]).

8       WALSH\_LENGTH     - Length of the Walsh code.

9                   The base station shall set this field to the WALSH\_LENGTH  
10                  value shown in Table 3.7.2.3.2.22-6 corresponding to the  
11                  length of the Walsh code for the pilot that is used in as the  
12                  Auxiliary pilot.

13      AUX\_PILOT\_WALSH     - Walsh code for the Auxiliary Pilot.

14                   The base station shall set this field to the Walsh code  
15                  corresponding to the Auxiliary Pilot.

16      RESERVED     - Reserved bits.

17                   The base station shall set all the bits of this field to '0' to make  
18                  the entire record octet-aligned.

19       If NGHBR\_PILOT\_REC\_TYPE is equal to '010', the base station shall include the following  
20       fields:

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| QOF                | 2                    |
| WALSH_LENGTH       | 3                    |
| AUX_WALSH          | WALSH_LENGTH+6       |
| AUX_TD_POWER_LEVEL | 2                    |
| TD_MODE            | 2                    |
| RESERVED           | 0 to 7 (as needed)   |

22

23       QOF     - Quasi-orthogonal function index for the Auxiliary Transmit  
24                  Diversity Pilot.

25                   The base station shall set this field to the index of the Quasi-  
26                  orthogonal function (see Table 3.1.3.1.12-2 of [2]).

- 1           WALSH\_LENGTH    - Length of the Walsh code.  
 2                             The base station shall set this field to the WALSH\_LENGTH  
 3                             value shown in 3.7.2.3.2.22-6 corresponding to the length of  
 4                             the Walsh code for the pilots that are used as Auxiliary pilot  
 5                             in the transmit diversity mode.
- 6           AUX\_WALSH      - Walsh code for the Auxiliary Pilot.  
 7                             The base station shall set this field to the Walsh code  
 8                             corresponding to the Auxiliary Pilot.
- 9           AUX\_TD-  
 10          \_POWER\_LEVEL    - Auxiliary Transmit Diversity Pilot power level.  
 11                             The base station shall set this field to the Auxiliary Transmit  
 12                             Diversity Pilot transmit power level relative to that of the  
 13                             Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.
- 14          TD\_MODE        - Transmit Diversity mode.  
 15                             The base station shall set this field to the Transmit Diversity  
 16                             mode, as specified in Table 3.7.2.3.2.26-3.
- 17          RESERVED        - Reserved bits.  
 18                             The base station shall set all the bits of this field to '0' to make  
 19                             the entire record octet-aligned.

20       If NGHBR\_PILOT\_REC\_TYPE is equal to '011', the base station shall include the following  
 21       fields:

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SR3_PRIMARY_PILOT | 2                    |
| SR3_PILOT_POWER1  | 3                    |
| SR3_PILOT_POWER2  | 3                    |

- 22  
 23       SR3\_PRIMARY\_PILOT    - Primary SR3 pilot.  
 24                             The base station shall set this field to the value shown in  
 25                             Table 3.7.2.3.2.26-5 corresponding to the position of the  
 26                             primary SR3 pilot.
- 27       SR3\_PILOT\_POWER1    - The primary SR3 pilot power level relative to that of the pilot  
 28                             on the lower frequency of the two remaining SR3 frequencies.  
 29                             The base station shall set this field to the value shown in  
 30                             Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 31                             primary pilot with respect to the pilot on the lower frequency  
 32                             of the two remaining SR3 frequencies.
- 33       SR3\_PILOT\_POWER2    - The primary SR3 pilot power level relative to that of the pilot  
 34                             on the higher frequency of the two remaining SR3 frequencies.  
 35                             The base station shall set this field to the value shown in  
 36                             Table 3.7.2.3.2.26-6 corresponding to the power level of the  
 37                             primary pilot with respect to the pilot on the higher frequency  
 38                             of the two remaining SR3 frequencies.

1 | **RESERVED**      Reserved bits.

2 | ~~The base station shall set this field to ‘0000000’.~~

3 |  
4 | If NGHBR\_PILOT\_REC\_TYPE is equal to ‘100’, the base station shall include the following  
5 | fields:

| <b>Field</b>      | <b>Length (bits)</b>    |
|-------------------|-------------------------|
| SR3_PRIMARY_PILOT | 2                       |
| SR3_PILOT_POWER1  | 3                       |
| SR3_PILOT_POWER2  | 3                       |
| QOF               | 2                       |
| WALSH_LENGTH      | 3                       |
| AUX_PILOT_WALSH   | WALSH_LENGTH+6          |
| ADD_INFO_INCL1    | 1                       |
| QOF1              | 0 or 2                  |
| WALSH_LENGTH1     | 0 or 3                  |
| AUX_PILOT_WALSH1  | 0 or<br>WALSH_LENGTH1+6 |
| ADD_INFO_INCL2    | 1                       |
| QOF2              | 0 or 2                  |
| WALSH_LENGTH2     | 0 or 3                  |
| AUX_PILOT_WALSH2  | 0 or<br>WALSH_LENGTH2+6 |
| RESERVED          | 0 – 7 (as needed)       |

- 6 | SR3\_PRIMARY\_PILOT    - Primary SR3 pilot.  
7 |  
8 | The base station shall set this field to the value shown in  
9 | Table 3.7.2.3.2.26-5 corresponding to the position of the  
primary SR3 pilot.
- 10 | SR3\_PILOT\_POWER1    - The primary SR3 pilot power level relative to that of the pilot  
11 | on the lower frequency of the two remaining SR3 frequencies.  
12 |  
13 | The base station shall set this field to the value shown in  
14 | Table 3.7.2.3.2.26-6 corresponding to the power level of the  
15 | primary pilot with respect to the pilot on the lower frequency  
of the two remaining SR3 frequencies.
- 16 | SR3\_PILOT\_POWER2    - The primary SR3 pilot power level relative to that of the pilot  
17 | on the higher frequency of the two remaining SR3 frequencies.  
18 |  
19 | The base station shall set this field to the value shown in  
20 | Table 3.7.2.3.2.26-6 corresponding to the power level of the  
21 | primary pilot with respect to the pilot on the higher frequency  
of the two remaining SR3 frequencies.

- 1                   QOF     - Quasi-orthogonal function index.  
 2                   The base station shall set this field to the index of the Quasi-  
 3                   orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the  
 4                   frequency of the primary pilot.
- 5                   WALSH\_LENGTH     - Length of the Walsh Code.  
 6                   The base station shall set this field to the WALSH\_LENGTH  
 7                   value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 8                   length of the Walsh code for the pilot that is used as the  
 9                   Auxiliary pilot on the frequency of the primary pilot.
- 10                  AUX\_PILOT\_WALSH     - Walsh Code for the Auxiliary Pilot.  
 11                  The base station shall set this field to the Walsh code  
 12                  corresponding to the Auxiliary pilot on the frequency of the  
 13                  primary pilot.
- 14                  ADD\_INFO\_INCL1     - Additional information included for the pilot on the lower  
 15                  frequency of the two remaining SR3 frequencies.  
 16                  If the additional information for the pilot on the lower  
 17                  frequencies of the two remaining SR3 frequencies is the same  
 18                  as pilot on the primary frequency, the base station shall set  
 19                  this field to '0'; otherwise, the base station shall set this field  
 20                  to '1'.
- 21                  QOF1     - Quasi-orthogonal function index for the pilot on the lower  
 22                  frequency of the two remaining SR3 frequencies.  
 23                  If ADD\_INFO\_INCL1 is set to '0', the base station shall omit  
 24                  this field; otherwise, the base station shall set this field as  
 25                  follows:  
 26                  The base station shall set this field to the index of the Quasi-  
 27                  orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the lower  
 28                  frequency of the two remaining SR3 frequencies.
- 29                  WALSH\_LENGTH1     - Length of the Walsh Code for the pilot on the lower frequency  
 30                  of the two remaining SR3 frequencies.  
 31                  If ADD\_INFO\_INCL1 is set to '0', the base station shall omit  
 32                  this field; otherwise, the base station shall set this field as  
 33                  follows:  
 34                  The base station shall set this field to the WALSH\_LENGTH  
 35                  value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 36                  length of the Walsh code for the pilot that is used as the  
 37                  Auxiliary pilot on the lower frequency of the two remaining  
 38                  SR3 frequencies.
- 39                  AUX\_PILOT\_WALSH1     - Walsh Code for the Auxiliary Pilot on the lower frequency of  
 40                  the two remaining SR3 frequencies.  
 41                  If ADD\_INFO\_INCL1 is set to '0', the base station shall omit  
 42                  this field; otherwise, the base station shall set this field as  
 43                  follows:  
 44                  The base station shall set this field to the Walsh code  
 45                  corresponding to the Auxiliary pilot on the lower frequency of  
 46                  the two remaining SR3 frequencies.

- 1           ADD\_INFO\_INCL2   - Additional information included for the pilot on the higher  
 2           frequency of the two remaining SR3 frequencies.
- 3           If the additional information for the pilot on the higher  
 4           frequencies of the two remaining SR3 frequencies is the same  
 5           as pilot on the primary frequency, the base station shall set  
 6           this field to '0'; otherwise, the base station shall set this field  
 7           to '1'.
- 8           QOF2   - Quasi-orthogonal function index for the pilot on the higher  
 9           frequency of the two remaining SR3 frequencies.
- 10          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 11         this field; otherwise, the base station shall set this field as  
 12         follows:
- 13          The base station shall set this field to the index of the Quasi-  
 14           orthogonal function (see Table 3.1.3.1.12-2 of [2]) on the  
 15           higher frequency of the two remaining SR3 frequencies.
- 16          WALSH\_LENGTH2   - Length of the Walsh Code for the pilot on the higher frequency  
 17           of the two remaining SR3 frequencies.
- 18          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 19         this field; otherwise, the base station shall set this field as  
 20         follows:
- 21          The base station shall set this field to the WALSH\_LENGTH  
 22           value shown in Table 3.7.2.3.2.22-6 corresponding to the  
 23           length of the Walsh code for the pilot that is used as the  
 24           Auxiliary pilot on the higher frequency of the two remaining  
 25           SR3 frequencies.
- 26          AUX\_PILOT\_WALSH2   - Walsh Code for the Auxiliary Pilot on the higher frequency of  
 27           the two remaining SR3 frequencies.
- 28          If ADD\_INFO\_INCL2 is set to '0', the base station shall omit  
 29         this field; otherwise, the base station shall set this field as  
 30         follows:
- 31          The base station shall set this field to the Walsh code  
 32           corresponding to the Auxiliary pilot on the higher frequency of  
 33           the two remaining SR3 frequencies.
- 34          RESERVED   - Reserved bits.
- 35          The base station shall set all the bits of this field to '0' to make  
 36           the entire record octet-aligned.
- 37          SRCH\_OFFSET\_NGHBR   - Neighbor pilot channel search window offset.
- 38          If CF\_SRCH\_OFFSET\_INCL is included and equals to '1', then  
 39           the base station shall set this field to the value specified in  
 40           Table 2.6.6.2.1-2 corresponding to the search window offset to  
 41           be used by the mobile station for this neighbor; otherwise, the  
 42           base station shall omit this field.
- 43          RESERVED\_3   - Reserved bits.
- 44          The base station shall add reserved bits as needed in order to  
 45           make the length of the Mode-specific fields equal to an integer  
 46           number of octets. The base station shall set these bits to '0'.

1 If SEARCH\_MODE is equal to '0001', the base station shall include the following fields:

2

| Field                 | Length (bits) |
|-----------------------|---------------|
| BAND_CLASS            | 5             |
| SF_TOTAL_EC_THRESH    | 5             |
| SF_TOTAL_EC_IO_THRESH | 5             |
| RESERVED_4            | 6             |
| NUM_ANALOG_FREQS      | 3             |

NUM\_ANALOG\_FREQS occurrences of the following record:

|             |    |
|-------------|----|
| ANALOG_FREQ | 11 |
|-------------|----|

|            |     |
|------------|-----|
| RESERVED_5 | 0-7 |
|------------|-----|

3

4

BAND\_CLASS - Band class.

5

6

7

The base station shall set this field to the CDMA band class associated with the analog frequencies included in this message.

8

9

SF\_TOTAL\_EC-\_THRESH - Serving Frequency total pilot E<sub>C</sub> threshold.

10

11

12

13

14

If the mobile station is not to use the measurement of total E<sub>C</sub> of the pilots in the Serving Frequency Active Set in the Analog Frequencies periodic search procedure, the base station shall set this field to '11111'; otherwise, the base station shall set this field to

$$\lceil (10 \times \log_{10} (total\_ec\_thresh) + 120) / 2 \rceil$$

15

16

17

18

19

where *total\_ec\_thresh* is defined by the following rule: The mobile station is not to visit any analog frequency if the total E<sub>C</sub> of the pilots in the Serving Frequency Active Set is greater than *total\_ec\_thresh*.

20

21

SF\_TOTAL\_EC-\_IO\_THRESH - Serving Frequency total pilot E<sub>C</sub>/I<sub>O</sub> threshold.

22

23

24

25

26

If the mobile station is not to use the measurement of total E<sub>C</sub>/I<sub>O</sub> of the pilots in the Serving Frequency Active Set in the Analog Frequencies periodic search procedure, the base station shall set this field to '11111'; otherwise, the base station shall set this field to

$$\lfloor -20 \times \log_{10} (total\_ec\_io\_thresh) \rfloor$$

27

where *total\_ec\_io\_thresh* is defined by the following rule: The mobile station is not to visit any analog frequency if the total  $E_c/I_o$  of the pilots in the Serving Frequency Active Set is greater than *total\_ec\_io\_thresh*.

- |              |                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESERVED_4   | - Reserved bits.<br>The base station shall set this field to '000000'.                                                                                                                                   |
| ANALOG_FREQS | - Number of analog frequencies.<br>The base station shall set this field to the number of neighbors on the candidate frequency. The base station shall set this field to a value from 1 to 7, inclusive. |

The message will include NUM\_ANALOG\_FREQS occurrences of the following one-field record, one for each neighbor on the candidate frequency.

- |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ANALOG_FREQ   | <ul style="list-style-type: none"><li>- Analog frequency channel number.<br/>The base station shall set this field to the analog frequency channel number to search.</li></ul>                                                                                                                                                                                                                                                                                   |
| RESERVED_5    | <ul style="list-style-type: none"><li>- Reserved bits.<br/>The base station shall add reserved bits as needed in order to make the length of the Mode-specific fields equal to an integer number of octets. The base station shall set these bits to '0'.</li></ul>                                                                                                                                                                                              |
| ALIGN_TIMING  | <ul style="list-style-type: none"><li>- Align timing indicator.<br/>If the base station requests that the mobile station offset the start of the first search from the action time of this message (or of a subsequent <i>Candidate Frequency Search Control Message</i> that starts a search) by a delay specified by the SEARCH_OFFSET field, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.</li></ul> |
| SEARCH_OFFSET | <ul style="list-style-type: none"><li>- Search offset.<br/>If the ALIGN_TIMING field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it to</li></ul>                                                                                                                                                                                                                                         |

where *search\_offset\_time* is the time offset, in seconds, of the start of the first search from the action time of this message (or of a subsequent *Candidate Frequency Search Control Message* that starts a search).

## 1    3.7.3.3.2.28 Candidate Frequency Search Control Message

2    MSG\_TAG: CFSCNM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| USE_TIME     | 1                    |
| ACTION_TIME  | 6                    |
| CFSCM_SEQ    | 2                    |
| SEARCH_TYPE  | 2                    |
| ALIGN_TIMING | 1                    |

4

5    USE\_TIME    -    Use action time indicator.

6    This field indicates whether an explicit action time is specified  
7    in this message.8    If an explicit action time is specified in this message, the base  
9    station shall set this field to '1'; otherwise, the base station  
10   shall set this field to '0'.11   If the base station requests the mobile station to perform an  
12   aligned search (see 2.6.6.2.8.3), the base station shall specify  
13   an explicit action time for the message.

14   ACTION\_TIME    -    Action time.

15   If the USE\_TIME field is set to '1', the base station shall set  
16   this field to the System Time, in units of 80 ms (modulo 64),  
17   at which the message is to take effect. If the USE\_TIME field  
18   is set to '0' the base station shall set this field to '000000'.19   CFSCM\_SEQ    -    *Candidate Frequency Search Control Message* sequence  
20   number.21   The base station shall set this field to the *Candidate*  
22   *Frequency Search Control Message* sequence number, as  
23   specified in 3.6.6.2.2.5.

24   SEARCH\_TYPE    -    Search command.

25   The base station shall set this field to the appropriate  
26   SEARCH\_TYPE code from Table 3.7.3.3.2.27-1 to indicate the  
27   purpose of the message.

28   ALIGN\_TIMING    -    Align timing indicator.

29   If the base station requests that the mobile station offset the  
30   start of the first search from the action time of this message  
31   by a delay specified by the SEARCH\_OFFSET field of the last  
32   *Candidate Frequency Search Request Message* sent to the  
33   mobile station, the base station shall set this field to '1';  
34   otherwise, the base station shall set this field to '0'.

4

- 5                USE\_TIME    -    Use action time indicator.  
                     The base station shall set this field to '1'.
- 6                ACTION\_TIME    -    Action time.  
                     The base station shall set this field to the System Time, in  
                     units of 80 ms (modulo 64), used in calculating the start of  
                     the first PUF probe.
- 7                ACTION\_TIME\_FRAME    -    Action time frame.  
                     The base station shall set this field to the number of frames  
                     after ACTION\_TIME that the mobile station is to begin the first  
                     PUF probe.
- 8                PUF\_SETUP\_SIZE    -    Number of PUF setup power control groups.  
                     The base station shall set this field to one less than the  
                     number of power control groups that the mobile station is to  
                     transmit at nominal power prior to transmitting a PUF pulse.  
                     The base station shall set the values of PUF\_SETUP\_SIZE and  
                     PUF\_PULSE\_SIZE so that [PUF\_SETUP\_SIZE + 1 +  
                     PUF\_PULSE\_SIZE + 1] mod 16 is not equal to 0.
- 9                PUF\_PULSE\_SIZE    -    Number of PUF pulse power control groups.

|    |                  |                                                                                                                                                                                                                                                                                                                                               |
|----|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  |                  | The base station shall set this field to one less than the number of power control groups that the mobile station is to transmit at elevated power level during the PUF pulse. The base station shall set the values of PUF_SETUP_SIZE and PUF_PULSE_SIZE so that $[PUF\_SETUP\_SIZE + 1 + PUF\_PULSE\_SIZE + 1] \bmod 16$ is not equal to 0. |
| 7  | PUF_INTERVAL     | - PUF interval.<br>The base station shall set this field to the number of frames between the start of each PUF probe.                                                                                                                                                                                                                         |
| 10 | PUF_INIT_PWR     | - Power increase of initial PUF pulse.<br>The base station shall set this field to the amount (in dB) that the mobile station is to increase its mean output power for the first PUF pulse.                                                                                                                                                   |
| 14 | PUF_PWR_STEP     | - PUF power step.<br>The base station shall set this field to the value (in dB) by which the mobile station is to increment the power of a PUF pulse above nominal power from one PUF pulse to the next.                                                                                                                                      |
| 18 | TOTAL_PUF_PROBES | - Total number of PUF probes.<br>The base station shall set this field to one less than the maximum number of PUF probes the mobile station is to transmit in a PUF attempt.                                                                                                                                                                  |
| 22 | MAX_PWR_PUF      | - Maximum number of PUF probes transmitted at full power.<br>The base station shall set this field to one less than the number of PUF pulses that the mobile station is to transmit at maximum power level.                                                                                                                                   |
| 26 | PUF_FREQ_INCL    | - Frequency included indicator.<br>If the mobile station is to change PUF_BAND_CLASS or PUF_CDMA_FREQ, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.                                                                                                                                 |
| 30 | PUF_BAND_CLASS   | - Band class.<br>If PUF_FREQ_INCL is set to '1', the base station shall include this field and set it to the CDMA band class corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [30]; otherwise, the base station shall omit this field.                                                                     |
| 36 | PUF_CDMA_FREQ    | - Frequency assignment.<br>If PUF_FREQ_INCL is set to '1', the base station shall include this field and set it to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency for the CDMA Channel as specified in [2]; otherwise, the base station shall omit this field.                                |

## 1    3.7.3.3.2.30 Power Up Function Completion Message

2    MSG\_TAG: PUFCM

| <b>Field</b>  | <b>Length (bits)</b> |
|---------------|----------------------|
| RESERVED      | 6                    |
| LOC_IND       | 1                    |
| RESERVED_1    | 0 or 3               |
| MS_LAT        | 0 or 22              |
| MS_LONG       | 0 or 23              |
| MS_LOC_TSTAMP | 0 or 24              |

4

- 5    RESERVED    -    Reserved bits.  
                     The base station shall set these bits to '000000'.
- 6    LOC\_IND    -    Location indicator  
                     If the base station is to include MS\_LAT, MS\_LONG, and  
                     MS\_LOC\_TSTAMP in this message, the base station shall set  
                     this field to '1'; otherwise, the base station shall set this field  
                     to '0'.
- 7    RESERVED\_1    -    Reserved bits.  
                     If LOC\_IND is equal to '1', the base station shall set these bits  
                     to '000'; otherwise, the base station shall not include this  
                     field.
- 8    MS\_LAT    -    Mobile station latitude.  
                     If LOC\_IND is equal to '1', the base station shall set this field  
                     to the mobile station's latitude in units of 0.25 second,  
                     expressed as a two's complement signed number with positive  
                     numbers signifying North latitudes. The base station shall set  
                     this field to a value in the range -1296000 to 1296000  
                     inclusive (corresponding to a range of -90° to +90°).  
                     Otherwise, the base station shall not include this field.
- 9    MS\_LONG    -    Mobile station longitude.  
                     If LOC\_IND is equal to '1', the base station shall set this field  
                     to the mobile station's longitude in units of 0.25 second,  
                     expressed as a two's complement signed number with positive  
                     numbers signifying East longitude. The base station shall set  
                     this field to a value in the range -2592000 to 2592000  
                     inclusive (corresponding to a range of -180° to +180°).  
                     Otherwise, the base station shall not include this field.
- 10    MS\_LOC\_TSTAMP    -    Time stamp.

If LOC\_IND is equal to ‘1’, the base station shall set this field to the time at which the mobile station’s location parameters were received; otherwise, the base station shall not include this field.

This field is formatted as shown below.

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| HOURS        | 8                    |
| MINUTES      | 8                    |
| SECONDS      | 8                    |

Note: All subfields contain two 4-bit BCD numbers giving the decimal value of the subfield. For example, if the minute is 53, the MINUTES subfield contains ‘01010011’.

- 7
- 8            HOURS    -    Current hour (UTC).
- 9                 The base station shall set this field to the current hour (UTC),
- 10                in the range 0-23.
- 11            MINUTES    -    Current minutes (UTC).
- 12                 The base station shall set this field to the current minutes
- 13                (UTC), in the range 0-59.
- 14            SECONDS    -    Current seconds (UTC).
- 15                 The base station shall set this field to the current seconds
- 16                (UTC), in the range 0-59.

3

USE\_TIME

- Use action time indicator.

4

5

This field indicates whether an explicit action time is specified in this message.

6

7

8

If an explicit action time is specified in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

9

ACTION\_TIME

- Action time.

10

11

12

13

If the USE\_TIME field is set to '1', the base station shall set this field to the System Time, in units of 80 ms (modulo 64), at which the handoff is to take effect. If the USE\_TIME field is set to '0' the base station shall omit this field.

14

HDM\_SEQ

- General Handoff Direction Message sequence number.

15

16

17

This field is used by the mobile station in the *Power Measurement Report Message* to identify the order in which the reported pilot strengths are sent.

- |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| T_ADD           | <ul style="list-style-type: none"> <li>- Pilot detection threshold.<br/>This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the <i>Pilot Strength Measurement Message</i> or <i>Extended Pilot Strength Measurement Message</i> initiating the handoff process (see 2.6.6.2.5.2).<br/>If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_ADD and set this field to the pilot detection threshold, expressed as an unsigned binary number equal to <math>\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor</math>; otherwise, the base station shall omit this field.</li> </ul> |
| T_DROP          | <ul style="list-style-type: none"> <li>- Pilot drop threshold.<br/>This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

1           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 2           include the field T\_DROP and set this field to the pilot drop  
 3           threshold, expressed as an unsigned binary number equal to  
 4            $\lfloor -2 \times 10 \times \log_{10} E_c/I_0 \rfloor$ ; otherwise, the base station shall omit  
 5           this field.

6           T\_COMP    - Active Set versus Candidate Set comparison threshold.  
 7           The mobile station transmits a *Pilot Strength Measurement*  
 8           *Message* or *Extended Pilot Strength Measurement Message*  
 9           when the strength of a pilot in the Candidate Set exceeds that  
 10          of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

11          If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 12          include the field T\_COMP and set this field to the threshold  
 13          Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB;  
 14          otherwise, the base station shall omit this field.

15          T\_TDROp   - Drop timer value.  
 16          Timer value after which an action is taken by the mobile  
 17          station for a pilot that is a member of the Active Set or  
 18          Candidate Set, and whose strength has not become greater  
 19          than T\_DROP. If the pilot is a member of the Active Set, a  
 20          *Pilot Strength Measurement Message* or *Extended Pilot Strength*  
 21          *Measurement Message* is issued. If the pilot is a member of  
 22          the Candidate Set, it will be moved to the Neighbor Set.

23          If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 24          include the field T\_TDROp and set this field to the T\_TDROp  
 25          value shown in Table 2.6.6.2.3-1 corresponding to the drop  
 26          timer value to be used by the mobile station; otherwise, the  
 27          base station shall omit this field.

28          SOFT\_SLOPE - The slope in the inequality criterion for adding a pilot to the  
 29          active set, or dropping a pilot from the active set (see 2.6.6.2.3  
 30          and 2.6.6.2.5.2).

31          If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 32          include the field SOFT\_SLOPE in the additional fields and set  
 33          this field as an unsigned binary number; otherwise, the base  
 34          station shall omit this field.

35          ADD\_INTERCEPT - The intercept in the inequality criterion for adding a pilot to  
 36          the active set (see 2.6.6.2.5.2).

37          If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 38          include the field ADD\_INTERCEPT in the additional fields and  
 39          set this field as a two's complement signed binary number;  
 40          otherwise, the base station shall omit this field.

41          DROP\_INTERCEPT - The intercept in the inequality criterion for dropping a pilot  
 42          from the active set (see 2.6.6.2.3).

43          If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 44          include the field DROP\_INTERCEPT in the additional fields and  
 45          set this field as a two's complement signed binary number;  
 46          otherwise, the base station shall omit this field.

47          EXTRA\_PARMS - Extra parameters included.

If the mobile station is to change FRAME\_OFFSET, PRIVATE\_LCM, ENCRYPT\_MODE, NOM\_PWR, BAND\_CLASS, or CDMA\_FREQ, or the mobile station is to perform a reset of the acknowledgment procedures, or the mobile station is to reset Forward Traffic Channel power control counters, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

P\_REV - Protocol revision level.  
If EXTRA\_PARMS is set to '1', the base station shall set this field to the base station protocol revision level that the mobile station is to use after completion of the handoff; otherwise, the base station shall omit this field.

PACKET\_ZONE\_ID - Packet data services zone identifier.  
If EXTRA\_PARMS is set to '1', the base station shall include the field PACKET\_ZONE\_ID and set this field as described below; otherwise, the base station shall omit this field.

If the base station supports a packet data service zone, the base station shall set this field to the non-zero packet data services zone identifier that the mobile station is to use after completion of the handoff.

If the base station does not support a packet data service zone, the base station shall set this field to '00000000'.

FRAME\_OFFSET - Frame offset.  
The Forward and Reverse Traffic Channel frames are delayed  $\text{FRAME\_OFFSET} \times 1.25 \text{ ms}$  relative to system timing (see of [2]).

If EXTRA\_PARMS is set to '1', the base station shall include the field FRAME\_OFFSET and set this field to the Forward and Reverse Traffic Channel frame offset; otherwise, the base station shall omit this field.

PRIVATE\_LCM - Private long code mask indicator.  
This field is used to change the long code mask after a hard handoff.  
If EXTRA\_PARMS is set to '1', the base station shall include the field PRIVATE\_LCM and set this field as described below; otherwise, the base station shall omit this field.

If the private long code mask is to be used after the handoff, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

RESET\_L2 - Reset acknowledgment procedures command.  
This field is used to reset acknowledgment processing in the mobile station.  
If EXTRA\_PARMS is set to '1', the base station shall include the field RESET\_L2 and set this field as described below; otherwise, the base station shall omit this field.

- 1                   If the field is included and the mobile station is to reset its  
 2                   acknowledgment procedures, the base station shall set this  
 3                   field to '1'; otherwise, the base station shall set this field to '0'.  
 4           RESET\_FPC - Reset Forward Traffic Channel power control.  
 5                   This field is used to reset the Forward Traffic Channel power  
 6                   control counters.  
 7                   If EXTRA\_PARMS is set to '1', the base station shall include  
 8                   the field RESET\_FPC and set this field as described below;  
 9                   otherwise, the base station shall omit this field.  
 10                  The base station shall set this field to '0' if the Forward Traffic  
 11                  Channel power control counters are to be maintained after  
 12                  completion of the handoff. If the counters are to be initialized  
 13                  as specified in 2.6.4.1.1.1, then the base station shall set this  
 14                  field to '1'.  
 15           SERV\_NEG\_TYPE - Service negotiation type.  
 16                  If EXTRA\_PARMS is set to '1', the base station shall include  
 17                  the field SERV\_NEG\_TYPE and set this field as described  
 18                  below; otherwise, the base station shall omit this field.  
 19                  If the mobile station is to use service negotiation, the base  
 20                  station shall set this field to '1'. If the mobile station is to use  
 21                  service option negotiation, the base station shall set this field  
 22                  to '0'.  
 23           ENCRYPT\_MODE - Message encryption mode.  
 24                  If EXTRA\_PARMS is set to '1', the base station shall include  
 25                  the field ENCRYPT\_MODE and set this field to the  
 26                  ENCRYPT\_MODE value shown in Table 3.7.2.3.2.8-2  
 27                  corresponding to the encryption mode that is to be used for  
 28                  messages sent on the Forward and Reverse Traffic Channels,  
 29                  as specified in 2.3.12.2; otherwise, the base station shall omit  
 30                  this field.  
 31           NOM\_PWR\_EXT - Extended nominal transmit power.  
 32                  If EXTRA\_PARMS is set to '1', the base station shall include  
 33                  this field and set this field as described below; otherwise, the  
 34                  base station shall omit this field.  
 35                  If this field is included and the mobile station is being handed  
 36                  off to a base station operating in Band Class 0 or Band Class  
 37                  3, the base station shall set this field to '0';otherwise,  
 38                  If this field is included and the mobile station is being handed  
 39                  off to a base station operating in a band class other than  
 40                  Band Class 0 or Band Class 3, the base station shall set this  
 41                  field to '1' if the correction factor to be used by the mobile  
 42                  station in the open loop power estimate is between -24 dB and  
 43                  -9 dB inclusive; otherwise (the correction factor is in the range  
 44                  -8 dB to 7 dB inclusive), the base station shall set this field to  
 45                  '0'.  
 46           NOM\_PWR - Nominal transmit power offset.

If EXTRA\_PARMS is set to ‘1’, the base station shall include the field NOM\_PWR and set this field to the correction factor to be used by the mobile station in the open loop power estimate, expressed as a two’s complement value in units of 1 dB (see [2]); otherwise, the base station shall omit this field.

- 6           NUM\_PREAMBLE - Traffic Channel preamble length.  
 7           If EXTRA\_PARMS is set to ‘0’, the base station shall omit the  
 8           NUM\_PREAMBLE field; otherwise, the base station shall  
 9           include this field and set it to the length of Traffic Channel  
 10          preamble that the mobile station is to send when performing a  
 11          handoff; as follows:

12          If, after the handoff, radio configuration 1 or radio  
 13          configuration 2 is to be used, the base station shall set  
 14          NUM\_PREAMBLE to the Traffic Channel preamble length in  
 15          20 ms units; otherwise, the base station shall set  
 16          NUM\_PREAMBLE to the value shown in Table 3.7.3.3.2.17-1  
 17          corresponding to the Traffic Channel preamble length in 1.25  
 18          ms units.

- 19           BAND\_CLASS - Band class.  
 20          If EXTRA\_PARMS is set to ‘1’, the base station shall include  
 21          the field BAND\_CLASS and set this field to the CDMA band  
 22          class corresponding to the CDMA frequency assignment for  
 23          the CDMA Channel as specified in [30]; otherwise, the base  
 24          station shall omit this field.

- 25           CDMA\_FREQ - Frequency assignment.  
 26          If EXTRA\_PARMS is set to ‘1’, the base station shall include  
 27          the field CDMA\_FREQ and set this field to the CDMA Channel  
 28          number, in the specified CDMA band class, corresponding to  
 29          the CDMA frequency assignment for the CDMA Channel as  
 30          specified in [2]; otherwise, the base station shall omit this  
 31          field.

- 32           RETURN\_IF\_HANDOFF - Return on failure flag.  
 33                \_FAIL If EXTRA\_PARMS is set to ‘1’, the base station shall include  
 34                the field RETURN\_IF\_HANDOFF\_FAIL and set this field as  
 35                described below; otherwise, the base station shall omit this  
 36                field.  
 37                If the base station includes this field, it shall set this field to  
 38                ‘1’ if the mobile station is to resume the use of the Active Set  
 39                on the Serving Frequency following an unsuccessful hard  
 40                handoff attempt, as specified in 2.6.6.2.8.2; otherwise, the  
 41                base station shall set this field to ‘0’.

- 42           COMPLETE\_SEARCH - Flag to complete search.  
 43                If RETURN\_IF\_HANDOFF\_FAIL is included and is set to ‘1’,  
 44                the base station shall include the field COMPLETE\_SEARCH  
 45                and set this field as described below; otherwise, the base  
 46                station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to complete the search of the Candidate Frequency Search Set before resuming the use of the Active Set on the Serving Frequency when an inter-frequency handoff attempt is unsuccessful, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to ‘0’.

- PERIODIC\_SEARCH - Flag to search the Candidate Frequency periodically.  
If EXTRA\_PARMS is set to ‘1’, the base station shall include the field PERIODIC\_SEARCH and set this field as described below; otherwise, the base station shall omit this field.  
If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to periodically search the Candidate Frequency, as specified in 2.6.6.2.8.3; otherwise, the base station shall set this field to ‘0’.
  - SCR\_INCLUDED - Service Configuration Record included indicator.  
If EXTRA\_PARMS is set to ‘1’, the base station shall include the field SCR\_INCLUDED and shall set this field as described below; otherwise, the base station shall omit this field.  
The base station shall set this field to ‘1’ if it includes Service Configuration Record in the message; otherwise, the base station shall set this field to ‘0’.
  - SERV\_CON\_SEQ - Connect sequence number.  
If SCR\_INCLUDED is included and is set to ‘1’, the base station shall include the field SERV\_CON\_SEQ and shall set this field to the connect sequence number pertaining to this service configuration as specified in 3.6.4.1.2.1.2.
- If SCR\_INCLUDED is included and is set to ‘1’, the base station shall include one occurrence of the following three-field record to specify the service configuration.
- RECORD\_TYPE - Information record type.  
If SCR\_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD\_TYPE and shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Service Configuration information record.
  - RECORD\_LEN - Information record length.  
If SCR\_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD\_LEN and shall set this field to the number of octets included in the type-specific fields of the Service Configuration information record.
  - Type-specific fields - Type-specific fields.  
If SCR\_INCLUDED is included and is set to ‘1’, the base station shall include the type specific fields and shall set these fields as specified in 3.7.5.7 for the Service Configuration information record.

- 1     SUP\_CHAN\_PARAMS-     -     Supplemental channel parameters included indicator.
- 2                 INCLUDED     The base station shall set this field to '1' if the base station  
 3                 includes the FOR\_INCLUDED, REV\_INCLUDED, and  
 4                 REV\_PARMS\_INCLUDED fields in the message; otherwise, the  
 5                 base station shall set this field to '0'.
- 6     FOR\_INCLUDED     -     Forward assignment information included indicator.  
 7                 If SUP\_CHAN\_PARAMS\_INCLUDED is set to '1', the base station  
 8                 shall include the field FOR\_INCLUDED and set this field as  
 9                 described below; otherwise, the base station shall omit this  
 10                field.
- 11                 If the base station includes this field, it shall set this field to  
 12                 '1' if Forward Supplemental Code Channel assignment  
 13                 information is included in the message; otherwise, the base  
 14                 station shall set this field to '0'.
- 15     FOR\_SUP\_CONFIG     -     Forward Supplemental Code Channel configuration indicator.  
 16                 If FOR\_INCLUDED is included and is set to '1', the base  
 17                 station shall include the field FOR\_SUP\_CONFIG and set this  
 18                 field according to the following rules:
- 19                 The base station shall set this field to '00' if Forward  
 20                 Supplemental Code Channels are not specified in the  
 21                 message, and the mobile station is to stop processing all  
 22                 Forward Supplemental Code Channels.
- 23                 The base station shall set this field to '01' if Forward  
 24                 Supplemental Code Channels are not specified in the  
 25                 message, and the mobile station is to start processing the  
 26                 Forward Supplemental Code Channels previously stored in its  
 27                 Code Channel List, CODE\_CHAN\_LIST<sub>s</sub>.
- 28                 The base station shall set this field to '10' if the Forward  
 29                 Supplemental Code Channels are specified in the message,  
 30                 and the mobile station is to stop processing all Forward  
 31                 Supplemental Code Channels in CODE\_CHAN\_LIST<sub>s</sub>, and to  
 32                 update the CODE\_CHAN\_LIST<sub>s</sub>, according to the information  
 33                 contained in the message.
- 34                 The base station shall set this field to '11' if the Forward  
 35                 Supplemental Code Channels are specified in the message,  
 36                 and the mobile station is to update its Code Channel List,  
 37                 CODE\_CHAN\_LIST<sub>s</sub>, according to the information contained in  
 38                 the message and to start processing the Forward  
 39                 Supplemental Code Channels.
- 40
- 41     NUM\_FOR\_SUP     -     Number of Forward Supplemental Code Channels.

1                   If FOR\_SUP\_CONFIG is included and is set to '10' or '11', the  
 2                   base station shall include the field NUM\_FOR\_SUP and set it  
 3                   to the number of Forward Supplemental Code Channels  
 4                   assigned to the mobile station; otherwise, the base station  
 5                   shall omit this field. NUM\_FOR\_SUP shall not exceed the  
 6                   maximum number of Forward Supplemental Code Channels  
 7                   for the negotiated multiplex option.

8                   **USE\_FOR\_DURATION**

- Use forward duration indicator.

9                   If FOR\_SUP\_CONFIG is included and is set to '01' or '11' the  
 10                  base station shall include the field USE\_FOR\_DURATION and  
 11                  set this field as described below; otherwise the base station  
 12                  shall omit this field.

13                  The base station shall set this field to '1' if the  
 14                  FOR\_DURATION field is included in the message and the  
 15                  mobile station is to process the Forward Supplemental Code  
 16                  Channels for a time duration indicated by FOR\_DURATION.

17                  The base station shall set this field to '0' if the mobile station  
 18                  is to process the Forward Supplemental Code Channels for an  
 19                  indefinite duration (i.e., the mobile station is to continue  
 20                  processing Forward Supplemental Code Channels until it  
 21                  receives a subsequent *Supplemental Channel Assignment*  
 22                  *Message* or a *General Handoff Direction Message* that specifies  
 23                  a different Forward Supplemental Code Channel assignment.

24                  **FOR\_DURATION**

- Duration of Forward Supplemental Code Channel assignment.

25                  If USE\_FOR\_DURATION is included and is set to '1' the base  
 26                  station shall include the field FOR\_DURATION and set this  
 27                  field to the allocated duration, in units of 80 ms, for which the  
 28                  mobile station is to process the Forward Supplemental Code  
 29                  Channels; otherwise, the base station shall omit this field.

30                  **REV\_INCLUDED**

- Reverse assignment information included indicator.

31                  If SUP\_CHAN\_PARMS\_INCLUDED is set to '1', the base station  
 32                  shall include the field REV\_INCLUDED and set this field as  
 33                  described below; otherwise, the base station shall omit this  
 34                  field.

35                  If the base station includes this field, it shall set this field to  
 36                  '1' if Reverse Supplemental Code Channel assignment  
 37                  information is included in the message; otherwise, the base  
 38                  station shall set this field to '0'.

39                  **REV\_DTX\_DURATION**

- Reverse Discontinuous Transmission Duration.

40                  If REV\_INCLUDED is included and is set to '1', the base  
 41                  station shall include the field REV\_DTX\_DURATION; otherwise  
 42                  the base station shall omit this field.

If the base station includes this field, it shall set this field to the maximum duration of time in units of 20 ms that the mobile station is allowed to stop transmission on a Reverse Supplemental Code Channel within the reverse assignment duration. The base station shall set this field to ‘0000’ if the mobile station is to stop using a Reverse Supplemental Code Channel once it has stopped transmitting on that Reverse Supplemental Code Channel. The base station shall set this field to ‘1111’ if the mobile station is allowed to resume transmission on a Reverse Supplemental Code Channel at any time within the reverse assignment duration.

- 12      CLEAR\_RETRY\_DELAY    -    Clear retry delay indicator.  
 13      If REV\_INCLUDED is included and is set to ‘1’, the base  
 14      station shall include the field CLEAR\_RETRY\_DELAY and set  
 15      this field as described below; otherwise the base station shall  
 16      omit this field.  
 17      The base station shall set this field to ‘1’ to indicate that the  
 18      mobile station is to clear any existing retry delay which it has  
 19      stored (see 2.6.6.2.5.1); otherwise, the base station shall set  
 20      this field to ‘0’.
- 21      USE\_REV\_DURATION    -    Use reverse duration indicator.  
 22      If REV\_INCLUDED is included and is set to ‘1’, the base  
 23      station shall include the field USE\_REV\_DURATION and set  
 24      this field as described below; otherwise the base station shall  
 25      omit this field.  
 26      The base station shall set this field to ‘1’ if the  
 27      REV\_DURATION field is included in the message and the  
 28      mobile station is allowed to transmit on the Reverse  
 29      Supplemental Code Channels for a time duration indicated by  
 30      REV\_DURATION.  
 31      The base station shall set this field to ‘0’ if the mobile station  
 32      is allowed to transmit on the Reverse Supplemental Code  
 33      Channels for an indefinite duration (i.e., the mobile station  
 34      may continue to transmit on the Reverse Supplemental Code  
 35      Channels until it receives a subsequent *Supplemental Channel*  
 36      *Assignment Message* or a *General Handoff Direction Message*  
 37      that specifies a different Reverse Supplemental Code Channel  
 38      assignment.
- 39      REV\_DURATION    -    Duration of Reverse Supplemental Code Channel Assignment.  
 40      If USE\_REV\_DURATION is included and is set to ‘1’, the base  
 41      station shall include the field REV\_DURATION and set this  
 42      field to the allocated duration, in units of 80 ms, for which the  
 43      mobile station may transmit on Reverse Supplemental Code  
 44      Channels; otherwise the base station shall omit this field.
- 45      NUM\_REV\_CODES    -    Number of Reverse Supplemental Code Channels.

- 1           If REV\_INCLUDED is included and is set to ‘1’, the base  
 2           station shall include the field NUM\_REV\_CODES and set this  
 3           field to the number of Reverse Supplemental Code Channels  
 4           which are assigned to the mobile station; otherwise the base  
 5           station shall omit this field.
- 6        USE\_T\_ADD\_ABORT    - Reverse use T\_ADD abort indicator.  
 7           If REV\_INCLUDED is included and is set to ‘1’, the base  
 8           station shall include the field USE\_T\_ADD\_ABORT and set  
 9           this field as described below; otherwise the base station shall  
 10          omit this field.  
 11          The base station shall set this field to ‘1’ to indicate that the  
 12           mobile station is to use the T\_ADD Reverse Supplemental  
 13           Code Channel abort feature for this reverse assignment;  
 14           otherwise, the base station shall set this field to ‘0’.
- 15        REV\_PARMS-  
 16            INCLUDED    - Reverse assignment parameters included indicator.  
 17           If SUP\_CHAN\_PARMS\_INCLUDED is set to ‘1’, the base station  
 18           shall include the field REV\_PARMS\_INCLUDED and set this  
 19           field as described below; otherwise, the base station shall omit  
 20          this field.  
 21          If the base station includes this field, it shall set this field to  
 22           ‘1’ if the following three fields are included in the message;  
 23           otherwise, the base station shall set this field to ‘0’.
- 24        T\_MULCHAN    - *Supplemental Channel Request Message* pilot strength  
 25           reporting offset.  
 26          If REV\_PARMS\_INCLUDED is included and is set to ‘1’, the  
 27           base station shall include the field T\_MULCHAN and set this  
 28           field as described below; otherwise the base station shall omit  
 29          this field.  
 30          The base station shall set this field to the threshold offset that  
 31           the mobile station is to use when reporting neighbor pilot  
 32           strength measurements in a *Supplemental Channel Request*  
 33           *Message*. The mobile station is to interpret this field as an  
 34           offset to T\_ADD ranging from 0.5 dB (corresponding to  
 35           T\_MULCHAN = ‘000’) to 4.0 dB (corresponding to T\_MULCHAN  
 36           = ‘111’), in 0.5 dB increments.
- 37        BEGIN\_PREAMBLE    - Number of preamble frames on Reverse Supplemental Code  
 38           Channels at the beginning of transmission on Reverse  
 39           Supplemental Code Channel.  
 40          If REV\_PARMS\_INCLUDED is included and is set to ‘1’, the  
 41           base station shall include the field BEGIN\_PREAMBLE and set  
 42           this field to the number of Reverse Supplemental Code  
 43           Channel preamble frames that the mobile station is to send  
 44           when beginning transmission on Reverse Supplemental Code  
 45           Channels; otherwise the base station shall omit this field.
- 46        RESUME\_PREAMBLE    - Number of preamble frames on Reverse Supplemental Code  
 47           Channels at the resumption of transmission.

If REV\_PARMS\_INCLUDED is included and is set to ‘1’, the base station shall include the field RESUME\_PREAMBLE and set this field to the number of Reverse Supplemental Code Channel preamble frames that the mobile station is to send when resuming transmission on a Reverse Supplemental Code Channel following an autonomous suspension of transmission on an allocated Supplemental Code Channel; otherwise the base station shall omit this field.

- 9      USE\_PWR\_CNTL\_STEP    -    Power control step size indicator.  
10     The base station shall set this field to ‘1’ if the field  
11     PWR\_CNTL\_STEP is included in the message.
- 12     PWR\_CNTL\_STEP    -    Power control step size.  
13     If USE\_PWR\_CNTL\_STEP is set to ‘1’, then the base station  
14     shall include the field PWR\_CNTL\_STEP and set this field to  
15     the step size that the mobile station is to use for closed loop  
16     power control, according to Table 3.7.3.3.2.25-1; otherwise,  
17     the base station shall omit this field.
- 18     NUM\_PILOTS    -    Number of pilots included in the message.  
19     The base station shall set this field to the number of pilots  
20     included in the message. The base station shall set this field  
21     to an integer that is equal to or greater than 1.

The base station shall include one occurrence of the following four-part record for each of the NUM\_PILOTS pilots included in the message:

- 25     PILOT\_PN    -    Pilot PN sequence offset index.  
26     The base station shall set this field to the pilot PN sequence  
27     offset for this pilot in units of 64 PN chips.
- 28     PWR\_COMB\_IND    -    Power control symbol combining indicator.  
29     If the Forward Traffic Channel associated with this pilot will  
30     carry the same closed-loop power control subchannel bits as  
31     that of the previous pilot in this message, the base station  
32     shall set this field to ‘1’; otherwise, the base station shall set  
33     this field to ‘0’. The base station shall set this field to ‘0’ in  
34     the first record in the pilot list.
- 35     FOR\_FUND\_CODE-  
36                \_CHAN    -    Forward Fundamental Channel.  
37     The base station shall set this field to the code channel index  
38     to be used for the Forward Fundamental Channel associated  
   with this pilot.
- 39     FOR\_SUP\_INCLUDED    -    Forward Supplemental Code Channel included.  
40     The base station shall include this field if FOR\_SUP\_CONFIG  
41     is included and is set to ‘10’ or ‘11’. If included, the base  
42     station shall set this field to ‘1’ if there are Supplemental Code  
43     Channels associated with this pilot.
- 44     FOR\_SUP\_CHAN\_REC    -    Forward Supplemental Code Channel record

1           If FOR\_SUP\_INCLUDED is set to ‘1’, the base station shall  
 2           include the record FOR\_SUP\_CHAN\_REC and set its fields as  
 3           described below; otherwise, the base station shall omit this  
 4           record.

5           FOR\_SUP\_CHAN\_REC contains information about Forward  
 6           Supplemental Code Channels associated with this pilot, and  
 7           consists of the field EXPL\_CODE\_CHAN, and either the  
 8           BASE\_CODE\_CHAN field or NUM\_FOR\_SUP occurrences of  
 9           the FOR\_SUP\_CODE\_CHAN field, as shown below.

|                |        |
|----------------|--------|
| EXPL_CODE_CHAN | 1      |
| BASE_CODE_CHAN | 0 or 8 |

11          If EXPL\_CODE\_CHAN is equal to ‘1’, NUM\_FOR\_SUP  
 12         occurrences of the following field:

|                   |   |
|-------------------|---|
| FOR_SUP_CODE_CHAN | 8 |
|-------------------|---|

- 14          EXPL\_CODE\_CHAN    - Explicit code channel indicator.  
                  The base station shall set this field to ‘1’ to indicate explicit  
                  assignment of each Forward Supplemental Code Channel by  
                  means of the field FOR\_SUP\_CODE\_CHAN. The base station  
                  shall set this field to ‘0’ if the mobile station is to use  
                  NUM\_FOR\_SUP adjacent code channels beginning with index  
                  BASE\_CODE\_CHAN (i.e., BASE\_CODE\_CHAN through  
                  BASE\_CODE\_CHAN + NUM\_FOR\_SUP - 1).  
                  In both cases (i.e., the explicit code channel list format and  
                  range format), the order of the code channel indices is the  
                  same for all pilots specified in this message (i.e., for each pilot,  
                  the  $i^{th}$  entry in the list indicates the code channel index to be  
                  used for the  $i^{th}$  Forward Supplemental Code Channel  
                  associated with that pilot).
- 28          BASE\_CODE\_CHAN   - Base code channel index.  
                  If the EXPL\_CODE\_CHAN field is included and is set to ‘0’ the  
                  base station shall include the field BASE\_CODE\_CHAN and  
                  set this field as described below; otherwise the base station  
                  shall omit this field.  
                  The base station shall set this field to the base code channel  
                  index (see [2]) in the range of 1 to (63 - NUM\_FOR\_SUP + 1),  
                  inclusive, that the mobile station is to use as the first Forward  
                  Supplemental Code Channel associated with this pilot. The  
                  mobile station is to use code channel index  
                  (BASE\_CODE\_CHAN +  $i - 1$ ), where  $i$  ranges from 1 to  
                  NUM\_FOR\_SUP, for the  $i^{th}$  Forward Supplemental Code  
                  Channel associated with this pilot.
- 41          FOR\_SUP\_CODE\_CHAN - Forward Supplemental Code Channel.

1           If EXPL\_CODE\_CHAN is included and is set to '1', the base  
 2           station shall include NUM\_FOR\_SUP occurrences of the field  
 3           FOR\_SUP\_CODE\_CHAN and set this field as described below;  
 4           otherwise the base station shall omit this field.

5           The base station shall set the  $i^{th}$  occurrence of this field to the  
 6           code channel index (see [2]), in the range 1 to 63 inclusive,  
 7           that the mobile station is to use for the  $i^{th}$  Forward Code  
 8           Channel associated with this pilot.

9        FPC\_SUBCHAN\_GAIN   - Forward power control subchannel relative gain.

10          The base station shall set FPC\_SUBCHAN\_GAIN equal to the  
 11           power level of the forward link power control subchannel  
 12           relative to that of 20 ms frames at a 9600 bps or 14400 bps  
 13           rate on the Forward Fundamental Channel or the Forward  
 14           Dedicated Control Channel that the Forward Power Control  
 15           Subchannel is punctured on. The base station shall set the  
 16           value in units of 0.25 dB.

17        USE\_PC\_TIME   - Use power control action time indicator.

18          This field indicates whether an explicit time  
 19           [PC\_ACTION\_TIME] at which a new value for Power Control  
 20           Subchannel to traffic ratio (FPC\_SUBCHAN\_GAIN) takes effect  
 21           is specified in the message.

22          If an explicit action time is specified in this message, the base  
 23           station shall set this field to '1'; otherwise, the base station  
 24           shall set this field to '0'.

25        PC\_ACTION\_TIME - Power Control Subchannel gain action time.

26          If the USE\_PC\_TIME field is set to '1', the base station shall  
 27           set this field to the System Time, in units of 80 ms (modulo  
 28           64), at which FPC\_SUBCHAN\_GAIN specified in this message  
 29           is to take effect. If the USE\_PC\_TIME field is set to '0' the  
 30           base station shall omit this field.

31        RLGAIN\_TRAFFIC-

32           \_PILOT   - Gain adjustment of the Reverse Traffic Channel relative to the  
 33           Reverse Pilot Channel power for Radio Configurations greater  
 34           than 2.

35          If EXTRA\_PARMS is set to '1', the base station shall include  
 36           this field and set it to the correction factor to be used by  
 37           mobile stations in setting the power of a code channel,  
 38           expressed as a two's complement value in units of 0.125 dB  
 39           (see 2.1.2.3.3 of [2]); otherwise, the base station shall omit  
 40           this field.

41        DEFAULT\_RLAG - Default reverse link attribute gain used indicator.

42          If EXTRA\_PARMS is set to '0', the base station shall omit this  
 43           field; otherwise, the base station set this field as follows.

1                   If the mobile station is to use the default values for the reverse  
 2                   link attribute gain, as specified in [2] after completion of  
 3                   handoff, the base station shall set this field to '1'; otherwise,  
 4                   the base station shall set this field to '0'.

5        **NNSCR\_INCLUDED**    - Non-negotiable Service Configuration Record included  
 6                    indicator.

7                   The base station shall omit this field, if EXTRA\_PARMS is set  
 8                   to '0'; otherwise, the base station shall include this field and  
 9                   set this field as described below:

10                  The base station shall set this field to '1', if the Non-negotiable  
 11                  Service Configuration record is included in this message;  
 12                  otherwise, the base station shall set this field to '0'.

13        If NNSCR\_INCLUDED is included and is set to '1', the base station shall include one  
 14                  occurrence of the following three-field record to specify the non-negotiable service  
 15                  configuration parameters.

16        **RECORD\_TYPE**    - Information record type.

17                  If NNSCR\_INCLUDED is included and is set to '1', the base  
 18                  station shall include the field RECORD\_TYPE and shall set  
 19                  this field to the record type value shown in Table 3.7.5-1  
 20                  corresponding to the Non-Negotiable Service Configuration  
 21                  information record.

22        **RECORD\_LEN**    - Information record length.

23                  If NNSCR\_INCLUDED is included and is set to '1', the base  
 24                  station shall include the field RECORD\_LEN and shall set this  
 25                  field to the number of octets included in the type-specific  
 26                  fields of the Non-Negotiable Service Configuration information  
 27                  record.

28        Type-specific fields   - Type-specific fields.

29                  If NNSCR\_INCLUDED is included and is set to '1', the base  
 30                  station shall include the type specific fields and shall set these  
 31                  fields as specified in 3.7.5.20 for the Non-Negotiable Service  
 32                  Configuration information record.

33        -

34        **REV\_FCH-  
35                  \_GATING\_MODE**   - Reverse eighth gating mode indicator.

36                  The base station shall set this field to '1' if the mobile station  
 37                  is allowed to perform the reverse eighth gating mode after  
 38                  handoff; otherwise, the base station shall set this field to '0'.

39        **REV\_PWR-  
40                  \_CNTL\_DELAY\_INCL**   - Reverse power control delay included indicator.

41                  If REV\_FCH\_GATING\_MODE is set to '0', the base station shall  
 42                  omit this field; otherwise, the base station shall include this  
 43                  field and set it as follows:

The base station shall set this field to '1' if REV\_PWR\_CNTL\_DELAY is included in this message; otherwise, the base station shall set this field to '0'.

REV\_PWR\_CNTL\_DELAY - The reverse power control delay.

If REV\_PWR\_CNTL\_DELAY\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see 2.1.2.3.2 of [2]) used by the mobile station after handoff, in units of 1.25 ms. ~~To disable the gating on the reverse Fundamental Channel, the base station shall set this field to '000'.~~

D\_SIG\_ENCRYPT\_MODE - Dedicated channel General encryption mode indicator.

If ENCRYPT\_MODE is included and is set to '11', the base station shall include this field and shall set it to the dedicated channel signaling message-encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

USE\_NEW\_KEY Use new encryption key indication

If ENCRYPT\_MODE is included and is set to '10' or '11', the base station shall include this field. If this field is included, the base station shall set this field to '0' to indicate that the stored encryption key to be used by the mobile station. Otherwise, the base station shall set this field to '1' to indicate that the new encryption key to be used by the mobile station.

ENC\_KEY\_SIZE - Encryption key size indication.

If ENCRYPT\_MODE is included and is set to '10' or 'USE\_NEW\_KEY' is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it to the encryption key size, as shown in Table 3.7.4.5-2; this field as described below otherwise, the base station shall omit this field.

The base station shall set this field to the encryption key size, as shown in Table 3.7.4.5-2.

**KEY\_SEQ** Encryption key sequence number.

If USE\_NEW\_KEY is included and is set to '0', the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set it to the encryption key sequence number to be used by the mobile station.

CC\_INFO\_INCL Call Control information included indicator.

1           If the SCR\_INCLUDED field is not included or is included but  
 2           is set to '0', the base station shall omit this field; otherwise,  
 3           the base station shall include this field and set it as follows:

4           The base station shall set this field to '1' if Call Control related  
 5           parameters (to assign new call(s)) are included in this  
 6           message; otherwise, the base station shall set this field to '0'.

7        **SYNC ID INCL** - Service Configuration synchronization identifier included  
 8           indicator.

9           If either the SCR INCLUDED field is included and is set to '1'  
 10          or the NNSCR INCLUDED field is included and is set to '1',  
 11          the base station shall include this field; otherwise, the base  
 12          station shall omit this field. If included, the base station shall  
 13          set this field as follows:

14          The base station shall set this field to '1' if the SYNC ID field  
 15          is included in this message; otherwise, the base station shall  
 16          set this field to '0'.

17        **SYNC ID LEN** - Service Configuration synchronization identifier length.

18          If the SYNC ID INCL field is not included or is included and is  
 19          set to '0', the base station shall omit this field; otherwise, the  
 20          base station shall include this field and set it as follows:

21          The base station shall set this field to the length (in octets) of  
 22          the SYNC ID field included in this message. The base station  
 23          shall set this field to a value larger than zero.

24        **SYNC ID** - Service Configuration synchronization identifier.

25          If the SYNC ID INCL field is not included or is included and is  
 26          set to '0', the base station shall omit this field; otherwise, the  
 27          base station shall include this field and set it as follows:

28          The base station shall set this field to the synchronization  
 29          identifier corresponding to the service configuration conveyed  
 30          by this message.

31        **NUM\_CALLS\_ASSIGN** - Number of call assignments.

32          If the CC\_INFO\_INCL field is not included or is included but is  
 33          set to '0', the base station shall omit this field; otherwise, the  
 34          base station shall include this field and set it as follows:

1                   The base station shall set this field to the number of new call  
 2                   assignments included in this message.

3                   The base station shall include NUM\_CALLS\_ASSIGN occurrences of the following variable  
 4                   length record (CON\_REF, RESPONSE\_IND, TAG, BYPASS\_ALERT\_ANSWER as per the  
 5                   following requirements).

6                   CON\_REF      Connection reference.

7                   The base station shall set this field to the connection reference  
 8                   of the service option connection corresponding to this call.

9                   RESPONSE\_IND      Response indicator.

10                  The base station shall set this field to '1' if this call  
 11                  assignment is a response to an *Enhanced Origination Message*  
 12                  from the mobile station; otherwise, the base station shall set  
 13                  this field to '0'.

14                  TAG      Transaction identifier.

15                  If the RESPONSE\_IND field is set to '0', the base station shall  
 16                  omit this field; otherwise, the base station shall include this  
 17                  field and set it as follows:

18                  The base station shall set this field to the value of the TAG  
 19                  field received in the *Enhanced Origination Message* to which  
 20                  this call assignment is the response.

21                  BYPASS\_ALERT

22                  ANSWER      Bypass alert indicator.

23                  If the RESPONSE\_IND field is set to '1', the base station shall  
 24                  omit this field; otherwise, the base station shall include this  
 25                  field and set it as follows:

26                  If the mobile station is to bypass the *Waiting for Order Substate*  
 27                  and the *Waiting for Mobile Station Answer Substate* for this call,  
 28                  the base station shall set this field to '1'; otherwise, the base  
 29                  station shall set this field to '0'.

31                  CS\_SUPPORTED      -      Concurrent Services supported indicator.

32                  If the base station supports concurrent services, the base  
 33                  station shall set this field to '1'; otherwise, the base station  
 34                  shall set this field to '0'.

## 1    3.7.3.3.2.32 Resource Allocation Message

2    MSG\_TAG: RAM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| USE_TIME     | 1                    |
| ACTION_TIME  | 0 or 6               |
| FPC_PRI_CHAN | 1                    |

4

5    USE\_TIME   -   Use action time indicator.

6                 This field indicates whether an explicit action time is specified  
7                 in this message.8                 If an explicit action time is specified in this message, the base  
9                 station shall set this field to '1'; otherwise, the base station  
10                shall set this field to '0'.

11                ACTION\_TIME   -   Action time.

12                If the USE\_TIME field is set to '1', the base station shall set  
13                this field to the System Time, in units of 80 ms (modulo 64),  
14                at which this message is to take effect. If the USE\_TIME field  
15                is set to '0' the base station shall omit this field.

16                FPC\_PRI\_CHAN   -   Power Control Subchannel indicator.

17                The base station shall set this field to '0' if the mobile station  
18                is to perform the primary inner loop estimation on the  
19                received Forward Fundamental Channel and the base station  
20                is to multiplex the Power Control Subchannel on the Forward  
21                Fundamental Channel. The base station shall set this field to  
22                '1' if the mobile station is to perform the primary inner loop  
23                estimation on the received Forward Dedicated Control  
24                Channel and the base station is to multiplex the Power  
25                Control Subchannel on the Forward Dedicated Control  
26                Channel.

## 1    3.7.3.3.2.33 Resource Allocation Mini Message

2    MSG\_TAG: RAMM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| USE_TIME     | 1                    |
| ACTION_TIME  | 0 or 6               |
| FPC_PRI_CHAN | 1                    |

4

5    USE\_TIME    -    Use action time indicator.

6                 This field indicates whether an ACTION\_TIME is specified in  
7                 this message.8                 If an ACTION\_TIME is specified in this message, the base  
9                 station shall set this field to '1'; otherwise, the base station  
10                shall set this field to '0'.

11                ACTION\_TIME    -    Action time.

12                If the USE\_TIME field is set to '1', the base station shall set  
13                this field to the System Time, in units of 80 ms (modulo 64),  
14                at which the message is to take effect. If the USE\_TIME field  
15                is set to '0' the base station shall omit this field.

16                FPC\_PRI\_CHAN    -    Power Control Subchannel indicator.

17                The base station shall set this field to '0' if the mobile station  
18                is to perform the primary inner loop estimation on the  
19                received Forward Fundamental Channel and the base station  
20                is to multiplex the Power Control Subchannel on the Forward  
21                Fundamental Channel. The base station shall set this field to  
22                '1' if the mobile station is to perform the primary inner loop  
23                estimation on the received Forward Dedicated Control  
24                Channel and the base station is to multiplex the Power  
25                Control Subchannel on the Forward Dedicated Control  
26                Channel.

## 1    3.7.3.3.2.34 Extended Release Message

2    MSG\_TAG: ERM

3

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| USE_TIME          | 1                    |
| ACTION_TIME       | 0 or 6               |
| CH_IND            | 3                    |
| GATING_RATE_INCL  | 1                    |
| PILOT_GATING_RATE | 0 or 2               |

4

5    USE\_TIME    -    Use action time indicator.

6    This field indicates whether an explicit action time is specified  
7    in this message.8    If an explicit action time is specified in this message, the base  
9    station shall set this field to '1'; otherwise, the base station  
10   shall set this field to '0'.

11    ACTION\_TIME    -    Action time.

12    If the USE\_TIME field is set to '1', the base station shall set  
13    this field to the System Time, in units of 80 ms (modulo 64),  
14    at which the message is to take effect. If the USE\_TIME field  
15    is set to '0' the base station shall omit this field.

16    CH\_IND    -    Channel Indicator.

17    The base station shall set this field as shown in Table  
18    3.7.3.3.2.34-1, to release physical resources.

**Table 3.7.3.3.2.34-1. Channel Indicator**

| <b>CH_IND<br/>(binary)</b> | <b>Physical Resource(s) Released</b>                                                 |

2    MSG\_TAG: ERMM

3

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| USE_TIME          | 1                    |
| ACTION_TIME       | 0 or 6               |
| CH_IND            | 3                    |
| GATING_RATE_INCL  | 1                    |
| PILOT_GATING_RATE | 0 or 2               |

4

5    USE\_TIME    -    Use action time indicator.

6    This field indicates whether an ACTION\_TIME is specified in  
7    this message.8    If an ACTION\_TIME is specified in this message, the base  
9    station shall set this field to '1'; otherwise, the base station  
10   shall set this field to '0'.

11    ACTION\_TIME    -    Action time.

12    If the USE\_TIME field is set to '1', the base station shall set  
13    this field to the System Time, in units of 80 ms (modulo 64),  
14    at which the message is to take effect. If the USE\_TIME field  
15    is set to '0' the base station shall omit this field.

16    CH\_IND    -    Channel Indicator.

17    The base station shall set this field as shown in Table  
18    3.7.3.3.2.34-1, to release physical resources.

19    GATING\_RATE\_INCL    -    Reverse pilot gating rate included flag.

20    The base station shall set this field to '1' if the  
21    PILOT\_GATING\_RATE field is included, otherwise it shall set  
22    this field to '0'.

23    PILOT\_GATING\_RATE    -    Actual Reverse Pilot gating Rate.

24    If the GATING\_RATE\_INCL field is set to '1' then the base  
25    station shall set this field to the PILOT\_GATING\_RATE field  
26    shown in Table 3.7.3.3.2.34-2 corresponding to the actual  
27    gating rate on the Reverse Pilot Channel; otherwise, the base  
28    station shall omit this field.

USE\_TIME - Use action time indicator.

1           This field indicates whether an explicit action time is specified  
 2           in this message.

3           If an explicit action time is specified in this message, the base  
 4           station shall set this field to '1'; otherwise, the base station  
 5           shall set this field to '0'.

- 6           ACTION\_TIME     - Action time.  
 7                         If the USE\_TIME field is set to '1', the base station shall set  
 8                         this field to the System Time, in units of 80 ms (modulo 64),  
 9                         at which the handoff is to take effect. If the USE\_TIME field is  
  10                  set to '0' the base station shall omit this field.
- 11           HDM\_SEQ       - *Universal Handoff Direction Message* sequence number.  
 12                         This field is used by the mobile station in the *Power*  
 13                         *Measurement Report Message* to identify the order in which  
 14                  the reported pilot strengths are sent.
- 15           PARMS\_INCL    - Parameters included indicator.  
 16                         The base station shall set this field to the handoff message  
 17                         sequence number, as specified in 2.6.6.2.2.10.
- 18           P\_REV         - Protocol revision level.  
 19                         If PARMS\_INCL is set to '1', the base station shall set this field  
 20                         to the base station protocol revision level that the mobile  
 21                         station is to use after completion of the handoff; otherwise,  
 22                  the base station shall omit this field.
- 23           SERV\_NEG\_TYPE - Service negotiation type.  
 24                         If PARMS\_INCL is set to '1', the base station shall include the  
 25                         field SERV\_NEG\_TYPE and set this field as described below;  
 26                  otherwise, the base station shall omit this field.  
 27                         If the mobile station is to use service negotiation, the base  
 28                         station shall set this field to '1'. If the mobile station is to use  
 29                         service option negotiation, the base station shall set this field  
 30                  to '0'.
- 31           SEARCH\_INCLUDED - Pilot search parameters included.  
 32                         If the mobile station is to change its pilot search parameters,  
 33                         the base station shall set this field to '1'; otherwise, the base  
 34                  station shall set this field to '0'.
- 35           SRCH\_WIN\_A    - Search window size for the Active Set and Candidate Set.  
 36                         If SEARCH\_INCLUDED is set to '1', the base station shall  
 37                         include the field SRCH\_WIN\_A and set this field to the window  
 38                         size parameter shown in Table 2.6.6.2.1-1 corresponding to  
 39                         the number of PN chips that the mobile station is to search for  
 40                         pilots in the Active Set and the Candidate Set; otherwise, the  
 41                  base station shall omit this field.

- 1           SRCH\_WIN\_N   - Search window size for the Neighbor Set.  
 2           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 3           include the field SRCH\_WIN\_N and set this field to the window  
 4           size parameter shown in Table 2.6.6.2.1-1 corresponding to  
 5           the search window size to be used by mobile stations for the  
 6           Neighbor Set after completion of the handoff; otherwise, the  
 7           base station shall omit this field.
- 8           SRCH\_WIN\_R   - Search window size for the Remaining Set.  
 9           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 10          include the field SRCH\_WIN\_R and set this field to the window  
 11          size parameter shown in Table 2.6.6.2.1-1 corresponding to  
 12          the search window size to be used by mobile stations for the  
 13          Remaining Set after completion of the handoff; otherwise, the  
 14          base station shall omit this field.
- 15           T\_ADD   - Pilot detection threshold.  
 16           This value is used by the mobile station to trigger the transfer  
 17           of a pilot from the Neighbor Set or Remaining Set to the  
 18           Candidate Set (see 2.6.6.2.6) and to trigger the sending of the  
 19           *Pilot Strength Measurement Message* or *Extended Pilot Strength*  
 20           *Measurement Message* initiating the handoff process (see  
 21           2.6.6.2.5.2).  
 22           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 23           include the field T\_ADD and set this field to the pilot detection  
 24           threshold, expressed as an unsigned binary number equal to  
 25            $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ ; otherwise, the base station shall omit  
 26           this field.
- 27           T\_DROP   - Pilot drop threshold.  
 28           This value is used by mobile stations to start a handoff drop  
 29           timer for pilots in the Active Set and the Candidate Set (see  
 30           2.6.6.2.3).  
 31           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 32           include the field T\_DROP and set this field to the pilot drop  
 33           threshold, expressed as an unsigned binary number equal to  
 34            $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ ; otherwise, the base station shall omit  
 35           this field.
- 36           T\_COMP   - Active Set versus Candidate Set comparison threshold.  
 37           The mobile station transmits a *Pilot Strength Measurement*  
 38           *Message* or *Extended Pilot Strength Measurement Message*  
 39           when the strength of a pilot in the Candidate Set exceeds that  
 40           of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).  
 41           If SEARCH\_INCLUDED is set to ‘1’, the base station shall  
 42           include the field T\_COMP and set this field to the threshold  
 43           Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB;  
 44           otherwise, the base station shall omit this field.

|    |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 27 | DROP_INTERCEPT | <ul style="list-style-type: none"> <li>- The intercept in the inequality criterion for dropping a pilot from the Active Set (see 2.6.6.2.3).</li> </ul> <p>If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field DROP_INTERCEPT in the additional fields and set this field as a two's complement signed binary number; otherwise, the base station shall omit this field.</p>                                                                                                                 |
| 33 | EXTRA_PARMS    | <ul style="list-style-type: none"> <li>- Extra parameters included.</li> </ul> <p>If the base station includes the fields PACKET_ZONE_ID, FRAME_OFFSET, PRIVATE_LCM, RESET_L2, RESET_FPC, SERV_NEG_TYPE, ENCRYPT_MODE, NOM_PWR_EXT, NOM_PWR, RLGAIN_TRAFFIC_PILOT, DEFAULT_RLAG, NUM_PREAMBLE, BAND_CLASS, PERIODIC_SEARCH, or CDMA_FREQ in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.</p>                                                |
| 41 | PACKET_ZONE_ID | <ul style="list-style-type: none"> <li>- Packet data services zone identifier.</li> </ul> <p>If EXTRA_PARMS is set to ‘1’, the base station shall include the field PACKET_ZONE_ID and set this field as described below; otherwise, the base station shall omit this field.</p>                                                                                                                                                                                                                                    |

If the base station supports a packet data service zone, the base station shall set this field to the non-zero packet data services zone identifier that the mobile station is to use after completion of the handoff.

If the base station does not support a packet data service zone, the base station shall set this field to '00000000'.

7           FRAME\_OFFSET - Frame offset.

8           The Forward and Reverse Traffic Channel frames are delayed  
9           FRAME\_OFFSET × 1.25 ms relative to system timing (see [2]).

10          If EXTRA\_PARMS is set to '1', the base station shall include  
11          the field FRAME\_OFFSET and set this field to the Forward  
12          and Reverse Traffic Channel frame offset; otherwise, the base  
13          station shall omit this field.

14          PRIVATE\_LCM - Private long code mask indicator.

15          This field is used to change the long code mask after a hard  
16          handoff.

17          If EXTRA\_PARMS is set to '1', the base station shall include  
18          the field PRIVATE\_LCM and set this field as described below;  
19          otherwise, the base station shall omit this field.

20          If the private long code mask is to be used after the handoff,  
21          the base station shall set this field to '1'; otherwise, the base  
22          station shall set this field to '0'.

23          RESET\_L2 - Reset acknowledgment procedures command.

24          This field is used to reset acknowledgment processing in the  
25          mobile station.

26          If EXTRA\_PARMS is set to '1', the base station shall include  
27          the field RESET\_L2 and set this field as described below;  
28          otherwise, the base station shall omit this field.

29          If the field is included and the mobile station is to reset its  
30          acknowledgment procedures, the base station shall set this  
31          field to '1'; otherwise, the base station shall set this field to '0'.

32          RESET\_FPC - Reset Forward Traffic Channel power control.

33          This field is used to reset the Forward Traffic Channel power  
34          control counters.

35          If EXTRA\_PARMS is set to '1', the base station shall include  
36          the field RESET\_FPC and set this field as described below;  
37          otherwise, the base station shall omit this field.

38          The base station shall set this field to '0' if the Forward Traffic  
39          Channel power control counters are to be maintained after  
40          completion of the handoff. If the counters are to be initialized  
41          as specified in 2.6.4.1.1.1, then the base station shall set this  
42          field to '1'.

|    |                      |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----|----------------------|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | ENCRYPT_MODE         | - | Message encryption mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2  |                      |   | If EXTRA_PARMS is set to '1', the base station shall include the field ENCRYPT_MODE and set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encryption mode that is to be used for messages sent on the Forward and Reverse Traffic Channels, as specified in 2.3.12.2; otherwise, the base station shall omit this field.                                                                                                        |

| 21 |                      |   | If the mobile station is to use the default values for the reverse link attribute gain, as specified in Table 2.1.2.3.3-1 of [2] after completion of handoff, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.                                                                                                                                                                                                     |
| 22 |                      |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 23 | NUM_PREAMBLE         | - | Number of Traffic Channel preamble.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 24 |                      |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

If EXTRA\_PARMS is set to '0', the base station shall omit the NUM\_PREAMBLE field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a handoff; as follows:

If, after the handoff, radio configuration 1 or radio configuration 2 is to be used, the base station shall set NUM\_PREAMBLE to the Traffic Channel preamble length in 20 ms units; otherwise, the base station shall set NUM\_PREAMBLE to the value shown in Table 3.7.3.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

**BAND\_CLASS** - Band class.

If EXTRA\_PARMS is set to '1', the base station shall include the field BAND\_CLASS and set this field to the CDMA band class corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [30]; otherwise, the base station shall omit this field.

**CDMA\_FREQ** - Frequency assignment.

If EXTRA\_PARMS is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [2]. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall include the field CDMA\_FREQ and set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA center SR3 frequency assignment for the CDMA Channel..

**RETURN\_IF\_HANOFF\_FAIL**

- Return on failure flag.

If EXTRA\_PARMS is set to '1', the base station shall include the field RETURN\_IF\_HANOFF\_FAIL and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to '1' if the mobile station is to resume the use of the Active Set on the Serving Frequency following an unsuccessful hard handoff attempt, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to '0'.

**COMPLETE\_SEARCH** - Flag to complete search.

If RETURN\_IF\_HANOFF\_FAIL is included and is set to '1', the base station shall include the field COMPLETE\_SEARCH and set this field as described below; otherwise, the base station shall omit this field.

1                   If the base station includes this field, it shall set this field to  
 2                   ‘1’ if the mobile station is to complete the search of the  
 3                   Candidate Frequency Search Set before resuming the use of  
 4                   the Active Set on the Serving Frequency when an inter-  
 5                   frequency handoff attempt is unsuccessful, as specified in  
 6                   2.6.6.2.8.2; otherwise, the base station shall set this field to  
 7                   ‘0’.

- 8       PERIODIC\_SEARCH - Flag to search the Candidate Frequency periodically.  
 9                   If EXTRA\_PARMS is set to ‘1’, the base station shall include  
 10                  the field PERIODIC\_SEARCH and set this field as described  
 11                  below; otherwise, the base station shall omit this field.
- 12       SCR\_INCLUDED - Service Configuration Record included indicator.  
 13                   If EXTRA\_PARMS is set to ‘1’, the base station shall include  
 14                  the field SCR\_INCLUDED and shall set this field as described  
 15                  below; otherwise, the base station shall omit this field.
- 16       SERV\_CON\_SEQ - Connect sequence number.  
 17                   The base station shall set this field to ‘1’ if it includes the  
 18                  Service Configuration Record in the message; otherwise, the  
 19                  base station shall set this field to ‘0’.
- 20       If SCR\_INCLUDED is included and is set to ‘1’, the base station shall include one  
 21                  occurrence of the following three-field record to specify the service configuration.
- 22       RECORD\_TYPE - Information record type.  
 23                   If SCR\_INCLUDED is included and is set to ‘1’, the base  
 24                  station shall include the field RECORD\_TYPE and shall set  
 25                  this field to the record type value shown in Table 3.7.5-1  
 26                  corresponding to the Service Configuration information  
 27                  record.
- 28       RECORD\_LEN - Information record length.  
 29                   If SCR\_INCLUDED is included and is set to ‘1’, the base  
 30                  station shall include the field RECORD\_LEN and shall set this  
 31                  field to the number of octets included in the type-specific  
 32                  fields of the Service Configuration information record.
- 33       Type-specific fields - Type-specific fields.  
 34                   If SCR\_INCLUDED is included and is set to ‘1’, the base  
 35                  station shall include the type specific fields and shall set these  
 36                  fields as specified in 3.7.5.7 for the Service Configuration  
 37                  information record.

1       NNSCR\_INCLUDED   - Non-negotiable Service Configuration Record Included  
 2                            indicator

3                           The base station shall omit this field, if EXTRA\_PARMS is set  
 4                           to '0'; otherwise, the base station shall include this field and  
 5                           set this field as described below:

6                           The base station shall set this field to '1', if the Non-negotiable  
 7                           Service Configuration record is included in this message;  
 8                           otherwise, the base station shall set this field to '0'.

9       If NNSCR\_INCLUDED is included and is set to '1', the base station shall include one  
 10                          occurrence of the following three-field record to specify the non-negotiable service  
 11                          configuration.

12       RECORD\_TYPE   - Information record type.

13                           If NNSCR\_INCLUDED is included and is set to '1', the base  
 14                           station shall include the field RECORD\_TYPE and shall set  
 15                           this field to the record type value shown in Table 3.7.5-1  
 16                           corresponding to the Non-Negotiable Service Configuration  
 17                           information record.

18       RECORD\_LEN   - Information record length.

19                           If NNSCR\_INCLUDED is included and is set to '1', the base  
 20                           station shall include the field RECORD\_LEN and shall set this  
 21                           field to the number of octets included in the type-specific  
 22                           fields of the Non-Negotiable Service Configuration information  
 23                           record.

24       Type-specific fields   - Type-specific fields.

25                           If NNSCR\_INCLUDED is included and is set to '1', the base  
 26                           station shall include the type specific fields and shall set these  
 27                           fields as specified in 3.7.5.20 for the Non-Negotiable Service  
 28                           Configuration information record.

29       USE\_PWR\_CNTL\_STEP   - Power control step size indicator.

30                           The base station shall set this field to '1' if the field  
 31                           PWR\_CNTL\_STEP is included in the message.

32       PWR\_CNTL\_STEP   - Power control step size.

33                           If USE\_PWR\_CNTL\_STEP is set to '1', then the base station  
 34                           shall include the field PWR\_CNTL\_STEP and set this field to  
 35                           the step size that the mobile station is to use for closed loop  
 36                           power control, according to Table 3.7.3.3.2.25-1; otherwise,  
 37                           the base station shall omit this field.

38       CLEAR\_RETRY\_DELAY   - Clear retry delay indicator.

39                           The base station shall set this field to '1' if the mobile station  
 40                           is to clear any existing retry delay which it has stored (see  
 41                           2.6.6.2.5.1); otherwise, the base station shall set this field to  
 42                           '0'.

43       SCH\_INCL   - SCH related parameters included indicator.

The base station shall set this field to '1' if this message include the NUM\_FOR\_ASSIGN, NUM\_REV\_ASSIGN, NUM\_FOR\_SCH, NUM\_REV\_SCH, and NUM\_SCH fields. Otherwise, the base station shall set this field to '0'.

## NUM\_FOR-

- Number of Forward Supplemental Channel assigned.  
If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the number of Forward Supplemental Channel assigned.

The base station shall include NUM\_FOR\_ASSIGN occurrences of the following five fields (FOR\_SCH\_ID, FOR\_SCH\_DURATION, FOR\_SCH\_START\_TIME\_INCL, FOR\_SCH\_START\_TIME, and SCCL\_INDEX).

FOR\_SCH\_ID

- Forward Supplemental Channel identifier.  
The base station shall set this field to the Identifier of the Forward Supplemental Channel.

## FOR\_SCH\_DURATION

- Duration of Forward Supplemental Channel assignment.  
The base station shall set this field to the duration (see Table 3.7.3.3.2.37-3), starting at the start time of the message specified by FOR\_START\_TIME, during which the mobile station is to process the Forward Supplemental Channel.

The base station shall set this field to '0000' to indicate that the mobile station should stop processing the Forward Supplemental Channel starting at the explicit start time of the message specified by FOR\_SCH\_START\_TIME or at the implicit start time if FOR\_SCH\_START\_TIME\_INCL is set to '0'.

The base station shall set this field to '1111' to indicate that the mobile station should process the Forward Supplemental Channel, starting at the start time of the message specified by FOR\_SCH\_START\_TIME, until the start time specified by a subsequent Forward Supplemental Channel assignment corresponding to the same forward Supplemental Channel (see 2.6.6.2.5.1.1).

FOR SCH

## START\_TIME\_INCL

- Start time included indicator.

If FOR\_SCH\_DURATION is not equal to '0000', the base station shall set this field to '1'. If FOR\_SCH\_DURATION is equal to '0000', the base station shall set this field as follows:

The base station shall set this field to '1' if FOR\_SCH\_START\_TIME is included in this message; otherwise, the base station shall set this field to '0'.

- FOR\_SCH\_START\_TIME** - Start time for Forward Supplemental Channel Assignment.

If FOR\_SCH\_START\_TIME INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the System Time, in units of time specified by START\_TIME\_UNIT, (modulo 32) at which the mobile station is to start processing the Forward Supplemental Channel specified in this message. The explicit start time for processing Forward Supplemental Channels is the time for which

$$(\lfloor t / (\text{START\_TIME\_UNIT} + 1) \rfloor - \text{FOR\_SCH\_START\_TIME}) \bmod 32 = 0,$$

where t is the System Time in units of 20 ms.

SCCL\_INDEX - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Forward Supplemental Channel Code list corresponding to the FOR\_SCH\_ID. The base station shall include an SCCL\_INDEX whose SCH Active Set is a subset of the Active Set of the Fundamental Channel, Dedicated Control Channel, or both.

**NUM\_REV\_ASSIGN** - Number of Reverse Supplemental Channel assigned.  
 If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the number of Reverse Supplemental Channel assigned.

The base station shall include NUM\_REV\_ASSIGN occurrences of the following five fields (REV\_SCH\_ID, REV\_SCH\_DURATION, REV\_SCH\_START\_TIME\_INCL, REV\_SCH\_START\_TIME, and REV\_SCH\_NUM\_BITS\_IDX).

**REV\_SCH\_ID** - Reverse Supplemental Channel Identifier.  
The base station shall set this field to the identifier of the Reverse Supplemental Channel.

**REV\_SCH-DURATION** - Duration of Reverse Supplemental Channel assignment.

The base station shall set this field to '0000' to indicate that the mobile station is to stop transmitting on the Reverse Supplemental Channel specified by REV\_SCH\_ID at the explicit action time specified by REV\_SCH\_START\_TIME or at the implicit start time if REV\_SCH\_START\_TIME\_INCL is set to '0'. The base station shall set this field to '1111' to indicate that the mobile station may transmit on the Reverse Supplemental Channel specified by REV\_SCH\_ID, starting at the explicit start time specified by REV\_SCH\_START\_TIME in this message, until the start time specified by a subsequent Reverse Supplemental Channel assignment corresponding to the same Supplemental Channel (see 2.6.6.2.5.1.1). The base station shall set this field to the duration according to Table 3.7.3.3.2.37-3, starting at the explicit start time specified by REV\_SCH\_START\_TIME, during which the mobile station may transmit on the Reverse Supplemental Channel specified by REV\_SCH\_ID.

REV\_SCH-

- Start time included indicator.  
If REV\_SCH\_DURATION is not equal to '0000', the base station shall set this field to '1'. If REV\_SCH\_DURATION is equal to '0000', the base station shall set this field as follows:

The base station shall set this field to '1' if REV\_SCH\_START\_TIME is included in this message; otherwise, the base station shall set this field to '0'.

- Start time for Reverse Supplemental Channel Assignment.

If REV\_SCH\_START\_TIME\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the System Time, in units of time specified by START\_TIME\_UNIT, (modulo 32) at which the mobile station may start transmitting on the Reverse Supplemental Channel specified in this message. The explicit start time for transmitting on the Reverse Supplemental Channel is the time for which

$\lfloor t / (\text{START\_TIME\_UNIT}_s + 1) \rfloor - \text{REV\_SCH\_START\_TIME} \bmod 32 = 0$ ,

where t is the System Time in units of 20 ms.

REV SCH-

- Reverse Supplemental Channel number of bits per frame index granted by the base station.

If USE\_FLEX\_NUM\_BITS is equal to '0' or if USE\_FLEX\_NUM\_BITS is equal to '1' and RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame [and the number of CRC bits per frame](#), that the mobile station may transmit on the reverse Supplemental Channel identified by REV\_SCH\_ID.

If USE\_FLEX\_NUM\_BITS is equal to '1' and RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is not equal to '0000', then the base station shall set [the REV\\_SCH\\_NUM\\_BITS\\_IDX](#) [this](#) field to indicate the Reverse Supplemental Channel number of information bits per frame that the mobile station may transmit on the Reverse Supplemental Channel identified by REV\_SCH\_ID to be NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]] [REV\_SCH\_NUM\_BITS\_IDX] [and the Reverse Supplemental Channel number of CRC bits per frame that the mobile station may transmit on the Reverse Supplemental Channel identified by REV\\_SCH\\_ID to be CRC\\_LEN\\_IDX\[RSCH\\_NBIT\\_TABLE\\_ID\[REV\\_SCH\\_ID\]\] \[REV\\_SCH\\_NUM\\_BITS\\_IDX\]](#).

~~The REV\_SCH\_NUM\_BITS\_IDX field also specifies the number of CRC bits per frame for the Reverse Supplemental Channel identified by REV\_SCH\_ID. The number of CRC bits per frame is specified by CRC\_LEN\_IDX[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]] [REV\_SCH\_NUM\_BITS\_IDX] and Table 3.7.5.20-4.~~

FPC\_SUBCHAN\_GAIN - Forward power control subchannel relative gain.

The base station shall set FPC\_SUBCHAN\_GAIN equal to the power level of the forward link power control subchannel relative to that of 20 ms frames at a 9600 bps or 14400 bps rate on the Forward Fundamental Channel or the Forward Dedicated Control Channel that the Forward Power Control Subchannel is punctured on. The base station shall set the value in units of 0.25 dB.

USE\_PC\_TIME - Use power control action time indicator.

This field indicates whether an explicit time [PC\_ACTION\_TIME] at which a new value for power control sub-channel to traffic ratio (FPC\_SUBCHAN\_GAIN) takes effect is specified in the message.

If an explicit action time is specified in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

PC\_ACTION\_TIME - Power Control Subchannel gain action time.

If the USE\_PC\_TIME field is set to '1', the base station shall set this field to the System Time, in units of 80 ms (modulo 64), at which FPC\_SUBCHAN\_GAIN specified in this message is to take effect. If the USE\_PC\_TIME field is set to '0' the base station shall omit this field.

- CH\_IND - Channel Indicator.  
The base station shall set this field as shown in Table 3.7.3.3.2.36-1.

**Table 3.7.3.3.2.36-1. Channel Indicator**

| <b>CH_IND<br/>(Binary)</b> | <b>Physical Resource(s) Allocated</b>                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 110                        | Dedicated Control Channel and Continuous Reverse Pilot Channel                                                                                                                                 |
| 111                        | Fundamental Channel, Dedicated Control Channel and Continuous Reverse Pilot Channel                                                                                                            |

- ACTIVE\_SET\_REC\_LEN - Active Set record length.  
The base station shall set this field to the number of octets in the ACTIVE\_SET\_REC\_FIELDS included in this message.
- ACTIVE\_SET-  
\_REC\_FIELDS - Active Set record fields.  
The Active Set record fields are determined by the value of CH\_IND, as described below.
- REV\_FCH-  
\_GATING\_MODE - Reverse eighth gating mode indicator.  
The base station shall set this field to '1' if the mobile station is allowed to perform the reverse eighth gating mode after handoff; otherwise, the base station shall set this field to '0'.

- 1                   REV\_PWR-
- 2     \_CNTL\_DELAY\_INCL - Reverse power control delay included indicator.
- 3                   If REV\_FCH\_GATING\_MODE is set to '0', the base station shall  
4                   omit this field; otherwise, the base station shall include this  
5                   field and set it as follows.
- 6                   The base station shall set this field to '1' if  
7                   REV\_PWR\_CNTL\_DELAY is included in this message;  
8                   otherwise, the base station shall set this field to '0'.
- 9                   REV\_PWR-
- 10    \_CNTL\_DELAY - The reverse power control delay.
- 11                   If REV\_PWR\_CNTL\_DELAY\_INCL is set to '0', the base station  
12                   shall omit this field; otherwise, the base station shall include  
13                   this field and set it as follows:
- 14                   The base station shall set this field to the closed-loop reverse  
15                   power control delay minus one (the closed-loop reverse power  
16                   control delay is the time between the end of a gated-on reverse  
17                   PCG and the beginning of the reverse PCG where the  
18                   corresponding feedback is sent on the Forward Power Control  
19                   Subchannel, see 2.1.2.3.2 of [2]) used by the mobile station  
20                   after handoff, in units of 1.25 ms.
- 21    | D\_SIG\_ENCRYPT\_MODE - Dedicated channel signaling General-encryption mode indicator.
- 22                   If ENCRYPT\_MODE is included and is set to '11', the base station  
23                   shall include this field and shall set it to the dedicated channel  
24                   signaling message-encryption mode, as shown in Table 3.7.4.5-1;  
25                   otherwise the base station shall omit this field.
- 26    | USE\_NEW\_KEY      Use new encryption key indication
- 27                   If ENCRYPT\_MODE is included and is set to '10' or '11', the base  
28                   station shall include this field. If this field is included, the base  
29                   station shall set this field to '0' to indicate that the stored  
30                   encryption key to be used by the mobile station. Otherwise, the  
31                   base station shall set this field to '1' to indicate that the new  
32                   encryption key to be used by the mobile station.
- 33    | ENC\_KEY\_SIZE     Encryption key size indication.
- 34                   If ENCRYPT\_MODE is included and is set to '10' or  
35                   '11' USE\_NEW\_KEY is included and is set to '0', the base  
36                   station shall omit this field; otherwise, the base station shall  
37                   include this field and set it to the encryption key size, as  
38                   shown in Table 3.7.4.5-2; otherwise, the base station shall  
39                   omit this field this field as described below.
- 40                   The base station shall set this field to the encryption key size, as  
41                   shown in Table 3.7.4.5-2.
- 42    | KEY\_SEQ         Encryption key sequence number.

1            If USE\_NEW\_KEY is included and is set to '0', the base station  
2            shall include this field; otherwise, the base station shall omit this  
3            field. If this field is included, the base station shall set it to the  
4            encryption key sequence number to be used by the mobile  
5            station.

6        3XFL\_1XRL\_INCL - 3X Forward Link and 1X Reverse Link indicator.

7            The base station shall set this field to '1' if the base station is  
8            assigning 3X traffic channel on the Forward Link and 1X  
9            traffic channel on the Reverse Link; otherwise, the base  
10          station shall set this field to '0'.

11        1XRL\_FREQ\_OFFSET - 1X Reverse Link frequency offset.

12            If 3XFL\_1XRL\_INCL is set to '0', the base station shall omit  
13            this field; otherwise, the base station shall set this field as  
14            follows:

15            The base station shall set this field to the value shown in  
16            Table 3.7.2.3.2.21-5 corresponding to the frequency offset of  
17            the 1X reverse link.

**SYNC\_ID\_INCL** - Service Configuration synchronization identifier included indicator.

If either the SCR INCLUDED field is included and is set to '1' or the NNSCR INCLUDED field is included and is set to '1', the base station shall include this field; otherwise, the base station shall omit this field. If included, the base station shall set this field as follows:

The base station shall set this field to '1' if the SYNC ID field is included in this message; otherwise, the base station shall set this field to '0'.

**SYNC ID LEN** - Service Configuration synchronization identifier length.

If the SYNC ID INCL field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length (in octets) of the SYNC ID field included in this message. The base station shall set this field to a value larger than zero.

**SYNC ID** - Service Configuration synchronization identifier.

If the SYNC ID INCL field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the synchronization identifier corresponding to the service configuration conveyed by this message.

**CC\_INFO\_INCL** - Call Control information included indicator.

If the SCR\_INCLUDED field is not included or is included but is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if Call Control related parameters (to assign new call(s)) are included in this message; otherwise, the base station shall set this field to '0'.

**NUM\_CALLS\_ASSIGN** - Number of call assignments.

If the CC\_INFO\_INCL field is not included or is included but is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

1                   The base station shall set this field to the number of new call  
 2                   assignments included in this message.

3                   The base station shall include NUM\_CALLS\_ASSIGN occurrences of the following variable  
 4                   length record (CON\_REF, RESPONSE\_IND, TAG, BYPASS\_ALERT\_ANSWER as per the  
 5                   following requirements).

6                   CON\_REF    - Connection reference.

7                   The base station shall set this field to the connection reference  
 8                   of the service option connection corresponding to this call.

9                   RESPONSE\_IND - Response indicator.

10                  The base station shall set this field to '1' if this call  
                      assignment is a response to an *Enhanced Origination Message*  
                      from the mobile station; otherwise, the base station shall set  
                      this field to '0'.

14                  TAG        - Transaction identifier.

15                  If the RESPONSE\_IND field is set to '0', the base station shall  
                      omit this field; otherwise, the base station shall include this  
                      field and set it as follows:

18                  The base station shall set this field to the value of the TAG  
                      field received in the *Enhanced Origination Message* to which  
                      this call assignment is the response.

21                  BYPASS\_ALERT-

22                  \_ANSWER - Bypass alert indicator.

23                  If the RESPONSE\_IND field is set to '1', the base station shall  
                      omit this field; otherwise, the base station shall include this  
                      field and set it as follows:

26                  If the mobile station is to bypass the *Waiting for Order*  
                      *Substate* and the *Waiting for Mobile Station Answer Substate*  
                      for this call, the base station shall set this field to '1';  
                      otherwise, the base station shall set this field to '0'.

30

31                  CS\_SUPPORTED - Concurrent Services supported indicator.

32                  If the base station supports concurrent services, the base  
                      station shall set this field to '1'; otherwise, the base station

1 shall set this field to '0'.  
 2

3 If the CH\_IND field is set to '101', the base station shall include the following fields:

4       NUM\_FOR\_SCH   - Number of Forward Supplemental Channel records.

5                     If SCH\_INCL is set to '0', the base station shall omit this field;  
 6                     otherwise, the base station shall set this field as follows:

7                     The base station shall set this field to the number of the  
 8                     Forward Supplemental Channel records need to be updated.

9 If NUM\_FOR\_SCH is included and not equal to '00000', the base station shall include  
 10 NUM\_FOR\_SCH occurrence of the following three fields:

11       FOR\_SCH\_ID   - Forward Supplemental Channel identifier.

12                     The base station shall set this field to the identifier of the  
 13                     Forward Supplemental Channel.

14       SCCL\_INDEX   - Supplemental Channel Code list index.

15                     The base station shall set this field to the index of the record  
 16                     in the Supplemental Channel Code list.

17       FOR\_SCH-  
 18       \_NUM\_BITS\_IDX   - Forward Supplemental Channel number of information bits  
 19                     index.

20                     If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 21                     USE\_FLEX\_NUM\_BITS is equal to '1' and  
 22                     FSCH\_NBIT\_TABLE\_ID for FOR\_SCH\_ID is equal to '0000',  
 23                     then the base station shall set this field according to Table  
 24                     3.7.3.3.2.37-4 to indicate the number of information bits per  
 25                     frame and the length of the CRC field for the Forward  
 26                     Supplemental Channel identified by FOR\_SCH\_ID  
 27                     corresponding to SCCL\_INDEX.

28                     If USE\_FLEX\_NUM\_BITS is equal to '1' and  
 29                     FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID] is not equal to '0000',  
 30                     then the base station shall set the FOR\_SCH\_NUM\_BITS\_IDX  
this field to indicate that the number of information bits per  
 31                     frame for the Forward Supplemental channel identified by  
 32                     FOR\_SCH\_ID to be  
 33                     NUM\_BITS[FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]][FOR\_SCH\_N  
 34                     UM\_BITS\_IDX] and the number of CRC bits per frame for the  
Forward Supplemental channel identified by FOR SCH ID to  
be  
CRC LEN IDX[FSCH\_NBIT\_TABLE\_ID[FOR SCH ID]][FOR SC  
H NUM BITS IDX].

1                   The FOR\_SCH\_NUM\_BITS\_IDX field also specifies the number  
 2                   of CRC bits per frame for the Forward Supplemental Channel  
 3                   identified by FOR\_SCH\_ID. The number of CRC bits per frame  
 4                   is specified by CRC\_LEN\_IDX  
 5                   [uSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]][FOR\_SCH\_NUM\_BITS\_  
 6                   IDX] and Table 3.7.5.20-4.

- 7        NUM\_REV\_SCH    - Number of Reverse Supplemental Channel records.  
 8                   If SCH\_INCL is set to '0', the base station shall omit this field;  
 9                   otherwise, the base station shall set this field as follows:  
 10                  The base station shall set this field to the number of the  
 11                  Reverse Supplemental Channels need to be updated.

12       If NUM\_REV\_SCH is included and not equal to '00000', the base station shall include  
 13        NUM\_REV\_SCH occurrence of the following three fields:

- 14       REV\_SCH\_ID    - Reverse Supplemental Channel identifier.  
 15                   The base station shall set this field to the identifier of the  
 16                  Reverse Supplemental Channel.
- 17       REV\_WALSH\_ID   - Reverse Supplemental Channel Walsh cover Identifier.  
 18                   The base station shall set this field according to Table  
 19                  3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile  
 20                  station is to use when transmitting at the rate specified by  
 21                  REV\_SCH\_NUM\_BITS\_IDX on the Reverse Supplemental  
 22                  Channel specified by REV\_SCH\_ID. If only one reverse  
 23                  supplemental channel is assigned, the base station should set  
 24                  this field to the default value for the REV\_WALSH\_ID as  
 25                  specified in 2.6.4.2.

- 26       REV\_SCH-  
 27       \_NUM\_BITS\_IDX   - Reverse Supplemental Channel number of bits per frame  
 28                  index.  
 29                   If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 30                  USE\_FLEX\_NUM\_BITS is equal to '1' and  
 31                  RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then  
 32                  the base station shall set this field according to Table  
 33                  3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel  
 34                  number of information bits per frame and the CRC bits per  
 35                  frame, corresponding to REV\_WALSH\_ID field.

36       If    USE\_FLEX\_NUM\_BITS    is    equal    to    '1'    and  
 37        RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]    is    not    equal    to    '0000',  
 38        then    the    base    station    shall    set    the    REV\_SCH\_NUM\_BITS\_IDX  
 39                  this    field    to    indicate    the    Reverse    Supplemental  
 40                  Channel    number    of    information    bits    per    frame,  
 41                  corresponding    to    REV\_WALSH\_ID    field    to    be  
 42                  NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
 43                  [REV\_SCH\_NUM\_BITS\_IDX] and the Reverse Supplemental  
 44                  Channel number of CRC bits per frame corresponding to  
 45                  REV WALSH ID    field    to    be

1                   CRC\_LEN\_IDX[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
 2                   [REV\_SCH\_NUM\_BITS\_IDX].

4           NUM\_PILOTS - Number of pilots included in the message.  
 5                   The base station shall set this field to the number of pilots  
 6                   included in the message. The base station shall set this field  
 7                   to an integer that is equal to or greater than 1.

8           SRCH\_OFFSET\_INCL - Target pilot channel search window offset included.  
 9                   If the SRCH\_OFFSET field is included in the following records,  
 10                  the base station shall set this field to '1'; otherwise, the base  
 11                  station shall set this field to '0'.

12          The base station shall include one occurrence of the following record for each of the  
 13          NUM\_PILOTS pilots included in the message:

14           PILOT\_PN - Pilot PN sequence offset index.  
 15                   The base station shall set this field to the pilot PN sequence  
 16                   offset for this pilot in units of 64 PN chips.

17           SRCH\_OFFSET - Target pilot channel search window offset.  
 18                   If SRCH\_OFFSET\_INCL equals to '1', then the base station  
 19                  shall set this field to the value shown in Table 2.6.6.2.1-2  
 20                  corresponding to the search window offset to be used by the  
 21                  mobile station for this target pilot. Otherwise, the base  
 22                  station shall omit this field.

23           ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.  
 24                   The base station shall set this field to '1' if additional pilot  
 25                  information listed in PILOT\_REC\_TYPE and RECORD\_LEN  
 26                  fields are included. The base station shall set this field to '0' if  
 27                  the corresponding pilot is the common pilot and there is no  
 28                  additional pilot information included.

29           PILOT\_REC\_TYPE - Pilot record type.  
 30                   If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 31                  set this field to the PILOT\_REC\_TYPE value shown in Table  
 32                  3.7.2.3.2.21-6 corresponding to the type of Pilot Record  
 33                  specified by this record.

34                   If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 35                  omit this field.

36           RECORD\_LEN - Pilot record length.  
 37                   If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 38                  set this field to the number of octets in the type-specific fields  
 39                  of this pilot record.

40                   If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 41                  omit this field.

42           Type-specific fields - Pilot record type-specific fields.

1                   If ADD\_PILOT\_REC\_INCL is set to ‘1’, the base station shall  
 2                   include type-specific fields based on the PILOT\_REC\_TYPE of  
 3                   this pilot record as described in 3.7.6.1.

4                   If ADD\_PILOT\_REC\_INCL is set to ‘0’, the base station shall  
 5                   omit this field.

- 6
- 7           PWR\_COMB\_IND     - Power control symbol combining indicator.  
 8                   If the Forward Traffic Channel associated with this pilot will  
 9                   carry the same closed-loop power control subchannel bits as  
 10                  that of the previous pilot in this message, the base station  
 11                  shall set this field to ‘1’; otherwise, the base station shall set  
 12                  this field to ‘0’. The base station shall set this field to ‘0’ in  
 13                  the first record in the pilot list.
- 14           CODE\_CHAN\_FCH    - Code channel on the Fundamental Channel.  
 15                   If a Radio Configuration associated with Spreading Rate 1 is  
 16                   used, the base station shall set this field to the code channel  
 17                   index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile  
 18                   station is to use on the Fundamental Channel of the Forward  
 19                   Traffic Channel. If a Radio Configuration associated with  
 20                   Spreading Rate 3 is used, the base station shall set this field  
 21                   to the code channel index that the mobile station is to use for  
 22                   the Fundamental Channel on the center SR3 frequency.  
 23                   If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is  
 24                   used, the base station shall set this field in the range 1 to 63  
 25                   inclusive. If Radio Configuration 4, 6 or 8 is used, the base  
 26                   station shall set this field in the range 1 to 127 inclusive. If  
 27                   Radio Configuration 7 or 9 is used, the base station shall set  
 28                   this field in the range 1 to 255 inclusive.
- 29           QOF\_MASK\_ID\_FCH - Quasi-orthogonal function index on the Fundamental  
 30                   Channel.  
 31                   If a Radio Configuration associated with Spreading Rate 1 is  
 32                   used, the base station shall set this field to the index of the  
 33                   Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]). If a  
 34                   Radio Configuration associated with Spreading Rate 3 is used,  
 35                   the base station shall set this field to the index of the Quasi-  
 36                   orthogonal function on the center SR3 frequency.
- 37           NUM\_SCH        - Number of Supplemental Channel records.  
 38                   If SCH\_INCL is set to ‘0’, the base station shall omit this field;  
 39                   otherwise, the base station shall set this field as follows:  
 40                   The base station shall set this field to the number of the  
 41                   Supplemental Channel records need to be updated.
- 42           If NUM\_SCH is included and not equal to ‘00000’, the base station shall include NUM\_SCH  
 43                   occurrence of the following five fields:
- 44           FOR\_SCH\_ID      - Forward Supplemental Channel identifier.

- |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.                                                                                                                                                                                                                                                                                                                                                                               |
| SCCL_INDEX          | <ul style="list-style-type: none"> <li>- Supplemental Channel Code list index.</li> </ul> <p>The base station shall set this field to the index of the record in the Supplemental Channel Code list.</p>                                                                                                                                                                                                                                                                                          |

| OF_MASK_ID-_FCH_LOW | <ul style="list-style-type: none"> <li>- QOF index for the FCH on the lowest SR3 frequency.</li> </ul> <p>If 3X_FCH_LOW_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:</p>                                                                                                                                                                                                                                              |

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) corresponding to the QOF index for the FCH on the lowest SR3 frequency.

## CODE\_CHAN-

- Code channel for the FCH on the lowest SR3 frequency.  
If 3X\_FCH\_LOW\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the FCH on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

### 3X\_FCH\_HIGH\_INCL

- FCH code channel on the highest SR3 frequency included indicator.  
If the FCH on the highest SR3 frequencies has a different code channel than the FCH on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF\_MASK\_ID-

- QOF index for the FCH on the highest SR3 frequency.  
If 3X\_FCH\_HIGH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2] corresponding to the QOF index for the FCH on the highest SR3 frequency.

## CODE\_CHAN-

- Code channel for the FCH on the highest SR3 frequency.  
If 3X\_FCH\_HIGH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the FCH on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

### 3X\_SCH\_INFO\_INCL

- 3X SCH information included indicator.  
If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the 3X Supplemental Channel information is included, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

The base station shall include NUM\_SCH occurrences of the following seven fields record if 3X\_SCH\_INFO\_INCL is included and set to '1'.

FOR\_SCH\_ID - Forward Supplemental Channel identifier.

The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.

3X\_SCH\_LOW\_INCL - SCH code channel on the lowest SR3 frequency included indicator.

If the SCH on the lowest SR3 frequencies has a different code channel than the SCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

QOF\_MASK\_ID-

\_SCH\_LOW - QOF index for the SCH on the lowest SR3 frequency.

If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) corresponding to the QOF index for the SCH on the lowest SR3 frequency.

CODE\_CHAN-

\_SCH\_LOW - Code channel for the SCH on the lowest SR3 frequency.

If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the SCH on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X\_SCH\_HIGH\_INCL - SCH code channel on the highest SR3 frequency included indicator.

If the SCH on the highest SR3 frequencies has a different code channel than the SCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

QOF\_MASK\_ID-

\_SCH\_HIGH - QOF index for the SCH on the highest SR3 frequency.

1           If 3X\_SCH\_HIGH\_INCL is set to ‘0’, the base station shall omit  
 2           this field; otherwise, the base station shall set this field as  
 3           follows:

4           The base station shall set this field to the index of the Quasi-  
 5           orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 6           corresponding to the QOF index for the SCH on the highest  
 7           SR3 frequency.

8           CODE\_CHAN-  
 9                \_SCH\_HIGH

- Code channel for the SCH on the highest SR3 frequency.

10          If 3X\_SCH\_HIGH\_INCL is set to ‘0’, the base station shall omit  
 11           this field; otherwise, the base station shall set this field as  
 12           follows:

13          The base station shall set this field to the code channel index  
 14           (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 15           to use on the SCH on the highest SR3 frequency. If Radio  
 16           Configuration 6 or 8 is used, the base station shall set this  
 17           field in the range 1 to 127 inclusive. If Radio Configuration 7  
 18           or 9 is used, the base station shall set this field in the range 1  
 19           to 255 inclusive.

20          If the CH\_IND field is set to ‘010’ or ‘110’, the base station shall include the following fields:

21            NUM\_FOR\_SCH    - Number of Forward Supplemental Channel records.  
 22                            If SCH\_INCL is set to ‘0’, the base station shall omit this field;  
 23                            otherwise, the base station shall set this field as follows:  
 24                            The base station shall set this field to the number of the  
 25                            Forward Supplemental Channel records need to be updated.

26          If NUM\_FOR\_SCH is included and not equal to ‘00000’, the base station shall include  
 27            NUM\_FOR\_SCH occurrence of the following three fields:

28            FOR\_SCH\_ID    - Forward Supplemental Channel identifier.  
 29                            The base station shall set this field to identifier of the Forward  
 30                            Supplemental Channel.

31            SCCL\_INDEX    - Supplemental Channel Code list index.  
 32                            The base station shall set this field to the index of the record  
 33                            in the Supplemental Channel Code list.

34            FOR\_SCH-  
 35                \_NUM\_BITS\_IDX    - Forward Supplemental Channel number of information bits  
 36                                    index.

If USE\_FLEX\_NUM\_BITS is equal to '0' or if USE\_FLEX\_NUM\_BITS is equal to '1' and FSCH\_NBIT\_TABLE\_ID for FOR\_SCH\_ID is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for the Forward Supplemental Channel identified by FOR\_SCH\_ID corresponding to SCCL\_INDEX.

If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID] is not equal to '0000', then the base station shall set the FOR\_SCH\_NUM\_BITS\_IDX this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by FOR\_SCH\_ID to be NUM\_BITS[FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]][FOR\_SCH\_NUM\_BITS\_IDX] and the number of CRC bits per frame for the Forward Supplemental channel identified by FOR SCH ID to be  
CRC\_LEN\_IDX[FSCH\_NBIT\_TABLE\_ID[FOR SCH ID]][FOR SCH\_NUM\_BITS\_IDX].

~~The FOR\_SCH\_NUM\_BITS\_IDX field also specifies the number of CRC bits per frame for the Forward Supplemental Channel identified by FOR\_SCH\_ID. The number of CRC bits per frame is specified by CRC\_LEN\_IDX[FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]][FOR\_SCH\_NUM\_BITS\_IDX] and Table 3.7.5.20-4.~~

- NUM\_REV\_SCH - Number of Reverse Supplemental Channel records.  
If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
The base station shall set this field to the number of the Reverse Supplemental Channels need to be updated.

If NUM\_REV\_SCH is included and not equal to '00000', the base station shall include NUM\_REV\_SCH occurrence of the following three fields:

- REV\_SCH\_ID - Reverse Supplemental Channel identifier.  
The base station shall set this field to the identifier of the Reverse Supplemental Channel.
- REV\_WALSH\_ID - Reverse Supplemental Channel Walsh cover Identifier.

1                   The base station shall set this field according to Table  
 2                   3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile  
 3                   station is to use when transmitting at the rate specified by  
 4                   REV\_SCH\_NUM\_BITS\_IDX on the Reverse Supplemental  
 5                   Channel specified by REV\_SCH\_ID. If only one reverse  
 6                   supplemental channel is assigned, the base station should set  
 7                   this field to the default value for the REV\_WALSH\_ID as  
 8                   specified in 2.6.4.2.

9                   REV\_SCH-  
 10                  \_NUM\_BITS\_IDX - Reverse Supplemental Channel number of bits per frame  
 11                  index.

12                  If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 13                  USE\_FLEX\_NUM\_BITS is equal to '1' and  
 14                  RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then  
 15                  the base station shall set this field according to Table  
 16                  3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel  
 17                  number of information bits per frame and the number of CRC  
 18                  bits per frame, corresponding to REV\_WALSH\_ID field.

19                  If USE\_FLEX\_NUM\_BITS is equal to '1' and  
 20                  RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is not equal to '0000', then  
 21                  the base station shall set the REV\_SCH\_NUM\_BITS\_IDX field  
 22                  to indicate the Reverse Supplemental Channel number of  
 23                  information bits per frame, corresponding to REV\_WALSH\_ID  
 24                  field to be NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
 25                  [REV\_SCH\_NUM\_BITS\_IDX]and the Reverse Supplemental  
 26                  Channel number of CRC bits per frame, corresponding to  
 27                  REV WALSH ID field to be  
 28                  CRC LEN IDX[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
 29                  [REV SCH\_NUM BITS IDX].

30  
 31                  NUM\_PILOTS - Number of pilots included in the message.

32                  The base station shall set this field to the number of pilots  
 33                  included in the message. The base station shall set this field  
 34                  to an integer that is equal to or greater than 1.

35                  SRCH\_OFFSET\_INCL - Target pilot channel search window offset included.

36                  If the SRCH\_OFFSET field is included in the following records,  
 37                  the base station shall set this field to '1'; otherwise, the base  
 38                  station shall set this field to '0'.

39                  The base station shall include one occurrence of the following record for each of the  
 40                  NUM\_PILOTS pilots included in the message:

41                   PILOT\_PN - Pilot PN sequence offset index.

42                  The base station shall set this field to the pilot PN sequence  
 43                  offset for this pilot in units of 64 PN chips.

- 1           SRCH\_OFFSET   - Target pilot channel search window offset.  
 2           If SRCH\_OFFSET\_INCL equals to '1', then the base station  
 3           shall set this field to the value shown in Table 2.6.6.2.1-2  
 4           corresponding to the search window offset to be used by the  
 5           mobile station for this target pilot. Otherwise, the base  
 6           station shall omit this field.
- 7           ADD\_PILOT\_REC\_INCL - Additional pilot information included indicator.  
 8           The base station shall set this field to '1' if additional pilot  
 9           information listed in PILOT\_REC\_TYPE and RECORD\_LEN  
 10          fields are included. The base station shall set this field to '0' if  
 11          the corresponding pilot is the common pilot and there is no  
 12          additional pilot information included.
- 13          PILOT\_REC\_TYPE - Pilot record type.  
 14          If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 15          set this field to the PILOT\_REC\_TYPE value shown in Table  
 16          3.7.2.3.2.21-6 corresponding to the type of Pilot Record  
 17          specified by this record.  
 18          If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 19          omit this field.
- 20          RECORD\_LEN - Pilot record length.  
 21          If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 22          set this field to the number of octets in the type-specific fields  
 23          of this pilot record.  
 24          If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 25          omit this field.
- 26          Type-specific fields - Pilot record type-specific fields.  
 27          If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 28          include type-specific fields based on the PILOT\_REC\_TYPE of  
 29          this pilot record as described in 3.7.6.1.  
 30          If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 31          omit this field.
- 32  
 33          PWR\_COMB\_IND - Power control symbol combining indicator.  
 34          If the Forward Traffic Channel associated with this pilot will  
 35          carry the same closed-loop power control subchannel bits as  
 36          that of the previous pilot in this message, the base station  
 37          shall set this field to '1'; otherwise, the base station shall set  
 38          this field to '0'. The base station shall set this field to '0' in  
 39          the first record in the pilot list.

- 1       CODE\_CHAN\_DCCH     - Code channel on the Dedicated Control Channel.  
 2  
 3  
 4  
 5  
 6  
 7  
 8  
 9  
 10  
 If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2] that the mobile station is to use on the Dedicated Control Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use for the Dedicated Control Channel on the center SR3 frequency.
- 11  
 12  
 13  
 14  
 15  
 16  
 If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.
- 17      QOF\_MASK\_ID\_DCCH    - Quasi-orthogonal function index on the Dedicated Control Channel.  
 18  
 19  
 20  
 21  
 22  
 23  
 24  
 If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]). If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]).
- 25      NUM\_SCH            - Number of Supplemental Channel records.  
 26  
 27  
 If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:  
 28  
 29  
 The base station shall set this field to the number of the Supplemental Channel records need to be updated.
- 30      If NUM\_SCH is included and not equal to '00000', the base station shall include NUM\_SCH occurrence of the following five fields:
- 32      FOR\_SCH\_ID          - Forward Supplemental Channel identifier  
 33  
 34  
 The base station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.
- 35      SCCL\_INDEX          - Supplemental Channel Code list index.  
 36  
 37  
 The base station shall set this field to the index of the record in the Supplemental Channel Code list.
- 38      PILOT\_INCL          - The corresponding pilot included in Supplemental Channel Active Set indicator.  
 39  
 40  
 41  
 The base station shall set this field to '1' if the corresponding pilot is included in the Active Set of Supplemental Channel; otherwise, the base station shall set this field to '0'.

- 1       CODE\_CHAN\_SCH    -   Code channel on the Supplemental Channel.  
 2                          The base station shall set this field to the code channel index  
 3                          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 4                          to use on the Supplemental Channel of the Forward Traffic  
 5                          Channel indexed by SCCL\_INDEX.
- 6       QOF\_MASK\_ID\_SCH   -   Quasi-orthogonal function index on the Supplemental  
 7                          Channel.  
 8                          If SCH\_INCL is set to '0', the base station shall omit this field;  
 9                          otherwise, the base station shall set this field as follows:  
 10                         The base station shall set this field to the index of the Quasi-  
 11                         orthogonal function (see Table 3.1.3.1.12-2 of [2]).
- 12      3X\_DCCH\_INFO\_INCL   -   3X DCCH information included indicator.  
 13                          If the 3X Dedicated Control Channel information is included,  
 14                          the base station shall set this field to '1'; otherwise, the base  
 15                          station shall set this field to '0'.  
 16                          The base station shall include NUM\_PILOTS occurrences of the following record if  
 17                          3X\_DCCH\_INFO\_INCL is set to '1'. The base station shall use the same order for the  
 18                          following fields as is used for the PILOT\_PN fields listed in this message.
- 19      3X\_DCCH\_LOW\_INCL   -   DCCH code channel on the lowest SR3 frequency included  
 20                          indicator.  
 21                          If the DCCH on the lowest SR3 frequencies has a different  
 22                          code channel than the DCCH on the center SR3 frequency,  
 23                          the base station shall set this field to '1'; otherwise, the base  
 24                          station shall set this field to '0'.
- 25      QOF\_MASK\_ID-  
 26                          \_DCCH\_LOW   -   QOF index for the DCCH on the lowest SR3 frequency.  
 27                          If 3X\_DCCH\_LOW\_INCL is set to '0', the base station shall  
 28                          omit this field; otherwise, the base station shall set this field  
 29                          as follows:  
 30                          The base station shall set this field to the index of the Quasi-  
 31                         orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 32                         corresponding to the QOF index for the DCCH on the lowest  
 33                         SR3 frequency.
- 34      CODE\_CHAN-  
 35                          \_DCCH\_LOW   -   Code channel for the DCCH on the lowest SR3 frequency.  
 36                          If 3X\_DCCH\_LOW\_INCL is set to '0', the base station shall  
 37                          omit this field; otherwise, the base station shall set this field  
 38                          as follows:  
 39                          The base station shall set this field to the code channel index  
 40                          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 41                          to use on the DCCH on the lowest SR3 frequency. If Radio  
 42                          Configuration 6 or 8 is used, the base station shall set this  
 43                          field in the range 1 to 127 inclusive. If Radio Configuration 7  
 44                          or 9 is used, the base station shall set this field in the range 1  
 45                          to 255 inclusive.

- 1       3X\_DCCH\_HIGH\_INCL   – DCCH code channel on the highest SR3 frequency included  
 2                            indicator.
- 3                            If the DCCH on the highest SR3 frequencies has a different  
 4                            code channel than the DCCH on the center SR3 frequency,  
 5                            the base station shall set this field to ‘1’; otherwise, the base  
 6                            station shall set this field to ‘0’.
- 7       QOF\_MASK\_ID-  
 8                            \_DCCH\_HIGH   – QOF index for the DCCH on the highest SR3 frequency.  
 9                            If 3X\_DCCH\_HIGH\_INCL is set to ‘0’, the base station shall  
 10                          omit this field; otherwise, the base station shall set this field  
 11                          as follows:  
 12                          The base station shall set this field to the index of the Quasi-  
 13                          orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 14                          corresponding to the QOF index for the DCCH on the highest  
 15                          SR3 frequency.
- 16       CODE\_CHAN-  
 17                            \_DCCH\_HIGH   – Code channel for the DCCH on the highest SR3 frequency.  
 18                            If 3X\_DCCH\_HIGH\_INCL is set to ‘0’, the base station shall  
 19                          omit this field; otherwise, the base station shall set this field  
 20                          as follows:  
 21                          The base station shall set this field to the code channel index  
 22                          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 23                          to use on the DCCH on the highest SR3 frequency. If Radio  
 24                          Configuration 6 or 8 is used, the base station shall set this  
 25                          field in the range 1 to 127 inclusive. If Radio Configuration 7  
 26                          or 9 is used, the base station shall set this field in the range 1  
 27                          to 255 inclusive.
- 28       3X\_SCH\_INFO\_INCL   – 3X SCH information included indicator.  
 29                            If SCH\_INCL is set to ‘0’, the base station shall omit this field;  
 30                          otherwise, the base station shall set this field as follows:  
 31                          If the 3X Supplemental Channel information is included, the  
 32                          base station shall set this field to ‘1’; otherwise, the base  
 33                          station shall set this field to ‘0’.
- 34       The base station shall include NUM\_SCH occurrences of the following seven fields record if  
 35                          3X\_SCH\_INFO\_INCL is included and set to ‘1’.
- 36       FOR\_SCH\_ID   – Forward Supplemental Channel identifier.  
 37                           The base station shall set this field the identifier of the  
 38                          Forward Supplemental Channel pertaining to this record.
- 39       3X\_SCH\_LOW\_INCL   – SCH code channel on the lowest SR3 frequency included  
 40                          indicator.  
 41                          If the SCH on the lowest SR3 frequencies has a different code  
 42                          channel than the SCH on the center SR3 frequency, the base  
 43                          station shall set this field to ‘1’; otherwise, the base station  
 44                          shall set this field to ‘0’.
- 45       QOF\_MASK\_ID-

- 1            \_SCH\_LOW    -    QOF index for the SCH on the lowest SR3 frequency.  
 2            If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit  
 3            this field; otherwise, the base station shall set this field as  
 4            follows:  
 5            The base station shall set this field to the index of the Quasi-  
 6            orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 7            corresponding to the QOF index for the SCH on the lowest  
 8            SR3 frequency.
- 9            CODE\_CHAN-  
 10          \_SCH\_LOW    -    Code channel for the SCH on the lowest SR3 frequency.  
 11          If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit  
 12          this field; otherwise, the base station shall set this field as  
 13          follows:  
 14          The base station shall set this field to the code channel index  
 15          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 16          to use on the SCH on the lowest SR3 frequency. If Radio  
 17          Configuration 6 or 8 is used, the base station shall set this  
 18          field in the range 1 to 127 inclusive. If Radio Configuration 7  
 19          or 9 is used, the base station shall set this field in the range 1  
 20          to 255 inclusive.
- 21          3X\_SCH\_HIGH\_INCL    -    SCH code channel on the highest SR3 frequency included  
 22          indicator.  
 23          If the SCH on the highest SR3 frequencies has a different code  
 24          channel than the SCH on the center SR3 frequency, the base  
 25          station shall set this field to '1'; otherwise, the base station  
 26          shall set this field to '0'.
- 27          QOF\_MASK\_ID-  
 28          \_SCH\_HIGH    -    QOF index for the SCH on the highest SR3 frequency.  
 29          If 3X\_SCH\_HIGH\_INCL is set to '0', the base station shall omit  
 30          this field; otherwise, the base station shall set this field as  
 31          follows:  
 32          The base station shall set this field to the index of the Quasi-  
 33          orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 34          corresponding to the QOF index for the SCH on the highest  
 35          SR3 frequency.
- 36          CODE\_CHAN-  
 37          \_SCH\_HIGH    -    Code channel for the SCH on the highest SR3 frequency.  
 38          If 3X\_SCH\_HIGH\_INCL is set to '0', the base station shall omit  
 39          this field; otherwise, the base station shall set this field as  
 40          follows:

1           The base station shall set this field to the code channel index  
 2           (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 3           to use on the SCH on the highest SR3 frequency. If Radio  
 4           Configuration 6 or 8 is used, the base station shall set this  
 5           field in the range 1 to 127 inclusive. If Radio Configuration 7  
 6           or 9 is used, the base station shall set this field in the range 1  
 7           to 255 inclusive.

8  
 9       If the CH\_IND field is set to '111', the base station shall include the following fields:

10      NUM\_FOR\_SCH   - Number of Forward Supplemental Channel records.

11  
 12     If SCH\_INCL is set to '0', the base station shall omit this field;  
      otherwise, the base station shall set this field as follows:

13  
 14     The base station shall set this field to the number of the  
      Forward Supplemental Channel records need to be updated.

15       If NUM\_FOR\_SCH is included and not equal to '00000', the base station shall include  
 16       NUM\_FOR\_SCH occurrence of the following three fields:

17      FOR\_SCH\_ID   - Forward Supplemental Channel identifier.

18  
 19     The base station shall set this field to the identifier of the  
      Forward Supplemental Channel.

20      SCCL\_INDEX   - Supplemental Channel Code list index.

21  
 22     The base station shall set this field to the index of the record  
      in the Supplemental Channel Code list.

23      FOR\_SCH-

24      \_NUM\_BITS\_IDX   - Forward Supplemental Channel number of information bits  
 25       index.

26  
 27     If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 28     USE\_FLEX\_NUM\_BITS is equal to '1' and  
 29     FSCH\_NBIT\_TABLE\_ID for FOR\_SCH\_ID is equal to '0000',  
 30     then the base station shall set this field according to Table  
 31     3.7.3.3.2.37-4 to indicate the number of information bits per  
 32     frame and the length of the CRC field for the Forward  
 33     Supplemental Channel identified by FOR\_SCH\_ID  
      corresponding to SCCL\_INDEX.

34  
 35     If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and  
 36     FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID] is not equal to '0000',  
 37     then the base station shall set the FOR\_SCH\_NUM\_BITS\_IDX  
this field to indicate that the number of information bits per  
 38     frame for the Forward Supplemental channel identified by  
 39     FOR\_SCH\_ID to be  
 40     NUM\_BITS[FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]][FOR\_SCH\_N  
 41     UM\_BITS\_IDX] and the number of CRC bits per frame for the  
Forward Supplemental channel identified by FOR SCH ID to  
be  
CRC LEN IDX[FSCH NBIT TABLE ID[FOR SCH ID]][FOR SC

### H NUM BITS IDX].

The FOR\_SCH\_NUM\_BITS\_IDX field also specifies the number of CRC bits per frame for the Forward Supplemental Channel identified by FOR\_SCH\_ID. The number of CRC bits per frame is \_\_\_\_\_ specified by CRC\_LEN\_IDX[FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]]||FOR\_SCH\_NUM\_BITS\_IDX and Table 3.7.5.20-4.

- NUM\_REV\_SCH** - Number of Reverse Supplemental Channel records.

If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Reverse Supplemental Channels need to be updated.

If NUM\_REV\_SCH is included and not equal to '00000', the base station shall include NUM\_REV\_SCH occurrence of the following three fields:

- |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If only one reverse supplemental channel is assigned, the base station should set this field to the default value for the REV_WALSH_ID as specified in 2.6.4.2.</li> </ul> |

- REV\_SCH-\_NUM\_BITS\_IDX - Reverse Supplemental Channel number of bits per frame index.

If USE\_FLEX\_NUM\_BITS is equal to '0' or if USE\_FLEX\_NUM\_BITS is equal to '1' and RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, corresponding to REV\_WALSH\_ID field.

If USE\_FLEX\_NUM\_BITS is equal to '1' and RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is not equal to '0000', then the base station shall set the REV\_SCH\_NUM\_BITS\_IDX field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to REV\_WALSH\_ID field to be NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]] [REV\_SCH\_NUM\_BITS\_IDX]and the Reverse Supplemental Channel number of information bits per frame, corresponding

|    |                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                    |

| 40 |                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                    |
| 41 |                                                                                                                                  | If ADD_PILOT_REC_INCL is set to '0', the base station shall omit this field.                                                                                                                                                                                                                                                                       |
| 42 |                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                    |
| 43 | Type-specific fields                                                                                                             | - Pilot record type-specific fields.                                                                                                                                                                                                                                                                                                               |

If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall include type-specific fields based on the PILOT\_REC\_TYPE of this pilot record as described in 3.7.6.1.

If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall omit this field.

- PWR\_COMB\_IND - Power control symbol combining indicator.  
If the Forward Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'. The base station shall set this field to '0' in the first record in the pilot list.
- CODE\_CHAN\_FCH - Code Channel on the Fundamental Channel.  
If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the code channel index that the mobile station is to use for the Fundamental Channel on the center SR3 frequency.  
If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.
- QOF\_MASK\_ID\_FCH - Quasi-orthogonal function index on the Fundamental Channel.  
If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]). If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the index of the Quasi-orthogonal function on the center SR3 frequency.
- CODE\_CHAN\_DCCH - Code channel on the DCCH.  
If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the Dedicated Control Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the code channel index that the mobile station is to use for the Dedicated Control Channel on the center SR3 frequency.

If Radio Configuration 1, 2, 3, or 5 (see 3.1.3.1.2 of [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

- 7      QOF\_MASK\_ID\_DCCH    - Quasi-orthogonal function index on the DCCH.  
8                             If a Radio Configuration associated with Spreading Rate 1 is  
9                             used, the base station shall set this field to the index of the  
10                            Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]). If a  
11                            Radio Configuration associated with Spreading Rate 1 is used,  
12                            the base station shall set this field to the index of the Quasi-  
13                            orthogonal function on the center SR3 frequency.
- 14      NUM\_SCH            - Number of Supplemental Channel records.  
15                            The base station shall set this field to the number of the  
16                            Supplemental Channel records need to be updated.

If NUM\_SCH is included and not equal to '00000', the base station shall include NUM\_SCH occurrence of the following fields:

- 19      FOR\_SCH\_ID        - Forward Supplemental Channel identifier.  
20                            The base station shall set this field to the identifier of the  
21                            Forward Supplemental Channel pertaining to this record.
- 22      SCCL\_INDEX        - Supplemental Channel Code list index.  
23                            The base station shall set this field to the index of the record  
24                            in the Supplemental Channel Code List Table.
- 25      PILOT\_INCL        - The corresponding pilot included in Supplemental Channel  
26                            Active Set indicator.  
27                            The base station shall set this field to '1' if the corresponding  
28                            pilot is included in the Active Set of Supplemental Channel;  
29                            otherwise, the base station shall set this field to '0'.
- 30      CODE\_CHAN\_SCH     - Code Channel on the Supplemental Channel.  
31                            If SCH\_INCL is set to '0', the base station shall omit this field;  
32                            otherwise, the base station shall set this field as follows:  
33                            The base station shall set this field to the code channel index  
34                            (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
35                            to use on the Supplemental Channel of the Forward Traffic  
36                            Channel indexed by SCCL\_INDEX.
- 37      QOF\_MASK\_ID\_SCH    - Quasi-orthogonal function index on the Supplemental  
38                            Channel.  
39                            If SCH\_INCL is set to '0', the base station shall omit this field;  
40                            otherwise, the base station shall set this field as follows:  
41                            The base station shall set this field to the index of the Quasi-  
42                            orthogonal function (see Table 3.1.3.1.12-2 of [2]).
- 43      3X\_FCH\_INFO\_INCL   - 3X FCH information included indicator.

- If the 3X Fundamental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
- 3X\_DCCH\_INFO\_INCL – 3X DCCH information included indicator.
- If the 3X Dedicated Control Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
- The base station shall include NUM\_PILOTS occurrences of the following record if 3X\_FCH\_INFO\_INCL or 3X\_FCH\_INFO\_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT\_PN fields listed in this message.
- 3X\_FCH\_LOW\_INCL – FCH code channel on the lowest SR3 frequency included indicator.
- If 3X\_FCH\_INFO\_INCL is set to ‘0’, the base station shall set omit this field; otherwise, the base station shall set this field as follows:
- If the FCH on the lowest SR3 frequencies has a different code channel than the FCH on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
- QOF\_MASK\_ID-
- \_FCH\_LOW – QOF index for the FCH on the lowest SR3 frequency.
- If 3X\_FCH\_LOW\_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:
- The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]) corresponding to the QOF index for the FCH on the lowest SR3 frequency.
- CODE\_CHAN-
- \_FCH\_LOW – Code channel for the FCH on the lowest SR3 frequency.
- If 3X\_FCH\_LOW\_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:
- The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the FCH on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.
- 3X\_FCH\_HIGH\_INCL – FCH code channel on the highest SR3 frequency included indicator.
- If 3X\_FCH\_INFO\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

1  
2  
3  
4  
If the FCH on the highest SR3 frequencies has a different code  
channel than the FCH on the center SR3 frequency, the base  
station shall set this field to '1'; otherwise, the base station  
shall set this field to '0'.

5           **QOF\_MASK\_ID-**

6            **\_FCH\_HIGH**

- QOF index for the FCH on the highest SR3 frequency.  
If 3X\_FCH\_HIGH\_INCL is included and set to '1', the base station shall set this field as follows; otherwise, the base station shall omit this field:

10          The base station shall set this field to the index of the Quasi-  
11          orthogonal function (see Table 3.1.3.1.12-2 of [2]  
12          corresponding to the QOF index for the FCH on the highest  
13          SR3 frequency.

14           **CODE\_CHAN-**

15            **\_FCH\_HIGH**

- Code channel for the FCH on the highest SR3 frequency.  
If 3X\_FCH\_HIGH\_INCL is included and set to '1', the base station shall set this field as follows; otherwise, the base station shall omit this field:

19          The base station shall set this field to the code channel index  
20          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
21          to use on the FCH on the highest SR3 frequency. If Radio  
22          Configuration 6 or 8 is used, the base station shall set this  
23          field in the range 1 to 127 inclusive. If Radio Configuration 7  
24          or 9 is used, the base station shall set this field in the range 1  
25          to 255 inclusive.

26           **3X\_DCCH\_LOW\_INCL**

- DCCH code channel on the lowest SR3 frequency included indicator.

28          If 3X\_DCCH\_INFO\_INCL is set to '0', the base station shall  
29          omit this field; otherwise, the base station shall set this field  
30          as follows:

31          If the DCCH on the lowest SR3 frequencies has a different  
32          code channel than the DCCH on the center SR3 frequency,  
33          the base station shall set this field to '1'; otherwise, the base  
34          station shall set this field to '0'.

35           **QOF\_MASK\_ID-**

36            **\_DCCH\_LOW**

- QOF index for the DCCH on the lowest SR3 frequency.  
If 3X\_DCCH\_LOW\_INCL is included and set to '1', the base station shall set this field as follows; otherwise, the base station shall omit this field:

40          The base station shall set this field to the index of the Quasi-  
41          orthogonal function (see Table 3.1.3.1.12-2 of [2])  
42          corresponding to the QOF index for the DCCH on the lowest  
43          SR3 frequency.

- 1           CODE\_CHAN-
- 2           \_DCCH\_LOW - Code channel for the DCCH on the lowest SR3 frequency.
- 3           If 3X\_DCCH\_LOW\_INCL is included and set to '1', the base station shall set this field as follows; otherwise, the base station shall omit this field:
- 4           The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the DCCH on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.
- 5
- 6           3X\_DCCH\_HIGH\_INCL - DCCH code channel on the highest SR3 frequency included indicator.
- 7           If 3X\_DCCH\_INFO\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:
- 8           If the DCCH on the highest SR3 frequencies has a different code channel than the DCCH on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.
- 9
- 10          QOF\_MASK\_ID-
- 11          \_DCCH\_HIGH - QOF index for the DCCH on the highest SR3 frequency.
- 12          If 3X\_DCCH\_HIGH\_INCL is included and set to '1', the base station shall set this field as follows; otherwise, the base station shall omit this field:
- 13          The base station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2] corresponding to the QOF index for the DCCH on the highest SR3 frequency.
- 14
- 15          CODE\_CHAN-
- 16          \_DCCH\_HIGH - Code channel for the DCCH on the highest SR3 frequency.
- 17          If 3X\_DCCH\_HIGH\_INCL is included and set to '1', the base station shall set this field as follows; otherwise, the base station shall omit this field:
- 18          The base station shall set this field to the code channel index (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is to use on the DCCH on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.
- 19
- 20          3X\_SCH\_INFO\_INCL - 3X SCH information included indicator.
- 21          If SCH\_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

1                   If the 3X Supplemental Channel information is included, the  
 2                   base station shall set this field to '1'; otherwise, the base  
 3                   station shall set this field to '0'.

4                   The base station shall include NUM\_SCH occurrences of the following seven fields record if  
 5                   3X\_SCH\_INFO\_INCL is included and set to '1'.

6                   FOR\_SCH\_ID    - Forward Supplemental Channel identifier.

7                   The base station shall set this field the identifier of the  
 8                   Forward Supplemental Channel pertaining to this record.

9                   3X\_SCH\_LOW\_INCL - SCH code channel on the lowest SR3 frequency included  
 10                  indicator.

11                  If the SCH on the lowest SR3 frequencies has a different code  
 12                  channel than the SCH on the center SR3 frequency, the base  
 13                  station shall set this field to '1'; otherwise, the base station  
 14                  shall set this field to '0'.

15                  QOF\_MASK\_ID-

16                  \_SCH\_LOW    - QOF index for the SCH on the lowest SR3 frequency.

17                  If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit  
 18                  this field; otherwise, the base station shall set this field as  
 19                  follows:

20                  The base station shall set this field to the index of the Quasi-  
 21                  orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 22                  corresponding to the QOF index for the SCH on the lowest  
 23                  SR3 frequency.

24                  CODE\_CHAN-

25                  \_SCH\_LOW    - Code channel for the SCH on the lowest SR3 frequency.

26                  If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit  
 27                  this field; otherwise, the base station shall set this field as  
 28                  follows:

29                  The base station shall set this field to the code channel index  
 30                  (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 31                  to use on the SCH on the lowest SR3 frequency. If Radio  
 32                  Configuration 6 or 8 is used, the base station shall set this  
 33                  field in the range 1 to 127 inclusive. If Radio Configuration 7  
 34                  or 9 is used, the base station shall set this field in the range 1  
 35                  to 255 inclusive.

36                  3X\_SCH\_HIGH\_INCL - SCH code channel on the highest SR3 frequency included  
 37                  indicator.

38                  If the SCH on the highest SR3 frequencies has a different code  
 39                  channel than the SCH on the center SR3 frequency, the base  
 40                  station shall set this field to '1'; otherwise, the base station  
 41                  shall set this field to '0'.

42                  QOF\_MASK\_ID-

43                  \_SCH\_HIGH    - QOF index for the SCH on the highest SR3 frequency.

1           If 3X\_SCH\_HIGH\_INCL is set to ‘0’, the base station shall omit  
2           this field; otherwise, the base station shall set this field as  
3           follows:

4           The base station shall set this field to the index of the Quasi-  
5           orthogonal function (see Table 3.1.3.1.12-2 of [2]  
6           corresponding to the QOF index for the SCH on the highest  
7           SR3 frequency.

8           CODE\_CHAN-

9            \_SCH\_HIGH – Code channel for the SCH on the highest SR3 frequency.

10          If 3X\_SCH\_HIGH\_INCL is set to ‘0’, the base station shall omit  
11          this field; otherwise, the base station shall set this field as  
12          follows:

13          The base station shall set this field to the code channel index  
14          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
15          to use on the SCH on the highest SR3 frequency. If Radio  
16          Configuration 6 or 8 is used, the base station shall set this  
17          field in the range 1 to 127 inclusive. If Radio Configuration 7  
18          or 9 is used, the base station shall set this field in the range 1  
19          to 255 inclusive.

## 1 3.7.3.3.2.37 Extended Supplemental Channel Assignment Message

2 MSG\_TAG: ESCAM

3

| Field                | Length (bits) |
|----------------------|---------------|
| START_TIME_UNIT      | 3             |
| REV_SCH_DTX_DURATION | 4             |
| USE_T_ADD_ABORT      | 1             |
| USE_SCRM_SEQ_NUM     | 1             |
| SCRIM_SEQ_NUM        | 0 or 4        |
| ADD_INFO_INCL        | 1             |
| FPC_PRI_CHAN         | 0 or 1        |

|                  |   |
|------------------|---|
| REV_CFG_INCLUDED | 1 |
|------------------|---|

The base station shall include the following field if REV\_CFG\_INCLUDED is set to '1'

|                  |   |
|------------------|---|
| NUM_REV_CFG_RECS | 5 |
|------------------|---|

The base station shall ~~the~~ include (NUM\_REV\_CFG\_RECS +1) occurrences of the following three fields if REV\_CFG\_INCLUDED is set to '1'

|                      |   |
|----------------------|---|
| REV_SCH_ID           | 1 |
| REV_WALSH_ID         | 1 |
| REV_SCH_NUM_BITS_IDX | 4 |

|             |   |
|-------------|---|
| NUM_REV_SCH | 2 |
|-------------|---|

The base station shall include NUM\_REV\_SCH occurrences of the following fields

|                         |        |
|-------------------------|--------|
| REV_SCH_ID              | 1      |
| REV_SCH_DURATION        | 4      |
| REV_SCH_START_TIME_INCL | 1      |
| REV_SCH_START_TIME      | 0 or 5 |
| REV_SCH_NUM_BITS_IDX    | 4      |

1

| <b>Field</b>     | <b>Length (bits)</b> |
|------------------|----------------------|
| FOR_CFG_INCLUDED | 1                    |
| FOR_SCH_FER REP  | 0 or 1               |

The base station shall include the following field if FOR\_CFG\_INCLUDED is set to '1'

|                  |   |
|------------------|---|
| NUM_FOR_CFG_RECS | 5 |
|------------------|---|

The base station shall ~~the~~ include (NUM\_FOR\_CFG\_RECS +1) occurrences of the following fields if FOR\_CFG\_INCLUDED is set to '1'

|                      |   |
|----------------------|---|
| FOR_SCH_ID           | 1 |
| SCCL_INDEX           | 4 |
| FOR_SCH_NUM_BITS_IDX | 4 |
| NUM_SUP_SHO          | 3 |

NUM\_SUP\_SHO+1 occurrences of the following fields

|                       |                     |
|-----------------------|---------------------|
| PILOT_PN              | 9                   |
| ADD_PILOT_REC_INCL    | 1                   |
| ACTIVE_PILOT_REC_TYPE | 0 or 3              |
| RECORD_LEN            | 0 or 3              |
| Type-specific fields  | 0 or 8 x RECORD_LEN |
| CODE_CHAN_SCH         | 11                  |
| QOF_MASK_ID_SCH       | 2                   |

|             |   |
|-------------|---|
| NUM_FOR_SCH | 2 |
|-------------|---|

The base station shall include NUM\_FOR\_SCH occurrences of the following fields

|                         |        |
|-------------------------|--------|
| FOR_SCH_ID              | 1      |
| FOR_SCH_DURATION        | 4      |
| FOR_SCH_START_TIME_INCL | 1      |
| FOR_SCH_START_TIME      | 0 or 5 |
| SCCL_INDEX              | 4      |

1

| Field            | Length (bits) |
|------------------|---------------|
| 3X_SCH_INFO_INCL | 1             |
| NUM_3X_CFG       | 0 or 2        |

NUM\_3X\_CFG occurrences of the following record if  
3X\_SCH\_INFO\_INCL is included\_and\_set to '1':

|            |   |
|------------|---|
| FOR_SCH_ID | 1 |
| NUM_3X_REC | 5 |

(NUM\_3X\_REC + 1) occurrences of the following record:

|            |   |
|------------|---|
| SCCL_INDEX | 4 |
|------------|---|

(NUM\_SUP\_SHO + 1) occurrences of the following record for each corresponding SCCL INDEX field:

|                      |         |
|----------------------|---------|
| 3X_SCH_LOW_INCL      | 1       |
| QOF_MASK_ID_SCH_LOW  | 0 or 2  |
| CODE_CHAN_SCH_LOW    | 0 or 11 |
| 3X_SCH_HIGH_INCL     | 1       |
| QOF_MASK_ID_SCH_HIGH | 0 or 2  |
| CODE_CHAN_SCH_HIGH   | 0 or 11 |

- 1
- 2     START\_TIME\_UNIT     - Unit for start time.
- 3
- 4                         The base station shall set this field to indicate the units of
- 5                         start time included in *Extended Supplemental Channel*
- 6                         *Assignment Message*, *Forward Supplemental Channel*
- 7                         *Assignment Mini Message*, *Reverse Supplemental Channel*
- 8                         *Assignment Mini Message*, and *Universal Handoff Direction*
- 9                         *Message*. The base station shall set this field to one less than
- 10                        the number of 20 ms frames that determines the
- 11                        START\_TIME\_UNIT.
- 12     REV\_SCH\_DTX-
- 13         \_DURATION     - Discontinuous Transmission on Reverse Supplemental
- 14                         Channel.
- 15                         The base station shall set this field to the maximum duration
- 16                         of time in units of 20 ms that the mobile station is allowed to
- 17                         stop transmission on a Reverse Supplemental Channel within
- 18                         the reverse assignment duration. The base station shall set
- 19                         this field to '0000' if the mobile station is to stop using a
- 20                         Reverse Supplemental Channel once it has stopped
- 21                         transmitting on that Reverse Supplemental Channel. The base
- 22                         shall set this field to '1111' if the mobile station is allowed to
- 23                         resume transmission on a Reverse Supplemental Channel at
- 24                         any time within the reverse assignment duration.
- 25     USE\_T\_ADD\_ABORT     - Reverse use T\_ADD abort indicator.
- 26                         The base station shall set this field to '1' to indicate that the
- 27                         mobile station is to utilize the T\_ADD Reverse Supplemental
- 28                         Channel abort feature for this reverse assignment; otherwise,
- 29                         the base station shall set this field to '0'.
- 30     USE\_SCRM-
- 31         \_SEQ\_NUM     - Use Supplemental Channel Request Message sequence
- 32                         number indicator.
- 33                         The base station shall set this field to '1' if the
- 34                         SCRM\_SEQ\_NUM field is included in this message; otherwise,
- 35                         the base station shall set this field to '0'.
- 36     SCRM\_SEQ\_NUM     - Supplemental Channel Request Message sequence number.
- 37                         If USE\_SCRM\_SEQ\_NUM is set to '1', the base station shall set
- 38                         this field to the sequence number corresponding to the
- 39                         SCRM\_SEQ\_NUM field in a Supplemental Channel Request
- 40                         Message to which the mobile station is to match this message;
- 41                         otherwise, the base station shall omit this field.
- 42     ADD\_INFO\_INCL     - Additional information included indicator.
- 43                         If the message is to contain the FPC\_PRI\_CHAN field, the
- 44                         base station shall set this field to '1'; otherwise, the base
- station shall set this field to '0'.

1                   The base station shall set this field to '0' if any of the following  
 2                   conditions holds:

- 3                   - The message does not contain any Supplemental Channel  
                   assignment.
- 4                   - The mobile station is currently in the [Control\\_Hold\\_Active](#)  
                   mode.

5                   FPC\_PRI\_CHAN - Power Control Subchannel Indicator.

6  
 7  
 8                   If the ADD\_INFO\_INCL field is set to '0', the base station shall  
 9                   omit this field; otherwise, the base station shall set this field  
 10                  as follows:

11                  The base station shall set this field to '0' if the mobile station  
 12                  is to perform the primary inner loop estimation on the  
 13                  received Forward Fundamental Channel and the base station  
 14                  is to multiplex the Power Control Subchannel on the Forward  
 15                  Fundamental Channel. The base station shall set this field to  
 16                  '1' if the mobile station is to perform the primary inner loop  
 17                  estimation on the received Forward Dedicated Control  
 18                  Channel and the base station is to multiplex the Power  
 19                  Control Subchannel on the Forward Dedicated Control  
 20                  Channel.

21                  REV\_CFG\_INCLUDED - Reverse Supplemental Channel configuration included.

22  
 23                  The base station shall set this field to '1' if this message  
 24                  contains a Reverse Supplemental Channel configuration.  
                  Otherwise, the base station shall set this field to '0'.

25                  NUM\_REV\_CFG\_RECS - Number of the Reverse Supplemental Channel configuration  
 26                  Records.

27  
 28                  If REV\_CFG\_INCLUDED is set to '1', ~~The base station shall~~  
 29                  set this field to one less than the number of reverse  
 30                  supplemental channel configuration records consisting of the  
 31                  following three fields that are included in this message:  
[otherwise, the base station shall omit this field.](#)

32                  The base station shall include NUM\_REV\_CFG\_RECS+1 occurrences of the following three  
 33                  fields only if the REV\_CFG\_INCLUDED field is set to '1'.

34                  REV\_SCH\_ID - Reverse Supplemental Channel Identifier.

35  
 36                  The base station shall set this field to the identifier of the  
                  Reverse Supplemental Channel.

37                  REV\_WALSH\_ID - Reverse Supplemental Channel Walsh cover Identifier.

38                  The base station shall set this field according to Table  
 39                  3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile  
 40                  station is to use when transmitting number of bits per frame  
 41                  specified by REV\_NUM\_BITS\_IDX on the Reverse  
 42                  Supplemental Channel specified by REV\_SCH\_ID. If only one  
 43                  reverse supplemental channel is assigned, the base station  
 44                  should set this field to the default value for the  
 45                  REV\_WALSH\_ID as specified in 2.6.4.2.

**Table 3.7.3.3.2.37-1. REV\_WALSH\_ID Field**

| REV_WALSH_ID<br>(binary) | Walsh Cover  |              |
|--------------------------|--------------|--------------|
|                          | SCH_ID = '0' | SCH_ID = '1' |
| 0                        | + -          | + + -        |
| 1                        | + + -        | + + + - + +  |

2

- 3                   REV\_SCH-
- 4                \_NUM\_BITS\_IDX    - Reverse Supplemental Channel number of bits per frame
- 5                index.
- 6                If USE\_FLEX\_NUM\_BITS is equal to '0' or if
- 7                USE\_FLEX\_NUM\_BITS is equal to '1' and
- 8                RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then
- 9                the base station shall set this field according to Table
- 10              3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel
- 11              number of information bits per frame and the number of CRC
- 12              bits per frame, corresponding to REV\_WALSH\_ID field.
- 13              If     USE\_FLEX\_NUM\_BITS    is     equal     to     '1'     and
- 14              RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is not equal to '0000',
- 15              then the base station shall set the REV\_SCH\_NUM\_BITS\_IDX
- 16              this field to indicate the Reverse Supplemental Channel
- 17              number of information bits per frame, corresponding to
- 18              REV\_WALSH\_ID                  field                  to              be
- 19              NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]
- 20              [REV\_SCH\_NUM\_BITS\_IDX]and the Reverse Supplemental
- 21              Channel number of CRC bits per frame, corresponding to
- 22              REV WALSH ID                  field                  to              be
- 23              CRC LEN IDX[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]
- 24              [REV SCH NUM BITS IDX].

25

26

**Table 3.7.3.3.2.37-2. R-SCH Number of Information Bits per Frame**

| REV_SCH_NUM_<br>BITS_IDX<br>(binary) | Number of information bits<br>per frame |         | Number of<br>CRC bits<br>per frame |
|--------------------------------------|-----------------------------------------|---------|------------------------------------|
|                                      | RC 3, 5                                 | RC 4, 6 |                                    |
| 0000                                 | 172                                     | 267     | 12                                 |
| 0001                                 | 360                                     | 552     | 16                                 |
| 0010                                 | 744                                     | 1,128   | 16                                 |

| RESERVED | All other values are reserved               |        |    |

1  
2       NUM\_REV\_SCH   - Number of Reverse Supplemental Channels assigned.

3                                  The base station shall set this field to the number of Reverse  
4                                  Supplemental Channel assigned. The base station shall set  
5                                  this field to '00' if the assignment of Supplemental Channel is  
6                                  not included.

7       The base station shall include NUM\_REV\_SCH occurrences of the following five fields  
8                                  (REV\_SCH\_ID, REV\_SCH\_DURATION, REV\_SCH\_START\_TIME\_INCL,  
9                                  REV\_SCH\_START\_TIME, and REV\_SCH\_NUM\_BITS\_IDX).

10      REV\_SCH\_ID   - Reverse Supplemental Channel Identifier.

11                                  The base station shall set this field to the identifier of the  
12                                  Reverse Supplemental Channel.

13      REV\_SCH\_DURATION   - Duration of Reverse Supplemental Channel assignment

14                                  The base station shall set this field to '0000' to indicate that  
15                                  the mobile station is to stop transmitting on the Reverse  
16                                  Supplemental Channel specified by REV\_SCH\_ID at the  
17                                  explicit start time specified by REV\_SCH\_START\_TIME or at  
18                                  the implicit start time if REV\_SCH\_START\_TIME\_INCL is set  
19                                  to '0'. The base station shall set this field to '1111' to indicate  
20                                  that the mobile station may transmit on the Reverse  
21                                  Supplemental Channel specified by REV\_SCH\_ID, starting at  
22                                  the explicit start time specified by REV\_SCH\_START\_TIME in  
23                                  this message, until the start time specified by a subsequent  
24                                  Reverse Supplemental Channel assignment corresponding to  
25                                  the same Supplemental Channel (see 2.6.6.2.5.1.1). The base  
26                                  station shall set this field to the duration according to Table  
27                                  3.7.3.3.2.37-3, starting at the start time specified by  
28                                  REV\_SCH\_START\_TIME, during which the mobile station may  
29                                  transmit on the Reverse Supplemental Channel specified by  
30                                  REV\_SCH\_ID.

31                                  **Table 3.7.3.3.2.37-3. FOR\_SCH\_DURATION and  
32                                  REV\_SCH\_DURATION Fields**

| <b>FOR_SCH_DURATION<br/>REV_SCH_DURITION<br/>(binary)</b> | <b>Duration in 20 ms</b> |
|-----------------------------------------------------------|--------------------------|
|                                                           |                          |

|      |          |
|------|----------|
| 0001 | 1        |
| 0010 | 2        |
| 0011 | 3        |
| 0100 | 4        |
| 0101 | 5        |
| 0110 | 6        |
| 0111 | 7        |
| 1000 | 8        |
| 1001 | 16       |
| 1010 | 32       |
| 1011 | 64       |
| 1100 | 96       |
| 1101 | 128      |
| 1110 | 256      |
| 1111 | Infinity |

1           REV\_SCH-

2    \_Start\_Time\_Incl    - Start time included indicator.

3           If REV\_SCH\_DURATION is not equal to '0000', the base  
4           station shall set this field to '1'. If REV\_SCH\_DURATION is  
5           equal to '0000', the base station shall set this field as follows:6           The base station shall set this field to '1' if  
7           REV\_SCH\_START\_TIME is included in this message;  
8           otherwise, the base station shall set this field to '0'.

9           REV\_SCH-

10   \_Start\_Time    - Start time for Reverse Supplemental Channel assignment.

11           If REV\_SCH\_START\_TIME\_INCL is set to '0', the base station  
12           shall omit this field; otherwise, the base station shall set this  
13           field to the System Time, in units of time specified by  
14           START\_TIME\_UNIT, (modulo 32) at which the mobile station  
15           may start transmitting on the Reverse Supplemental Channel  
16           specified in this message. The explicit start time for  
17           transmitting on the Reverse Supplemental Channel is the time  
18           for which19            $(\lfloor t / (\text{START\_TIME\_UNIT}_s + 1) \rfloor - \text{REV\_SCH\_START\_TIME}) \bmod 32 = 0,$ 

21           where t is the System Time in units of 20 ms.

22    REV\_SCH-

1        \_NUM\_BITS\_IDX    - Reverse Supplemental Channel number of bits per frame  
 2                         index.

3                         If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 4                         USE\_FLEX\_NUM\_BITS is equal to '1' and  
 5                         RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then  
 6                         the base station shall set this field according to Table  
 7                         3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel  
 8                         number of information bits per frame and the number of CRC  
 9                         bits per frame, corresponding to REV\_WALSH\_ID field.

10                  If USE\_FLEX\_NUM\_BITS is equal to '1' and  
 11                  RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is not equal to '0000', then the base station shall set the REV\_SCH\_NUM\_BITS\_IDX  
 12                  this field to indicate the Reverse Supplemental Channel  
 13                  number of information bits per frame, corresponding to  
 14                  REV\_WALSH\_ID field to be  
 15                  NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
 16                  [REV\_SCH\_NUM\_BITS\_IDX] and the Reverse Supplemental  
 17                  Channel number of CRC bits per frame, corresponding to  
 18                  REV WALSH ID field to be  
 19                  CRC LEN IDX|RSCH NBIT TABLE ID[REV SCH ID]  
 20                  [REV SCH NUM BITS IDX].

22  
 23        FOR\_CFG\_INCLUDED    - Forward Supplemental Channel configuration included.  
 24                  The base station shall set this field to '1' if this message  
 25                  contains a Forward Supplemental Channel configuration.  
 26                  Otherwise, the base station shall set this field to '0'.

27        FOR\_SCH\_FER REP    - Forward Supplemental Channel FER report indicator.  
 28                  If FOR\_CFG\_INCLUDED is set to '0', the base station shall  
 29                  omit this field, otherwise, the base station shall include this  
 30                  field and set it as follows:

31                  The base station shall set this field to '1' if the mobile station  
 32                  is to report the Supplemental Channel frame counts (see  
 33                  2.6.4.1.1); otherwise, the base station shall set this field to '0'.

34        NUM\_FOR\_CFG\_RECS    - Number of the Forward Supplemental Channel configuration  
 35                  Records.

36                  If REVFOR CFG INCLUDED is set to '1', the base station  
 37                  shall set this field to one less than the number of forward  
 38                  supplemental channel configuration records consisting of the  
 39                  following three fields that are included in this message:  
otherwise, the base station shall omit this field.

41        The base station shall include NUM\_FOR\_CFG\_RECS+1 occurrences of the following fields  
 42                  only if the FOR\_CFG\_INCLUDED field is set to '1'.

43        FOR\_SCH\_ID    - Forward Supplemental Channel identifier  
 44                  The base station shall set this field to the identifier of the  
 45                  Forward Supplemental Channel.

- 1 SCCL\_INDEX - Supplemental Channel Code list index.  
 2 The base station shall set this field to the index of the record  
 3 in the Supplemental Channel Code list.
- 4 FOR\_SCH-  
 5 \_NUM\_BITS\_IDX - Forward Supplemental Channel number of information bits  
 6 index.  
 7 If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 8 USE\_FLEX\_NUM\_BITS is equal to '1' and  
 9 FSCH\_NBIT\_TABLE\_ID for FOR\_SCH\_ID is equal to '0000',  
 10 then the base station shall set this field according to Table  
 11 3.7.3.3.2.37-4 to indicate the number of information bits per  
 12 frame and the length of the CRC field for the Forward  
 13 Supplemental Channel identified by FOR\_SCH\_ID  
 14 corresponding to SCCL\_INDEX.

15

16

If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID] is not equal to '0000', then the base station shall set the FOR\_SCH\_NUM\_BITS\_IDX this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by FOR\_SCH\_ID to be NUM\_BITS[FSCH\_NBIT\_TABLE\_ID[FOR\_SCH\_ID]][FOR\_SCH\_NUM\_BITS\_IDX] that the number of CRC bits per frame for the Forward Supplemental channel identified by FOR SCH ID to be

1                   CRC\_LEN\_IDX|FSCH\_NBIT\_TABLE\_ID|FOR\_SCH\_ID||FOR\_SC  
 2                   H\_NUM\_BITS\_IDX].

3                   The FOR\_SCH\_NUM\_BITS\_IDX field also specifies the number  
 4                   of CRC bits per frame for the Forward Supplemental Channel  
 5                   identified by FOR\_SCH\_ID. The number of CRC bits per frame  
 6                   is specified by  
 7                   CRC\_LEN\_IDX|FSCH\_NBIT\_TABLE\_ID|FOR\_SCH\_ID||FOR\_SC  
 8                   H\_NUM\_BITS\_IDX] and Table 3.7.5.20-4.

- 
- 10                  NUM\_SUP\_SHO    -   Number of Forward Supplemental Channels in Soft Handoff  
 11                                   The base station shall set this field to the size of the Forward  
 12                                   Supplemental Channel Active Set minus one.  
 13                  The base station shall include NUM\_SUP\_SHO+1 occurrences of the following fields for each  
 14                  Forward Supplemental channel corresponding to the FOR\_SCH\_ID and the SCCL\_INDEX  
 15                  whose frames may be soft-combined by the mobile station:  
 16  
 17                  PILOT\_PN      -   Pilot PN sequence offset index.  
 18                                   The base station shall set this field to the pilot PN sequence  
 19                                   offset for this pilot in units of 64 PN chips.  
 20                  ADD\_PILOT\_REC\_INCL    -   Additional pilot information included indicator.  
 21                                   The base station shall set this field to '1' if additional pilot  
 22                                   information listed in PILOT\_REC\_TYPE and RECORD\_LEN  
 23                                   fields are included. The base station shall set this field to '0' if  
 24                                   the corresponding pilot is the common pilot and there is no  
 25                                   additional pilot information included.  
 26                  PILOT\_REC\_TYPE    -   Pilot record type  
 27                                   If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 28                                   set this field to the PILOT\_REC\_TYPE value shown in Table  
 29                                   3.7.2.3.2.21-6 corresponding to the type of Pilot Record  
 30                                   specified by this record.  
 31                                   If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 32                                   omit this field.  
 33                  RECORD\_LEN      -   Pilot record length.  
 34                                   If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 35                                   set this field to the number of octets in the type-specific fields  
 36                                   of this pilot record.  
 37                                   If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
 38                                   omit this field.  
 39                  Type-specific fields    -   Pilot record type-specific fields.  
 40                                   If ADD\_PILOT\_REC\_INCL is set to '1', the base station shall  
 41                                   include type-specific fields based on the  
 42                                   ACTIVE\_PILOT\_REC\_TYPE of this pilot record as described in  
 43                                   3.7.6.1.

- 1                   If ADD\_PILOT\_REC\_INCL is set to '0', the base station shall  
2                   omit this field.
- 3     CODE\_CHAN\_SCH - Code channel on the Supplemental Channel.  
4                   The base station shall set this field to the code channel index  
5                   (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
6                   to use on the Supplemental Channel of the Forward Traffic  
7                   Channel indexed by SCCL\_INDEX.
- 8     QOF\_MASK\_ID\_SCH - Quasi-orthogonal function index on the Supplemental  
9                   Channel.  
10                  The base station shall set this field to the index of the Quasi-  
11                  orthogonal function (see 3.1.3.1.13 of [2]).
- 12
- 13     NUM\_FOR\_SCH - Number of Forward Supplemental Channels assigned.  
14                  The base station shall set this field to the number of forward  
15                  Supplemental Channel assigned. The base station shall set  
16                  this field to '00' if the assignment of Supplemental Channel is  
17                  not included.
- 18     The base station shall include NUM\_FOR\_SCH occurrences of the following five fields  
19                  (FOR\_SCH\_ID, FOR\_SCH\_DURATION, FOR\_SCH\_START\_TIME\_INCL,  
20                  FOR\_SCH\_START\_TIME, and SCCL\_INDEX).
- 21
- 22     FOR\_SCH\_ID - Forward Supplemental Channel identifier.  
23                  The base station shall set this field to the identifier of the  
24                  Forward Supplemental Channel pertaining to this record.
- 25     FOR\_SCH\_DURATION - Duration of Forward Supplemental Channel assignment.  
26                  The base station shall set this field to the duration (see Table  
27                  3.7.3.3.2.37-3), starting at the start time of the message  
28                  specified by FOR\_SCH\_START\_TIME, during which the mobile  
29                  station is to process the Forward Supplemental Channel.
- 30                  The base station shall set this field to '0000' to indicate that  
31                  the mobile station should stop processing the Forward Supplemental  
32                  Channel starting at the explicit start time of the message specified by  
33                  FOR\_SCH\_START\_TIME or at the  
34                  implicit start time if FOR\_SCH\_START\_TIME\_INCL is set to '0'.
- 35                  The base station shall set this field to '1111' to indicate that  
36                  the mobile station should process the Forward Supplemental  
37                  Channel, starting at the start time of the message specified by  
38                  FOR\_SCH\_START\_TIME, until the start time specified by a  
39                  subsequent Forward Supplemental Channel assignment  
40                  corresponding to the same Supplemental Channel (see  
41                  2.6.6.2.5.1.1).

1 FOR\_SCH-

- 2 \_START\_TIME\_INCL - Start time included indicator.

3 If FOR\_SCH\_DURATION is not equal to '0000', the base  
 4 station shall set this field to '1'. If FOR\_SCH\_DURATION is  
 5 equal to '0000', the base station shall set this field as follows:  
 6 The base station shall set this field to '1' if  
 7 FOR\_SCH\_START\_TIME is included in this message;  
 8 otherwise, the base station shall set this field to '0'.

9 FOR\_SCH-

- 10 \_START\_TIME - Start time for Forward Supplemental Channel assignment.

11 If FOR\_SCH\_START\_TIME\_INCL is set to '0', the base station  
 12 shall omit this field; otherwise, the base station shall set this  
 13 field to the System Time, in units of time specified by  
 14 START\_TIME\_UNIT, (modulo 32) at which the mobile station is  
 15 to start processing the Forward Supplemental Channel  
 16 specified in this message. The start time for processing  
 17 Forward Supplemental Channels is the time for which

$$( \lfloor t / (\text{START\_TIME\_UNIT} + 1) \rfloor - \text{FOR\_SCH\_START\_TIME} ) \bmod 32 = 0,$$

20 where  $t$  is the System Time in units of 20 ms.

21 SCCL\_INDEX

- 22 - Supplemental Channel Code list index.

23 The base station shall set this field to the index of the record  
 24 in the Forward Supplemental Channel Code list corresponding  
 25 to the FOR\_SCH\_ID. The base station shall include an  
 26 SCCL\_INDEX whose SCH Active Set is a subset of the Active  
 27 Set of the Fundamental Channel, Dedicated Control Channel,  
 or both.

28 FPC\_INCL

- 29 - Forward Link Power Control parameter included indicator.

30 If the forward power control related information is included in  
 31 this message, the base station shall set this field to '1';  
 otherwise, the base station shall set this field to '0'.

32 FPC\_MODE\_SCH

- 33 - Forward Power Control operational mode indicator used  
 during forward Supplemental Channel assignment interval.

34 If FPC\_INCL is set to '1', the base station shall set the value to  
 35 the forward power control operation mode (see [2]); otherwise,  
 36 the base station shall omit this field.

37 FPC\_SCH-

38 \_INIT\_SETPT\_OP

- 39 - Initial Supplemental Channel Outer Loop Eb/Nt setpoint  
 option.

40 If FPC\_INCL is set to '0', the base station shall omit this field;  
 41 otherwise, the base station shall set this field as follows:

The base station shall set this field to '0' to indicate that FPC\_SCH\_INIT\_SETPT contains the absolute value of the initial F-SCH Eb/Nt setpoint. The base station shall set this field to '1' to indicate that FPC\_SCH\_INIT\_SETPT contains the offset value of the initial F-SCH Eb/Nt setpoint relative to the current value used in the mobile station for the channel carrying the Forward Power Control Subchannel.

- |              |                                                                                                                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FPC_SEC_CHAN | <ul style="list-style-type: none"> <li>- Master Supplemental channel index.</li> </ul> <p>If FPC_INCL is set to ‘1’ and FPC_MODE_SCH is set to ‘001’, ‘010’, ‘101’, or ‘110’, the base station shall set this field to the master Supplemental Channel index; otherwise, the base station shall omit this field.</p> |
| NUM_SUP      | <ul style="list-style-type: none"> <li>- Number of Supplemental Channels.</li> </ul> <p>If FPC_INCL is set to ‘0’ the base station shall omit this field; otherwise, the base station shall set this field to the total number of the Supplemental Channels.</p>                                                     |

The base station shall include NUM\_SUP occurrences of the following record:

- |    |                     |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

If SCH setpoint report threshold is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

## FPC\_SETPT-

## \_THRESH\_SCH

- SCH Setpoint Report Threshold.

If FPC\_THRESH\_SCH\_INCL is set to ‘1’, the base station shall set [this field the value to the value of SETPT\\_THRESH\\_SCH](#) [the Supplemental Channel setpoint threshold](#) (in units of 0.125 dB) above which the outer loop report message will be sent by the mobile station; otherwise, the base station shall omit this field.

## RPC\_INCL

- Reverse Power Control parameter included indicator.

The base station shall set this field to ‘1’ if RPC\_NUM\_SUP is included in this message; otherwise the base station shall set this field to ‘0’.

## RPC\_NUM\_SUP

- Number of Supplemental Channels.

If RPC\_INCL is set to ‘1’, the base station shall set this field to the total number of the Supplemental Channels minus one; otherwise, the base station shall omit this field.

The base station shall include RPC\_NUM\_SUP +1 occurrences of the following two fields record:

## SCH\_ID

- Supplemental channel index.

The base station shall set this field to the Supplemental Channel index.

## RLGAIN\_SCH\_PILOT

- Supplemental channel power offset adjustment relative to Reverse Pilot Channel power for radio configurations greater than 2.

The base station shall set this field to the correction factor to be used by mobile stations setting the power of a supplemental channel, expressed as a two’s complement value in units of 0.125 dB.

## 3X\_SCH\_INFO\_INCL

- 3X SCH information included indicator.

If the 3X Supplemental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

[If FOR CFG INCLUDED is set to ‘0’, the base station shall set this field to ‘0’.](#)

## NUM\_3X\_CFG

- Number of 3X Supplemental Channels to be configured

If 3X\_SCH\_INFO\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of 3X Forward Supplemental Channels to be configured. The base station shall set this field to ‘00’ if the configuration of Supplemental Channel is not included.

1 The base station shall include NUM\_3X\_CFG occurrences of the following record if  
 2 3X\_SCH\_INFO\_INCL is included and set to '1'.

3           FOR\_SCH\_ID    - Forward Supplemental Channel identifier.  
 4                         The base station shall set this field the identifier of the  
 5                         Forward Supplemental Channel pertaining to this record.  
 6           NUM\_3X\_REC    - Number of 3X records  
 7                         The base station shall set this field to the number of instances  
 8                         of the following record minus one included in this message.

9           The base station shall include NUM\_3X\_REC+1 occurrences of the following variable-length  
 10          record.

11  
 12           SCCL\_INDEX    - Supplemental Channel Code list index.  
 13                         The base station shall set this field to the index of the record  
 14                         in the Supplemental Channel Code list.

15 The base station shall include NUM\_SUP\_SHO+1 occurrences of the following fields for each  
 16 Forward Supplemental channel corresponding to the FOR\_SCH\_ID and the SCCL\_INDEX  
 17 whose frames may be soft-combined by the mobile station:

18           3X\_SCH\_LOW\_INCL    - SCH code channel on the lowest SR3 frequency included  
 19                         indicator.  
 20                         If the SCH on the lowest SR3 frequencies has a different code  
 21                         channel than the SCH on the center SR3 frequency, the base  
 22                         station shall set this field to '1'; otherwise, the base station  
 23                         shall set this field to '0'.

24           QOF\_MASK\_ID-  
 25                \_SCH\_LOW    - QOF index for the SCH on the lowest SR3 frequency.  
 26                         If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit  
 27                         this field; otherwise, the base station shall set this field as  
 28                         follows:  
 29                         The base station shall set this field to the index of the Quasi-  
 30                         orthogonal function (see Table 3.1.3.1.12-2 of [2])  
 31                         corresponding to the QOF index for the SCH on the lowest  
 32                         SR3 frequency.

33           CODE\_CHAN-  
 34                \_SCH\_LOW    - Code channel for the SCH on the lowest SR3 frequency.  
 35                         If 3X\_SCH\_LOW\_INCL is set to '0', the base station shall omit  
 36                         this field; otherwise, the base station shall set this field as  
 37                         follows:  
 38                         The base station shall set this field to the code channel index  
 39                         (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
 40                         to use on the SCH on the lowest SR3 frequency. If Radio  
 41                         Configuration 6 or 8 is used, the base station shall set this  
 42                         field in the range 1 to 127 inclusive. If Radio Configuration 7  
 43                         or 9 is used, the base station shall set this field in the range 1  
 44                         to 255 inclusive.

1       3X\_SCH\_HIGH\_INCL   - SCH code channel on the highest SR3 frequency included  
2                            indicator.

3                            If the SCH on the highest SR3 frequencies has a different code  
4                            channel than the SCH on the center SR3 frequency, the base  
5                            station shall set this field to '1'; otherwise, the base station  
6                            shall set this field to '0'.

7       QOF\_MASK\_ID-

8            \_SCH\_HIGH   - QOF index for the SCH on the highest SR3 frequency.

9                            If 3X\_SCH\_HIGH\_INCL is set to '0', the base station shall omit  
10                          this field; otherwise, the base station shall set this field as  
11                          follows:

12                          The base station shall set this field to the index of the Quasi-  
13                          orthogonal function (see Table 3.1.3.1.12-2 of [2])  
14                          corresponding to the QOF index for the SCH on the highest  
15                          SR3 frequency.

16       CODE\_CHAN-

17            \_SCH\_HIGH   - Code channel for the SCH on the highest SR3 frequency.

18                          If 3X\_SCH\_HIGH\_INCL is set to '0', the base station shall omit  
19                          this field; otherwise, the base station shall set this field as  
20                          follows:

21                          The base station shall set this field to the code channel index  
22                          (see 2.1.3.1.9 and 3.1.3.1.13 of [2]) that the mobile station is  
23                          to use on the SCH on the highest SR3 frequency. If Radio  
24                          Configuration 6 or 8 is used, the base station shall set this  
25                          field in the range 1 to 127 inclusive. If Radio Configuration 7  
26                          or 9 is used, the base station shall set this field in the range 1  
27                          to 255 inclusive.

1    3.7.3.3.2.38 Forward Supplemental Channel Assignment Mini Message

2    MSG\_TAG: FSCAMM

3

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| FOR_SCH_ID         | 1                    |
| FOR_SCH_DURATION   | 4                    |
| FOR_SCH_START_TIME | 5                    |
| SCCL_INDEX         | 4                    |

- 1 |
- 2       FOR\_SCH\_ID   - Forward Supplemental Channel identifier.  
 3                     The base station shall set this field to the identifier of the  
 4                     Forward Supplemental Channel.
- 5       FOR\_SCH\_DURATION   - Duration of Forward Supplemental Channel assignment.  
 6                     The base station shall set this field to the duration (see Table  
 7                     3.7.3.3.2.37-3), starting at the start time of the message  
 8                     specified by FOR\_SCH\_START\_TIME, during which the mobile  
 9                     station is to process the Forward Supplemental Channel.
- 10                   The base station shall set this field to '0000' to indicate that  
 11                   the mobile station should stop processing the Forward  
 12                   Supplemental Channel starting at the start time of the  
 13                   message specified by FOR\_SCH\_START\_TIME.
- 14                   The base station shall set this field to '1111' to indicate that  
 15                   the mobile station should process the Forward Supplemental  
 16                   Channel, starting at the explicit start time of the message  
 17                   specified by FOR\_SCH\_START\_TIME, until the start time of a  
 18                   subsequent Forward Supplemental Channel assignment  
 19                   corresponding to the same Forward Supplemental Channel  
 20                   (see 2.6.6.2.5.1.1).
- 21       FOR\_SCH-  
 22            \_START\_TIME   - Start time for Forward Supplemental Channel assignment.  
 23                     The base station shall set this field to the System Time, in  
 24                     units of time specified by START\_TIME\_UNIT, (modulo 32) at  
 25                     which the mobile station is to start processing the Forward  
 26                     Supplemental Channel specified in this message. The start  
 27                     time for processing Forward Supplemental Channels is the  
 28                     time for which  

$$\lfloor t / (\text{START\_TIME\_UNIT} + 1) \rfloor - \text{FOR\_SCH\_START\_TIME} \bmod 32 = 0,$$
 29                     where  $t$  is the System Time in units of 20 ms.
- 30       SCCL\_INDEX   - Supplemental Channel Code list index.  
 31                     The base station shall set this field to the index of the record  
 32                     in the Forward Supplemental Channel Code list corresponding  
 33                     to the FOR\_SCH\_ID. The base station shall include an  
 34                     SCCL\_INDEX whose SCH Active Set is a subset of the Active  
 35                     Set of the Fundamental Channel, Dedicated Control Channel,  
 36                     or both.

## 1 3.7.3.3.2.39 Reverse Supplemental Channel Assignment Mini Message

2 MSG\_TAG: RSCAMM

3

| <b>Field</b>         | <b>Length (bits)</b> |
|----------------------|----------------------|
| REV_SCH_ID           | 1                    |
| REV_SCH_DURATION     | 4                    |
| REV_SCH_START_TIME   | 5                    |
| REV_SCH_NUM_BITS_IDX | 4                    |

- 1
- 2       REV\_SCH\_ID     - Reverse Supplemental Channel identifier.  
 3                     The base station shall set this field to the identifier of the  
 4                     Reverse Supplemental Channel.
- 5       REV\_SCH\_DURATION     - Duration of Reverse Supplemental Channel assignment.  
 6                     The base station shall set this field to '0000' to indicate that  
 7                     the mobile station is to stop transmitting on the Reverse  
 8                     Supplemental Channel specified by REV\_SCH\_ID at the start  
 9                     time specified by START\_TIME. The base station shall set this  
 10                    field to '1111' to indicate that the mobile station may transmit  
 11                    on the Reverse Supplemental Channel specified by  
 12                    REV\_SCH\_ID, starting at the start time specified by  
 13                    REV\_SCH\_START\_TIME in this message, until the start time  
 14                    specified by a subsequent Reverse Supplemental Channel  
 15                    assignment corresponding to the same Supplemental Channel  
 16                    (see 2.6.6.2.5.1.1). The base station shall set this field to the  
 17                    duration according to Table 3.7.3.3.2.37-3, starting at the  
 18                    explicit start time specified by REV\_SCH\_START\_TIME, during  
 19                    which the mobile station may transmit on the Reverse  
 20                    Supplemental Channel specified by REV\_SCH\_ID.

- 21       REV\_SCH-  
 22        \_Start\_Time     - Start time for *Reverse Supplemental Channel Assignment Mini*  
 23                    *Message*.  
 24                     The base station shall set this field to the System Time, in  
 25                    units of time specified by START\_TIME\_UNIT, (modulo 32) at  
 26                    which the mobile station may start transmitting on the  
 27                    Reverse Supplemental Channel specified in this message. The  
 28                    explicit start time for transmitting on the Reverse  
 29                    Supplemental Channel is the time for which  
 30                     $(\lfloor t / (\text{START\_TIME\_UNIT} + 1) \rfloor - \text{REV\_SCH\_START\_TIME}) \bmod 32 = 0$ ,  
 31                    where t is the System Time in units of 20 ms.

- 32
- 33       REV\_SCH-  
 34        \_NUM\_BITS\_IDX     - Reverse Supplemental Channel number of information bits per  
 35                    frame index.  
 36                     If USE\_FLEX\_NUM\_BITS is equal to '0' or if  
 37                     USE\_FLEX\_NUM\_BITS is equal to '1' and  
 38                     RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is equal to '0000', then  
 39                     the base station shall set this field according to Table  
 40                     3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel  
 41                     number of information bits per frame and the number of CRC  
 42                     bits per frame, that the mobile station may transmit on the  
 43                     reverse Supplemental Channel identified by REV\_SCH\_ID.

44       If     USE\_FLEX\_NUM\_BITS<sub>s</sub>     is     equal     to     '1'     and

1 RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID] is not equal to '0000',  
2 then the base station shall set the REV\_SCH\_NUM\_BITS\_IDX  
3 field to indicate the Reverse Supplemental Channel number of  
4 information bits per frame that the mobile station may  
5 transmit on the Reverse Supplemental Channel identified by  
6 REV\_SCH\_ID to be  
7 NUM\_BITS[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
8 [REV\_SCH\_NUM\_BITS\_IDX] and the Reverse Supplemental  
9 Channel number of CRC bits per frame that the mobile station  
10 may transmit on the Reverse Supplemental Channel identified  
11 by REV SCH ID to be  
12 CRC\_LEN\_IDX[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]]  
13 [REV SCH NUM BITS IDX].  
14 The REV\_SCH\_NUM\_BITS\_IDX field also specifies the number  
15 of CRC bits per frame for the Reverse Supplemental Channel  
16 identified by REV\_SCH\_ID. The number of CRC bits per frame  
17 is specified by  
18 CRC\_LEN\_IDX[RSCH\_NBIT\_TABLE\_ID[REV\_SCH\_ID]][REV\_SCH\_NUM\_BITS\_IDX] and Table 3.7.5.20-4.  
19

## 1 3.7.3.3.2.40 Mobile Assisted Burst Operation Parameters Message

2 MSG\_TAG: MABOPM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| ORDER_FLAG   | 1                    |

If ORDER\_FLAG is set to '1', the base station shall include following record:

|                |   |
|----------------|---|
| PS_MIN_DELTA   | 3 |
| ORDER_INTERVAL | 3 |

|               |   |
|---------------|---|
| PERIODIC_FLAG | 1 |
|---------------|---|

If PERIODIC\_FLAG is set to '1', the base station shall include following record:

|                   |   |
|-------------------|---|
| NUM_PILOTS        | 3 |
| PERIODIC_INTERVAL | 6 |

|                |   |
|----------------|---|
| THRESHOLD_FLAG | 1 |
|----------------|---|

If THRESHOLD\_FLAG is set to '1', the base station shall include following record:

|                    |   |
|--------------------|---|
| PS_FLOOR_HIGH      | 6 |
| PS_FLOOR_LOW       | 6 |
| PS_CEILING_HIGH    | 6 |
| PS_CEILING_LOW     | 6 |
| THRESHOLD_INTERVAL | 6 |

- 1
- 2           **ORDER\_FLAG**     - Order change reporting flag.
- 3                         The base station shall set this field to '1' to indicate that the  
 4                         mobile station is to send a *Pilot Strength Measurement Mini*  
 5                         *Message* to the base station whenever a received pilot strength  
 6                         measurement changes its relative order with respect to all  
 7                         other reported pilot strength measurements during  
 8                         supplemental channel burst operations; otherwise, the base  
 9                         station shall set this field to '0'.
- 10          If ORDER\_FLAG is set to '1', the base stations shall include the following two-field record:
- 11            **PS\_MIN\_DELTA**     - Minimum power strength delta.
- 12                         The base station shall set this field to one less than the  
 13                         minimum pilot strength measurement difference between two  
 14                         pilots (in units of 0.5 dB) that must be measured in order for  
 15                         the mobile station to send a *Pilot Strength Measurement Mini*  
 16                         *Messages* when the rank order mode is enabled. A difference  
 17                         in pilot strength of at least (PS\_MIN\_DELTA + 1), in units of  
 18                         0.5 dB, must be measured for ORDER\_INTERVAL successive  
 19                         20 ms intervals before a rank order based *Pilot Strength*  
 20                         *Measurement Mini Message* is generated.
- 21            **ORDER\_INTERVAL**     - Order interval.
- 22                         The base station shall set this field to the minimum interval (in  
 23                         20 ms units) during which the indicated pilot strength  
 24                         measurement difference greater than or equal to  
 25                         (PS\_MIN\_DELTA + 1), in units of 0.5 dB, must be measured by |  
 26                         the mobile station in order for the mobile station to send a  
 27                         *Pilot Strength Measurement Mini Messages* when the rank order  
 28                         mode is enabled.
- 29            **PERIODIC\_FLAG**     - Periodic report flag.
- 30                         The base station shall set this field to '1' to indicate that the  
 31                         mobile station is to send *Pilot Strength Measurement Mini*  
 32                         *Messages* periodically during supplemental channel burst  
 33                         operations; otherwise the base station shall set this field to '0'.
- 34          If PERIODIC\_FLAG is set to '1', the base station shall include the following two-field record:
- 35            **NUM\_PILOTS**      - Number of pilots.
- 36                         The base station shall set this field to the number of pilots for  
 37                         which the mobile station is to send *Pilot Strength Measurement Mini*  
 38                         *Messages* when the periodic mode is enabled.
- 39            **PERIODIC\_INTERVAL**     - Periodic interval.
- 40                         The base station shall set this field to the interval (in 20 ms  
 41                         units) between *Pilot Strength Measurement Mini Messages* when  
 42                         the periodic mode is enabled.
- 43            **THRESHOLD\_FLAG**     - Threshold reporting flag.

1           The base station shall set this field to ‘1’ to indicate that the  
 2           mobile station is to send *Pilot Strength Measurement Mini*  
 3           *Messages* whenever a measured pilot crosses below a lower  
 4           bound or exceeds an upper bound during Supplemental  
 5           channel burst operations; otherwise the base station shall set  
 6           this field to ‘0’.

7       If THRESHOLD\_FLAG is set to ‘1’, the base station shall include the following five-field  
 8       record:

9       PS\_FLOOR\_HIGH    - Lower bound reporting high water mark.

10      The base station shall set this field to the high water mark for  
 11      the lower bound below which the mobile station is to send *Pilot*  
 12      *Strength Measurement Mini Messages* when the threshold mode  
 13      is enabled.

14      The base station shall set this field as an unsigned binary  
 15      number equal to  $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .

16      PS\_FLOOR\_LOW     - Lower bound reporting low water mark.

17      The base station shall set this field to the low water mark for  
 18      the lower bound below which the mobile station is to send *Pilot*  
 19      *Strength Measurement Mini Messages* when the threshold mode  
 20      is enabled.

21      The base station shall set this field as an unsigned binary  
 22      number equal to  $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .

23      PS\_CEILING\_HIGH   - Upper bound reporting high water mark.

24      The base station shall set this field to the high water mark for  
 25      the upper bound above which the mobile station is to send  
 26      *Pilot Strength Measurement Mini Messages* when the threshold  
 27      mode is enabled.

28      The base station shall set this field as an unsigned binary  
 29      number equal to  $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .

30      PS\_CEILING\_LOW    - Upper bound reporting low water mark.

31      The base station shall set this field to the low water mark for  
 32      the upper bound above which the mobile station is to send  
 33      *Pilot Strength Measurement Mini Messages* when the threshold  
 34      mode is enabled.

35      The base station shall set this field as an unsigned binary  
 36      number equal to  $\lfloor -2 \times 10 \times \log_{10} E_c/I_o \rfloor$ .

37      THRESHOLD-

38      \_INTERVAL        - Threshold reporting interval.

39      The base station shall set this field to the interval (in 20 ms  
 40      units) between *Pilot Strength Measurement Mini Messages* when  
 41      the threshold reporting mode is enabled.

## 1    3.7.3.3.2.41 User Zone Reject Message

2    MSG\_TAG: UZRM

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| REJECT_UZID        | 16                   |
| REJECT_ACTION_INDI | 3                    |
| UZID_ASSIGN_INCL   | 1                    |
| ASSIGN_UZID        | 0 or 16              |

- 3    REJECT\_UZID    -    Rejected User Zone identifier.  
   4                         The base station shall set this field to the User Zone identifier  
   5                         of the User Zone rejected by the base station.
- 6    REJECT\_ACTION\_INDI    -    Rejection action indicator.  
   7                         The base station shall set this field to the value shown in  
   8                         Table [3.7.2.3.2.29-1](#) [3.7.5.19-1](#) corresponding to the User  
   9                         Zone rejection action field to identify the mobile station action.
- 10    UZID\_ASSIGN\_INCL    -    User Zone identifier assignment included indicator.  
   11                         If assigned UZID information is included, the base station  
   12                         shall set this field to '1'; otherwise, the base station shall set  
   13                         this field to '0'.
- 14    ASSIGN\_UZID    -    Assigned User Zone identifiers.  
   15                         The base station shall set this field to the User Zone identifier  
   16                         of the User Zone assigned to the mobile station.

## 1    3.7.3.3.2.42 User Zone Update Message

2    MSG\_TAG: UZUM

3

| Specific Field | Length (bits) |
|----------------|---------------|
| UZID           | 16            |

4    UZID    -    User Zone identifier.

5    The base station shall set this field to the User Zone identifier  
6    supported by the base station.

## 1    3.7.3.3.2.43 Call Assignment Message

2    MSG\_TAG: CLAM

3

| <b>Field</b>        | <b>Length (bits)</b> |
|---------------------|----------------------|
| RESPONSE_IND        | 1                    |
| TAG                 | 0 or 4               |
| ACCEPT_IND          | 0 or 1               |
| REJECT_PKTDATA_IND  | 0 or 1               |
| BYPASS_ALERT_ANSWER | 0 or 1               |
| SO_INCL             | 1                    |
| SO                  | 0 or 16              |
| CON_REF_INCL        | 1                    |
| CON_REF             | 0 or 8               |

4

5    RESPONSE\_IND    -    Response indicator.

6                     The base station shall set this field to '1' if this message is a  
7                     response to an *Enhanced Origination Message* from the mobile  
8                     station; otherwise, the base station shall set this field to '0'.

9    TAG    -    Transaction identifier.

10                   If the RESPONSE\_IND field is set to '0', the base station shall  
11                   omit this field; otherwise, the base station shall include this  
12                   field and set it as follows:13                   The base station shall set this field to the value of the TAG  
14                   field of the *Enhanced Origination Message* to which this  
15                   message is the response.

16    ACCEPT\_IND    -    Accepted indicator.

17                   If the RESPONSE\_IND field is set to '0', the base station shall  
18                   omit this field; otherwise, the base station shall include this  
19                   field and shall set it as follows:

1                   If the base station accepts the call request from the mobile  
 2                   station, the base station shall set this field to '1'; otherwise,  
 3                   the base station shall set this field to '0'.

4    REJECT\_PKTDATA\_IND – Packet data service option rejection indicator.

5                   If the ACCEPT\_IND field is not included or is included and is  
 6                   set to '1', the base station shall omit this field; otherwise, the  
 7                   base station shall include this field and shall set it as follows:

8                   The base station shall set this field to '1' to indicate rejection  
 9                   of the packet data service option requested by the mobile  
 10                  station; otherwise, the base station shall set this field to '0'.

11                  BYPASS\_ALERT-

12                  ANSWER – Bypass alert indicator.

13                  If the RESPONSE\_IND field is set to '1', the base station shall  
 14                  omit this field; otherwise, the base station shall include this  
 15                  field and shall set it as follows:

16                  If the mobile station is to bypass the *Waiting for Order*  
 17                  *Substate* and the *Waiting for Mobile Station Answer Substate*  
 18                  for this call, the base station shall set this field to '1';  
 19                  otherwise, the base station shall set this field to '0'.

20                  SO\_INCL – Service option included indicator.

21                  The base station shall set this field to '1' if the service option  
 22                  field is included in this message; otherwise, if the base station  
 23                  shall set this field to '0'.

24                  SO – Service option.

25                  If the SO\_INCL field is set to '0', the base station shall omit  
 26                  this field; otherwise, the base station shall include this field  
 27                  and shall set it to the value of the service option number (as  
 28                  specified in [30]) that the base station proposes for this call.

29                  CON\_REF\_INCL – Connection reference included indicator.

30                  If the ACCEPT\_IND field is not included or is included but is  
 31                  set to '1', the base station shall set this field to '1'; otherwise,  
 32                  the base station shall set this field to '0'.

33                  CON\_REF – Connection reference.

1       If the CON\_REF\_INCL field is set to '0', the base station shall  
2       omit this field; otherwise, the base station shall include this  
3       field and shall set it to the value of the connection reference  
4       that was/will be assigned to the service option connection  
5       corresponding to this call.

## 1    3.7.3.3.2.44 Extended Alert With Information Message

2    MSG\_TAG: EAWIM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| CON_REF_INCL | 1                    |
| CON_REF      | 0 or 8               |
| NUM_REC      | 4                    |

NUM\_REC occurrences of the following three-field record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    CON\_REF\_INCL – Connection reference included indicator.

6                          The base station shall set this field to ‘1’ if the connection  
7                          reference field is included in this message; otherwise, it shall  
8                          set this field to ‘0’.

9    CON\_REF – Connection reference.

10                         If the CON\_REF\_INCL field is set to ‘0’, the base station shall  
11                         omit this field; otherwise, the base station shall include this  
12                         field and shall set it to the value of the connection reference  
13                         assigned to the service option connection of the call, to which  
14                         this message corresponds.

15    NUM\_REC – Number of records.

16                         The base station shall set this field to the number of  
17                         information records included with this message.18    The base station shall include NUM\_REC occurrences of the following three-field record as  
19                         specified in 3.7.5.

20    RECORD\_TYPE – Information record type.

21                         The base station shall set this field as specified in 3.7.5.

- 1            RECORD\_LEN    -    Information record length.
- 2                            The base station shall set this field to the number of octets in  
3                            the type-specific fields included in this record.
- 4    Type-specific fields    -    Type-specific fields.  
5                            The base station shall include type-specific fields as specified  
6                            in 3.7.5.

## 1    3.7.3.3.2.45 Extended Flash With Information Message

2    MSG\_TAG: EFWIM

3

| <b>Field</b> | <b>Length (bits)</b> |
|--------------|----------------------|
| CON_REF_INCL | 1                    |
| CON_REF      | 0 or 8               |
| NUM_REC      | 4                    |

NUM\_REC occurrences of the following three-field record:

|                      |                               |
|----------------------|-------------------------------|
| RECORD_TYPE          | 8                             |
| RECORD_LEN           | 8                             |
| Type-specific fields | $8 \times \text{RECORD\_LEN}$ |

4

5    CON\_REF\_INCL – Connection reference included indicator.

6                          The base station shall set this field to ‘1’ if the connection  
7                          reference field is included in this message; otherwise, it shall  
8                          set this field to ‘0’.

9    CON\_REF – Connection reference.

10                         If the CON\_REF\_INCL field is set to ‘0’, the base station shall  
11                         omit this field; otherwise, the base station shall include this  
12                         field and shall set it to the value of the connection reference  
13                         assigned to the service option connection of the call, to which  
14                         this message corresponds.

15    NUM\_REC – Number of records.

16                         The base station shall set this field to the number of  
17                         information records included with this message.18    The base station shall include NUM\_REC occurrences of the following three-field record as  
19                         specified in 3.7.5.

20    RECORD\_TYPE – Information record type.

21                         The base station shall set this field as specified in 3.7.5.

- 1            RECORD\_LEN    -    Information record length.
- 2                            The base station shall set this field to the number of octets in  
3                            the type-specific fields included in this record.
- 4        Type-specific fields    -    Type-specific fields.  
5                            The base station shall include type-specific fields as specified  
6                            in 3.7.5.

## 1    3.7.3.3.2.46 Security Mode Command Message

## 2    MSG\_TAG: SMCM

| Field                     | Length (bits) |
|---------------------------|---------------|
| USE_TIME                  | 1             |
| ACTION_TIME               | 0 or 6        |
| <u>D_SIG_ENCRYPT_MODE</u> | 3             |
| NUM_RECS                  | 3             |

NUM\_RECS occurrences of the following two-field record

|                 |   |
|-----------------|---|
| CON_REF         | 8 |
| UI_ENCRYPT_MODE | 3 |

|                                |               |
|--------------------------------|---------------|
| <u>USE_NEW_KEY</u>             | <u>0-or-1</u> |
| <u>ENC_KEY_SIZE</u>            | 0 or 3        |
| <u>KEY_SEQ</u>                 | <u>0-or-4</u> |
| <u>C SIG ENCRYPT MODE INCL</u> | <u>1</u>      |
| <u>C SIG ENCRYPT MODE</u>      | <u>0 or 3</u> |

3

4    USE\_TIME - Use action time indicator.

5    This field indicates whether an ACTION\_TIME is specified in  
6    this message.7    If an ACTION\_TIME is specified in this message, the base  
8    station shall set this field to '1'; otherwise, the base station  
9    shall set this field to '0'.

10    ACTION\_TIME - Action time.

11    If the USE\_TIME field is set to '1', the base station shall set  
12    this field to the System Time, in units of 80 ms (modulo 64),  
13    at which the message is to take effect. If the USE\_TIME field  
14    is set to '0' the base station shall omit this field.15    D\_SIG\_ENCRYPT\_MODE - Dedicated channel Common Channel-encryption mode indicator.16    The base station shall set it to signaling message-encryption  
17    mode, as shown in Table 3.7.4.5-1.

18    NUM\_REC - Number of user information encryption records.

19    The base station shall set this field to the number of user  
20    information encryption records included in this message.

21    The base station shall include NUM\_REC occurrences of the following two-field record

22    CON\_REF - Connection reference corresponding to the service option  
23    connection requesting for encryption.

|    |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | If this field is included, the base station shall set this field to the connection reference of the service option connection corresponding to this user information encryption.                                                                                                                                                                                                                                                    |
| 2  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 4  | UI_ENCRYPT_MODE - Encryption mode indicator for user information privacy.                                                                                                                                                                                                                                                                                                                                                           |
| 5  | The base station shall set this field to user information encryption mode for the service option connection identified by CON_REF as shown in Table 3.7.5.7-3.                                                                                                                                                                                                                                                                      |
| 6  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 7  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 8  | <u>USE_NEW_KEY</u> Use new encryption key indication.                                                                                                                                                                                                                                                                                                                                                                               |
| 9  | <del>If both of UI_ENCRYPT_MODE and SIG_ENCRYPT_MODE are equal to '000' or any reserved value, the base station shall omit this field; otherwise, the base station shall include this field. If included, the base station shall set this field to '0' to indicate that the stored encryption key is to be used by the mobile station and to '1' to indicate that the new encryption key is to be used by the mobile station.</del> |

3      [QUAL INFO TYPE](#) - Qualification information type.

4      The base station shall set this field to the QUAL INFO TYPE  
 5      field in the corresponding *Base Station Status Request*  
 6      *Message*.

7      [QUAL INFO LEN](#) - Qualification information length.

8      The base station shall set this field to the QUAL INFO LEN  
 9      field in the corresponding *Base Station Status Request*  
 10     *Message*.

11     [Type-specific fields](#) - Type-specific fields.

12     The base station shall set these fields to the qualification  
 13     information in the corresponding *Base Station Status Request*  
 14     *Message*.

15     [NUM RECORD](#) - Number of records included in this message.

16     The base station shall set this field to the number of  
 17     occurrences of RECORD TYPE field in this message.

18     The base station shall include one occurrence of the following variable-length record for  
 19     each information record that is included:

20     [RECORD TYPE](#) - Information record type.

21     The base station shall set this field to the record type value  
 22     shown in Table 3.7.3.3.47-1 corresponding to the  
 23     information record included.

1           **Table 3.7.3.3.3.47-1. Base Station Status Response Information Record**  
 2           **Types**

| <u>Information Record Requested</u> | <u>Record Type</u>                  |
|-------------------------------------|-------------------------------------|
| <u>Pilot Information</u>            | <u>00000000</u>                     |
| <u>Reserved</u>                     | <u>00000001-</u><br><u>11111111</u> |

3           RECORD LENGTH - Information record length.  
 4           The base station shall set this field to the length, in octets, of  
 5           the record type specific fields included in this record.

6           Record type specific  
 7           fields - Record type specific fields  
 8           The base station shall set this field to the type specific fields  
 9           corresponding to this record type.

10          If the RECORD TYPE field is set to '00000000', the base  
 11         station shall set the record type specific field as follows:

| <u>Field</u>       | <u>Length (bits)</u> |
|--------------------|----------------------|
| <u>NUM_PILOTS</u>  | <u>4</u>             |
| <u>SID_NID_IND</u> | <u>1</u>             |

NUM\_PILOTS occurrences of the  
 following variable-length record

|                     |                          |
|---------------------|--------------------------|
| <u>RECORD_LEN</u>   | <u>4</u>                 |
| <u>PILOT_PN</u>     | <u>9</u>                 |
| <u>BASE_ID</u>      | <u>16</u>                |
| <u>SID_NID_INCL</u> | <u>0 or 1</u>            |
| <u>SID</u>          | <u>0 or 15</u>           |
| <u>NID</u>          | <u>0 or 16</u>           |
| <u>RESERVED_1</u>   | <u>0-7 (as required)</u> |

13  
 14          NUM\_PILOTS - Number of Pilots reported.

1           The base station shall set this field to the number of pilots  
2           whose information is reported in this message.

3           The base station shall set this field to a number equal or  
4           greater than one.

5       SID NID IND - SID, NID included indicator.

6           The base station shall set this field to '1' if SID, NID  
7           information is included in this message; otherwise, it shall set  
8           this field to '0'.

9           The base station shall include NUM PILOTS occurrences of the following variable  
10          length record:

11       RECORD LEN - Record Length

12           The base station shall set this field to the length in octets of  
13          this record.

14       PILOT PN - Pilot PN sequence offset index.

15           The base station shall set this field to the pilot PN sequence  
16          offset for this base station, in units of 64 PN chips.

17       BASE ID - Base station identification.

18           The base station shall set this field to the Base Station  
19          identification number corresponding to this pilot.

20       SID NID INCL - SID, NID included indicator.

21           If the SID NID IND field is set to '0', the base station shall  
22          omit this field; otherwise, the base station shall include this  
23          field and set it as follows:

24           If this is the first pilot included in this message, the base  
25          station shall set this field to '1'; otherwise, the base station  
26          shall set this field as follows:

27           If the SID and NID of this pilot are same as the SID and NID  
28          of the previous pilot, the base station shall set this field to '0';  
29          otherwise, the base station shall set this field to '1'.

30       SID - System identification.

1           If the SID\_NID\_INCL field is not included or is included and is  
2           set to '0', the base station shall omit this field; otherwise, the  
3           base station shall include this field and set it as follows:

4           The base station shall set this field to the system identification  
5           number of the system corresponding to this pilot (see  
6           2.6.5.2).

7           NID - Network identification.

8           If the SID\_NID\_INCL field is not included or is included and is  
9           set to '0', the base station shall omit this field; otherwise, the  
10          base station shall include this field and set it as follows:

11          The base station shall set this field to the network  
12          identification number of the network corresponding to this  
13          pilot (see 2.6.5.2).

14          RESERVED 1 - Reserved bits.

15          The base station shall add reserved bits as needed in order to  
16          make the length of the pilot specific record equal to an integer  
17          number of octets. The base station shall set these bits to '0'.

19          RESERVED - Reserved bits.

20          The base station shall add reserved bits as needed in order to  
21          make the length of the record equal to an integer number of  
22          octets. The base station shall set these bits to '0'.

23

24

1    3.7.4 Orders

2    *Order Messages* are sent by the base station on the f-csch and the f-dsch. The general PDU  
3    format used on the f-csch is defined in 3.7.2.3.2.7, and the general PDU format used on the  
4    f-dsch is defined in 3.7.3.3.2.1. There are many specific types of *Order Messages*, as shown  
5    in Table 3.7.4-1.

6    The base station may send on the f-csch any type of order shown in Table 3.7.4-1 with a 'Y'  
7    in the first column, but shall not send on the f-csch any type of order with an 'N' in the first  
8    column. The base station may send on the f-dsch any type of order shown in Table 3.7.4-1  
9    with a 'Y' in the second column, but shall not send on the f-dsch any type of order with an  
10   N' in the second column.

11   An order consists of a 6-bit order code and zero or more order-specific fields. The base  
12   station shall set the ORDER field in the *Order Message* to the order code shown in Table  
13   3.7.4-1 corresponding to the type of order being sent.

14   If the order qualification code in the fourth column of Table 3.7.4-1 is '00000000' and there  
15   are no other additional fields as shown by an 'N' in the sixth column, the base station shall  
16   include no order qualification code or other order-specific fields in the *Order Message*. The  
17   order qualification code of such a message is implicitly '00000000'.

18   If the order qualification code is not '00000000' and there are no other additional fields as  
19   shown in Table 3.7.4-1 by an 'N' in the sixth column, the base station shall include the  
20   order qualification code as the only order specific field in the *Order Message*.

21   If there are other additional fields as shown in Table 3.7.4-1 by a 'Y' in the sixth column,  
22   the base station shall include order-specific fields as specified in the corresponding  
23   subsection of this section.

**Table 3.7.4-1. Order and Order Qualification Codes Used on the f-csch and the f-dsch  
(Part 1 of 4)**

| <b>f-csch<br/>Order</b> | <b>f-dsch<br/>Order</b> | <b>Order<br/>Code,<br/>ORDER<br/>(binary)</b> | <b>Order Qual-<br/>ification<br/>Code,<br/>ORDQ<br/>(binary)</b> | <b>ACTION_<br/>TIME<br/>can be<br/>specified</b> | <b>Addi-<br/>tional<br/>Fields<br/>other than<br/>ORDQ</b> | <b>Name/Function</b>                                                                |
|-------------------------|-------------------------|-----------------------------------------------|------------------------------------------------------------------|--------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Y                       | N                       | 000001                                        | 00000000                                                         | N                                                | N                                                          | <i>Abbreviated Alert Order</i>                                                      |
| Y                       | Y                       | 000010                                        | 00000000                                                         | N                                                | Y                                                          | <i>Base Station Challenge Confirmation Order (see 3.7.4.1)</i>                      |
| N                       | Y                       | 000011                                        | 000000nn                                                         | Y                                                | N                                                          | <i>Message Encryption Mode Order</i> (where nn is the mode per Table 3.7.2.3.2.8-2) |
| Y                       | N                       | 000100                                        | 00000000                                                         | N                                                | N                                                          | <i>Reorder Order</i>                                                                |
| N                       | Y                       | 000101                                        | 0000nnnn                                                         | N                                                | N                                                          | <i>Parameter Update Order</i> (where 'nnnn' is the Request Number)                  |
| Y                       | Y                       | 000110                                        | 00000000                                                         | N                                                | N                                                          | <i>Audit Order</i>                                                                  |
| Y                       | N                       | 001001                                        | 00000000                                                         | N                                                | N                                                          | <i>Intercept Order</i>                                                              |

## 1    3.7.4.1 Base Station Challenge Confirmation Order

2    The *Base Station Challenge Confirmation Order* can be sent on either the f-csch or on the f-  
3    dsch.

4

| <b>Order Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| AUTHBS                      | 18                   |
| RESERVED                    | 6                    |

5

6            ORDQ    -    Order qualification code.

7                 The base station shall set this field to '00000000'.

8            AUTHBS    -    Challenge response.

9                 The base station shall set this field as specified in 2.3.12.1.5.

10          RESERVED    -    Reserved bits.

11                 The base station shall set this field to '000000'.

### 3.7.4.2 Service Option Request Order

<sup>2</sup> The *Service Option Request Order* can be sent only on the f-dsch.

| <b>Order Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| SERVICE_OPTION              | 16                   |

4

The base station shall set this field to '00000000'.

7

SERVICE\_OPTION - Service option.

8

The base station shall set this field to the service option code shown in [30], corresponding to the requested or alternative service option.

## 1    3.7.4.3 Service Option Response Order

2    The *Service Option Response Order* can be sent only on the f-dsch.

3

| <b>Order Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| SERVICE_OPTION              | 16                   |

4

5            ORDQ    -    Order qualification code.

6                 The base station shall set this field to '00000000'.

7            SERVICE\_OPTION    -    Service option.

8                 The base station shall set this field to the service option code  
9                 shown in [30], corresponding to the accepted service option, or  
10                to '0000000000000000' to reject the last service option  
11                requested by the mobile station.

1      3.7.4.4 Status Request Order

2      The *Status Request Order* can be sent only on the f-dsch. The ORDQ field of the *Status*  
 3      *Request Order* specifies the information record to be returned by the mobile station in the  
 4      *Status Message*.

5

| Order Specific Field | Length (bits) |
|----------------------|---------------|
| ORDQ                 | 8             |

6

7      ORDQ - Order qualification code.

8      The base station shall set this field to the order qualification  
 9      code corresponding to the information record type to be  
 10     returned by the mobile station in the *Status Message*, as  
 11     shown in Table 3.7.4.4-1.

12     If MOB P REV is equal to or greater than seven, the base  
 13     station shall not request the Call Mode information record  
 14     (record type '00000111' in Table 3.7.2.3.2.15-2).

15

16

**Table 3.7.4.4-1. Status Request ORDQ Values**

| Information Record Requested        | ORDQ (binary) |
|-------------------------------------|---------------|
| Reserved                            | 00000110      |
| Call Mode                           | 00000111      |
| Terminal Information                | 00001000      |

## 1    3.7.4.5 Registration Accepted Order

2    The *Registration Accepted Order* can be sent only on the f-csch.

3

| <b>Order Specific Field</b>        | <b>Length (bits)</b> |
|------------------------------------|----------------------|
| ORDQ                               | 8                    |
| ROAM_INDI                          | 0 or 8               |
| <a href="#">C SIG_ENCRYPT_MODE</a> | 0 or 3               |
| <a href="#">USE_NEW_KEY</a>        | <del>0 or 1</del>    |
| <a href="#">ENC_KEY_SIZE</a>       | 0 or 3               |
| <a href="#">KEY_SEQ</a>            | <del>0 or 4</del>    |
| RESERVED                           | 0 – 7 (as needed)    |

4

5    ORDQ - Order qualification code.

6    If only ORDQ is included in the order, the base station shall set  
7    this field to '00000000'. If only ORDQ and ROAM\_INDI are  
8    included in the order, the base station shall set this field to  
9    '00000101'. If ORDQ, ROAM\_INDI, and the signaling encryption  
10   related fields are included in the order, the base station shall set  
11   this field to '00000111'.

12    ROAM\_INDI - Roaming display indication.

13    If ORDQ is set to '00000000', the base station shall omit this field.

14    If ORDQ is set to '00000101' or '00000111', the base station shall  
15   include this field and shall set it to the appropriate ROAM\_INDI  
16   code corresponding to the MS roaming condition. These values  
17   are defined in [30].18    [C SIG\\_ENCRYPT\\_MODE](#) - [Common channel sSignaling message](#) encryption mode indicator.19    If ORDQ is set to '00000111', the base station shall include this  
20   field and shall set it to [the common channel](#) signaling [message](#)  
21   encryption mode, as shown in Table 3.7.4.5-1; otherwise the base  
22   station shall omit this field.

| <u>010</u>                                            | <u>Rijndael Encryption Algorithm enabled</u>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <u>011010 - 111</u>                                   | <u>Reserved</u>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

3

4

USE\_NEW\_KEY — Use new encryption key indication.

If SIG\_ENCRYPT\_MODE is set to '001', the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field as follows:

The base station shall set this field to '0' to indicate that the stored encryption key is to be used by the mobile station, and to '1' to indicate that the new encryption key is to be used by the mobile station.

ENC\_KEY\_SIZE — Key size used for encryption

<sup>6</sup> D\_SIG\_ENCRYPT\_MODE<sub>r</sub> = '000' is used to indicate to the mobile station that the current common channel encryption mode (and encryption algorithm, if encryption is turned on) shall be used for dedicated channel encryption. D\_SIG\_ENCRYPT\_MODE<sub>s</sub> = '000' means that no dedicated channel extended encryption shall be performed in the mobile station.

1           If C SIG ENCRYPT MODE is set to '001' if USE\_NEW\_KEY is  
 2           not included, or if USE\_NEW\_KEY is included and is set to '0',  
 3           the base station shall omit this field; otherwise, the base  
 4           station shall include this field and set this field to the  
 5           encryption key\_size used for encryption according to as  
 6           shown in Table 3.7.4.5-2; otherwise, the base station shall  
 7           omit this field.

8           **Table 3.7.4.5-2. ENC\_KEY\_SIZE Values**

| <b>ENC_KEY_SIZE (binary)</b> | <b>Descriptions</b> |
|------------------------------|---------------------|
| 000                          | 40 bits Reserved    |
| 001                          | 64 bits             |
| 010                          | 128 bits            |
| 011-111                      | Reserved            |

9           KEY\_SEQ         Encryption key sequence number.

10           If USE\_NEW\_KEY is included and is set to '0', the base station  
 11           shall include this field; otherwise, the base station shall omit this  
 12           field. If this field is included, the base station shall set it to the  
 13           encryption key sequence number to be used by the mobile  
 14           station.

15           RESERVED        -     Reserved bits.

16           The base station shall add reserved bits as needed in order to  
 17           make the total length of the fields included in this order equal  
 18           to an integer number of octets. The base station shall set  
 19           these bits to '0'.

## 1    3.7.4.6 Periodic Pilot Measurement Request Order

2    The *Periodic Pilot Measurement Request Order* can be sent only on the f-dsch.

3

| <b>Order Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| MIN_PILOT_PWR_THRESH        | 5                    |
| MIN_PILOT_EC_IO_THRESH      | 5                    |
| INCL_SETPT                  | 1                    |
| RESERVED                    | <b>65</b>            |

4

5    ORDQ    -    Order qualification code.

6              If INCL\_SETPT equals '0', the base station shall set this field  
 7              to a report period, in units of 0.08 seconds, in the range of  
 8              '00001010' to '1111110' inclusive; otherwise, the base station  
 9              shall set this field to a report period, in units of 0.08 seconds,  
 10             in the range of '00000001' to '11111110' inclusive. The base  
 11             station shall set this field to '11111111' to request a one time  
 12             *Periodic Pilot Strength Measurement Message*.

13    MIN\_PILOT\_PWR-

14            -    The threshold of the total received  $E_c$  of the pilots in the  
 15            Active Set.

16              If the mobile station is to report pilot strength measurements  
 17              periodically to the base station irrespective of the pilot power  
 18              of the Active Set, the base station shall set this field to  
 19              '11111'; otherwise, the base station shall set this field to the  
 20              total  $E_c$  threshold, expressed as an unsigned binary number  
 21              equal to:

$$\lceil (10 \times \log_{10}(pilot\_ec\_thresh) + 120) / 2 \rceil$$

22              where *pilot\_ec\_thresh* is the threshold of the mobile station  
 23              received total  $E_c$  (in mW) of the pilots in the Active Set below  
 24              which the mobile station is to send the pilot strength  
 25              measurements periodically to the base station.

27    MIN\_PILOT\_EC-

28            -    Pilot Strength Threshold of Serving Frequency.

29              If the mobile station is to ignore this threshold, the base  
 30              station shall set this field to '11111'; otherwise, the base  
 31              station shall set this field to the total  $E_c/I_o$  threshold,  
 32              expressed as an unsigned binary number equal to:

$$\lfloor -20 \times \log_{10} pilot\_streng\_thresh \rfloor,$$

1                   where *pilot\_streng\_thresh* is the threshold of the total received  
2                   E<sub>C</sub>/I<sub>0</sub> of the pilots in Active Set (see 2.6.6.2.2) below which the  
3                   mobile station is to send the pilot strength measurements  
4                   periodically to the base station.

- 5                   INCL\_SETPT    - Include Setpoint information indicator.  
6                                 The base station shall set this field to '1' to indicate that the  
7                                 mobile station shall include outer loop E<sub>b</sub>/N<sub>t</sub> setpoint  
8                                 information in the *Periodic Pilot Strength Measurement*  
9                                 Message; otherwise, the base station shall set this field to '0'.  
10                  RESERVED     - Reserved bits.  
11                                 The base station shall set this field to '000000'. |

## 1    3.7.4.7 Retry Order

2    The *Retry Order* can be sent on either the f-csch or on the f-dsch to indicate the requested  
 3    service is rejected and specify the retry delay.

4

| <b>Order Specific Field</b> | <b>Length (bits)</b> |
|-----------------------------|----------------------|
| ORDQ                        | 8                    |
| RETRY_TYPE                  | 3                    |
| RETRY_DELAY                 | 0 or 8               |
| <u>RESERVED</u>             | <u>5</u>             |

- 5              ORDQ    -    Order qualification code.  
 6                 The base station shall set this field to '00000000'.  
 7              RETRY\_TYPE    -    Retry delay type.  
 8                 The base station shall set this field specified as in Table  
 9                 3.7.4.7-1.

10              **Table 3.7.4.7-1 Retry Delay Type**

| <b>Value<br/>(binary)</b> | <b>Retry Type</b>            | <b>Usage</b>                                                                                                                                           |
|---------------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000                       | Clear all                    | The <i>Retry Order</i> is used to clear any existent retry delay                                                                                       |
| 001                       | Origination                  | The <i>Retry Order</i> specifies the RETRY_DELAY for a <i>Packet Data Origination Message</i> or <i>Enhanced Origination Message</i>                   |
| 010                       | Resource Request             | The <i>Retry Order</i> specifies the RETRY_DELAY for a <i>Resource Request Message</i> or <i>Resource Request Mini Message</i>                         |
| 011                       | Supplemental Channel Request | The <i>Retry Order</i> specifies the RETRY_DELAY for a <i>Supplemental Channel Request Message</i> or <i>Supplemental Channel Request Mini Message</i> |
| 100-111                   | Reserved                     |                                                                                                                                                        |

11

12

- RETRY\_DELAY    -    Retry delay.

If RETRY\_TYPE is set to '000' the base station shall omit this field. Otherwise the base station shall include this field and set it as follows:

If RETRY\_TYPE is set to '001', the base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.7-2, during which the mobile station is not permitted to send an *Origination Message* or an *Enhanced Origination Message* with the same Packet Data Service Option. The base station shall set this field to '00000000' to indicate that there is no retry delay or to clear a previously set retry delay.

**Table 3.7.4.7-2 Retry Delay for RETRY\_TYPE '001'**

| Bits    | Description                                                         |
|---------|---------------------------------------------------------------------|
| 7 (MSB) | Unit for the Retry Delay<br>‘0’ – unit is 1s<br>‘1’ – unit is 1 min |
| 6 to 0  | Retry Delay interval                                                |

If RETRY\_TYPE is set to '010' or '011', the base station shall set this field to the duration of the delay interval in units of 320 ms during which the mobile station is not permitted to send another *Supplemental Channel Request (Mini) Message* or *Resource Request (Mini) Message*. The base station shall set RETRY\_DELAY to '00000000' to indicate that there is no retry delay or to clear a previously set retry delay. The base station shall set RETRY\_DELAY to '11111111' to indicate that the mobile station is to refrain from sending the request indefinitely.

RESERVED - Reserved bits.

The base station shall set this field to '00000'.

1    3.7.5 Information Records

2    On the f-csch, information records may be included in the *Feature Notification Message*. On  
3    the f-dsch, information records may be included in the *Alert with Information Message*, the  
4    *Flash with Information Message*, the *Extended Alert with Information Message*, and the  
5    *Extended Flash with Information Message*, the Service Request Message, the Service  
6    Response Message, the Service Connect Message, the General Handoff Direction Message,  
7    and the Universal Handoff Direction Message. Table 3.7.5-1 lists the information record  
8    type values that may be used with each message type. The following sections describe the  
9    contents of each of the record types in detail.

## 1    3.7.5.1 Display

2    This information record allows the network to supply display information that may be  
3    displayed by the mobile station.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
|---------------------|---------------|

One or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

5

6    CHARi - Character.

7    The base station shall include one occurrence of this field for  
8    each character to be displayed. The base station shall set  
9    each occurrence of this field to the ASCII representation  
10   corresponding to the character entered, as specified in [9],  
11   with the most significant bit set to '0'.

## 1    3.7.5.2 Called Party Number

2    This information record identifies the called party's number.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |

Zero or more occurrences of the following field:

|          |   |
|----------|---|
| CHARi    | 8 |
| RESERVED | 1 |

4

5    NUMBER\_TYPE

- Type of number.

6

7

8

The base station shall set this field to the NUMBER\_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the called number, as defined in [7], Section 4.5.9.

9

NUMBER\_PLAN

- Numbering plan.

10

11

12

13

The base station shall set this field to the NUMBER\_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the called number, as defined in [7], Section 4.5.9.

14

CHARi

- Character.

15

16

17

18

19

The base station shall include one occurrence of this field for each character in the called number. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to '0'.

20

RESERVED

- Reserved bits.

21

The base station shall set this field to '0'.

## 1    3.7.5.3 Calling Party Number

2    This information record identifies the calling party's number.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |
| PI                  | 2             |
| SI                  | 2             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

|          |   |
|----------|---|
| RESERVED | 5 |
|----------|---|

4

- 5    NUMBER\_TYPE    -    Type of number.  
      The base station shall set this field to the NUMBER\_TYPE  
      value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
      of the calling number, as defined in [7], Section 4.5.9.
- 9    NUMBER\_PLAN    -    Numbering plan.  
      The base station shall set this field to the NUMBER\_PLAN  
      value shown in Table 2.7.1.3.2.4-3 corresponding to the  
      numbering plan used for the calling number, as defined in [7],  
      Section 4.5.9.
- 14    PI    -    Presentation indicator.  
      This field indicates whether or not the calling number should  
      be displayed.  
      The base station shall set this field to the PI value shown in  
      Table 2.7.4.4-1 corresponding to the presentation indicator,  
      as defined in [7], Section 4.5.9.
- 20    SI    -    Screening indicator.  
      This field indicates how the calling number was screened.  
      The base station shall set this field to the SI value shown in  
      Table 2.7.4.4-2 corresponding to the screening indicator  
      value, as defined in [7], Section 4.5.9.
- 25    CHARi    -    Character.  
      The base stations shall include one occurrence of this field for  
      each character in the calling number. The base station shall  
      set each occurrence of this field to the ASCII representation  
      corresponding to the character, as specified in [9], with the  
      most significant bit set to '0'.

1      RESERVED    -    Reserved bits.

2                  The base station shall set this field to '00000'.

## 1    3.7.5.4 Connected Number

2    This information record identifies the responding party to a call.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |
| PI                  | 2             |
| SI                  | 2             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

|          |   |
|----------|---|
| RESERVED | 5 |
|----------|---|

4

- 5    NUMBER\_TYPE    -    Type of number.  
      The base station shall set this field to the NUMBER\_TYPE  
      value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
      of the connected number, as defined in [7], Section 4.5.9.
- 9    NUMBER\_PLAN    -    Numbering plan.  
      The base station shall set this field to the NUMBER\_PLAN  
      value shown in Table 2.7.1.3.2.4-3 corresponding to the  
      numbering plan used for the connected number, as defined in  
      [7], Section 4.5.9.
- 14    PI    -    Presentation indicator.  
      This field indicates whether or not the connected number  
      should be displayed.  
      The base station shall set this field to the PI value shown in  
      Table 2.7.4.4-1 corresponding to the presentation indicator,  
      as defined in [7], Section 4.5.9.
- 20    SI    -    Screening indicator.  
      This field indicates how the connected number was screened.  
      The base station shall set this field to the SI value shown in  
      Table 2.7.4.4-2 corresponding to the screening indicator  
      value, as defined in [7], Section 4.5.9.
- 25    CHARi    -    Character.  
      The base station shall include one occurrence of this field for  
      each character in the connected number. The base station  
      shall set each occurrence of this field to the ASCII  
      representation corresponding to the character, as specified in  
      [9], with the most significant bit set to '0'.

1      RESERVED    -    Reserved bits.

2                  The base station shall set this field to '00000'.

## 1    3.7.5.5 Signal

2    This information record allows the network to convey information to a user by means of  
 3    tones and other alerting signals.

4    The Standard Alert is defined as SIGNAL\_TYPE = '10', ALERT\_PITCH = '00' and SIGNAL =  
 5    '000001'.

6

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| SIGNAL_TYPE         | 2             |
| ALERT_PITCH         | 2             |
| SIGNAL              | 6             |
| RESERVED            | 6             |

7

8    SIGNAL\_TYPE - Signal type.

9

10   The base station shall set this field to the signal type value  
 11   shown in Table 3.7.5.5-1.

12                      **Table 3.7.5.5-1. Signal Type**

| Description     | SIGNAL_TYPE<br>(binary) |
|-----------------|-------------------------|
| Tone signal     | 00                      |
| ISDN Alerting   | 01                      |
| IS-54B Alerting | 10                      |
| Reserved        | 11                      |

13

14    ALERT\_PITCH - Pitch of the alerting signal.

15

16   This field is ignored unless SIGNAL\_TYPE is '10', IS-54B  
 17   Alerting.

18

19   If SIGNAL\_TYPE is '10', the base station shall set this field to  
 20   the alert pitch shown in Table 3.7.5.5-2; otherwise, the base  
 21   station shall set this field to '00'.

**Table 3.7.5.5-2. Alert Pitch**

| <b>Description</b>            | <b>ALERT_PITCH<br/>(binary)</b> |
|-------------------------------|---------------------------------|
| Medium pitch (standard alert) | 00                              |
| High pitch                    | 01                              |
| Low pitch                     | 10                              |
| Reserved                      | 11                              |

2

3

SIGNAL - Signal code.

4

5

6

7

8

9

The base station shall set this field to the specific signal desired. If SIGNAL\_TYPE is '00', the base station shall set this field as described in Table 3.7.5.5-3. If SIGNAL\_TYPE is '01', the base station shall set this field as described in Table 3.7.5.5-4. If SIGNAL\_TYPE is '10', the base station shall set this field as described in Table 3.7.5.5-5.

10

**Table 3.7.5.5-3. Tone Signals (SIGNAL\_TYPE = '00')**

| <b>Description</b>                                                                                                                         | <b>SIGNAL<br/>(binary)</b> |
|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Dial tone on: a continuous 350 Hz tone added to a 440 Hz tone.                                                                             | 000000                     |
| Ring back tone on: a 440 Hz tone added to a 480 Hz tone repeated in a 2 s on, 4 s off pattern.                                             | 000001                     |
| Intercept tone on: alternating 440 Hz and 620 Hz tones, each on for 250 ms.                                                                | 000010                     |
| Abbreviated intercept: alternating 440 Hz and 620 Hz tones, each on for 250 ms, repeated for four seconds.                                 | 000011                     |
| Network congestion (reorder) tone on: a 480 Hz tone added to a 620 Hz tone repeated in a 250 ms on, 250 ms off cycle.                      | 000100                     |
| Abbreviated network congestion (reorder): a 480 Hz tone added to a 620 Hz tone repeated in a 250 ms on, 250 ms off cycle for four seconds. | 000101                     |
| Busy tone on: a 480 Hz tone added to a 620 Hz tone repeated in a 500 ms on, 500 ms off cycle.                                              | 000110                     |
| Confirm tone on: a 350 Hz tone added to a 440 Hz tone repeated 3 times in a 100 ms on, 100 ms off cycle.                                   | 000111                     |
| Answer tone on: answer tone is not presently used in North American networks.                                                              | 001000                     |
| Call waiting tone on: a 300 ms burst of 440 Hz tone.                                                                                       | 001001                     |
| Pip tone on: four bursts of 480 Hz tone (0.1 s on, 0.1 s off).                                                                             | 001010                     |
| Tones off                                                                                                                                  | 111111                     |
| All other SIGNAL values are reserved                                                                                                       |                            |

**Table 3.7.5.5-4. ISDN Alerting (SIGNAL\_TYPE = '01')**

| <b>Description</b>                                                                                  | <b>SIGNAL<br/>(binary)</b> |
|-----------------------------------------------------------------------------------------------------|----------------------------|
| Normal Alerting: 2.0 s on, 4.0 s off, repeating                                                     | 000000                     |
| Intergroup Alerting: 0.8 s on, 0.4 s off, 0.8 s on, 4.0 s off, repeating                            | 000001                     |
| Special/Priority Alerting: 0.4 s on, 0.2 s off, 0.4 s on, 0.2 s off, 0.8 s on, 4.0 s off, repeating | 000010                     |
| Reserved (ISDN Alerting pattern 3)                                                                  | 000011                     |
| “Ping ring”: single burst of 500 ms                                                                 | 000100                     |
| Reserved (ISDN Alerting pattern 5)                                                                  | 000101                     |
| Reserved (ISDN Alerting pattern 6)                                                                  | 000110                     |
| Reserved (ISDN Alerting pattern 7)                                                                  | 000111                     |
| Alerting off                                                                                        | 001111                     |
| All other SIGNAL values are reserved                                                                |                            |

**Table 3.7.5.5-5. IS-54B Alerting (SIGNAL\_TYPE = '10')**

| <b>Description</b>                                                                                                                 | <b>SIGNAL<br/>(binary)</b> |
|------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <i>No Tone:</i> Off                                                                                                                | 000000                     |
| <i>Long:</i> 2.0 s on, 4.0 s off, repeating (standard alert)                                                                       | 000001                     |
| <i>Short-Short:</i> 0.8 s on, 0.4 s off, 0.8 s on, 4.0 s off, repeating                                                            | 000010                     |
| <i>Short-Short-Long:</i> 0.4 s on, 0.2 s off, 0.4 s on, 0.2 s off, 0.8 s on, 4.0 s off, repeating                                  | 000011                     |
| <i>Short-Short-2:</i> 1.0 s on, 1.0 s off, 1.0 s on, 3.0 s off, repeating.                                                         | 000100                     |
| <i>Short-Long-Short:</i> 0.5 s on, 0.5 s off, 1.0 s on, 0.5 s off, 0.5 s on, 3.0 s off, repeating.                                 | 000101                     |
| <i>Short-Short-Short-Short:</i> 0.5 s on, 0.5 s off, 0.5 s on, 0.5 s off, 0.5 s on, 0.5 s off, 0.5 s on, 2.5 s off, repeating.     | 000110                     |
| <i>PBX Long:</i> 1.0 s on, 2.0 s off, repeating.                                                                                   | 000111                     |
| <i>PBX Short-Short:</i> 0.4 s on, 0.2 s off, 0.4 s on, 2.0 off, repeating.                                                         | 001000                     |
| <i>PBX Short-Short-Long:</i> 0.4 s on, 0.2 s off, 0.4 s on, 0.2 s off, 0.8 s on, 1.0 s off, repeating.                             | 001001                     |
| <i>PBX Short-Long-Short:</i> 0.4 s on, 0.2 s off, 0.8 s on, 0.2 s off, 0.4 s on, 1.0 s off, repeating.                             | 001010                     |
| <i>PBX Short-Short-Short-Short:</i> 0.4 s on, 0.2 s off, 0.4 s on, 0.2 s off, 0.4 s on, 0.2 s off, 0.4 s on, 0.8 s off, repeating. | 001011                     |
| <i>Pip-Pip-Pip-Pip:</i> 0.1 s on, 0.1 s off, 0.1 s on, 0.1 s off, 0.1 s on, 0.1 s off, 0.1 s on.                                   | 001100                     |
| All other SIGNAL values are reserved                                                                                               |                            |

2

3

RESERVED - Reserved bits.

4

The base station shall set this field to '000000'.

1    3.7.5.6 Message Waiting

2    This information record conveys to the user the number of messages waiting.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| MSG_COUNT           | 8             |

4

5    MSG\_COUNT    -    Number of waiting messages.

6                      The base station shall set this field to the number of messages  
7                      waiting.

## 1    3.7.5.7 Service Configuration

2    For the mobile station, this record is included in a *Status Response Message* to return the  
 3    current service configuration, and in a *Service Request Message* and a *Service Response*  
 4    *Message* to propose a service configuration.

5    For a base station, this record is included in a *Service Request Message* and a *Service*  
 6    *Response Message* to propose a service configuration. It is included in a *Service Connect*  
 7    *Message* to specify an actual service configuration to be used. It can be included in a  
 8    *General Handoff Direction Message* and *Universal Handoff Direction Message* to specify an  
 9    actual service configuration to be used.

10

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| FOR_MUX_OPTION      | 16            |
| REV_MUX_OPTION      | 16            |
| FOR_NUM_BITS        | 8             |
| REV_NUM_BITS        | 8             |
| NUM_CON_REC         | 8             |

NUM\_CON\_REC occurrences of the following variable-length record:

|                 |                         |
|-----------------|-------------------------|
| RECORD_LEN      | 8                       |
| CON_REF         | 8                       |
| SERVICE_OPTION  | 16                      |
| FOR_TRAFFIC     | 4                       |
| REV_TRAFFIC     | 4                       |
| UI_ENCRYPT_MODE | 3                       |
| SR_ID           | 3                       |
| RLP_INFO_INCL   | 1                       |
| RLP_BLOB_LEN    | 0 or 4                  |
| RLP_BLOB        | 0 or (8 × RLP_BLOB_LEN) |
| QOS_PARMS_INCL  | 1                       |
| QOS_PARMS_LEN   | 0 or 5                  |
| QOS_PARMS       | 0 or variable           |
| QOS_RESERVED    | 0-7                     |
| RESERVED        | 0-7 (as needed)         |

|                |        |
|----------------|--------|
| FCH_CC_INCL    | 1      |
| FCH_FRAME_SIZE | 0 or 1 |
| FOR_FCH_RC     | 0 or 5 |
| REV_FCH_RC     | 0 or 5 |

|                 |        |
|-----------------|--------|
| DCCH_CC_INCL    | 1      |
| DCCH_FRAME_SIZE | 0 or 2 |
| FOR_DCCH_RC     | 0 or 5 |
| REV_DCCH_RC     | 0 or 5 |

(continues on next page)

1

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| FOR_SCH_CC_INCL     | 1             |
| NUM_FOR_SCH         | 0 or 2        |

NUM\_FOR\_SCH occurrences of the following three-field record

|                            |                          |
|----------------------------|--------------------------|
| FOR_SCH_ID                 | 2                        |
| FOR_SCH_MUX                | 16                       |
| SCH_CC_Type-specific field | Variable (see 3.7.5.7.1) |

|                 |        |
|-----------------|--------|
| REV_SCH_CC_INCL | 1      |
| NUM_REV_SCH     | 0 or 2 |

NUM\_REV\_SCH occurrences of the following three-field record

|                            |                          |
|----------------------------|--------------------------|
| REV_SCH_ID                 | 2                        |
| REV_SCH_MUX                | 16                       |
| SCH_CC_Type-specific field | Variable (see 3.7.5.7.1) |

|          |                 |
|----------|-----------------|
| RESERVED | 0-7 (as needed) |
|----------|-----------------|

2

- 3 FOR\_MUX\_OPTION - Forward Fundamental and Dedicated Control Channel  
4 multiplex option.

5 The mobile station shall set this field as follows:

6 For a *Status Response Message*, the mobile station shall  
7 set this field to the number of the multiplex option for the  
8 Forward Fundamental Channel, Forward Dedicated  
9 Control Channel, or both, if both present (e.g., 1  
10 corresponds to Multiplex Option 1).

11 For a *Service Request Message* and a *Service Response*  
12 *Message*, the mobile station shall set this field to the  
13 number of the multiplex option for the Forward  
14 Fundamental Channel, Forward Dedicated Control  
15 Channel, or both, if both present.

16 The base station shall set this field as follows:

1                   For a *Service Request Message* and a *Service Response  
Message*, the base station shall set this field to the  
2                   number of the multiplex option for the Forward  
3                   Fundamental Channel, Forward Dedicated Control  
4                   Channel, or both, if both present.  
5

6                   For a *Service Connect Message*, *General Handoff Direction  
Message*, and a *Universal Handoff Direction Message*, the  
7                   base station shall set this field to the number of multiplex  
8                   option for the Forward Fundamental Channel, Forward  
9                   Dedicated Control Channel, or both, if both present.  
10

- 11           REV\_MUX\_OPTION     - Reverse Fundamental and Dedicated Control Channel  
12                                multiplex option.

13                   The mobile station shall set this field as follows:

14                   For a *Status Response Message*, the mobile station shall  
15                   set this field to the number of the multiplex option for the  
16                   Reverse Fundamental Channel, Reverse Dedicated Control  
17                   Channel, or both, if both present(e.g., 1 corresponds to  
18                   Multiplex Option 1).

19                   For a *Service Request Message* and a *Service Response  
Message*, the mobile station shall set this field to the  
20                   number of the multiplex option for the Reverse  
21                   Fundamental Channel, Reverse Dedicated Control  
22                   Channel, or both, if both present.  
23

24                   The base station shall set this field as follows:

25                   For a *Service Request Message* and a *Service Response  
Message*, the base station shall set this field to the  
26                   number of the multiplex option for the Reverse  
27                   Fundamental Channel, Reverse Dedicated Control  
28                   Channel, or both, if both present.  
29

30                   For a *Service Connect Message*, *General Handoff Direction  
Message*, and a *Universal Handoff Direction Message*, the  
31                   base station shall set this field to the number of the  
32                   multiplex option for the Reverse Fundamental Channel,  
33                   Reverse Dedicated Control Channel, or both, if both  
34                   present.  
35

- 36           FOR\_NUM\_BITS     - Set of number of bits per frame of the Forward Fundamental  
37                                Channel.

38                   The mobile station shall set this field as follows:

39                   The mobile station shall use the Forward Fundamental  
40                   Channel transmission set of number of bits per frame  
41                   specified in 2.7.4.28 for the specified Forward Traffic  
42                   Channel multiplex option.

1                   For a *Status Response Message*, the mobile station shall  
 2                   set the subfields corresponding to the Forward Traffic  
 3                   Channel transmission set of number of bits per frame of  
 4                   the current service configuration to '1', and shall set the  
 5                   remaining subfields to '0'. If FOR\_MUX\_OPTION is equal  
 6                   to 1 or 2, the mobile station shall set RESERVED to  
 7                   '0000'.

8                   For a *Service Request Message* and a *Service Response*  
 9                   *Message*, the mobile station shall set the subfields  
 10                  corresponding to the Forward Traffic Channel  
 11                  transmission set of number of bits per frame of the  
 12                  proposed service configuration to '1', and shall set the  
 13                  remaining subfields to '0'. If FOR\_MUX\_OPTION is equal  
 14                  to 1 or 2, the mobile station shall set RESERVED to  
 15                  '0000'.

16                  The base station shall set this field as follows:

17                  The base station shall set this field to the Forward  
 18                  Fundamental Channel transmission set of number of bits  
 19                  per frame specified in 2.7.4.28 for the specified Forward  
 20                  Traffic Channel multiplex option.

21                  For a *Service Request Message* or a *Service Response*  
 22                  *Message*, the base station shall set the subfields  
 23                  corresponding to the Forward Fundamental Channel  
 24                  transmission set of number of bits per frame of the  
 25                  proposed service configuration to '1', and shall set the  
 26                  remaining subfields to '0'. If FOR\_MUX\_OPTION is equal  
 27                  to 1 or 2, the base station shall set RESERVED to '0000'.

28                  For a *Service Connect Message*, *General Handoff Direction*  
 29                  *Message*, and a *Universal Handoff Direction Message*, the  
 30                  base station shall set the subfields corresponding to the  
 31                  Forward Fundamental Channel transmission set of  
 32                  number of bits per frame of the actual service  
 33                  configuration to be used to '1', and shall set the remaining  
 34                  subfields to '0'. If FOR\_MUX\_OPTION is equal to 1 or 2,  
 35                  the base station shall set RESERVED to '0000'.

- 36                  REV\_NUM\_BITS - Set of number of bits per frame of the Reverse Fundamental  
 37                  Channel.

38                  The mobile station shall set this field as follows:

39                  The mobile station shall use the Reverse Fundamental  
 40                  Channel transmission set of number of bits per frame  
 41                  specified in 2.7.4.28 for the specified Reverse Traffic  
 42                  Channel multiplex option.

1           For a *Status Response Message*, the mobile station shall  
 2           set the subfields corresponding to the Reverse Traffic  
 3           Channel transmission set of number of bits per frame of  
 4           the current service configuration to '1', and shall set the  
 5           remaining subfields to '0'. If REV\_MUX\_OPTION is equal  
 6           to 1 or 2, the mobile station shall set RESERVED to  
 7           '0000'.

8           For a *Service Request Message* and a *Service Response*  
 9           *Message*, the mobile station shall set the subfields  
 10          corresponding to the Reverse Traffic Channel transmission  
 11          set of number of bits per frame of the proposed service  
 12          configuration to '1', and shall set the remaining subfields  
 13          to '0'. If REV\_MUX\_OPTION is equal to 1 or 2, the mobile  
 14          station shall set RESERVED to '0000'.

15          The base station shall set this field as follows:

16          The base station shall set this field to the Reverse  
 17          Fundamental Channel transmission set of number of bits  
 18          per frame specified in 2.7.4.28 for the specified Reverse  
 19          Traffic Channel multiplex option.

20          For a *Service Request Message* or a *Service Response*  
 21          *Message*, the base station shall set the subfields  
 22          corresponding to the Reverse Fundamental Channel  
 23          transmission set of number of bits per frame of the  
 24          proposed service configuration to '1', and shall set the  
 25          remaining subfields to '0'. If REV\_MUX\_OPTION is equal  
 26          to 1 or 2, the base station shall set RESERVED to '0000'.

27          For a *Service Connect Message*, *General Handoff Direction*  
 28          *Message*, and a *Universal Handoff Direction Message*, the  
 29          base station shall set the subfields corresponding to the  
 30          Reverse Fundamental Channel transmission set of  
 31          number of bits per frame of the actual service  
 32          configuration to be used to '1', and shall set the remaining  
 33          subfields to '0'. If REV\_MUX\_OPTION is equal to 1 or 2,  
 34          the base station shall set RESERVED to '0000'.

35          NUM\_CON\_REC      - Number of service option connection records.

36          The mobile station shall set this field as follows:

37          The mobile station shall set this field to the number of  
 38          service option connection records included in the message.

39          The base station shall set this field as follows:

40          The base station shall set this field to the number of  
 41          service option connection records included in the message.

42          For a *Status Response Message*, the mobile station shall include one occurrence of the  
 43          following variable-length record for each service option connection of the current service  
 44          configuration. For a *Service Request Message* and a *Service Response Message*, the mobile

1 station shall include one occurrence of the following variable-length record for each service  
 2 option connection of the proposed service configuration.

3 For a *Service Request Message* or a *Service Response Message*, the base station shall  
 4 include one occurrence of the following variable-length record for each service option  
 5 connection of the proposed service configuration.

6 For a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff*  
 7 *Direction Message*, the base station shall include one occurrence of the following variable-  
 8 length record for each service option connection of the actual service configuration to be  
 9 used.

10 RECORD\_LEN - Service option connection record length.

11 The mobile station shall set this field as follows:

12 The mobile station shall set this field to the number of  
 13 octets included in this service option connection record  
 14 including this field.

15 The base station shall set this field as follows:

16 The base station shall set this field to the number of octets  
 17 included in this service option connection record including  
 18 this field.

19 CON\_REF - Service option connection reference.

20 The mobile station shall set this field as follows:

21 For a *Status Response Message*, the mobile station shall  
 22 set this field to the service option connection reference.

23 For a *Service Request Message* and a *Service Response*  
 24 *Message*, if the service option connection is part of the  
 25 current service configuration, the mobile station shall set  
 26 this field to the service option connection reference; otherwise,  
 27 the mobile station shall set this field to  
 28 '00000000'.

29 The base station shall set this field as follows:

30 For a *Service Request Message* or a *Service Response*  
 31 *Message*: if the service option connection is part of the  
 32 current service configuration, the base station shall set  
 33 this field to the service option connection reference; otherwise,  
 34 the base station shall set this field to  
 35 '00000000'.

1                   For a *Service Connect Message*, *General Handoff Direction*  
 2                   *Message*, and a *Universal Handoff Direction Message*, the  
 3                   base station shall set this field to the service option  
 4                   connection reference assigned to the service option  
 5                   connection.

6       SERVICE\_OPTION - Service option.

7                   The mobile station shall set this field as follows:

8                   For a *Status Response Message*, the mobile station shall  
 9                   set this field to the service option in use with the service  
 10                  option connection.

11                  For a *Service Request Message* and a *Service Response*  
 12                  *Message*, the mobile station shall set this field to the  
 13                  service option to be used with the service option  
 14                  connection.

15                  The base station shall set this field as follows:

16                  The base station shall set this field to the service option to  
 17                  be used with the service option connection.

18       FOR\_TRAFFIC - Forward Traffic Channel traffic type.

19                  The mobile station shall set this field as follows:

20                  For a *Status Response Message*, the mobile station shall  
 21                  set this field to the FOR\_TRAFFIC code shown in  
 22                  Table 3.7.5.7-1 corresponding to the Forward Traffic  
 23                  Channel traffic type in use with the service option  
 24                  connection.

25                  For a *Service Request Message* and a *Service Response*  
 26                  *Message*, the mobile station shall set this field to the  
 27                  FOR\_TRAFFIC code shown in Table 3.7.5.7-1  
 28                  corresponding to the Forward Traffic Channel traffic type  
 29                  to be used with the service option connection.

30                  The base station shall set this field as follows:

31                  The base station shall set this field to the FOR\_TRAFFIC  
 32                  code shown in Table 3.7.5.7-1 corresponding to the  
 33                  Forward Traffic Channel traffic type to be used with the  
 34                  service option connection.

1

**Table 3.7.5.7-1. FOR\_TRAFFIC Codes**

| <b>FOR_TRAFFIC<br/>(binary)</b>           | <b>Description</b>                                                                   |
|-------------------------------------------|--------------------------------------------------------------------------------------|
| 0000                                      | The service option connection does not use Forward Traffic Channel traffic.          |
| 0001                                      | The service option connection uses primary traffic on the Forward Traffic Channel.   |
| 0010                                      | The service option connection uses secondary traffic on the Forward Traffic Channel. |
| All other FOR_TRAFFIC codes are reserved. |                                                                                      |

2

3 REV\_TRAFFIC - Reverse Traffic Channel traffic type.

4 The mobile station shall set this field as follows:

5 For a *Status Response Message*, the mobile station shall  
6 set this field to the REV\_TRAFFIC code shown in  
7 Table 3.7.5.7-2 corresponding to the Reverse Traffic  
8 Channel traffic type in use with the service option  
9 connection.10 For a *Service Request Message* and a *Service Response*  
11 *Message*, the mobile station shall set this field to the  
12 REV\_TRAFFIC code shown in Table 3.7.5.7-2  
13 corresponding to the Reverse Traffic Channel traffic type  
14 to be used with the service option connection.

15 The base station shall set this field as follows:

16 The base station shall set this field to the REV\_TRAFFIC  
17 code shown in Table 3.7.5.7-2 corresponding to the  
18 Reverse Traffic Channel traffic type to be used with the  
19 service option connection.  
20

**Table 3.7.5.7-2. REV\_TRAFFIC Codes**

| <b>REV_TRAFFIC<br/>(binary)</b>           | <b>Description</b>                                                                   |
|-------------------------------------------|--------------------------------------------------------------------------------------|
| 0000                                      | The service option connection does not use Reverse Traffic Channel traffic.          |
| 0001                                      | The service option connection uses primary traffic on the Reverse Traffic Channel.   |
| 0010                                      | The service option connection uses secondary traffic on the Reverse Traffic Channel. |
| All other REV_TRAFFIC codes are reserved. |                                                                                      |

- UI\_ENCRYPT\_MODE - Encryption mode indicator for user information privacy.

The mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to indicate the current user information encryption mode as shown in Table 3.7.5.7-3.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to indicate the proposed user information encryption mode as shown in Table 3.7.5.7-3.

The base station shall set this field as follows:

For a *Service Request Message* or a *Service Response Message*: the base station shall set this field to the proposed user information encryption mode, as shown in Table 3.7.5.7-3.

For a *Service Connect Message*, *General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the assigned user information encryption mode, as shown in Table 3.7.5.7-3.

**Table 3.7.5.7-3. User information Encryption Modes**

| <b>UI_ENCRYPT_MODE<br/>Field<br/>(binary)</b> | <b>Encryption Mode Used</b>                                                                                                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000                                           | User information Encryption disabled                                                                                                                                                                                            |
| 001                                           | User information Encryption with ORYX <a href="#">encryption</a> algorithm enabled (not applicable to voice service option). <a href="#">Encryption procedures specified in the service option standard shall be performed.</a> |
| <a href="#">010</a>                           | <a href="#">User information Encryption using the Rijndael encryption algorithm. Encryption procedures defined in 2.3.12.4.2.1 shall be performed.</a>                                                                          |
| <a href="#">010011</a> - 111                  | Reserved                                                                                                                                                                                                                        |

2 SR\_ID – Service reference identifier.

3 The mobile station shall set this field as follows:

4 For a *Status Response Message*, the mobile station shall  
 5 set this field to the service reference identifier in use.

6 For a *Service Request Message* and a *Service Response*  
 7 *Message*, the mobile station shall set this field as follows:

8 If the service option connection is a part of the current  
 9 service configuration, the mobile station shall set this field  
 10 to the service reference identifier in use.

11 If the service option connection is not a part of the current  
 12 service configuration, the mobile station shall perform the  
 13 following:

- 14 – If this service option connection request is initiated by  
 15 the base station, the mobile station shall set this field  
 16 to the value sent by the base station.

- 1           – If this service option connection request is initiated by  
 2           the mobile station, the mobile station shall perform the  
 3           following: if the service instance provides a service  
 4           reference identifier, the mobile station shall set this  
 5           field to the service reference identifier specified by the  
 6           service instance; otherwise, the mobile station shall set  
 7           this field to the smallest unused service reference  
 8           identifier number value between 1-and 6 inclusive.

9           The base station shall set this field as follows:

10           For a *Service Request Message*, or a *Service Response*  
 11           *Message*, a Service Connect Message, a General Handoff  
 12           Direction Message, or a Universal Handoff Direction  
 13           Message, the base station shall set this field as follows:

14           If the service option connection is a part of the current  
 15           service configuration, the base station shall set this field  
 16           to the service reference identifier in use.

17           If the service option connection is not a part of the current  
 18           service configuration, the base station shall perform the  
 19           following:

- 20           – If this service option connection request is initiated by  
 21           the mobile station, the base station shall set this field  
 22           to the value sent by the mobile station.  
 23           – If this service option connection request is initiated by  
 24           the base station, the base station shall perform the  
 25           following: if the service instance provides a service  
 26           reference identifier, the base station shall set this field  
 27           to the service reference identifier specified by the  
 28           service instance; otherwise, the base station shall set  
 29           this field to the highest unused service reference  
 30           identifier number value between 1-and 6 inclusive.

31           For a Service Connect Message, General Handoff Direction  
 32           Message, and a Universal Handoff Direction Message, the  
 33           base station shall set this field to the service reference  
 34           identifier to be used for the service instance corresponding  
 35           to this record.

36           RLP\_INFO\_INCL   – RLP information included indicator.

37           The mobile station shall set this field as follows:

38           The mobile station shall set this field to '1' if the  
 39           RLP\_BLOB field is included in this record; otherwise, it  
 40           shall set this field to '0'.

41           The base station shall set this field as follows:

The base station shall set this field to '1' if the RLP\_BLOB field is included in this record; otherwise, it shall set this field to '0'.

- RLP\_BLOB\_LEN** - RLP information block of bits length.

The mobile station shall set this field as follows:

If the RLP\_INFO\_INCL field is set to '0', the mobile station shall omit this field; otherwise, it shall include this field and set it as follows:

The mobile station shall set this field to the size of the RLP\_BLOB field in integer number of octets.

The base station shall set this field as follows:

If the RLP\_INFO\_INCL field is set to '0', the base station shall omit this field; otherwise, it shall include this field and set it as follows:

The base station shall set this field to the size of the RLP BLOB field in integer number of octets.

- RLP\_BLOB** - Radio Link Protocol block of bits.

The mobile station shall set this field as follows:

If the RLP\_INFO\_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

For a *Status Response Message*, the mobile station shall set this field to the Radio Link Protocol block of bits for this service option connection.

For a *Service Request Message* or *Service Response Message*, the mobile station shall set this field to the proposed Radio Link Protocol block of bits for this service option connection, and shall add '0' bits to the end of the field as needed in order to make the length of this field equal to an integer number of octets.

The base station shall set this field as follows:

If the RLP\_INFO\_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the Radio Link Protocol block of bits for this service option connection, and shall add '0' bits to the end of the field as needed in order to make the length of this field equal to an integer number of octets.

- QOS\_PARMS\_INCL** - Presence indicator for the QoS parameters.

The mobile station shall set this field as follows:

The mobile station shall set this field to '1', if QOS\_PARMS field is included in the record; otherwise the base station shall set this field to '0'.

The base station shall set this field as follows:

The base station shall set this field to '1', if QOS\_PARMS field is included in the record; otherwise, the base station shall set this field to '0'.

- QOS\_PARMS\_LEN** - Length of the block of QoS parameters.

The mobile station shall set this field as follows:

If QOS\_PARMS\_INCL is set to '1', the mobile station shall set this field to the combined length in octets, of the QOS\_PARMS field and the immediately following QOS\_RESERVED field; otherwise, the mobile station shall omit this field.

The base station shall set this field as follows:

If QOS\_PARMS\_INCL is set to ‘1’, the base station shall set this field to the combined length in octets, of the QOS\_PARMS field and the immediately following QOS\_RESERVED field; otherwise, the base station shall omit this field.

- QOS PARMs** - QoS parameters block.

The mobile station shall set this field as follows:

If QOS\_PARMS\_INCL is set to '1', the mobile station shall include this field in the record [as follows](#):

For a *Status Response Message*, the mobile station shall set this field to the set of QoS parameters configured for this service option connection.

For a Service Request Message or Service Response Message, the mobile station shall set this field and set it to the set of QoS parameters requested for the respective connection.

1                   The base station shall set this field as follows:

2                   If QOS\_PARMS\_INCL is set to ‘1’, the base station shall  
3                   include this field in the record and set it to the set of QoS  
4                   parameters requested or required for the respective  
5                   connection.

- 6           QOS\_RESERVED - Padding bits.

7                   The mobile station shall set this field as follows:

8                   If QOS\_PARMS\_INCL is set to ‘1’, the mobile station shall  
9                   include the minimum number of ‘0’ bits necessary to  
10                  ensure that the combined length of the QOS\_PARMS field  
11                  and of this field is an integer number of octets; otherwise,  
12                  the mobile station shall omit this field.

13                  The base station shall set this field as follows:

14                  If QOS\_PARMS\_INCL is set to ‘1’, the base station shall  
15                  include the minimum number of ‘0’ bits necessary to  
16                  ensure that the combined length of the QOS\_PARMS field  
17                  and of this field is an integer number of octets; otherwise,  
18                  the base station shall omit this field.

- 19           RESERVED - Reserved bits.

20                  The mobile station shall set this field as follows:

21                  The mobile station shall add reserved bits as needed in  
22                  order to make the length of the entire record equal to an  
23                  integer number of octets. The mobile station shall set  
24                  these bits to ‘0’.

25                  The base station shall set this field as follows:

26                  The base station shall add reserved bits as needed in order  
27                  to make the length of this record equal to an integer  
28                  number of octets. The base station shall set these bits to  
29                  ‘0’.

- 30           FCH\_CC\_INCL - Channel configuration for the Fundamental Channel included  
31                  indicator.

32                  The mobile station shall set this field as follows:

33                  The mobile station shall set this field to ‘1’, if Fundamental  
34                  Channel Configuration information is included in the  
35                  record; otherwise, the mobile station shall set this field to  
36                  ‘0’.

1           The base station shall set this field as follows:

2           The base station shall set this field to '1', if the channel  
3           configuration information for the Fundamental Channel is  
4           included in this Service Configuration Record; otherwise,  
5           the base station shall set this field to '0'.

- 6       FCH\_FRAME\_SIZE - Fundamental Channel frame size supported indicator.

7           The mobile station shall set this field as follows:

8           If FCH\_CC\_INCL field is set to '1', the mobile station shall  
9           include this field and set it as described below; otherwise,  
10          the mobile station shall omit this field.

11          For a *Status Response Message*, the mobile station shall  
12          set this field to '1', if the 5ms frame size is used in the  
13          Forward and Reverse Fundamental Channel, in addition to  
14          20ms frame, for the current service configuration;  
15          otherwise, the mobile station shall set this field to '0'.

16          For a *Service Request Message* or a *Service Response*  
17          *Message*, the mobile station shall set this field to '1' to  
18          propose that the 5 ms frame size in addition to the 20 ms  
19          frame size is used for the proposed service configuration;  
20          otherwise the mobile station shall set this field to '0'

21           The base station shall set this field as follows:

22          If the FCH\_CC\_INCL field is set to '0', the base station  
23          shall omit this field; otherwise, the base station shall  
24          include this field and set it as follows:

25          The base station shall set this field to '1' if the service  
26          configuration includes the use of 5 ms frame size in  
27          addition to 20ms frame size for the Forward and Reverse  
28          Fundamental Channel; otherwise, the base station shall  
29          set this field to '0'.

- 30       FOR\_FCH\_RC - Forward Fundamental Channel Radio Configuration.

31           The mobile station shall set this field as follows:

32          If FCH\_CC\_INCL field is set to '1', the mobile station shall  
33          include this field and set it as described below; otherwise,  
34          the mobile station shall omit this field.

35          For a *Status Response Message*, the mobile station shall  
36          set this field to the Forward Fundamental Channel Radio  
37          Configuration for the current service configuration.

38          For a *Service Request Message* or *Service Response*  
39          *Message*, the mobile station shall set this field to the  
40          Forward Fundamental Channel Radio Configuration for  
41          the proposed service configuration.

42          (see [2] Table 3.1.3.1-1)

1                   The base station shall set this field as follows:

2                   If the FCH\_CC\_INCL field is set to '0', the base station  
3                   shall omit this field; otherwise, the base station shall  
4                   include this field and set it as follows:

5                   For a *Service Request Message* or a *Service Response*  
6                   *Message*, the base station shall set this field to the  
7                   Forward Fundamental Channel Radio Configuration (see  
8                   Table 3.1.3.1-1 of [2]) in the proposed service  
9                   configuration.

10                  For a *Service Connect Message*, a *General Handoff*  
11                  *Direction Message*, or a *Universal Handoff Direction*  
12                  *Message*, the base station shall set this field to the actual  
13                  Forward Fundamental Channel Radio Configuration to be  
14                  used.

- 15                  REV\_FCH\_RC - Reverse Fundamental Channel Radio Configuration.

16                  The mobile station shall set this field as follows:

17                  If FCH\_CC\_INCL field is set to '1', the mobile station shall  
18                  include this field and set it as described below; otherwise,  
19                  the mobile station shall omit this field.

20                  For a *Status Response Message*, the mobile station shall  
21                  set field to the Reverse Fundamental Channel Radio  
22                  Configuration for the current service configuration.

23                  For a *Service Request Message* or a *Service Response*  
24                  *Message*, the mobile station shall set this field to the  
25                  Reverse Fundamental Channel Radio Configuration for the  
26                  proposed service configuration.

27                  (see [2] Table 2.1.3.1-1)

28                  The base station shall set this field as follows:

29                  If the FCH\_CC\_INCL field is set to '0', the base station  
30                  shall omit this field; otherwise, the base station shall  
31                  include this field and set it as follows:

32                  For a *Service Request Message* or a *Service Response*  
33                  *Message*, the base station shall set this field to the  
34                  Reverse Fundamental Channel Radio Configuration (see  
35                  Table 2.1.3.1-1 of [2]) in the proposed service  
36                  configuration.

37                  For a *Service Connect Message*, a *General Handoff*  
38                  *Direction Message*, or a *Universal Handoff Direction*  
39                  *Message*, the base station shall set this field to the actual  
40                  Reverse Fundamental Channel Radio Configuration to be  
41                  used.

- 42                  DCCH\_CC\_INCL - Channel configuration for the Dedicated Control Channel  
43                  included indicator.

1           The mobile station shall set this field as follows:

2           The mobile station shall set this field to ‘1’, if DCCH  
3           channel configuration information is included in this  
4           record; otherwise, the mobile station shall set this field to  
5           ‘0’.

6           The base station shall set this field as follows:

7           The base station shall set this field to ‘1’, if channel  
8           configuration information for the Dedicated Control  
9           Channel is included in this Service Configuration Record;  
10          otherwise, the base station shall set this field to ‘0’.

11         DCCH\_FRAME\_SIZE - Dedicated Control Channel frame size.

12          The mobile station shall set this field as follows:

13          If DCCH\_CC\_INCL field is set to ‘1’, the mobile station  
14          shall include this field and set it as described below;  
15          otherwise, the mobile station shall omit this field.

16          For a *Status Response Message*, the mobile station shall  
17          set this field to the frame size, as defined in Table 3.7.5.7-  
18          4, for the current service configuration.

19          For a *Service Request Message* or a *Service Response*  
20          *Message*, the mobile station shall set this field to the  
21          frame size, as defined in Table 3.7.5.7-4, for the proposed  
22          service configuration.

23          The base station shall set this field as follows:

24          If the DCCH\_CC\_INCL field is set to ‘0’, the base station  
25          shall omit this field; otherwise, the base station shall  
26          include this field and set it according to the Table 3.7.5.7-  
27          4 as follows:

28          For a *Service Connect Message*, a *General Handoff*  
29          *Direction Message*, or a *Universal Handoff Direction*  
30          *Message*, the base station shall set this field to the actual  
31          Dedicated Control Channel frame size(s) to be used in the  
32          service configuration.

33          For a *Service Request Message* or a *Service Response*  
34          *Message*, the base station shall set this field to the  
35          Dedicated Control Channel frame size for the proposed  
36          service configuration message.

**Table 3.7.5.7-4. DCCH Frame Size**

| <b>DCCH_FRAME_SIZE<br/>(binary)</b> | <b>Description</b>              |
|-------------------------------------|---------------------------------|
| 00                                  | Reserved                        |
| 01                                  | 20 ms frame size only           |
| 10                                  | 5 ms frame size only            |
| 11                                  | Both 5 ms and 20 ms frame sizes |

FOR\_DCCH\_RC - Forward Dedicated Control Channel Radio Configuration.

The mobile station shall set this field as follows:

If DCCH\_CC\_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a *Status Response Message*, the mobile station shall set this field to the Forward Dedicated Control Channel Radio Configuration for the current service configuration.

For a *Service Request Message* or a *Service Response Message*, the mobile station shall set this field to the forward Dedicated Control Channel Radio Configuration (see [2] Table 3.1.3.1-1) for the proposed service configuration.

The base station shall set this field as follows:

If the DCCH\_CC\_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*, the base station shall set this field to the actual Forward Dedicated Control Channel Radio Configuration to be used (see Table 3.1.3.1-1 of [2]).

For a *Service Request Message* or a *Service Response Message*, the base station shall set this field to the Forward Dedicated Control Channel Radio Configuration for the proposed service configuration.

REV\_DCCH\_RC - Reverse Dedicated Control Channel Radio Configuration.

The mobile station shall set this field as follows:

If DCCH\_CC\_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

1           For a *Status Response Message*, the mobile station shall  
 2           set this field to the Reverse Dedicated Control Channel  
 3           Radio Configuration (see Table 2.1.3.1-1 of [2]) for the  
 4           current service configuration.

5           For a *Service Request Message* or a *Service Response*  
 6           *Message*, the mobile station shall set this field to the  
 7           Reverse Dedicated Control Channel Radio Configuration  
 8           for the proposed service configuration.

9           The base station shall set this field as follows:

10          If the DCCH\_CC\_INCL field is set to ‘0’, the base station  
  11          shall omit this field; otherwise, the base station shall  
  12          include this field and set it as follows:

13          For a *Service Connect Message*, a *General Handoff*  
  14          *Direction Message*, or a *Universal Handoff Direction*  
  15          *Message*, the base station shall set this field to the actual  
  16          Reverse Dedicated Control Channel Radio Configuration to  
  17          be used (see Table 2.1.3.1-1 of [2]).

18          For a *Service Request Message* or a *Service Response*  
  19          *Message*, the base station shall set this field to the reverse  
  20          Dedicated Control Channel Radio Configuration for the  
  21          proposed service configuration.

22          FOR\_SCH-

23            \_CC\_INCL - Channel configuration for the Forward Supplemental Channel  
 24            included indicator.

25           The mobile station shall set this field as follows:

26          The mobile station shall set this field to ‘1’, if the Forward  
  27          Supplemental Channel Configuration information is  
  28          included; otherwise, the mobile station shall set this field  
  29          to ‘0’.

30           The base station shall set this field as follows:

31          The base station shall set this field to ‘1’, if the channel  
  32          configuration information for the forward Supplemental  
  33          Channel is included in this Service Configuration Record;  
  34          otherwise, the base station shall set this field to ‘0’.

35          NUM\_FOR\_SCH

35           - Number of Forward Supplemental Channels.

36           The mobile station shall set this field as follows:

37          If FOR\_SCH\_CC\_INCL field is set to ‘1’, the mobile station  
  38          shall include this field and set it as describe below;  
  39          otherwise, the mobile station shall omit this field.

1                   For a *Status Response Message*, the mobile station shall  
 2                   set this field to the number of Forward Supplemental  
 3                   Channels for the current service configuration and include  
 4                   one occurrence of the following three-field SCH record for  
 5                   each Supplemental Channel Configuration.

6                   For a *Service Request Message* or a *Service Response*  
 7                   *Message*, the mobile station shall set this field to the  
 8                   number of Forward Supplemental Channels for the  
 9                   proposed service configuration and include one occurrence  
 10                  of the following three-field SCH record for each  
 11                  Supplemental Channel Configuration.

12                  The base station shall set this field as follows:

13                  If the FOR\_SCH\_CC\_INCL field is set to '0', the base  
 14                  station shall omit this field; otherwise, the base station  
 15                  shall set this field to the number of Forward Supplemental  
 16                  Channels associated with this service configuration.

17                  If the NUM\_FOR\_SCH field is present and is set to any value other than '00', the base  
 18                  station shall include one occurrence of the following three-field record for each Forward  
 19                  Supplemental Channel included in this record:

20                  FOR\_SCH\_ID - Forward Supplemental Channel Identification

21                  The mobile station shall set this field as follows:

22                  The mobile station shall set this field to the identification  
 23                  of the Supplemental Channel included in this Forward  
 24                  Supplemental Channel Configuration record.

25                  The mobile station shall set this field to the Supplemental  
 26                  Channel identifier, shown in Table 3.7.5.7-5.

27                  **Table 3.7.5.7-5. SCH Identifier**

| <b>FOR_SCH_ID</b><br><b>REV_SCH_ID</b><br><b>(binary)</b> | <b>Description</b>     |
|-----------------------------------------------------------|------------------------|
| 00                                                        | Supplemental Channel 0 |
| 01                                                        | Supplemental Channel 1 |
| 10-11                                                     | Reserved               |

28                  The base station shall set this field as follows:

29                  The base station shall set this field to the identifier of the  
 30                  Forward Supplemental Channel pertaining to this record.

31                  The base station shall set this field to the Supplemental  
 32                  Channel identifier, shown in Table 3.7.5.7-5.

34                  FOR\_SCH\_MUX - Forward Supplemental Channel Multiplex Option.

1           The mobile station shall set this field as follows:

2           The mobile station shall set this field to the Multiplex  
 3           Option associated with the maximum data rate for this  
 4           Forward SCH-Supplemental Channel (see [3]).

5           The base station shall set this field as follows:

6           The base station shall set this field to the Multiplex Option  
 7           associated with the maximum data rate for this Forward  
 8           Supplemental Channel (see [3]).

9           SCH\_CC-

10          \_Type-specific field - Supplemental Channel Configuration Information.

11           The mobile station shall set this field as follows:

12           The mobile station shall set this field to the subfields of  
 13           the Channel Configuration record defined in 3.7.5.7.1, for  
 14           this Forward Supplemental Channel included in the  
 15           service configuration.

16           The base station shall set this field as follows:

17           The base station shall set this field as defined in 3.7.5.7.1  
 18           for this Forward Supplemental Channel.

19          REV\_SCH\_CC\_INCL

20          - Channel configuration for the Reverse Supplemental Channel  
               included indicator.

21           The mobile station shall set this field as follows:

22           The mobile station shall set this field to '1', if the Reverse  
 23           Supplemental Channel Configuration information is  
 24           included; otherwise, the mobile station shall set this field  
 25           to '0'.

26           The base station shall set this field as follows:

27           The base station shall set this field to '1' if the channel  
 28           configuration information for the Reverse Supplemental  
 29           Channel is included in this service configuration record;  
 30           otherwise, the base station shall set this field to '0'.

31          NUM\_REV\_SCH

32          - Number of Reverse Supplemental Channels.

33           The mobile station shall set this field as follows:

34           If REV\_SCH\_CC\_INCL field is set to '1', the mobile station  
 35           shall include this field and set it as described below;  
               otherwise, the mobile station shall omit this field.

1                   For a *Status Response Message*, the mobile station shall  
 2                   set this field to the number of Reverse Supplemental  
 3                   Channels for the current service configuration and include  
 4                   one occurrence of the following three-field record for each  
 5                   reverse Supplemental Channel Configuration.

6                   For a *Service Request Message* or a *Service Response*  
 7                   Message, the mobile station shall set this field to the  
 8                   number of Reverse Supplemental Channels for the  
 9                   proposed service configuration and include one occurrence  
 10                  of the following three-field record for each reverse  
 11                  Supplemental Channel Configuration.

12                  The base station shall set this field as follows:

13                  If the REV\_SCH\_CC\_INCL field is set to '0', the base  
 14                  station shall omit this field; otherwise, the base station  
 15                  shall set this field to the number of Reverse Supplemental  
 16                  Channels associated with this service configuration.

17                  If the NUM\_REV\_SCH field is present and is set to any value other than '00', the base  
 18                  station shall include one occurrence of the following three-field record for each Reverse  
 19                  Supplemental Channel included in this record:

20                  REV\_SCH\_ID - Reverse Supplemental Channel Identification

21                  The mobile station shall set this field as follows:

22                  The mobile station shall set this field to the identifier of  
 23                  the Supplemental Channel included in this Reverse  
 24                  Supplemental Channel Configuration record.

25                  The mobile station shall set this field to the Supplemental  
 26                  Channel identifier, shown in Table 3.7.5.7-5.

27                  The base station shall set this field as follows:

28                  The base station shall set this field to the identifier of the  
 29                  Reverse Supplemental Channel pertaining to this record.

30                  The base station shall set this field to the Supplemental  
 31                  Channel identifier, shown in Table 3.7.5.7-5.

32                  REV\_SCH\_MUX - Reverse Supplemental Channel Multiplex Option

33                  The mobile station shall set this field as follows:

34                  The mobile station shall set this field to the Multiplex  
 35                  Option associated with the maximum data rate for this  
 36                  Reverse SCH (see [3]).

37                  The base station shall set this field as follows:

1                   The base station shall set this field to the Multiplex Option  
2                   associated with the maximum data rate for this Reverse  
3                   Supplemental Channel (see [3]).

4                   **SCH\_CC-**

5                   \_Type-specific field    -    Supplemental Channel Configuration Information.

6                   The mobile station shall set this field as follows:

7                   The mobile station shall set this field to the subfields of  
8                   the Channel Configuration record defined in 3.7.5.7.1, for  
9                   this Reverse Supplemental Channel included in the service  
10                  configuration.

11                  The base station shall set this field as follows:

12                  The base station shall set this field as defined in 3.7.5.7.1  
13                  for this Reverse Supplemental Channel.

14                  **RESERVED**    -    Reserved bits.

15                  The mobile station shall set this field as follows:

16                  The mobile station shall add reserved bits as needed in  
17                  order to make the length of the entire information record  
18                  equal to an integer number of octets. The mobile station  
19                  shall set these bits to '0'.

20                  The base station shall set this field as follows:

21                  The base station shall add reserved bits as needed in order  
22                  to make the length of the entire message equal to an  
23                  integer number of octets. The base station shall set these  
24                  bits to '0'.

## 1    3.7.5.7.1 Channel Configuration for the Supplemental Channel

2    The channel configuration information for the Supplemental Channel consists of the  
 3    following subfields:

4

| <b>Subfields</b> | <b>Length (bits)</b> |
|------------------|----------------------|
| SCH_REC_LEN      | 4                    |
| SCH_RC           | 5                    |
| CODING           | 1                    |
| FRAME_40_USED    | 1                    |
| FRAME_80_USED    | 1                    |
| MAX_RATE         | 4                    |

- 5
- 6    SCH\_REC\_LEN    -    Supplemental Channel channel configuration record length.  
 7    The mobile station or base station shall set this field to the  
 8    number of octets included in this Supplemental Channel  
 9    channel configuration record including this SCH\_REC\_LEN  
 10   field.
- 11   SCH\_RC    -    Supplemental Channel Radio Configuration.  
 12   The mobile station or base station shall set this field to the  
 13   Radio Configuration for this Supplemental Channel. Radio  
 14   Configurations are defined Table 3.1.3.1-1 of [2] for the  
 15   Forward Supplemental Channel and Table 2.1.3.1-1 of [2] for  
 16   the Reverse Supplemental Channel.
- 17   CODING    -    Coding type.  
 18   The mobile station or base station shall set this field to '1' if  
 19   the mobile station or the base station is to use Convolutional  
 20   Coding when the number of channel bits per frame is less  
 21   than 360 and Turbo Coding when the number of channel bits  
 22   per frame is equal to or greater than 360. The mobile station  
 23   or base station shall set this field to '0' if the mobile station or  
 24   the base station uses Convolution Coding for all block sizes.
- 25   FRAME\_40\_USED    -    40ms frame used indicator  
 26   The mobile station or base station shall set this field to '1' if  
 27   40ms frame is used; otherwise, the mobile station or base  
 28   station shall set this field to '0'.  
 29   If a f-dtch logical channel corresponding to the same sr\_id is  
 30   mapped to both forward Supplemental Channels 0 and 1,  
 31   then the mobile station or base station shall specify the same  
 32   frame length for both forward Supplemental Channels 0 and  
 33   1.

1                   If a r-dtch logical channel corresponding to the same sr\_id is  
 2                   mapped to both reverse Supplemental Channels 0 and 1, then  
 3                   the mobile station or base station shall specify the same frame  
 4                   length for both forward Supplemental Channels 0 and 1.

5                   The base station shall not set both FRAME\_40\_USED and  
 6                   FRAME\_80\_USED fields set to '1'.

7  
 8                 **FRAME\_80\_USED**   - 80ms frame used indicator.

9  
 10                  The mobile station or base station shall set this field to '1' if  
 11                  80ms frame is to be used; otherwise, the mobile station or  
 12                  base station shall set this field to '0'.

13                  If a f-dtch logical channel corresponding to the same sr\_id is  
 14                  mapped to both forward Supplemental Channels 0 and 1,  
 15                  then the mobile station or base station shall specify the same  
 16                  frame length for both forward Supplemental Channels 0 and 1.

17                  If a r-dtch logical channel corresponding to the same sr\_id is  
 18                  mapped to both reverse Supplemental Channels 0 and 1, then  
 19                  the mobile station or base station shall specify the same frame  
 20                  length for both reverse Supplemental Channels 0 and 1.

21                  Then the base station shall not set both FRAME\_40\_USED  
 22                  and FRAME\_80\_USED fields set to '1'.

23                 **MAX\_RATE**   - Maximum supplemental channel rate

24                  The mobile station or base station shall set this field according  
 25                  to Table 2.7.4.27.3-2 to indicate the maximum forward or  
 26                  reverse supplemental channel data rate supported.

### 3.7.5.8 Called Party Subaddress

<sup>2</sup> This information record identifies the called party subaddress.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

CHARI 8

- |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXTENSION_BIT      | - The extension bit.<br>The base station shall set this field to '1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SUBADDRESS_TYPE    | - Type of subaddress.<br>The base station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.8.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ODD/EVEN_INDICATOR | - The indicator of odd/even bits.<br>The base station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.8. It is only used when the type of subaddress is "User specified" and the coding is BCD.                                                                                                                                                                                                                                                                                                                     |
| RESERVED           | - Reserved bits.<br>The base station shall set this field to '000'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CHAR1              | - Character.<br>The base station shall include one occurrence of this field for each character in the called party subaddress.<br>When the SUBADDRESS_TYPE field is equal to '000', the NSAP address shall be encoded using the preferred binary encoding specified in <a href="#">CCITT Recommendation X.213 or ISO 8348 AD2 [35]</a> .<br>When the SUBADDRESS_TYPE field is set to '010', user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with <a href="#">CCITT Recommendation X.25[36]</a> networks, BCD coding should be applied. |

### 3.7.5.9 Calling Party Subaddress

This information record identifies the calling party subaddress.

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

CHARi 8

- |  |                    |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--|--------------------|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | EXTENSION_BIT      | - | The extension bit.<br>The base station shall set this field to '1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|  | SUBADDRESS_TYPE    | - | Type of subaddress.<br>The base station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.10.                                                                                                                                                                                                                                                                                                                                                                                                                               |
|  | ODD/EVEN INDICATOR | - | The indicator of odd/even bits.<br>The base station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.10. It is only used when the type of subaddress is "User specified" and the coding is BCD.                                                                                                                                                                                                                                                                                                                     |
|  | RESERVED           | - | Reserved bits.<br>The base station shall set this field to '000'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|  | CHARi              | - | Character.<br>The base station shall include one occurrence of this field for each character in the calling party subaddress.<br>When the SUBADDRESS_TYPE field is equal to '000', the NSAP address shall be encoded using the preferred binary encoding specified in <a href="#">CCITT Recommendation X.213 or ISO 8348 AD2</a> [35].<br>When the SUBADDRESS_TYPE field is set to '010', user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with <a href="#">CCITT Recommendation X.25</a> [36] networks, BCD coding should be applied. |

## 1    3.7.5.10 Connected Subaddress

2    This information record identifies the subaddress of the responding party.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

4

- 5    EXTENSION\_BIT    -    The extension bit.  
                             The base station shall set this field to '1'.
- 6    SUBADDRESS\_TYPE    -    Type of subaddress.  
                             The base station shall set this field to the  
                             SUBADDRESS\_TYPE value shown in Table 2.7.4.19-1  
                             corresponding to the type of the subaddress, as defined in [7],  
                             Section 4.5.14.
- 7    ODD/EVEN\_INDICATOR    -    The indicator of odd/even bits.  
                             The base station shall set this field to the  
                             ODD/EVEN\_INDICATOR value shown in Table 2.7.4.19-2  
                             corresponding to the indicator of even/odd bits, as defined in  
                             [7], Section 4.5.14. It is only used when the type of  
                             subaddress is "User specified" and the coding is BCD.
- 8    RESERVED    -    Reserved bits.  
                             The base station shall set this field to '000'.
- 9    CHARi    -    Character.  
                             The base station shall include one occurrence of this field for  
                             each character in the connected subaddress.  
                             When the SUBADDRESS\_TYPE field is equal to '000', the  
                             NSAP address shall be encoded using the preferred binary  
                             encoding specified in [CCITT Recommendation X.213 or ISO 8348-AD2](#) [35].
- 10   |    CHARi    -    When the SUBADDRESS\_TYPE field is set to '010', user-  
                             specified subaddress field is encoded according to the user  
                             specification, subject to a maximum length of 20 octets.  
                             When interworking with [CCITT Recommendation X.25](#) [36]  
                             networks, BCD coding should be applied.

## 1    3.7.5.11 Redirecting Number

2    This information record identifies the Redirecting Number.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT_1     | 1             |
| NUMBER_TYPE         | 3             |
| NUMBER_PLAN         | 4             |
| EXTENSION_BIT_2     | 0 or 1        |
| PI                  | 0 or 2        |
| RESERVED            | 0 or 3        |
| SI                  | 0 or 2        |
| EXTENSION_BIT_3     | 0 or 1        |
| RESERVED            | 0 or 3        |
| REDIRECTION_REASON  | 0 or 4        |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

4

5    EXTENSION\_BIT\_1    -    The extension bit.

6                         If the PI and SI are included in this record, the base station  
7                         shall set this field to '0'; otherwise, the base station shall set  
8                         this field to '1'.

9    NUMBER\_TYPE    -    Type of number.

10                       The base station shall set this field to the NUMBER\_TYPE  
11                       value shown in Table 2.7.1.3.2.4-2 corresponding to the type  
12                       of the redirecting number, as defined in [ANSI T1.625 §6.1.3.7](#)  
13                       [34].

14    NUMBER\_PLAN    -    Numbering plan.

15                       The base station shall set this field to the NUMBER\_PLAN  
16                       value shown in Table 2.7.1.3.2.4-3 corresponding to the  
17                       numbering plan used for the redirecting number, as defined in  
18                       [ANSI T1.625 §6.1.3.7](#)[34].

19    EXTENSION\_BIT\_2    -    The extension bit.

20                       If the EXTENSION\_BIT\_1 is set to '0' and  
21                       REDIRECTION\_REASON is included in this record, the base  
22                       station shall set this field to '0'. If the EXTENSION\_BIT\_1 is  
23                       set to '0' and REDIRECTION\_REASON is not included in this  
24                       record, the base station shall set this field to '1'. If the  
25                       EXTENSION\_BIT\_1 is set to '1', the base station shall omit  
26                       this field.

|    |                    |   |                                                                              |
|----|--------------------|---|------------------------------------------------------------------------------|
| 1  | PI                 | - | Presentation indicator.                                                      |
| 2  |                    |   | This field indicates whether or not the redirecting number                   |
| 3  |                    |   | should be displayed.                                                         |
| 4  |                    |   | if the EXTENSION_BIT_1 is set to '0', the base station shall set             |
| 5  |                    |   | this field to the PI value shown in Table 2.7.4.4-1                          |
| 6  |                    |   | corresponding to the presentation indicator, as defined in                   |
| 7  |                    |   | <a href="#">ANSI T1.625 §6.1.3.7[34]</a> ; otherwise, the base station shall |
| 8  |                    |   | omit this field.                                                             |
| 9  | RESERVED           | - | Reserved bits.                                                               |
| 10 |                    |   | If the EXTENSION_BIT_1 is set to '0', the base station shall set             |
| 11 |                    |   | this field to '000'; otherwise, the base station shall omit this             |
| 12 |                    |   | field.                                                                       |
| 13 | SI                 | - | Screening indicator.                                                         |
| 14 |                    |   | This field indicates how the redirecting number was screened.                |
| 15 |                    |   | If the EXTENSION_BIT_1 is set to '0', the base station shall set             |
| 16 |                    |   | this field to the SI value shown in Table 2.7.4.4-2                          |
| 17 |                    |   | corresponding to the screening indicator value, as defined in                |
| 18 |                    |   | <a href="#">ANSI T1.625 6.1.3.7[34]</a> ; otherwise, the base station shall  |
| 19 |                    |   | omit this field.                                                             |
| 20 | EXTENSION_BIT_3    | - | The extension bit.                                                           |
| 21 |                    |   | If the EXTENSION_BIT_2 is set to '0', the base station shall set             |
| 22 |                    |   | this field to '1'; otherwise, the base station shall omit this               |
| 23 |                    |   | field.                                                                       |
| 24 | RESERVED           | - | Reserved bits.                                                               |
| 25 |                    |   | If the EXTENSION_BIT_2 is set to '0', the base station shall set             |
| 26 |                    |   | this field to '000'; otherwise, the base station shall omit this             |
| 27 |                    |   | field.                                                                       |
| 28 | REDIRECTION_REASON | - | The reason for redirection.                                                  |
| 29 |                    |   | If the EXTENSION_BIT_2 is set to '0', the base station shall set             |
| 30 |                    |   | this field to the REDIRECTION_REASON value shown in Table                    |
| 31 |                    |   | 3.7.5.5.11-1 corresponding to the redirection reason, as                     |
| 32 |                    |   | defined in <a href="#">ANSI T1.625 6.1.3.7 [34]</a> ; otherwise, the base    |
| 33 |                    |   | station shall omit this field.                                               |
| 34 |                    |   |                                                                              |

**Table 3.7.5.11-1. Redirection Reason**

| <b>Description</b>                                           | <b>REDIRECTION-REASON<br/>(binary)</b> |
|--------------------------------------------------------------|----------------------------------------|
| Unknown                                                      | 0000                                   |
| Call forwarding busy or called DTE busy                      | 0001                                   |
| Call forwarding no reply (circuit-mode only)                 | 0010                                   |
| Called DTE out of order (packet-mode only)                   | 1001                                   |
| Call forwarding by the called DTE (packet-mode only)         | 1010                                   |
| Call forwarding unconditional or Systematic call redirection | 1111                                   |
| Reserved                                                     | others                                 |

2

3

CHARi - Character.

4

5

6

7

8

The base stations shall include one occurrence of this field for each character in the Redirecting Number. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to '0'.

## 1    3.7.5.12 Redirecting Subaddress

2    This information record identifies the subaddress of the responding party.

3

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXTENSION_BIT       | 1             |
| SUBADDRESS_TYPE     | 3             |
| ODD/EVEN_INDICATOR  | 1             |
| RESERVED            | 3             |

Zero or more occurrences of the following field:

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

4

- 5    EXTENSION\_BIT    -    The extension bit.  
                             The base station shall set this field to '1'.
- 6    SUBADDRESS\_TYPE    -    Type of subaddress.  
                             The base station shall set this field to the  
                             SUBADDRESS\_TYPE value shown in Table 2.7.4.19-1  
                             corresponding to the type of the subaddress, as defined in  
[ANSI T1.625 §6.1.3.8\[34\]](#).
- 7    ODD/EVEN\_INDICATOR    -    The indicator of odd /even bits.  
                             The base station shall set this field to the  
                             ODD/EVEN\_INDICATOR value shown in Table 2.7.4.19-2  
                             corresponding to the indicator of even/odd bits, as defined in  
[ANSI T1.625 §6.1.3.8\[34\]](#). It is only used when the type of  
                             subaddress is "User specified" and the coding is BCD.
- 8    RESERVED    -    Reserved bits.  
                             The base station shall set this field to '000'.
- 9    CHARi    -    Character.  
                             The base station shall include one occurrence of this field for  
                             each character in the redirecting subaddress.  
                             When the SUBADDRESS\_TYPE field is equal to '000', the  
                             NSAP address shall be encoded using the preferred binary  
                             encoding specified in ~~CCITT Recommendation X.213 or ISO~~  
[8348 AD2\[35\]](#).
- 10      |  
 11      |  
 12      |  
 13      |  
 14      |  
 15      |  
 16      |  
 17      |  
 18      |  
 19      |  
 20      |  
 21      |  
 22      |  
 23      |  
 24      |  
 25      |  
 26      |  
 27      |  
 28      |  
 29      |  
 30      |  
 31      |
- When the SUBADDRESS\_TYPE field is set to '010', user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with ~~CCITT Recommendation X.25[36]~~ networks, BCD coding should be applied.

## 1    3.7.5.13 Meter Pulses

2    This information record identifies the number of meter pulses and frequency of the alert  
 3    tone.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| PULSE_FREQUENCY     | 11            |
| PULSE_ON_TIME       | 8             |
| PULSE_OFF_TIME      | 8             |
| PULSE_COUNT         | 4             |
| RESERVED            | 1             |

5

- 6    PULSE\_FREQUENCY    -    Pulse frequency.  
 7                         The base station shall set this field to the frequency of the  
 8                         alert signals in units of 10 Hz or to zero to indicate that line  
 9                         polarity control is to be used. If this field is set to zero, the  
 10                        PULSE\_ON\_TIME and PULSE\_OFF\_TIME shall be the period of  
 11                        line polarity reversal and normal line polarity, respectively.
- 12    PULSE\_ON\_TIME    -    Pulse on time.  
 13                        The base station shall set this field to the period of the meter  
 14                        pulses in units of 5 ms.
- 15    PULSE\_OFF\_TIME    -    Pulse off time.  
 16                        The base station shall set this field to the period of the inter-  
 17                        pulse spacing in units of 5 ms.
- 18    PULSE\_COUNT    -    Pulse count.  
 19                        The base station shall set this field to the number of meter  
 20                        pulses.
- 21    RESERVED    -    Reserved bits.  
 22                        The base station shall set this field to '0'.

## 1    3.7.5.14 Parametric Alerting

2    This information record allows the network to convey information to a user by means of  
 3    programmable alerting signals.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| CADENCE_COUNT       | 8             |
| NUM_GROUPS          | 4             |

NUM\_GROUPS occurrences of the following record:

|           |    |
|-----------|----|
| AMPLITUDE | 8  |
| FREQ_1    | 10 |
| FREQ_2    | 10 |
| ON_TIME   | 8  |
| OFF_TIME  | 8  |
| REPEAT    | 4  |
| DELAY     | 8  |

|              |   |
|--------------|---|
| CADENCE_TYPE | 2 |
| RESERVED     | 2 |

5

6    CADENCE\_COUNT    -    Cadence count.

7    The base station shall set this field to the number of times the  
 8    cadence of tone groups will be generated between 0x01 and  
 9    0xFE. The base station shall set this field to 0x00 to indicate  
 10   that the mobile station should end alert tone generation. The  
 11   base station shall set this field to 0xFF to indicate that the  
 12   cadence will repeat indefinitely.

13    NUM\_GROUPS    -    Number of groups.

14    The base station shall set this field to the number of groups.

15

16    AMPLITUDE    -    Amplitude.

17    The base station shall set this field to the amplitude level of  
 18    the tone group in units of -1 dBm.

19    FREQ\_1    -    Tone frequency 1.

20    The base station shall set this field to the first frequency of  
 21    the tone group in units of 5 Hz.

22    FREQ\_2    -    Tone frequency 2.

The base station shall set this field to the second frequency of the tone group in units of 5 Hz. Setting this field to zero creates a single frequency tone.

- |          |                                                                                                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ON_TIME  | - On time.<br><br>The base station shall set this field to the duration of the tone group in units of 50 ms.                                                                                                        |
| OFF_TIME | - Off time.<br><br>The base station shall set this field to the duration of the spacing between tones in units of 50 ms.                                                                                            |
| REPEAT   | - Repeat.<br><br>The base station shall set this field to the number of times the tone group should repeat. The base station shall set this field to 0xFF to indicate that the tone group will repeat indefinitely. |
| DELAY    | - Delay.<br><br>The base station shall set this field to the length of time before the next tone group begins in units of 50 ms.                                                                                    |
| ENC_TYPE | - Parametric Alerting cadence type.<br><br>The base station shall set this field to indicate that the alert should be conveyed to the user as specified in Table 3.7.5.14.                                          |

**Table 3.7.5.14. Cadence Types**

| <b>CADENCE_TYPE</b> | <b>Meaning</b>                                                     |
|---------------------|--------------------------------------------------------------------|
| 00                  | Not specified                                                      |
| 01                  | Acoustic earpiece or similar device                                |
| 10                  | Device other than acoustic earpiece or similar device (Eg. Ringer) |
| 11                  | Reserved                                                           |

- RESERVED** - Reserved bits.  
The base station shall set this field to '00'.

## 1    3.7.5.15 Line Control

2    This information record allows the network to convey line control information.

3

| Type-Specific Field | Length (bits)     |
|---------------------|-------------------|
| POLARITY_INCLUDED   | 1                 |
| TOGGLE_MODE         | 0 or 1            |
| REVERSE_POLARITY    | 0 or 1            |
| POWER_DENIAL_TIME   | 8                 |
| RESERVED            | 0 - 7 (as needed) |

4

5    POLARITY\_INCLUDED    -    Polarity parameter included.

6                          If the mobile station is to change the line polarity, the base  
7                          station shall set this field to '1'; otherwise, the base station  
8                          shall set this field to '0'.9                          TOGGLE\_MODE    -    If POLARITY\_INCLUDED is set to '1', the base station shall  
10                         include this field and set it to '1' to toggle the line polarity or  
11                         to '0' to set the polarity to the absolute value indicated in the  
12                         REVERSE\_POLARITY field.

13                         REVERSE\_POLARITY    -    Reverse polarity.

14                         If POLARITY\_INCLUDED is set to '1' and TOGGLE\_MODE is  
15                         equal to '0', the base station shall include this field and set it  
16                         to '1' to reverse the tip and ring polarity or to '0' to use normal  
17                         polarity. If POLARITY\_INCLUDED is set to '1' and  
18                         TOGGLE\_MODE is set to '1', the base station shall include  
19                         this field and set it to '0'; otherwise, the base station shall  
20                         omit this field.

21                         POWER\_DENIAL\_TIME    -    Power denial timeout.

22                         The base station shall include this field and set it to the  
23                         duration of the power denial in increments of 5 ms.

24                         RESERVED    -    Reserved bits.

25                         The base station shall add reserved bits as needed in order to  
26                         make the length of the entire message equal to an integer  
27                         number of octets. The base station shall set these bits to '0'.

## 1    3.7.5.16 Extended Display

2    This information record allows the network to supply supplementary service display  
 3    information that may be displayed by the mobile station.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| EXT_DISPLAY_IND     | 1             |
| DISPLAY_TYPE        | 7             |

One or more occurrences of the following record:

|             |   |
|-------------|---|
| DISPLAY_TAG | 8 |
| DISPLAY_LEN | 8 |

DISPLAY\_LEN occurrences of the following field if the  
 DISPLAY\_TAG field is not equal to '10000000' or  
 '10000001':

|       |   |
|-------|---|
| CHARi | 8 |
|-------|---|

5

- 6    EXT\_DISPLAY\_IND    - The indicator of Extended Display Information record.  
 7                         The base station shall set this field to '1'.  
 8    DISPLAY\_TYPE    - The type of display.  
 9                         The base station shall set this field to the DISPLAY\_TYPE  
 10                        value shown in Table 3.7.5.16-1 corresponding to the type of  
 11                        display, as defined in [8] Annex D.

12

13                        **Table 3.7.5.16-1. Display Type**

| Description                                 | DISPLAY_TYPE<br>(binary) |
|---------------------------------------------|--------------------------|
| Normal                                      | 0000000                  |
| All other DISPLAY_TYPE values are reserved. |                          |

14

- 15    DISPLAY\_TAG    - The indicator of the display information.  
 16                         There are three types of display tags: mandatory control tags  
 17                         (Blank and Skip), display text tags, and optional control tags,  
 18                         see [8] Annex D.  
 19                         The base station shall set this field to the DISPLAY\_TAG value  
 20                         shown in Table 3.7.5.16-2 corresponding to the type of  
 21                         information contained in the following CHARi field, as defined  
 22                         in [8] Annex D.

23

**Table 3.7.5.16-2. Mandatory Control Tags and Display Text Tags**

| <b>Description</b>       | <b>DISPLAY_TAG<br/>(binary)</b> |
|--------------------------|---------------------------------|
| Blank                    | 10000000                        |

- 1           DISPLAY\_LEN    - The display length.  
2  
3           The base station shall set this field to the number of octets of  
4           display text. See [8] Annex D.  
5  
6           CHARi        - Character.  
7  
8           The base station shall include DISPLAY\_LEN occurrences of  
9           this field, one for each character to be displayed, except for  
10          blank and skip. The base station shall set each occurrence of  
            this field to the ASCII representation corresponding to the  
            character entered, as specified in [9], with the most significant  
            bit set to '0'.

1    3.7.5.17 Extended Record Type - International

2    The use of this record type is country-specific. The first ten bits of the type-specific fields  
3    shall include the Mobile Country Code (MCC) associated with the national standards  
4    organization administering the use of the record type. Encoding of the MCC shall be as  
5    specified in 2.3.1.3. The remaining six bits of the first two octets of the type-specific fields  
6    shall be used to specify the country-specific record type.

1 3.7.5.18 Reserved

1 3.7.5.19 Reserved

1    3.7.5.20 Non-Negotiable Service Configuration

2    This record is included in a *Service Connect Message* to specify the non-negotiable service  
 3    configuration parameters to be used by the mobile station. This record can be included in a  
 4    *General Handoff Direction Message* or a *Universal Handoff Direction Message* to specify the  
 5    non-negotiable service configuration parameters to be used by the mobile station.

6

| Type Specific Field | Length (bits) |
|---------------------|---------------|
| FPC_INCL            | 1             |
| FPC_PRI_CHAN        | 0 or 1        |
| FPC_MODE            | 0 or 3        |
| FPC_OLPC_FCH_INCL   | 0 or 1        |
| FPC_FCH_FER         | 0 or 5        |
| FPC_FCH_MIN_SETPT   | 0 or 8        |
| FPC_FCH_MAX_SETPT   | 0 or 8        |
| FPC_OLPC_DCCH_INCL  | 0 or 1        |
| FPC_DCCH_FER        | 0 or 5        |
| FPC_DCCH_MIN_SETPT  | 0 or 8        |
| FPC_DCCH_MAX_SETPT  | 0 or 8        |

|                   |        |
|-------------------|--------|
| GATING_RATE_INCL  | 1      |
| PILOT_GATING_RATE | 0 or 2 |

|              |        |
|--------------|--------|
| FOR_SCH_INCL | 1      |
| NUM_FOR_SCH  | 0 or 2 |

If FOR\_SCH\_INCL = '1', include NUM\_FOR\_SCH occurrences  
 of the following two-field record

|                      |   |
|----------------------|---|
| FOR_SCH_ID           | 2 |
| FOR_SCH_FRAME_OFFSET | 2 |

(continues on next page)

7

| Type Specific Field | Length (bits) |
|---------------------|---------------|
| REV_SCH_INCL        | 1             |
| NUM_REV_SCH         | 0 or 2        |

If REV\_SCH\_INCL = '1', include NUM\_REV\_SCH occurrences of the following two-field record

|                      |   |
|----------------------|---|
| REV_SCH_ID           | 2 |
| REV_SCH_FRAME_OFFSET | 2 |

|                 |        |
|-----------------|--------|
| LPM_IND         | 2      |
| NUM_LPM_ENTRIES | 0 or 4 |

If LPM\_IND = '01', include NUM\_LPM\_ENTRIES occurrences of the following six-field record:

|                   |   |
|-------------------|---|
| SR_ID             | 3 |
| LOGICAL_RESOURCE  | 4 |
| PHYSICAL_RESOURCE | 4 |
| FORWARD_FLAG      | 1 |
| REVERSE_FLAG      | 1 |
| PRIORITY          | 4 |

|         |   |
|---------|---|
| NUM_REC | 3 |
|---------|---|

NUM\_REC occurrences of the following variable-length record:

|             |                 |
|-------------|-----------------|
| RECORD_LEN  | 8               |
| SR_ID       | 3               |
| SDB_SO OMIT | 1               |
| RESERVED    | 0-7 (as needed) |

| Type Specific Field                      | Length (bits) |
|------------------------------------------|---------------|
| USE_FLEX_NUM_BITS                        | 1             |
| <u>USE_OLD_FLEX_NUM_BITS_TABLES_INCL</u> | 0 or 1        |
| NUM_BITS_TABLES_COUNT                    | 0 or 3        |

If USE\_FLEX\_NUM\_BITS is equal to '1' and NUM\_BITS\_TABLES\_INCL is equal to '1', then include NUM\_BITS\_TABLES\_COUNT+1 occurrences of the following record

|                   |   |
|-------------------|---|
| NUM_BITS_TABLE_ID | 4 |
| NUM_RECS          | 4 |

If USE\_FLEX\_NUM\_BITS is equal to '1', then NUM\_RECS +1 occurrences of the following record

|              |    |
|--------------|----|
| NUM_BITS_IDX | 4  |
| NUM_BITS     | 16 |
| CRC_LEN_IDX  | 3  |

|                                |        |
|--------------------------------|--------|
| USE_VAR_RATE                   | 1      |
| <u>USE_OLD_VAR_TABLES_INCL</u> | 0 or 1 |
| VAR_RATE_TABLES_COUNT          | 0 or 3 |

If USE\_VAR\_RATE is equal to '1' and VAR\_TABLES\_INCL is equal to '1', then include VAR\_RATE\_TABLES\_COUNT+1 occurrences of the following record

|                   |   |
|-------------------|---|
| VAR_RATE_TABLE_ID | 3 |
| NUM_RECS          | 4 |

For each of the above record, If USE\_VAR RATENUM\_BITS is equal to '1', then include NUM\_RECS +1 occurrences of the following record

|              |              |
|--------------|--------------|
| NUM_BITS_IDX | 4            |
| MASK         | NUM_BITS_IDX |

If USE\_FLEX\_NUM\_BITS is equal to '1', include the following fields

|                      |        |
|----------------------|--------|
| USE_OLD_FLEX_MAPPING | 1      |
| FSCH0_NBIT_TABLE_ID  | 0 or 4 |

---

3

4

- 5           FPC\_INCL    - Forward power control information included indicator.  
 6                         The base station shall set this field to '1' if the forward power  
 7                         control information parameters are included in this record;  
 8                         otherwise, it shall set this field to '0'.

9

- 10          FPC\_PRI\_CHAN - Power Control Subchannel indicator.  
 11                         If the FPC\_INCL field is set to '0', the base station shall omit  
 12                         this field; otherwise, the base station shall include this field  
 13                         and set it as follows:

14                         The base station shall set this field to '0' if the mobile station  
 15                         is to perform the primary inner loop estimation on the  
 16                         received Forward Fundamental Channel and the base station  
 17                         is to multiplex the Power Control Subchannel on Forward  
 18                         Fundamental Channel; the base station shall set this field to  
 19                         '1' if the mobile station is to perform the primary inner loop  
 20                         estimation on the received Forward Dedicated Control  
 21                         Channel and the base station is to multiplex the Power  
 22                         Control Subchannel on Forward Dedicated Control Channel.

23                         If only Fundamental Channel is assigned, the base station  
 24                         shall set this field to '0'. If only the Dedicated Control  
 25                         Channel is assigned, the base station shall set this field to '1'.

- 25          FPC\_MODE    - Forward Power Control operation mode indicator.

If the FPC\_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the forward power control operation mode (see [2]).

FPC\_OLPC\_FCH\_INCL - Fundamental Channel Outer Loop Power Control parameter included indicator.

If the FPC\_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the forward link Fundamental Channel outer loop power control parameters are included in this record, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

FPC\_FCH\_FER - Fundamental Channel target Frame Error Rate.

If FPC\_OLPC\_FCH\_INCL is included and set to '1', the base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2; otherwise, the base station shall omit this field.

FPC\_FCH\_MIN\_SETPT - Minimum Fundamental Channel Outer Loop Eb/Nt setpoint.

If FPC\_OLPC\_FCH\_INCL is included and set to '1', the base station shall set this field to minimum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB; otherwise, the base station shall omit this field.

FPC\_FCH\_MAX\_SETPT - Maximum Fundamental Channel Outer Loop Eb/Nt setpoint.

If FPC\_OLPC\_FCH\_INCL is set to '1', the base station shall set this field to maximum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB; otherwise, the base station shall omit this field.

FPC\_OLPC\_DCCH\_INCL - Dedicated Control Channel Outer Loop Power Control parameter included indicator.

If the FPC\_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the forward link Dedicated Control Channel outer loop power control parameters are included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

FPC\_DCCH\_FER - Dedicated Control Channel target Frame Error Rate.

If FPC\_OLPC\_DCCH\_INCL is included and set to '1', the base station shall set this field to the target Frame Error Rate on the Forward Dedicated Control Channel, as specified in Table 3.7.3.3.2.25-2; otherwise, the base station shall omit this field.

- 1 FPC\_DCCH\_MIN\_SETPT - Minimum Dedicated Control Channel Outer Loop Eb/Nt  
2 setpoint.
- 3 If FPC\_OLPC\_DCCH\_INCL is included and set to '1', the base  
4 station shall set this field to minimum Dedicated Control  
5 Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB;  
6 otherwise, the base station shall omit this field.
- 7 FPC\_DCCH\_MAX\_SETPT - Maximum Dedicated Control Channel Outer Loop Eb/Nt  
8 setpoint.
- 9 If FPC\_OLPC\_DCCH\_INCL is included and set to '1', the base  
10 station shall set this field to maximum Dedicated Control  
11 Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB;  
12 otherwise, the base station shall omit this field.
- 13 GATING\_RATE\_INCL- Reverse Pilot Channel Gating rate included flag.  
14 The base station shall set this field to '1' if the  
15 PILOT\_GATING\_RATE field is included; otherwise, it shall set  
16 this field to '0'.
- 17 PILOT\_GATING\_RATE - Reverse Pilot Channel Gating rate.  
18 If the GATING\_RATE\_INCL field is set to '0', the base station  
19 shall omit this field; otherwise, the base station shall set this  
20 field as follows: The base station shall set this field to the  
21 PILOT\_GATING\_RATE field shown in Table 3.7.5.20-1  
22 corresponding to the gating rate on the Reverse Pilot Channel.

**Table 3.7.5.20-1. Reverse Pilot Gating rate**

| <b>PILOT_GATING_RATE field<br/>(binary)</b> | <b>Meaning</b>            |
|---------------------------------------------|---------------------------|
| 00                                          | Gating rate 1             |
| 01                                          | Gating rate $\frac{1}{2}$ |
| 10                                          | Gating rate $\frac{1}{4}$ |
| 11                                          | Reserved                  |

- 24
- 25 FOR\_SCH\_INCL - Forward Supplemental Channel information included  
26 indicator.
- 27 The base station shall set this field to '1', if the forward  
28 Supplemental Channel information is included; otherwise, the  
29 base station shall set this field to '0'.
- 30 NUM\_FOR\_SCH - Number of Forward Supplemental Channels.  
31 If the FOR\_SCH\_INCL field is set to '0', the base station shall  
32 omit this field; otherwise, the base station shall set this field  
33 to the number of Forward Supplemental Channels associated  
34 with this service configuration.
- 35 If the NUM\_FOR\_SCH field is present and is set to any value other than '00', the base  
36 station shall include one occurrence of the following two field record for each Forward  
37 Supplemental Channel included in this record:

- 1           FOR\_SCH\_ID   - Forward Supplemental Channel Identification.  
 2                         The base station shall set this field to the identifier of the  
 3                         Forward Supplemental Channel pertaining to this record.
- 4           FOR\_SCH-  
 5       \_FRAME\_OFFSET   - Forward Supplemental Channel multiple frame offset.  
 6                         The base station shall set this field to the multiple frame offset  
 7                         of this Forward Supplemental Channel. The frames of this  
 8                         Forward Supplemental Channel are delayed by  
 9                         ( $\text{FRAME\_OFFSET} \times 1.25 + \text{FOR\_SCH\_FRAME\_OFFSET} \times 20$ )  
 10                         ms relative to system timing (see [2]).
- 11
- 12          REV\_SCH\_INCL   - Reverse Supplemental Channel information included  
 13                         indicator.  
 14                         The base station shall set this field to '1' if the reverse  
 15                         Supplemental Channel information is included; otherwise, the  
 16                         base station shall set this field to '0'.
- 17          NUM\_REV\_SCH   - Number of Reverse Supplemental Channels.  
 18                         If the REV\_SCH\_INCL field is set to '0', the base station shall  
 19                         omit this field; otherwise, the base station shall set this field  
 20                         to the number of Reverse Supplemental Channels associated  
 21                         with this service configuration.
- 22          If the NUM\_REV\_SCH field is present and is set to any value other than '00', the base  
 23                         station shall include one occurrence of the following four field record for each Reverse  
 24                         Supplemental Channel included in this record:
- 25          REV\_SCH\_ID   - Reverse Supplemental Channel Identification.  
 26                         The base station shall set this field to the identifier of the  
 27                         Reverse Supplemental Channel pertaining to this record.
- 28          REV\_SCH-  
 29       \_FRAME\_OFFSET   - Reverse Supplemental Channel multiple frame offset.  
 30                         The base station shall set this field to the multiple frame offset  
 31                         with this Reverse Supplemental Channel. The frames of this  
 32                         Reverse Supplemental Channel are delayed by  
 33                         ( $\text{FRAME\_OFFSET} \times 1.25 + \text{REV\_SCH\_FRAME\_OFFSET} \times 20$ )  
 34                         ms relative to system timing (see [2]).
- 35
- 36          LPM\_IND   - Logical to Physical Mapping indicator.  
 37                         The base station shall set this field to the LPM\_IND field value  
 38                         shown in Table 3.7.5.20-2 corresponding to the Logical to  
 39                         Physical Mapping indicator.
- 40                         The base station shall not set this field to '00' if there is more  
 41                         than one service option connection in the current Service  
 42                         Configuration information record.

**Table 3.7.5.20-2. Logical to Physical Mapping indicator**

| <b>LPM_IND Field (binary)</b> | <b>Logical-to-Physical Mapping indicator</b>              |
|-------------------------------|-----------------------------------------------------------|
| 00                            | Use the default Logic-to-Physical Mapping                 |
| 01                            | Use the Logic-to-Physical Mapping included in this record |
| 10                            | Use the previous stored Logic-to-Physical Mapping         |
| 11                            | Reserved                                                  |

3      NUM\_LPM\_ENTRIES -     Number of Logical-to-Physical Mapping entries.

4                          If the LPM\_IND field is set to '01', the base station shall  
 5                          include this field and set it as follows; otherwise, the base  
 6                          station shall omit this field:

7                          The base station shall set this field to the number of Logical-  
 8                          to-Physical Mapping entries that are included in this record.

9                          If the NUM\_LPM\_ENTRIES field is included and is not equal to '0000', the base station shall  
 10                        include NUM\_LPM\_ENTRIES occurrences of the following six-field record for each Logical-  
 11                        to-Physical Mapping entry:

- 12                        SR\_ID    -    Service reference identifier.  
                                 The base station shall set this field to the identifier of the service reference to which this Logical to Physical Mapping entry applies.
- 16                        LOGICAL\_RESOURCE    -    Logical resource identifier.  
                                 The base station shall set this field to the logical resource identifier shown in Table 3.7.5.20-3 which is to be mapped by this Logical to Physical Mapping entry.

**Table 3.7.5.20-3. Logical Resource Identifier.**

| <b>LOGICAL_RESOURCE (binary)</b> | <b>Logical Resource</b> |
|----------------------------------|-------------------------|
| 0000                             | dtch                    |
| 0001                             | dsch                    |
| 0010 – 1111                      | Reserved                |

21                        PHYSICAL\_RESOURCE    -    Physical resource identifier.

1                   The base station shall set this field to the physical resource  
 2                   identifier shown in Table 3.7.5.20-4 to which the logical  
 3                   channel specified in this Logical to Physical Mapping entry is  
 4                   to be mapped.

**Table 3.7.5.20-4. Physical Resource Identifier.**

| <b>PHYSICAL_RESOURCE<br/>(binary)</b> | <b>Physical Resource</b> |
|---------------------------------------|--------------------------|
| 0000                                  | FCH                      |
| 0001                                  | DCCH                     |
| 0010                                  | SCH0                     |
| 0011                                  | SCH1                     |
| 0100 – 1111                           | Reserved                 |

- 6
- 7       FORWARD\_FLAG   - Forward mapping indicator.  
 8                   The base station shall set this field to ‘1’ if the logical to  
 9                   physical channel mapping specified in this record applies to  
 10                  forward logical channels; otherwise, the base station shall set  
 11                  this field to ‘0’.
- 12      REVERSE\_FLAG   - Reverse mapping indicator.  
 13                   The base station shall set this field to ‘1’ if the logical to  
 14                   physical channel mapping specified in this record applies to  
 15                  reverse logical channels; otherwise, the base station shall set  
 16                  this field to ‘0’.
- 17      PRIORITY       - Multiplexing priority.  
 18                   The base station shall set this field to ‘0000’.
- 19      NUM\_REC        - Number of service-specific records.  
 20                   The base station shall set this field to the number of the  
 21                  following variable-length records included in the message.
- 22      The base station shall include one occurrence of the following variable-length record for  
 23                  each service option connection for which this record needs to be specified.
- 24      RECORD\_LEN      - Record length.  
 25                   The base station shall set this field to the number of octets  
 26                  included in this variable-length record including this field.
- 27      SR\_ID           - Service reference identifier.  
 28                   The base station shall set this field to the identifier of the  
 29                  service reference associated with this service-specific record.
- 30      SDB\_SO OMIT    - Short Data Burst service option number omitted indicator.

The base station shall set this field to '1' if the mobile station is required to omit the service option number when sending Short Data Burst (see IS-707-A-2) for this service option connection; otherwise, the base station shall set this field to '0'.

10 USE\_FLEX\_NUM\_BITS - Use flexible (non-default) number of bits per frame indicator.  
11  
12 The base station shall set this field to '0' to indicate that the  
13 mapping between the number of information bits per frame  
14 [NUM BITS], and a four-bit index field [NUM BITS IDX], shall  
15 follow the default mapping identified in Table 3.7.3.3.2.37-2  
and Table 3.7.3.3.2.37-4.

16 The base station shall set this field to '1' to indicate a non-  
17 default mapping between the number of information bits per  
18 frame, [\[NUM\\_BITS\]](#), and a four-bit index field  
19 [\[NUM\\_BITS\\_IDX\]](#) is [specified in this message used](#) for at least  
20 a forward or reverse traffic channel.

**USE\_OLD\_FLEXNUM\_BITS** TABLES\_INCL - Use the previously downloaded Flexible Rate Tables included indicator.

If the USE FLEX NUM BITS field is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

27 The base station shall include this field only if  
28 USE\_FLEX\_NUM\_BITS is equal to '1'. If this field is included,  
29 the base station shall set this field to '1' to indicate that the  
30 mobile station is to use the previously downloaded Flexible  
31 Rate Table. The base station shall set this field to '0' if the  
32 fields related to downloading the Flexible Rate Table are  
33 included in this message. If the Flexible Rate Tables are  
34 included in this message, the base station shall set this field  
35 to '1'; otherwise, the base station shall set this field to '0'.

37                   NUM\_BITS-  
38    \_TABLES\_COUNT - Number of instances of the Flexible Rate Table included in  
39                    this message.

1            If the NUM\_BITS\_TABLES\_INCL field is included and is equal  
 2            to '1', the base station shall include this field only if  
 3            ~~USE\_OLD\_FLEX\_TABLE~~ field is included and is set to '0'. If  
 4            ~~this field is included, the base station shall and~~ set this field  
 5            to one less than the number of instances of the Flexible Rate  
 6            Table included in this message; otherwise, the base station  
 7            shall omit this field.

8     If ~~USE\_OLD\_FLEXNUM\_TABLES\_INCL~~ is included and is equal to '01', the base station  
 9     shall include NUM\_BITS\_TABLES\_COUNT+1 instances of the Flexible Rate Table

10    NUM\_BITS\_TABLE\_ID    - Flexible Rate Table ID.

11            The base station shall set this field to the ID of the Flexible  
 12            Rate Table that follows. The value of '0000' is reserved to  
 13            indicate the default table. The base station shall not set this  
 14            field to '0000'.

15    NUM\_RECS    - Number of records in the Flexible Rate Table.

16            The base station shall set this field to one less than the  
 17            number of three-field records that follows

18     The base station shall include NUM\_RECS+1 instances of the following three-field record:

19     NUM\_BITS\_IDX    - Index to the number of bits array.

20            The base station shall set this field to the index to the array  
 21            that identifies the number of bits per frame.

22     NUM\_BITS    - Number of bits array.

23            The base station shall set this field to the number of  
 24            information bits per frame corresponding to the index  
 25            specified by NUM\_BITS\_IDX. The base station shall set the  
 26            number of information bits per frame in accordance with the  
 27            number of information bits per frame specified by the service  
 28            option numbers included in the service configuration record.

29     CRC\_LEN\_IDX    - Array of Number of CRC bits.

30            The base station shall set this field to specify the number of  
 31            CRC bits per frame corresponding to the index specified by  
 32            NUM\_BITS\_IDX according to Table 3.7.5.20-4. The base  
 33            station shall not specify more than one value of the CRC  
 34            length for the same number of bits per frame for a specific  
 35            channel (i.e., for a given channel, the number of information  
 36            bits per frame uniquely specifies the length of the CRC field).

**Table 3.7.5.20-4. CRC\_LEN\_IDX**

| <b>CRC_LEN_IDX<br/>(binary)</b> | <b>Number of CRC<br/>bits per frame</b> |
|---------------------------------|-----------------------------------------|
| 000                             | 0                                       |
| 001                             | 6                                       |
| 010                             | 8                                       |
| 011                             | 10                                      |
| 100                             | 12                                      |
| 101                             | 16                                      |
| 110-111                         | Reserved                                |

- 2
- 3        USE\_VAR\_RATE     - Use variable rate on supplemental channels indicator.
- 4              The base station shall set this field to '1' to indicate that at
- 5              least one of the forward or reverse supplemental channels is
- 6              to operate in the variable rate mode (i.e., the rate of the
- 7              supplemental channel can be picked from a pre-determined
- 8              set of rates autonomously).
- 9              The base station shall set this bit to '0' to indicate that
- 10             variable rate on supplemental channels are not allowed.

11        USE\_OLD\_VAR\_TABLES\_INCL    - Use the previously downloaded Variable Rate Tables included indicator.

13            If the USE VAR RATE field is equal to '0', the base station  

14            shall omit this field; otherwise, the base station shall include  

15            this field and set this field as follows:

17            ~~The base station shall include this field only if~~  

18            ~~USE\_VAR\_RATE is equal to '1'. If this field is included, the~~  

19            ~~base station shall set this field to '1' to indicate that the~~  

20            ~~mobile station is to use the previously downloaded Variable~~  

21            ~~Rate Mask Table. The base station shall set this field to '0' if~~  

22            ~~the fields related to downloading the Variable Rate Mask Table~~  

23            ~~are included in this message. If the Variable Rate Tables are~~  

24            ~~included in this message, the base station shall set this field~~  

25            ~~to '1'; otherwise, the base station shall set this field to '0'.~~

- 26
- 27        VAR\_RATE-  

28        \_TABLES\_COUNT     - Number of instances of the Variable Rate Mask Table included

29            in this message.

If VAR\_TABLES\_INCL is included and is equal to '1', the base station shall include this field and set this field to one less than the number of instances of the Variable Rate Mask table included in this message as follows; otherwise, the base station shall omit this field:

The base station shall include this field only if USE\_OLD\_VAR\_TABLE field is included and is set to '0'. If this field is included, the base station shall set this field to one less than the number of instances of the Variable Rate Mask table included in this message as follows.

If USE\_OLD\_VAR\_TABLES\_INCL is included and is equal to '10', the base station shall include VAR\_RATE\_TABLES\_COUNT +1 instances of the Variable Rate Mask table

VAR\_RATE\_TABLE\_ID - Variable Rate Mask table ID.

The base station shall set this field to the ID of the Variable Rate Mask table that follows. The value of '000' is reserved to indicate no variable rate operation. The base station shall not set this field to '000'.

NUM\_RECS - Number of records in the Variable Rate Mask table.

The base station shall set this field to one less than the number of two-field records that follows

The base station shall include NUM\_RECS+1 instances of the following two fields:

NUM\_BITS\_IDX - Index to the number of bits array.

The base station shall set this field to the index to the array that identifies the number of bits per supplemental channel frame.

MASK - Number of bits array.

The base station shall set this field to a mask that identifies the other members of the Variable Rate Set. The base station shall set the  $i^{\text{th}}$  LSB bit ( $i=1, \dots, \text{NUM\_BITS\_IDX}$ ) of this field to '1' to indicates that the number of bits per frame specified by the index  $\text{NUM\_BITS\_IDX}-i$  is to be included in the Supplemental Variable Rate Set.

USE\_OLD-\_FLEX\_MAPPING - Use the previously downloaded mapping between the channels and Flexible Rate Tables.

If the USE\_FLEX\_NUM\_BITS field is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

1           The base station shall include this field only if  
 2           ~~USE\_FLEX\_NUM\_BITS~~ field is set to '1'. If this field is  
 3           included, the base station shall set this field to '1' to indicate  
 4           that the mobile station is to use the previously downloaded  
 5           mapping between the channels and Flexible Rate Tables. The  
 6           base station shall set this field to '0', if the following eight  
 7           fields are included in this message.

- 8        FSCH0\_NBIT\_TABLE\_ID - Forward Supplemental Channel 0 Flexible Rate Table ID.  
 9           If the USE OLD FLEX MAPPING field is included and is equal  
 10          to '0', the base station shall include this field and set this field  
 11          as follows; otherwise, the base station shall omit this field:

12           The base station shall include this field only if  
 13           ~~USE\_OLD\_FLEX\_MAPPING~~ field is included and is set to '0'. If  
 14           this field is included, the base station shall set this field to the  
 15           ID of the Flexible Rate Table corresponding to Forward  
 16           Supplemental Channel 0. The base station shall set this field  
 17           to '0000' to indicate that the Flexible Rate feature is not used  
 18           for Forward Supplemental 0 and the default table specified in  
 19           3.7.3.3.2.37-4 shall be used.

- 21        RSCH0\_NBIT\_TABLE\_ID - Reverse Supplemental Channel 0 Flexible Rate Table ID.  
 22           If the USE OLD FLEX MAPPING field is included and is equal  
 23          to '0', the base station shall include this field and set this field  
 24          as follows; otherwise, the base station shall omit this field:

25           The base station shall include this field only if  
 26           ~~USE\_OLD\_FLEX\_MAPPING~~ field is included and is set to '0'. If  
 27           this field is included, the base station shall set this field to the  
 28           ID of the Flexible Rate Table corresponding to Reverse  
 29           Supplemental Channel 0. The base station shall set this field  
 30           to '0000' to indicate that the Flexible Rate feature is not used  
 31           for Reverse Supplemental 0 and the default table specified in  
 32           3.7.3.3.2.37-2 shall be used.

- 33        FSCH1\_NBIT\_TABLE\_ID - Forward Supplemental Channel 1 Flexible Rate Table ID.  
 34           If the USE OLD FLEX MAPPING field is included and is equal  
 35          to '0', the base station shall include this field and set this field  
 36          as follows; otherwise, the base station shall omit this field:

37           The base station shall include this field only if  
 38           ~~USE\_OLD\_FLEX\_MAPPING~~ field is included and is set to '0'. If  
 39           this field is included, the base station shall set this field to the  
 40           ID of the Flexible Rate Table corresponding to Forward  
 41           Supplemental Channel 1. The base station shall set this field  
 42           to '0000' to indicate that the Flexible Rate feature is not used  
 43           for Forward Supplemental 1 and the default table specified in  
 44           3.7.3.3.2.37-4 shall be used.

- 46        RSCH1\_NBIT\_TABLE\_ID - Reverse Supplemental Channel 1 Flexible Rate Table ID.

1           If the USE OLD FLEX MAPPING field is included and is equal  
 2           to '0', the base station shall include this field and set this field  
 3           as follows; otherwise, the base station shall omit this field:

5           The ~~base station shall include this field only if~~  
 6           ~~USE\_OLD\_FLEX\_MAPPING field is included and is set to '0'.~~ If  
 7           ~~this field is included, the~~ base station shall set this field to the  
 8           ID of the Flexible Rate Table corresponding to Reverse  
 9           Supplemental Channel 1. The base station shall set this field  
 10          to '0000' to indicate that the Flexible Rate feature is not used  
 11          for Reverse Supplemental 1 and the default table specified in  
 12          3.7.3.3.2.37-2 shall be used.

13         .

14 FFCH\_NBIT\_TABLE\_ID - Forward Fundamental Channel Flexible Rate Table ID.

15           If the USE OLD FLEX MAPPING field is included and is equal  
 16           to '0', the base station shall include this field and set this field  
 17           as follows; otherwise, the base station shall omit this field:

18           The ~~base station shall include this field only if~~  
 19           ~~USE\_OLD\_FLEX\_MAPPING field is included and is set to '0'.~~ If  
 20           ~~this field is included, the~~ base station shall set this field to the  
 21           ID of the Flexible Rate Table corresponding to the Forward  
 22           Fundamental Channel. The base station shall set this field to  
 23           't0000' to indicate that the Flexible Rate feature is not used for  
 24           the Forward Fundamental Channel.

25 RFCH\_NBIT\_TABLE\_ID - Reverse Fundamental Channel Flexible Rate Table ID.

26           If the USE OLD FLEX MAPPING field is included and is equal  
 27           to '0', the base station shall include this field and set this field  
 28           as follows; otherwise, the base station shall omit this field:

29           The ~~base station shall include this field only if~~  
 30           ~~USE\_OLD\_FLEX\_MAPPING field is included and is set to '0'.~~ If  
 31           ~~this field is included, the~~ base station shall set this field to the  
 32           ID of the Flexible Rate Table corresponding to the Reverse  
 33           Fundamental Channel. The base station shall set this field to  
 34           't0000' to indicate that the Flexible Rate feature is not used for  
 35           the Reverse Fundamental Channel.

36 FDCCCH\_NBIT\_TABLE\_ID - Forward Dedicated Control Channel Flexible Rate Table ID.

37           If the USE OLD FLEX MAPPING field is included and is equal  
 38           to '0', the base station shall include this field and set this field  
 39           as follows; otherwise, the base station shall omit this field:

40           The ~~base station shall include this field only if~~  
 41           ~~USE\_OLD\_FLEX\_MAPPING field is included and is set to '0'.~~ If  
 42           ~~this field is included, the~~ base station shall set this field to the  
 43           ID of the Flexible Rate Table corresponding to the Forward  
 44           Dedicated Control Channel. The base station shall set this  
 45           field to '0000' to indicate that the Flexible Rate feature is not  
 46           used for the Forward Dedicated Control Channel.

|    |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | FDCCH_NBITS_IDX     | <ul style="list-style-type: none"> <li>- Forward Dedicated Control Channel number of information bits per frame index.</li> </ul> <p><u>If the FDCCH_NBIT_TABLE_ID field is included and is not equal to '0000'.</u></p> <p><u>The base station shall include this field only if the FDCCH_NBITS_TABLE_ID field is included and is not equal to '0000'. | 38 |                     | The number of information bits per frame is specified by the Flexible Rate Table associated with Reverse Dedicated Control Channel and RDCCH_NBITS_IDX as the index to the table (i.e., $\text{NUM\_BITS}_S[\text{RDCCH\_NBITS\_TABLE\_ID}_R][\text{RDCCH\_NBITS\_IDX}]$ ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 43 | USE_OLD_VAR_MAPPING | <ul style="list-style-type: none"> <li>- Use the previously downloaded mapping between the channels and Variable Rate Mask Tables.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

If the USE\_VAR\_RATE field is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows: only if USE\_VAR\_RATE field is set to '1'. If this field is included, the base station shall set this field to '1' to indicate that the mobile station is to use the previously downloaded mapping between the channels and Variable Rate Mask Tables. The base station shall set this field to '0', if the following four fields are included in this message.

- FSCH0\_VAR\_TABLE\_ID - Forward Supplemental Channel 0 Variable Rate Mask Table ID.

If the USE\_OLD\_VAR\_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall include this field only if USE\_OLD\_VAR\_MAPPING field is included and is set to '1'. If this field is included, the base station shall set this field to the ID of the Variable Rate Mask Table corresponding to Forward Supplemental Channel 0. The base station shall set this field to '000' to indicate that no variable rate operation is performed on the F-SCH0.

- RSCH0\_VAR\_TABLE\_ID - Reverse Supplemental Channel 0 Variable Rate Mask Table ID.

If the USE\_OLD\_VAR\_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall include this field only if USE\_OLD\_VAR\_MAPPING field is included and is set to '1'. If this field is included, the base station shall set this field to the ID of the Variable Rate Mask Table corresponding to Reverse Supplemental Channel 0. The base station shall set this field to '000' to indicate that the mobile station is not to autonomously change the rate of the R-SCH0.

- FSCH1\_VAR\_TABLE\_ID - Forward Supplemental Channel 1 Variable Rate Mask Table ID.

If the USE\_OLD\_VAR\_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

1           The base station shall include this field only if  
 2           ~~USE\_OLD\_VAR\_MAPPING field is included and is set to '1'.~~ If  
 3           ~~this field is included, the~~ base station shall set this field to the  
 4           ID of the Variable Rate Mask Table corresponding to Forward  
 5           Supplemental Channel 1. The base station shall set this field  
 6           to '000' to indicate that no variable rate operation is performed  
 7           on the F-SCH1.

8       RSCH1\_VAR\_TABLE\_ID - Reverse Supplemental Channel 1 Variable Rate Mask Table  
 9           ID.

10           If the USE OLD VAR MAPPING field is included and is equal  
           to '0', the base station shall include this field and set this field  
           as follows; otherwise, the base station shall omit this field:

13           The base station shall include this field only if  
 14           ~~USE\_OLD\_VAR\_MAPPING field is included and is set to '1'.~~ If  
 15           ~~this field is included, the~~ base station shall set this field to the  
 16           ID of the Variable Rate Mask Table corresponding to Reverse  
 17           Supplemental Channel 1. The base station shall set this field  
 18           to '000' to indicate that the mobile station is not to  
 19           autonomously change the rate of the R-SCH1.

20       R\_INC\_RATE\_ALLOWED - Reverse increase rate within Variable Rate Set Allowed  
 21           indicator.

22           If the USE VAR RATE field is included and is equal to '1', the  
           base station shall include this field and set this field as  
           follows; otherwise, the base station shall omit this field:

26           The base station shall include this field only if  
 27           ~~USE\_VAR\_RATE field is included and is set to '1'.~~ If this field  
 28           is included, the base station shall set this field to '1' to  
 29           indicate that the mobile station is allowed to switch between  
 30           any of the rates (i.e., number of bits per frame) in the Variable  
 31           Rate Set for the Reverse Supplemental channels. The base  
 32           station shall set this field to '0' to indicate that only a  
 33           downward transition in rate within the rates (i.e., number of  
 34           bits per frame) in the Variable Rate Set for the Reverse  
 35           Supplemental channels is allowed.

36       F\_INC\_RATE\_ALLOWED - Forward increase rate within Variable Rate Set Allowed  
 37           indicator.

38           If the USE VAR RATE field is included and is equal to '1', the  
           base station shall include this field and set this field as  
           follows; otherwise, the base station shall omit this field:

1                   The ~~base station shall include this field only if  
2                   USE\_VAR\_RATE field is included and is set to '1'. If this field  
3                   is included, the~~ base station shall set this field to '1' to  
4                   indicate that the base station is allowed to switch between any  
5                   of the rates (i.e., number of bits per frame) in the Variable  
6                   Rate Set for the Forward Supplemental channels. The base  
7                   station shall set this field to '0' to indicate that only a  
8                   downward transition in rate within the rates (i.e., number of  
9                   bits per frame) in the Variable Rate Set for the Forward  
10                  Supplemental channels is possible.

11                  LTU\_INFO\_INCL - LTU ~~Size~~-Tables included indicator.

12  
13                  The base station shall set this field to '1' ~~if the base station  
14                  includes to indicate that LTU Size Table information LTU  
15                  related information is included~~ in this message; otherwise, the  
16                  base station shall set this field to '0'. ~~The base station shall  
17                  include at least one LTU Size Table if USE\_FLEX\_NUM\_BITS is  
18                  equal to '1' and at least one of FSCH0\_NBIT\_TABLE\_ID,  
19                  FSCH1\_NBIT\_TABLE\_ID, RSCH0\_NBIT\_TABLE\_ID, or  
20                  RSCH1\_NBIT\_TABLE\_ID is not equal to '0000' (i.e., the base  
21                  station is to specify the LTU size table for the supplemental  
22                  channels that are using the flexible rate feature).~~

23  
24                  The base station shall set this field to '0' ~~if the mobile station  
25                  indicates that it does not support downloadable LTU Table in  
26                  the capability information (i.e., the  
27                  F SCH LTU TAB SUPPORTED and  
28                  R SCH LTU TAB SUPPORTED fields in the capability  
29                  information are equal to '0');~~

30                  USE\_OLD\_LTU\_TABLES\_INCL - ~~Use the previously downloaded~~ LTU Tables included  
31                  indicator.

32  
33                  If the LTU INFO INCL field is equal to '0', the base station  
34                  shall omit this field; otherwise, the base stations shall include  
35                  this field and set this field as follows:

36  
37                  The base station shall include this field only if  
38                  USE\_FLEX\_NUM\_BITS is equal to '1' and LTU\_INFO\_INCL is  
39                  equal to '1'. If this field is included, the base station shall set  
40                  this field to '1' to indicate that the mobile station is to use the  
41                  previously downloaded LTU Table. The base station shall set  
42                  this field to '0' if the fields related to downloading the LTU  
43                  Table are included in this message. ~~If the LTU Tables are  
44                  included in this message, the base station shall set this field  
45                  to '1'; otherwise, the base station shall set this field to '0'.~~

If USE\_OLD\_LTU\_TABLES\_INCL is included and is equal to '01', the base station shall include the following fields related to the LTU Size Table information:

NUM\_LTU\_TABLES - Number of LTU tables included.

If USE\_OLD\_LTU\_TABLE is equal to '0', the base station shall include this field. If this field is included, the The base station shall set this field to the number of LTU Tables minus one included in this message.

If USE\_OLD\_LTU\_TABLES\_INCL is included and is equal to '01', then the base station shall include NUM\_LTU\_TABLES + 1 occurrences of the following fields:

LTU\_TABLE\_ID - LTU Table ID.

The base station shall set this field to the ID of the LTU Table that follows. The base station shall not set this field to '000'.

NUM\_ROWS - Number of configurations associated with the LTU Table identified by LTU\_TABLE\_ID.

The base station shall set this field to one less than the number of rows of the LTU Table identified by LTU\_TABLE\_ID.

If USE\_OLD\_LTU\_TABLES\_INCL is included and is equal to '01', then the base station shall include the NUM\_ROWS + 1 occurrences of the following fields:

NBITS\_IDX - Number of bits per frame index.

The base station shall set this field to the 4-bit index that specified the number of information bits per supplemental channel frame.

NUM\_LTUS\_LEN - Length\_Number of the LTUs per physical layer supplemental channel frame.

The base station shall set this field to the length specify the number of an LTUs per physical layer supplemental channel frame (in units of bits) corresponding to the number of information bits per supplemental channel frame specified by NBITS\_IDX according to Table 3.7.5.20-5. The base station shall set this field to zero '0000' to indicate that no LTUs are supported for the number of information bits per frame specified by NBITS\_IDX.

**Table 3.7.5.20-5. NUM\_LTUS**

| <u>NUM_LTUS<br/>(binary)</u> | <u>Number of LTUS<br/>per supplemental<br/>channel frame</u> |
|------------------------------|--------------------------------------------------------------|
| <u>0000</u>                  | <u>0</u>                                                     |
| <u>0001</u>                  | <u>2</u>                                                     |
| <u>0010</u>                  | <u>3</u>                                                     |
| <u>0011</u>                  | <u>4</u>                                                     |
| <u>0100</u>                  | <u>5</u>                                                     |
| <u>0101</u>                  | <u>6</u>                                                     |
| <u>0110</u>                  | <u>7</u>                                                     |
| <u>0111</u>                  | <u>8</u>                                                     |
| <u>1000-1111</u>             | <u>Reserved</u>                                              |

- 4                  USE\_OLD-  
 5                  \_LTU\_MAPPING    -    Use the previously downloaded mapping between the channels  
 6                  and LTU Tables.
- 7                  If the LTU\_INFO\_INCL field is equal to '0', the base station  
 8                  shall omit this field; otherwise, the base station shall include  
 9                  this field and set this field as follows:
- 10                 ~~The base station shall include this field only if USE\_FLEX\_NUM\_BITS is equal to '1' and at least one of FSCH0\_NBIT\_TABLE\_ID, FSCH1\_NBIT\_TABLE\_ID, RSCH0\_NBIT\_TABLE\_ID, or RSCH1\_NBIT\_TABLE\_ID is not equal to '0000' (i.e., the base station is to specify the LTU size table for the supplemental channels that are using the flexible rate feature). If this field is included, the base station shall set this field to '1' to indicate that the mobile station is to use the previously downloaded mapping between the channels and LTU Tables. The base station shall set this field to '0', if the following four fields are included in this message.~~
- 22                 FSCH0\_LTU\_TAB\_ID    -    Forward Supplemental Channel LTU ~~Size~~-Table ID.

1           If USE\_OLD\_LTU\_MAPPING is included and is equal to '0',  
 2           the base station shall include this field and set this field as  
 3           follows; otherwise, the base station shall omit this field:- If  
 4           this field is included, the The base station shall set this field  
 5           to the LTU Table ID to be used for the Forward Supplemental  
 6           Channel 0. The base station shall set this field to '000' to  
 7           indicate that the default number of LTUs sizes are to be used  
 8           (see [3]). (The default LTU size is not applicable to  
 9           supplemental channels with multiplex options that use  
 10          MuxPDU Type 5; see [3]). The base station shall set this field  
 11          to '000' if MuxPDU Type 5 is not used on this channel (see  
 12          [3]).

- 13
- 14
- 15        RSCH0\_LTU\_TAB\_ID    - Reverse Supplemental Channel LTU Size-Table ID.  
 16        If USE\_OLD\_LTU\_MAPPING is included and is equal to '0',  
 17        the base station shall include this field and set this field as  
 18        follows; otherwise, the base station shall omit this field:- If  
 19        this field is included, the The base station shall set this field  
 20        to the LTU Table ID to be used for the Reverse Supplemental  
 21        Channel 0. The base station shall set this field to '000' to  
 22        indicate that the default number of LTUs sizes are to be used  
 23        (see [3]). (The default LTU size is not applicable to  
 24        supplemental channels with multiplex options that use  
 25        MuxPDU Type 5; see [3]). The base station shall set this field  
 26        to '000' if MuxPDU Type 5 is not used on this channel (see  
 27        [3]).
- 28
- 29        FSCH1\_LTU\_TAB\_ID    - Forward Supplemental Channel LTU Size-Table ID.  
 30        If USE\_OLD\_LTU\_MAPPING is included and is equal to '0',  
 31        the base station shall include this field and set this field as  
 32        follows; otherwise, the base station shall omit this field:- If  
 33        this field is included, the The base station shall set this field to  
 34        the LTU Table ID to be used for the Forward Supplemental  
 35        Channel 1. The base station shall set this field to '000' to  
 36        indicate that the default number of LTUs sizes are to be used  
 37        (see [3]). (The default LTU size is not applicable to  
 38        supplemental channels with multiplex options that use  
 39        MuxPDU Type 5; see [3]). The base station shall set this field  
 40        to '000' if MuxPDU Type 5 is not used on this channel (see  
 41        [3]).
- 42
- 43        RSCH1\_LTU\_TAB\_ID    - Reverse Supplemental Channel LTU Size-Table ID.

If USE\_OLD\_LTU\_MAPPING is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field to the LTU Table ID to be used for the Reverse Supplemental Channel 1. The base station shall set this field to '000' to indicate that the default number of LTUs sizes are to be used (see [3]). (The default LTU size is not applicable to supplemental channels with multiplex options that use MuxPDU Type 5; see [3]). The base station shall set this field to '000' if MuxPDU Type 5 is not used on this channel (see [3]).

#### USE\_OLD

PARTITION\_TABLES\_INFO\_INCL - Use the previously downloaded Partition Tables information included indicator.

If USE\_FLEX\_NUM\_BITS is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

If Partition Tables information is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

The base station shall include this field only if USE\_FLEX\_NUM\_BITS is equal to '1' and at least one of FPCH\_NBIT\_TABLE\_ID, RFCH\_NBIT\_TABLE\_ID, FDCCCH\_NBIT\_TABLE\_ID, or RDCCCH\_NBIT\_TABLE\_ID is not equal to '0000'. If this field is included, the base station shall set this field to '1' to indicate that the mobile station is to use the previously downloaded Partition Table. The base station shall set this field to '0' if the fields related to downloading the Partition Table are included in this message.

PARTITION\_TABLES\_INCL - Partition Tables included indicator.

If PARTITION\_TABLES\_INFO\_INCL is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

If the Partition Tables are included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

If USE\_OLD\_PPARTITION\_TABLES\_INCL is included and is equal to '01', then the base station shall include the following fields

NUM-

PARTITION\_TABLES - Number of partition tables.

1           **If USE\_OLD\_PARTITION\_TABLE is equal to '0', then the base**  
 2           **station shall include this field. If this field is included, The**  
 3           **the** base station shall set this field to one less than the  
 4           number of Partition Tables corresponding to an FCH or DCCH  
 5           included in this message.

6       If **USE\_OLD\_PARTITION\_TABLES\_INCL** is included and is equal to '**01**', then the base  
 7       station shall include the NUM\_PARTITION\_TABLES + 1 occurrences of the following fields:

8       PARTITION\_TABLE\_ID   -   Partition Table ID.

9           The base station shall set this field to the ID of the Partition  
 10          Table that follows. **The base station shall not set this field to**  
 11          **'000'.**

12       NUM\_ROWS   -   Number of configurations associated with the Partition Table  
 13          identified by PARTITION\_TABLE\_ID.

14           The base station shall set this field to one less than the  
 15          number of rows of the Partition Table identified by  
 16          PARTITION\_TABLE\_ID.

17       If **USE\_OLD\_PARTITION\_TABLES\_INCL** is included and is equal to '**01**', then the base  
 18       station shall include NUM\_ROWS + 1 occurrences of the following fields:

19       CATEGORY   -   Category number.

20           The base station shall set this field to the category number of  
 21          the entry of the Partition Table identified by number of bits  
 22          per each service as specified below. The base station shall not  
 23          set this field to '00001' or '00010'. The base station shall  
 24          place rows of the Partition Table corresponding to the same  
 25          number of total information bits per frame consecutively. See  
 26          [3].

27       MUX\_HEADER\_LEN   -   Multiplex Sublayer Header Length.

28           The base station shall set this field to the length of the  
 29          multiplex sublayer header corresponding to the entry of the  
 30          Partition Table identified by number of bits per each service as  
 31          specified below.

32       MUX\_HEADER   -   Multiplex Sublayer Header.

33           The base station shall set this field to the multiplex sublayer  
 34          header corresponding to the entry of the Partition Table  
 35          identified by number of bits per each service as specified  
 36          below.<sup>7</sup>

---

<sup>7</sup> The values of the MUX HEADER corresponding to a specific number of bits per frame, shall be encoded using prefix-free codes. Prefix-free code is defined to be a code constructed so that any partial code word, beginning at the start of a code word but terminating prior to the end of that code word, is not a valid code word.

(footnote continued on next page)

1       NUM\_PARTITIONS   -   Number of partitions.  
 2                          The base station shall set this field to one less than the  
 3                          number of partitions corresponding to each service (including  
 4                          signaling) included in the entry of the Partition Table  
 5                          identified by CATEGORY.

6       If USE\_OLD\_PARTITION\_TABLES\_INCL is included and is equal to '10', then the base  
 7       station shall include NUM\_PARTITIONS + 1 occurrences of the following fields:

8                          SR\_ID   -   Service Reference ID.  
 9                          The base station shall set this field to the sr\_id of the service  
 10                         (sr\_id = '000' for signaling) present in this category.

11                         SRV\_NUM\_BITS   -   Number of bits allocated to the service.  
 12                         The base station shall set this field to the number of bits  
 13                         allocated to the service (including signaling) identified by  
 14                         SR\_ID.

15                         USE\_OLD-  
 16                         \_PART\_MAPPING   -   Use the previously downloaded mapping between the channels  
 17                         and Partition Tables.

18                         The base station shall include this field only if  
 19                         USE\_FLEX\_NUM\_BITS is equal to '1'  
 20                         PARTITION TABLES INFO INCL is equal to '1' and the base  
 21                         station shall set this field as follows; otherwise, the base  
 22                         station shall omit this field.

23                         and at least one of FFCH\_NBIT\_TABLE\_ID,  
 24                         RFCH\_NBIT\_TABLE\_ID, FDCCH\_NBIT\_TABLE\_ID, or  
 25                         RDCCH\_NBIT\_TABLE\_ID is not equal to '0000'. If this field is  
 26                         included, the The base station shall set this field to '1' to  
 27                         indicate that the mobile station is to use the previously  
 28                         downloaded mapping between the channels and Partition  
 29                         Tables. The base station shall set this field to '0', if the  
 30                         following four fields are included in this message.

31                         FFCH\_PART\_TAB\_ID   -   Forward Fundamental Channel Partition Table ID.  
 32                         If USE\_OLD\_PART\_MAPPING is included and is equal to '0',  
 33                         the base station shall include this field and set this field as  
 34                         follows; otherwise, the base station shall omit this field:

36                         . If this field is included, the The base station shall set this  
 37                         field to the Partition Table ID to be used for the Forward  
 38                         Fundamental Channel. The base station shall set this field to  
 39                         '000' to indicate that the default number of bits per service is

|    |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                   | to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than '000' if the FFCH_NBIT_TABLE_ID field <u>is included in this message and</u> is not set to '0000'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5  | RFCH_PART_TAB_ID  | - Reverse Fundamental Channel Partition Table ID.<br><br>If USE_OLD_PART_MAPPING is <u>included and is</u> equal to '0', the base station shall include this field <u>and set this field as follows; otherwise, the base station shall omit this field:</u><br><br><u>If this field is included, the</u> The base station shall set this field to the Partition Table ID to be used for the Reverse Fundamental Channel. The base station shall set this field to '000' to indicate that the default number of bits per service is to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than '000' if the RFCH_NBIT_TABLE_ID <u>is included in this message and</u> field is not set to '0000'.              |
| 17 | FDCCH_PART_TAB_ID | - Forward Dedicated Control Channel Partition Table ID.<br><br>If USE_OLD_PART_MAPPING is <u>included and is</u> equal to '0', the base station shall include this field <u>and set this field as follows; otherwise, the base station shall omit this field:</u><br><br><u>If this field is included, the</u> The base station shall set this field to the Partition Table ID to be used for the Forward Dedicated Control Channel. The base station shall set this field to '000' to indicate that the default number of bits per service is to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than '000' if the FDCCH_NBIT_TABLE_ID field <u>is included in this message and</u> is not set to '0000'. |
| 30 | RDCCH_PART_TAB_ID | - Reverse Dedicated Control Channel Partition Table ID.<br><br>If USE_OLD_PART_MAPPING is <u>included and is</u> equal to '0', the base station shall include this field <u>and set this field as follows; otherwise, the base station shall omit this field:</u><br><br><u>If this field is included, the</u> The base station shall set this field to the Partition Table ID to be used for the Reverse Dedicated Control Channel. The base station shall set this field to '000' to indicate that the default number of bits per service is to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than '000' if the RDCCH_NBIT_TABLE_ID field <u>is included in this message and</u>                       |

1                   is not set to '0000'.

2           RESERVED   -   Reserved bits.

3                   The base station shall add reserved bits as needed in order to  
4                   make the length of the entire record equal to an integer  
5                   number of octets. The base station shall set these bits to '0'.

1    3.7.5.21 Multiple Character Extended Display

2    This information record allows the network to supply supplementary service multiple  
3    character display information that may be displayed by the mobile station.

4

| Type-Specific Field | Length (bits) |
|---------------------|---------------|
| MC_EXT_DISPLAY_IND  | 1             |
| DISPLAY_TYPE        | 7             |

One or more occurrences of the following record:

|             |   |
|-------------|---|
| DISPLAY_TAG | 8 |
| NUM_RECORD  | 8 |

NUM\_RECORD occurrences of the following record if the  
DISPLAY\_TAG field is not equal to '10000000' or  
'10000001':

|                  |   |
|------------------|---|
| DISPLAY_ENCODING | 8 |
| NUM_FIELDS       | 8 |

NUM\_FIELDS occurrences of the following field:

|       |          |
|-------|----------|
| CHARi | Variable |
|-------|----------|

|          |                   |
|----------|-------------------|
| RESERVED | 0 - 7 (as needed) |
|----------|-------------------|

5

6    MC\_EXT\_DISPLAY\_IND    -    The indicator of Multiple Character Extended Display  
7    information record.

8                             The base station shall set this field to '1'.

9    DISPLAY\_TYPE    -    The type of display.

10                          The base station shall set this field to the DISPLAY\_TYPE  
11                          value shown in Table 3.7.5.16-1 corresponding to the type of  
12                          display, as defined in [8] Annex D.

13    DISPLAY\_TAG    -    The indicator of the display information.

14                          There are three types of display tags: mandatory control tags  
15                          (Blank and Skip), display text tags, and optional control tags,  
16                          see [8] Annex D.

17                          The base station shall set this field to the DISPLAY\_TAG value  
18                          shown in Table 3.7.5.16-2 corresponding to the type of  
19                          information contained in the following CHARi field, as defined  
20                          in [8] Annex D.

21    NUM\_RECORD    -    The number of records displaying.

22                          The base station shall set this field to the number of records  
23                          of display text.

1 DISPLAY\_ENCODING - Display encoding.

2 See [30].

3 Support of an encoding method does not imply that the entire  
4 encodable character set must be supported. In general, once  
5 the supported character set is determined, various subsets of  
6 the character set can be supported. If a message is comprised  
7 entirely of characters from a supported subset of a character  
8 set, it can be displayed. If a message contains an  
9 unsupported character of a character set, it can be discarded.

10 NUM\_FIELDS - Number of occurrences of the CHARi field.

11 The base station shall set this field to the number of  
12 characters included in this record.

13 CHARi - Character.

14 The base station shall include NUM\_FIELDS occurrences of  
15 this field, one for each character to be displayed, except for  
16 blank and skip.

17 RESERVED - Reserved bits.

18 The base station shall add reserved bits as needed in order to  
19 make the length of the entire record equal to an integer  
20 number of octets. The base station shall set these bits to '0'.

1    3.7.5.22 Call Waiting Indicator

2    This information record allows the base station to inform the mobile station that a call  
 3    waiting call is available. This indicator may be used to suppress the generation of the local  
 4    dial tone in mobile stations that provide locally generated dial tone.

5

| Type-Specific Field    | Length (bits) |
|------------------------|---------------|
| CALL_WAITING_INDICATOR | 1             |
| RESERVED               | 7             |

6

7    CALL\_WAITING-

- 8        \_INDICATOR    -    Call waiting indicator.  
 9                  The base station shall set this field to a '1' to indicate to the  
 10          mobile station that a call is waiting. The base station shall set  
 11          this field to a '0' if the call waiting call is not answered by the  
 12          mobile station and the call waiting call goes away.
- 13        RESERVED    -    Reserved bits.  
 14                  The base station shall set this field to '0000000'.

## 1    3.7.6 Information Elements

## 2    3.7.6.1 Pilot Record Type Specific Fields

3    If PILOT\_REC\_TYPE is equal to '000', the Pilot Record Type Specific fields include the  
 4    following fields:

5

| <b>Field</b>   | <b>Length (bits)</b> |
|----------------|----------------------|
| TD_POWER_LEVEL | 2                    |
| TD_MODE        | 2                    |
| RESERVED       | 4                    |

6

7    TD\_POWER\_LEVEL - TD transmit power level.

8                  The base station or mobile station shall set this field to the TD  
 9                  transmit power level relative to that of the Forward Pilot  
 10                 Channel, as specified in Table 3.7.6.1-1.

11

**Table 3.7.6.1-1. TD Transmit Power Level**

| <b>TD_POWER_LEVEL</b> | <b>Transmit Power Level</b>                            |
|-----------------------|--------------------------------------------------------|
| 00                    | 9 dB below the Forward Pilot<br>Channel transmit power |
| 01                    | 6 dB below the Forward Pilot<br>Channel transmit power |
| 10                    | 3 dB below the Forward Pilot<br>Channel transmit power |
| 11                    | Same as the Forward Pilot<br>Channel transmit power    |

12

13    TD\_MODE - Transmit Diversity mode.

14                  The base station or mobile station shall set this field to the  
 15                 Transmit Diversity mode, as specified in Table 3.7.6.1-2.

**Table 3.7.6.1-2. TD Mode**

| <b>TD_MODE</b> | <b>Descriptions</b>                      |
|----------------|------------------------------------------|
| 00             | OTD (Orthogonal Transmit Diversity) mode |
| 01             | STS (Space Time Spreading) mode          |
| 10-11          | Reserved                                 |

- RESERVED - Reserved bits.  
The base station or mobile station shall set this field to '000000'.

If PILOT\_REC\_TYPE is equal to '001', the base station or mobile station shall include the following fields:

| <b>Field</b>    | <b>Length (bits)</b> |
|-----------------|----------------------|
| QOF             | 2                    |
| WALSH_LENGTH    | 3                    |
| AUX_PILOT_WALSH | WALSH_LENGTH+6       |
| RESERVED        | 0 to 7 (as needed)   |

- QOF - Quasi-orthogonal function index.  
The base station or mobile station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]).
- WALSH\_LENGTH - Length of the Walsh Code.  
The base station or mobile station shall set this field to the WALSH\_LENGTH value shown in Table 3.7.6.1-3 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot.

**Table 3.7.6.1-3. Walsh Code Length**

| <b>WALSH_LENGTH<br/>(binary)</b> | <b>Length of the Walsh<br/>Code</b> |
|----------------------------------|-------------------------------------|
| '000'                            | 64                                  |
| '001'                            | 128                                 |
| '010'                            | 256                                 |
| '011'                            | 512                                 |
| '100' – '111'                    | Reserved                            |

- AUX\_PILOT\_WALSH - Walsh Code for the Auxiliary Pilot.  
The base station or mobile station shall set this field to the Walsh code corresponding to the Auxiliary pilot.
- RESERVED - Reserved bits.  
The base station or mobile station shall set all the bits of this field to '0' to make the entire record octet-aligned.
- If PILOT\_REC\_TYPE is equal to '010', the base station or mobile station shall include the following fields:

| <b>Field</b>       | <b>Length (bits)</b> |
|--------------------|----------------------|
| QOF                | 2                    |
| WALSH_LENGTH       | 3                    |
| AUX_WALSH          | WALSH_LENGTH+6       |
| AUX_TD_POWER_LEVEL | 2                    |
| TD_MODE            | 2                    |
| RESERVED           | 0 to 7 (as needed)   |

- QOF - Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot.  
The base station or mobile station shall set this field to the index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2 of [2]).
- WALSH\_LENGTH - Length of the Walsh code.  
The base station or mobile station shall set this field to the WALSH\_LENGTH value shown in 3.7.6.1-3 corresponding to the length of the Walsh code for the pilots that are used as Auxiliary pilot in the transmit diversity mode.
- AUX\_WALSH - Walsh Code for the Auxiliary Pilot.

The base station or mobile station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

AUX\_TD-

## \_POWER\_LEVEL

- Auxiliary Transmit Diversity Pilot Power Level.

The base station or mobile station shall set this field to the Auxiliary Transmit Diversity Pilot transmit power level relative to that of the Auxiliary Pilot as specified in Table 3.7.6.1-4.

**Table 3.7.6.1-4. Auxiliary Transmit Diversity Pilot Transmit Power Level**

| <b>AUX_TD_POWER_LEVEL</b> | <b>Transmit Power Level</b>                           |
|---------------------------|-------------------------------------------------------|
| 00                        | 9 dB below the Auxiliary Pilot Channel transmit power |
| 01                        | 6 dB below the Auxiliary Pilot Channel transmit power |
| 10                        | 3 dB below the Auxiliary Pilot Channel transmit power |
| 11                        | Same as the Auxiliary Pilot Channel transmit power    |

## TD MODE

- Transmit Diversity mode.

The base station or mobile station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.6.1-2.

**RESERVED**

- Reserved bits.

The base station or mobile station shall set all the bits of this field to '0' to make the entire record octet-aligned.

If PILOT\_REC\_TYPE is equal to '011', the base station or mobile station shall include the following fields:

| <b>Field</b>      | <b>Length (bits)</b> |
|-------------------|----------------------|
| SR3_PRIMARY_PILOT | 2                    |
| SR3_PILOT_POWER1  | 3                    |
| SR3_PILOT_POWER2  | 3                    |

SR3 PRIMARY PILOT

- Primary SR3 pilot.

The base station or mobile station shall set this field to the value shown in Table 3.7.6.1-5 corresponding to the position of the primary SR3 pilot.

**Table 3.7.6.1-5. The Position of the Primary SR3 Pilot**

| <b>SR3_PRIMARY_PILOT<br/>(Binary)</b> | <b>Position</b>                                   |
|---------------------------------------|---------------------------------------------------|
| 00                                    | The primary pilot is on the lowest SR3 frequency  |
| 01                                    | The primary pilot is on the center SR3 frequency  |
| 10                                    | The primary pilot is on the highest SR3 frequency |
| 11                                    | Reserved                                          |

- SR3\_PILOT\_POWER1
- The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station or mobile station shall set this field to the value shown in Table 3.7.6.1-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

**Table 3.7.6.1-6. Pilot Transmission Power**

| <b>SR3_PILOT_POWER1,<br/>SR3_PILOT_POWER2<br/>(Binary)</b> | <b>Relative Transmission Power</b> |
|------------------------------------------------------------|------------------------------------|
| 000                                                        | 0dB                                |
| 001                                                        | 1dB                                |
| 010                                                        | 2dB                                |
| 011                                                        | 3dB                                |
| 100                                                        | 4dB                                |
| 101                                                        | 5dB                                |
| 110                                                        | 6dB                                |
| 111                                                        | 7dB                                |

- SR3\_PILOT\_POWER2
- The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

The base station or mobile station shall set this field to the value shown in Table 3.7.6.1-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

1

2 If PILOT\_REC\_TYPE is equal to '100', the base station or mobile station shall include the  
 3 following fields:

4

| <b>Field</b>      | <b>Length (bits)</b>    |
|-------------------|-------------------------|
| SR3_PRIMARY_PILOT | 2                       |
| SR3_PILOT_POWER1  | 3                       |
| SR3_PILOT_POWER2  | 3                       |
| QOF               | 2                       |
| WALSH_LENGTH      | 3                       |
| AUX_PILOT_WALSH   | WALSH_LENGTH+6          |
| ADD_INFO_INCL1    | 1                       |
| QOF1              | 0 or 2                  |
| WALSH_LENGTH1     | 0 or 3                  |
| AUX_PILOT_WALSH1  | 0 or<br>WALSH_LENGTH1+6 |
| ADD_INFO_INCL2    | 1                       |
| QOF2              | 0 or 2                  |
| WALSH_LENGTH2     | 0 or 3                  |
| AUX_PILOT_WALSH2  | 0 or<br>WALSH_LENGTH2+6 |
| RESERVED          | 0 – 7 (as needed)       |

5

- 6 SR3\_PRIMARY\_PILOT – Primary SR3 pilot.  
 7 The base station or mobile station shall set this field to the  
 8 value shown in Table 3.7.6.1-5 corresponding to the position  
 9 of the primary SR3 pilot.
- 10 SR3\_PILOT\_POWER1 – The primary SR3 pilot power level relative to that of the pilot  
 11 on the lower frequency of the two remaining SR3 frequencies.  
 12 The base station or mobile station shall set this field to the  
 13 value shown in Table 3.7.6.1-6 corresponding to the power  
 14 level of the primary pilot with respect to the pilot on the lower  
 15 frequency of the two remaining SR3 frequencies.
- 16 SR3\_PILOT\_POWER2 – The primary SR3 pilot power level relative to that of the pilot  
 17 on the higher frequency of the two remaining SR3 frequencies.  
 18 The base station or mobile station shall set this field to the  
 19 value shown in Table 3.7.6.1-6 corresponding to the power  
 20 level of the primary pilot with respect to the pilot on the  
 21 higher frequency of the two remaining SR3 frequencies.

- 1                   QOF     - Quasi-orthogonal function index.  
 2                   The base station or mobile station shall set this field to the  
 3                   index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2  
 4                   of [2]) on the frequency of the primary pilot.
- 5                   WALSH\_LENGTH     - Length of the Walsh Code.  
 6                   The base station or mobile station shall set this field to the  
 7                   WALSH\_LENGTH value shown in Table 3.7.6.1-3  
 8                   corresponding to the length of the Walsh code for the pilot  
 9                   that is used as the Auxiliary pilot on the frequency of the  
 10                  primary pilot.
- 11                  AUX\_PILOT\_WALSH     - Walsh Code for the Auxiliary Pilot.  
 12                  The base station or mobile station shall set this field to the  
 13                  Walsh code corresponding to the Auxiliary pilot on the  
 14                  frequency of the primary pilot.
- 15                  ADD\_INFO\_INCL1     - Additional information included for the pilot on the lower  
 16                  frequency of the two remaining SR3 frequencies.  
 17                  If the additional information for the pilot on the lower  
 18                  frequencies of the two remaining SR3 frequencies is the same  
 19                  as pilot on the primary frequency, the base station or mobile  
 20                  station shall set this field to '0'; otherwise, the base station or  
 21                  mobile station shall set this field to '1'.
- 22                  QOF1     - Quasi-orthogonal function index for the pilot on the lower  
 23                  frequency of the two remaining SR3 frequencies.  
 24                  If ADD\_INFO\_INCL1 is set to '0', the base station or mobile  
 25                  station shall omit this field; otherwise, the base station or  
 26                  mobile station shall set this field as follows:  
 27                  The base station or mobile station shall set this field to the  
 28                  index of the Quasi-orthogonal function (see Table 3.1.3.1.12-2  
 29                  of [2]) on the lower frequency of the two remaining SR3  
 30                  frequencies.
- 31                  WALSH\_LENGTH1     - Length of the Walsh Code for the pilot on the lower frequency  
 32                  of the two remaining SR3 frequencies.  
 33                  If ADD\_INFO\_INCL1 is set to '0', the base station or mobile  
 34                  station shall omit this field; otherwise, the base station or  
 35                  mobile station shall set this field as follows:  
 36                  The base station or mobile station shall set this field to the  
 37                  WALSH\_LENGTH value shown in Table 3.7.6.1-3  
 38                  corresponding to the length of the Walsh code for the pilot  
 39                  that is used as the Auxiliary pilot on the lower frequency of  
 40                  the two remaining SR3 frequencies.
- 41                  AUX\_PILOT\_WALSH1     - Walsh Code for the Auxiliary Pilot on the lower frequency of  
 42                  the two remaining SR3 frequencies.  
 43                  If ADD\_INFO\_INCL1 is set to '0', the base station or mobile  
 44                  station shall omit this field; otherwise, the base station or  
 45                  mobile station shall set this field as follows:

|    |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  |                  | The base station or mobile station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.                                                                                                                                                                                                                                                                                                                                                                                             |
| 2  |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3  |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4  | ADD_INFO_INCL2   | - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.<br><br>If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station or mobile station shall set this field to '0'; otherwise, the base station or mobile station shall set this field to '1'.                                                                                                                                               |

1   **ANNEX B CDMA CALL FLOW EXAMPLES**

2   This is an informative annex which contains examples of call flow. The diagrams follow  
 3   these conventions:

- 4     • All messages are received without error
- 5     • Receipt of messages is not shown except in the handoff examples
- 6     • Acknowledgments are not shown
- 7     • Optional authentication procedures are not shown
- 8     • Optional private long code transitions are not shown

9   For the call flow diagrams B-22 through B-31, the following conventions hold:

- 10    • The following message acronyms are defined:

11      ERRM: Extended Release Response Message

12      ERRMM: Extended Release Response Mini Message

13      RRM: Resource Request Message

14      RRMM: Resource Request Mini Message

15      RRRM: Resource Release Request Message

16      RRRMM: Resource Release Request Mini Message

17      SreqM: Service Request Message

18      SCRM: Supplemental Channel Request Message

19      SCRMM: Supplemental Channel Request Mini Message

20      ERM: Extended Release Message

21      ERMM: Extended Release Mini Message

22      RAM: Resource Allocation Message

23      RAMM: Resource Allocation Mini Message

24      SCM: Service Connect Message

25      GHDM: General Handoff Direction Message

26      UHDM: Universal Handoff Direction Message

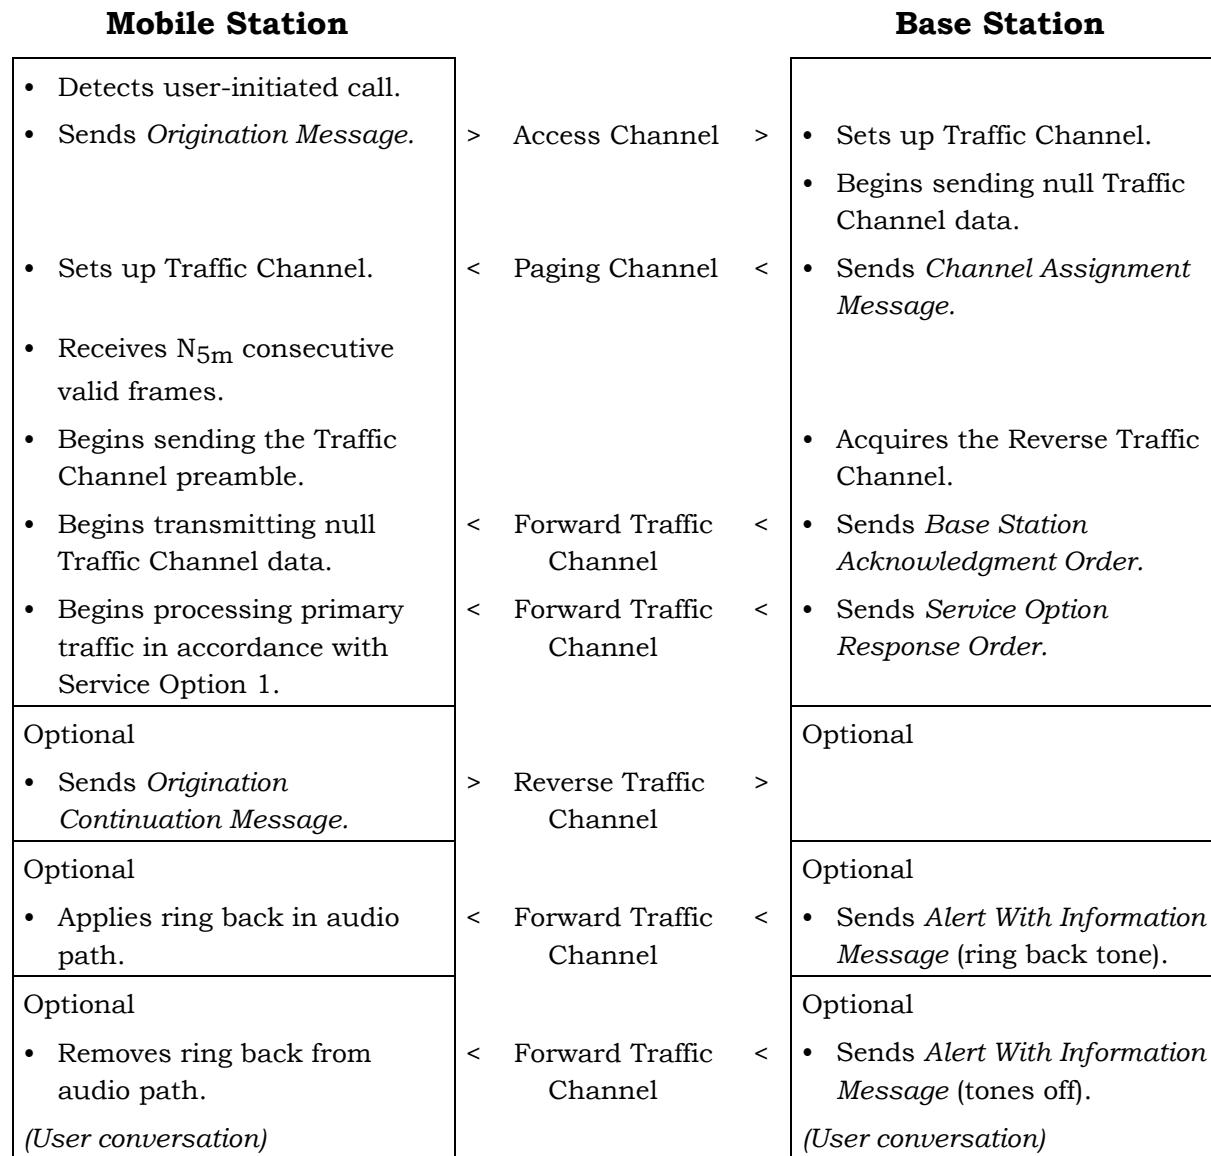

27      ESCAM: Extended Supplemental Channel Assignment Message

28      FSCAMM: Forward Supplemental Channel Assignment Mini Message

1 RSCAMM: Reverse Supplemental Channel Assignment Mini Message

2 HCM: (Extended) Handoff Complete Message

3

4 **Figure B-1A. Simple Call Flow, Mobile Station Origination Example Using  
5 Service Option Negotiation with Service Option 1**

**Figure B-9. PACA Call Processing (Part 2 of 2)**

Figure B-10 illustrates call processing operations for failure recovery for hard handoff on the same frequency. Figure B-11 illustrates call flow for failure recovery for inter-frequency handoff when the mobile station does not search the Candidate Frequency. Figures B-12 and B-13 show the call flow for mobile-assisted inter-frequency handoff (handoff preceded by searching of the Candidate Frequency Search Set by the mobile station), where the search is started by using the *Candidate Frequency Search Control Message*. Figures B-14 and B-15 illustrate call flow for inter-frequency handoff when failure recovery also includes searching the Candidate Frequency Search Set. In the periodic search examples (Figures B-13 and B-15), it is assumed that the mobile station performs a search of the Candidate Frequency Search Set in a single visit to the Candidate Frequency. Figures B-16 and B-17 illustrate the interaction of inter-frequency handoff operations with an ongoing periodic search of the Candidate Frequency Search Set.

**Mobile Station***(Continued from previous page)*

- Receives *General Handoff Direction Message*.  
Disables periodic search timer.  
Saves current configuration.  
Discontinues use of serving Active Set.
- Tunes to F2.  
Attempts to hand off to target Active Set.

*(Handoff attempt succeeds)**(Starts transmitting on Reverse Traffic Channel on F2)*

- Sends *Handoff Completion Message*.

*(Continues communication on F2)***Base Station***(Continued from previous page)*

- < Forward Traffic Channel on F1 <
- Sends *General Handoff Direction Message*  
(RETURN\_IF\_HO\_FAIL = '1'; Target Frequency = F2).

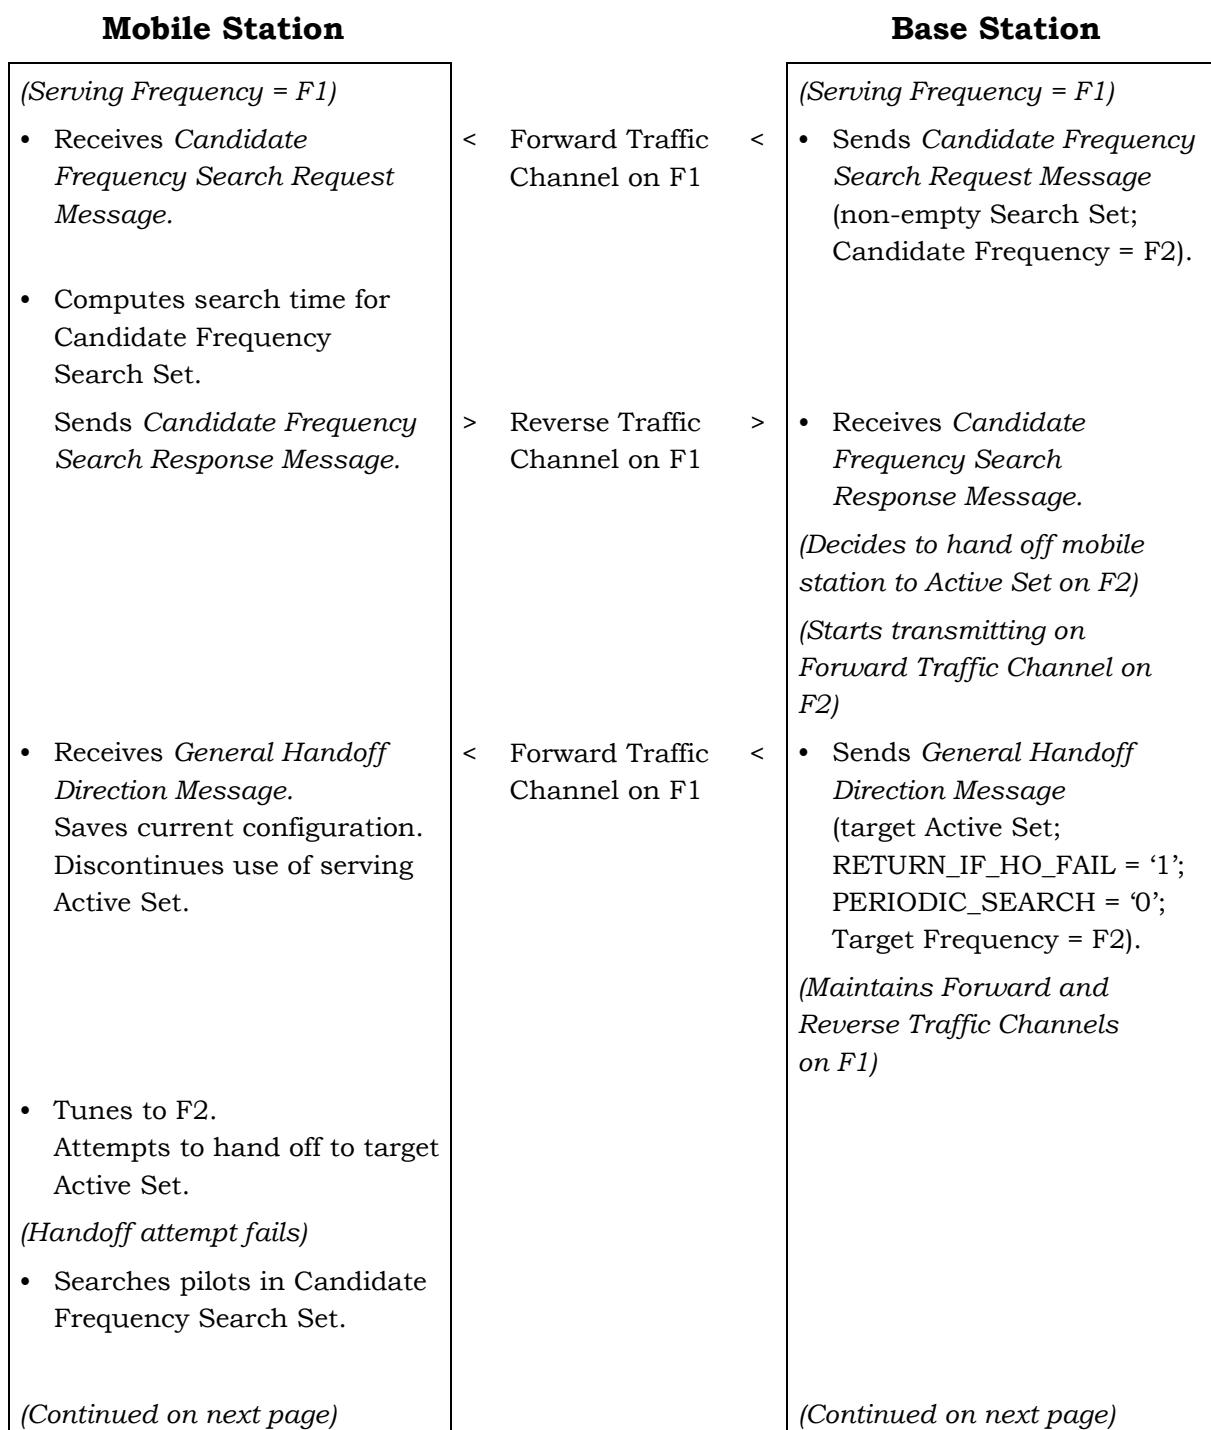

*(Maintains Forward and Reverse Traffic Channels on F1)*

- > Reverse Traffic Channel on F2 >
- Receives *Handoff Completion Message*.

*(Discontinues use of Active Set on F1)**(Continues communication on F2)*

**1 ANNEX C RESERVED**

1 No text.

1    **ANNEX D CDMA CONSTANTS**

2    Annex D is a normative annex which contains tables that give specific values for the  
 3    constant identifiers. These identifiers take the forms such as  $T_{20m}$  and  $N_{5m}$ . The  
 4    subscripted numbers vary to identify the particular constant. Typically the subscripted  
 5    letter "m" refers to the mobile station and the subscripted letter "b" refers to the base  
 6    station. The following tables provide values for identifiers given in the text:

7       Table D-1. Time Limits

8       Table D-2. Other Constants

9

10    **Table D-1. Time Limits (Part 1 of 5)**

| <b>Time Limit</b> | <b>Description</b>                                                                                                 | <b>Value</b> | <b>References</b> |
|-------------------|--------------------------------------------------------------------------------------------------------------------|--------------|-------------------|
| $T_{5m}$          | Limit of the Forward Traffic Channel fade timer                                                                    | 5 s          | 2.6.4.1.8         |
| $T_{20m}$         | Maximum time to remain in the <i>Pilot Channel Acquisition Substate of the Mobile Station Initialization State</i> | 15 s         | 2.6.1.2           |
| $T_{21m}$         | Maximum time to receive a valid Sync Channel message                                                               | 1 s          | 2.6.1.3           |
| $T_{30m}$         | Maximum time to receive a valid Paging Channel or Forward Common Control Channel/Broadcast Control Channel message | 3 s          | 2.6.2.1.1.1       |
| $T_{31m}$         | Maximum time for which configuration parameters are considered valid                                               | 600 s        | 2.6.2.2           |

**Table D-1. Time Limits (Part 2 of 5)**

| <b>Time Limit</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                      | <b>Value</b> | <b>References</b>                          |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------------------------|
| T <sub>32m</sub>  | Maximum time to enter the <i>Update Overhead Information Substate</i> of the <i>System Access State</i> to respond to an <i>SSD Update Message</i> , <i>Base Station Challenge Confirmation Order</i> , and <i>Authentication Challenge Message</i>                                                                                     | 5 s          | 2.6.2.4<br>2.6.4                           |
| T <sub>33m</sub>  | Maximum time to enter the <i>Update Overhead Information Substate</i> of the <i>System Access State</i> (except in response to authentication messages)                                                                                                                                                                                 | 0.3 s        | 2.6.2<br>2.6.5.5.2.3                       |
| T <sub>34m</sub>  | Maximum time to enter the <i>Update Overhead Information Substate</i> or the <i>Mobile Station Idle State</i> after receiving a <i>Channel Assignment Message</i> with <i>ASSIGN_MODE<sub>r</sub></i> equal to '001' or '101' <i>or Extended Channel Assignment Message with ASSIGN_MODE<sub>r</sub> equal to '001'</i>                 | 3 s          | 2.6.3.3                                    |
| T <sub>40m</sub>  | Maximum time to receive a valid Paging Channel or Forward Common Control Channel/Broadcast Control Channel message before aborting an access attempt (see T <sub>72m</sub> )                                                                                                                                                            | 3 s          | 2.6.3.1.8                                  |
| T <sub>41m</sub>  | Maximum time to obtain updated overhead messages arriving on the Paging Channel or Broadcast Control Channel                                                                                                                                                                                                                            | 4 s          | 2.6.3.2                                    |
| T <sub>42m</sub>  | Maximum time to receive a delayed <i>Layer 3</i> response following the receipt of an acknowledgment for an access probe in the <i>System Access State</i> .<br><br>The maximum time to receive a <i>Layer 3</i> response to an <i>Enhanced Origination Message</i> on the <i>Mobile Station Control on the Traffic Channel State</i> . | 12 s         | 2.6.3.1.1.2<br>2.6.3.3<br>2.6.3.5<br>2.6.4 |
| T <sub>50m</sub>  | Maximum time to obtain N <sub>5m</sub> consecutive good Forward Traffic Channel frames when in the <i>Traffic Channel Initialization Substate</i> of the <i>Mobile Station Control on the Traffic Channel State</i>                                                                                                                     | 1 s          | 2.6.4.2                                    |
| T <sub>51m</sub>  | Maximum time for the mobile station to receive a <i>Base Station Acknowledgment Order</i> after the first occurrence of receiving N <sub>5m</sub> consecutive good frames when in the <i>Traffic Channel Initialization Substate</i> of the <i>Mobile Station Control on the Traffic Channel State</i>                                  | 2 s          | 2.6.4.2                                    |

|                  |                                                                                                                                                                                |     |            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------------|
| T <sub>52m</sub> | Maximum time to receive a message in the <i>Waiting for Order Substate</i> of the Call Control processing that transits Call Control instance to a different substate or state | 5 s | 2.6.10.1.1 |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------------|

**Table D-1. Time Limits (Part 3 of 5)**

| <b>Time Limit</b> | <b>Description</b>                                                                                                                                                                                   | <b>Value</b> | <b>References</b>        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------|
| T <sub>53m</sub>  | Maximum time to receive a message in the <i>Waiting for Mobile Station Answer Substate</i> of Call Control processing that transits the Call Control instance to a different substate or state       | 65 s         | 2.6.10.1.2               |
| T <sub>54m</sub>  | Maximum time for the Call Control instance to send an <i>Origination Continuation Message</i> upon entering the <i>Conversation Substate</i>                                                         | 0.2 s        | 2.6.10.2                 |
| T <sub>55m</sub>  | Maximum time to receive a message in the <i>Release Substate</i> of the <i>Mobile Station Control on the Traffic Channel State</i> that transits the mobile station to a different substate or state | 2 s          | 2.6.4.5                  |
| T <sub>56m</sub>  | Default maximum time to respond to a received message or order on the Forward Traffic Channel                                                                                                        | 0.2 s        | 2.6.4<br>2.6.6           |
| T <sub>57m</sub>  | Limit of the power-up registration timer                                                                                                                                                             | 20 s         | 2.6.5.1.1<br>2.6.5.5.1.3 |
| T <sub>58m</sub>  | Maximum time for the mobile station to respond to a service option request                                                                                                                           | 5 s          | 2.6.4.1.2.2              |
| T <sub>59m</sub>  | Maximum time for the mobile station to respond to a <i>Service Request Message</i> or a <i>Service Response Message</i>                                                                              | 5 s          | 2.6.4.1.2.2              |
| T <sub>60m</sub>  | Maximum time to execute a hard handoff without return on failure involving a new frequency assignment using the same base station                                                                    | 0.06 s       | 2.6.6.2.8.1              |
| T <sub>61m</sub>  | Maximum time to execute a hard handoff without return on failure involving a new frequency assignment using a different base station                                                                 | 0.08 s       | 2.6.6.2.8.1              |

**Table D-1. Time Limits (Part 4 of 5)**

| <b>Time Limit</b> | <b>Description</b>                                                                                                                                                                                                                                                                           | <b>Value</b> | <b>References</b>              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------------|
| T <sub>62m</sub>  | Maximum time to execute a hard handoff without return on failure involving the same frequency assignment                                                                                                                                                                                     | 0.02 s       | 2.6.6.2.8.1                    |
| T <sub>63m</sub>  | Maximum time to execute a CDMA-to-Analog handoff                                                                                                                                                                                                                                             | 0.1 s        | 2.6.6.2.9                      |
| T <sub>64m</sub>  | Maximum time to wait for a <i>Base Station Challenge Confirmation Order</i>                                                                                                                                                                                                                  | 10 s         | 2.3.12.1.5                     |
| T <sub>65m</sub>  | Maximum time for the mobile station to wait for a <i>Service Connect Message</i> while the <i>Waiting for Service Connect Message Subfunction</i> is active                                                                                                                                  | 5 s          | 2.6.4.1.2.2.4                  |
| T <sub>66m</sub>  | Maximum time for the mobile station to delete the TMSI after TMSI expiration time has exceeded the System Time                                                                                                                                                                               | 200 s        | 2.6.2                          |
| T <sub>68m</sub>  | Maximum time for the mobile station to wait for a <i>Service Request Message</i> , <i>Service Response Message</i> , or <i>Service Connect Message</i> while the <i>Waiting for Service Request Message Subfunction</i> or <i>Waiting for Service Response Message Subfunction</i> is active | 5 s          | 2.6.4.1.2.2.2<br>2.6.4.1.2.2.3 |
| T <sub>69m</sub>  | Fixed portion of the full-TMSI timer                                                                                                                                                                                                                                                         | 24 s         | 2.6.3.1.6                      |
| T <sub>70m</sub>  | Maximum time between the mobile station's obtaining a measurement and sending a <i>Candidate Frequency Search Report Message</i> which contains that measurement                                                                                                                             | 0.8 s        | 2.6.6.2.8.3<br>2.6.6.2.10      |
| T <sub>71m</sub>  | Maximum time for the mobile station to send a <i>Candidate Frequency Search Report Message</i> after completing a search                                                                                                                                                                     | 0.04 s       | 2.6.6.2.8.3                    |
| T <sub>72m</sub>  | Maximum time to receive a valid Paging Channel or Forward Common Control Channel/Broadcast Control Channel message before aborting an access attempt, when there exists at least one access handoff candidate pilot for the access attempt (see also T <sub>40m</sub> )                      | 1 s          | 2.6.3.1.8                      |
| T <sub>73m</sub>  | Maximum time for the mobile station to send a <i>Handoff Completion Message</i> after the action time of a received handoff message directing the mobile station to perform a hard handoff without return on failure                                                                         | 0.3s         | 2.6.6.2.5.2                    |
| T <sub>74m</sub>  | Default value of the slotted timer                                                                                                                                                                                                                                                           | 0.0s         | 2.6.4.2                        |

1   **ANNEX E CDMA RETRIEVABLE AND SETTABLE PARAMETERS**

2   This is a normative annex which describes the parameters that can be retrieved and set in  
3   the mobile station using the *Retrieve Parameters Message*, the *Parameters Response*  
4   *Message*, and the *Set Parameters Message*.

5   PARAMETER\_ID values from 0 through 32767 are reserved for definition by this standard  
6   and shall not be defined by mobile station manufacturers. PARAMETER\_ID values from  
7   32768 through 65535 may be defined by mobile station manufacturers.

**Table E-1. Retrievable and Settable Parameters (Part 1 of 19)**

1   **ANNEX F MOBILE STATION DATABASE**

2   **F.1 Introduction**

3   This is an informative annex which lists the numeric indicators that are described by this  
4   document and stored in the mobile station's permanent or semi-permanent memory. Some  
5   of these indicators are required; other indicators are optional and are so noted.

6   The indicators are organized in this annex according to two categories:

- 7       • Mobile station indicators   These indicators are global to the mobile station and  
8                                          independent of the mobile station's NAMs.
- 9       • NAM indicators              These indicators specify parameters associated with the  
10                                         mobile station's NAM.

11   The description of each indicator below includes the indicator's name, the number of bits it  
12   contains, and the section in this document where it is defined. Permanent indicators are  
13   denoted by the "p" subscript; semi-permanent indicators are denoted by the "s-p"  
14   subscript.

1   **F.2 Mobile Station Indicators**

2   Mobile station indicators are organized into permanent mobile station indicators and semi-  
3   permanent mobile station indicators.

4   F.2.1 Permanent Mobile Station Indicators

5   Permanent mobile station indicators specify physical station configuration and attributes,  
6   independent of NAM. The indicators are listed in Table F.2.1-1.

7

8   **Table F.2.1-1. Permanent Mobile Station Indicators**

| <b>Indicator</b>               | <b>Number of Bits</b> | <b>Where Defined</b> | <b>Notes</b>                                                                                           |
|--------------------------------|-----------------------|----------------------|--------------------------------------------------------------------------------------------------------|

9

1 F.2.2 Semi-permanent Mobile Station Indicators

2 Semi-permanent mobile station indicators are retained when the mobile station power is  
 3 turned off. These indicators are associated with mobile station registration and lock. They  
 4 are independent of the NAM in use. CDMA indicators are listed in Table F.2.2-1.

5

6 **Table F.2.2-1. CDMA Semi-permanent Mobile Station Indicators**

**ANNEX G CDMA EXTENDED ENCRYPTION CALL FLOW EXAMPLES**

This is an informative annex, which contains examples of extended encryption call flow.  
The diagrams follow these conventions:

- All messages are received without error
- Acknowledgments are not shown

For all the call flow diagrams, the following conventions hold:

- The following message acronyms are defined:

RGM: Registration Message

ORM: Origination Message

CAM: Channel Assignment Message

ECAM: Extended Channel Assignment Message

SMCM: Security Mode Command Message

- The following short forms are defined:

enc.k1: encrypt the message with key k1

csch enc req: C SIG ENCRYPT REQ

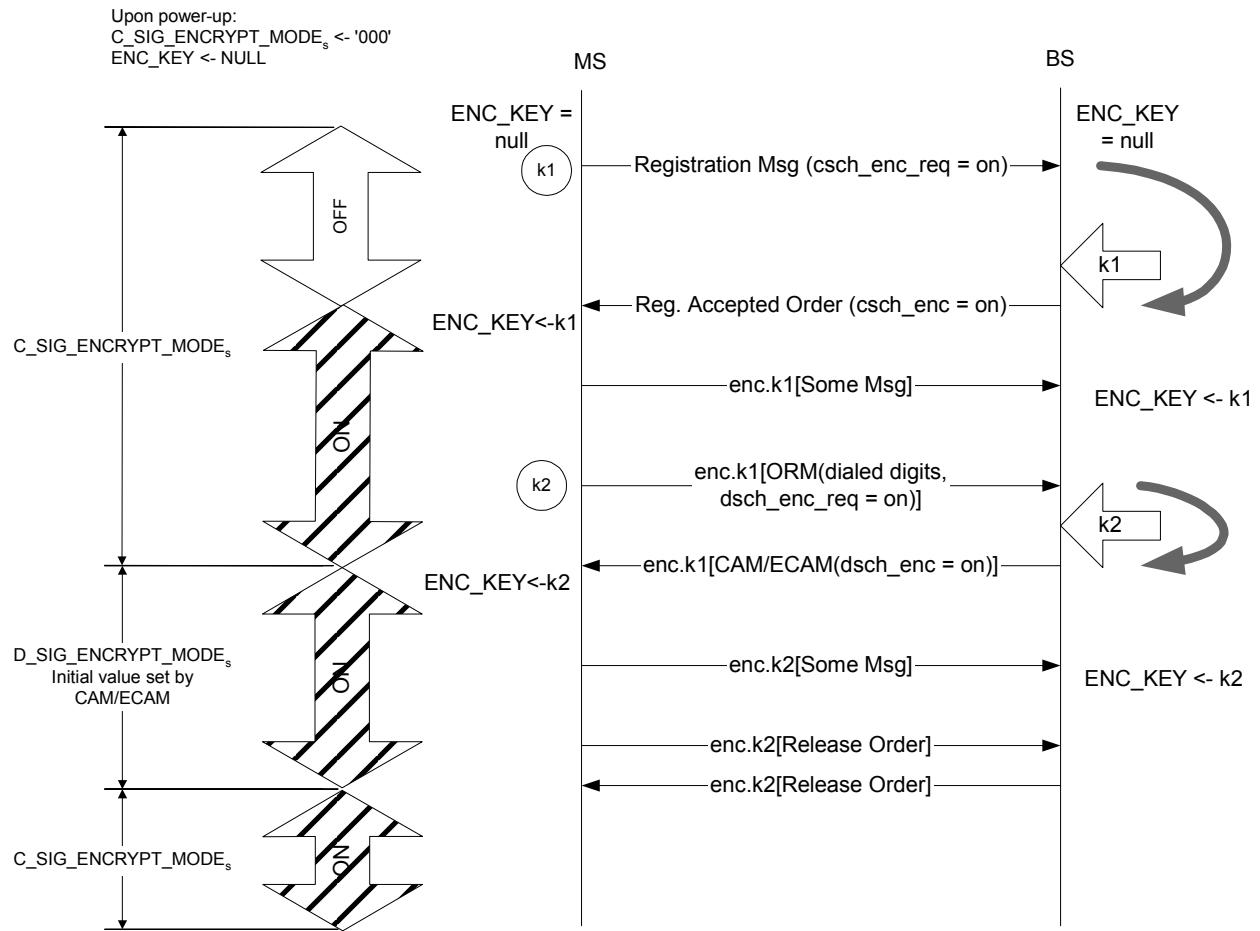

dsch enc req: D SIG ENCRYPT REQS

csch enc: C SIG ENCRYPT MODE

dsch enc: D SIG ENCRYPT MODE

A <- B: assign value B to variable A

20

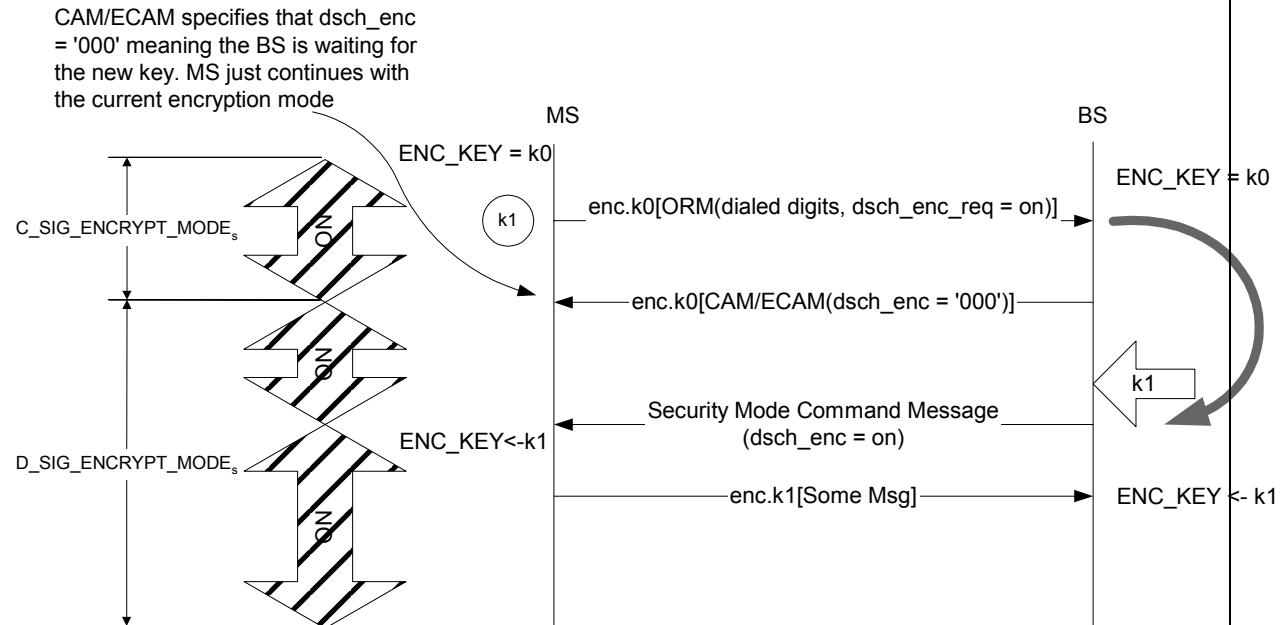

= successful key exchange

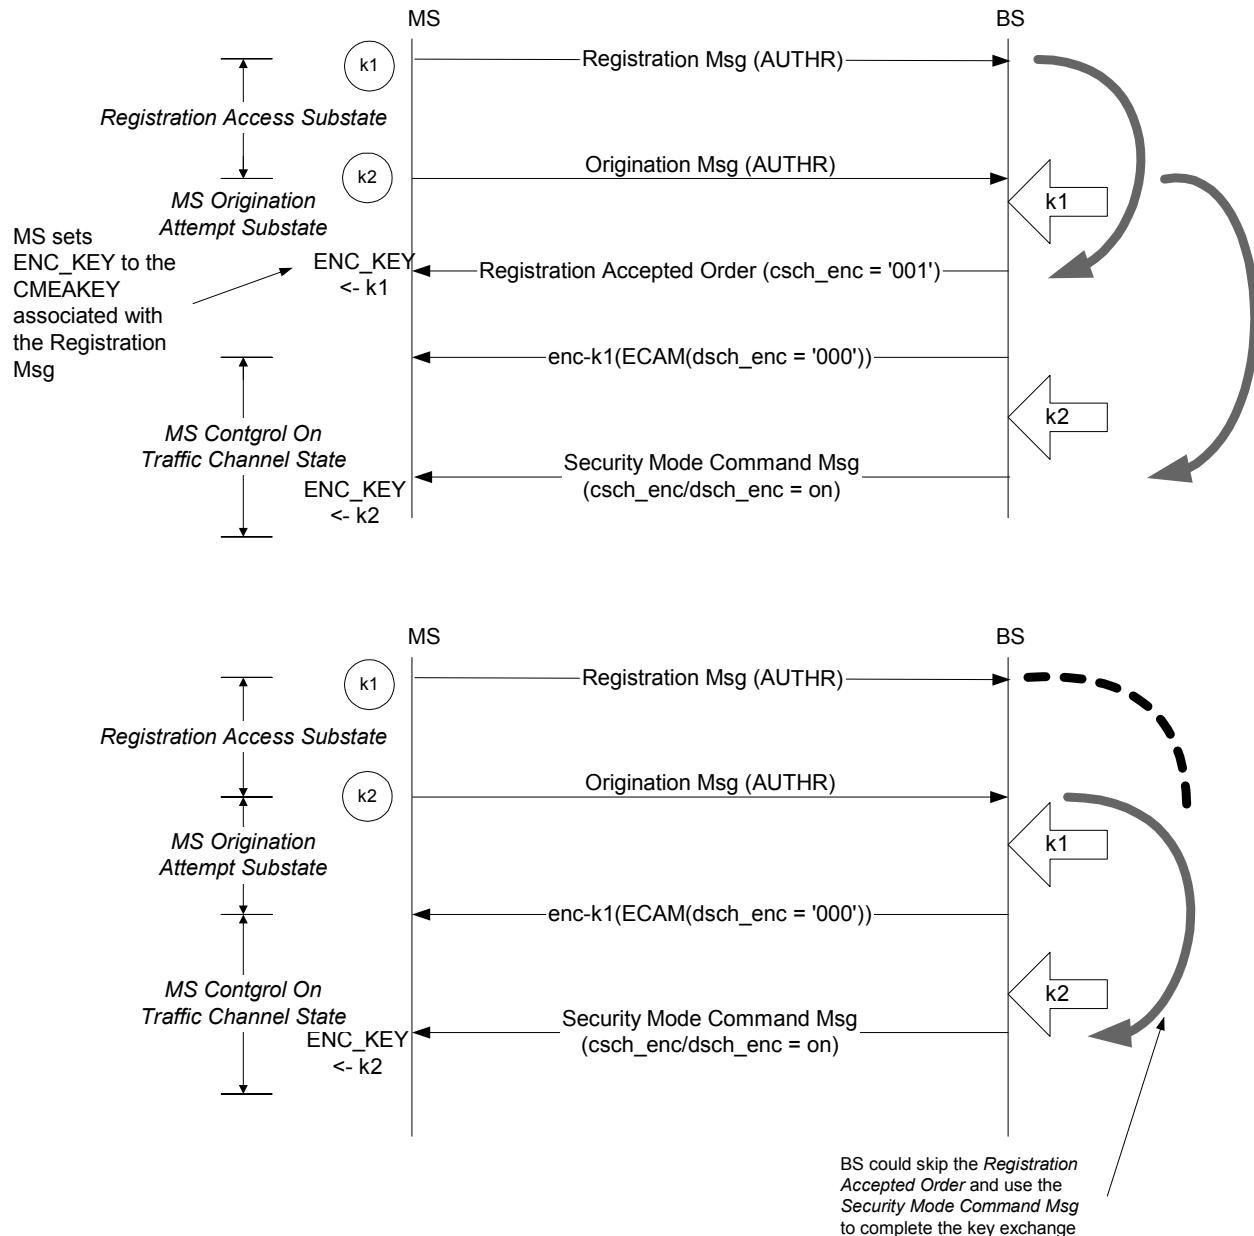

= unsuccessful key exchange

k = CMEKEY generated in MS

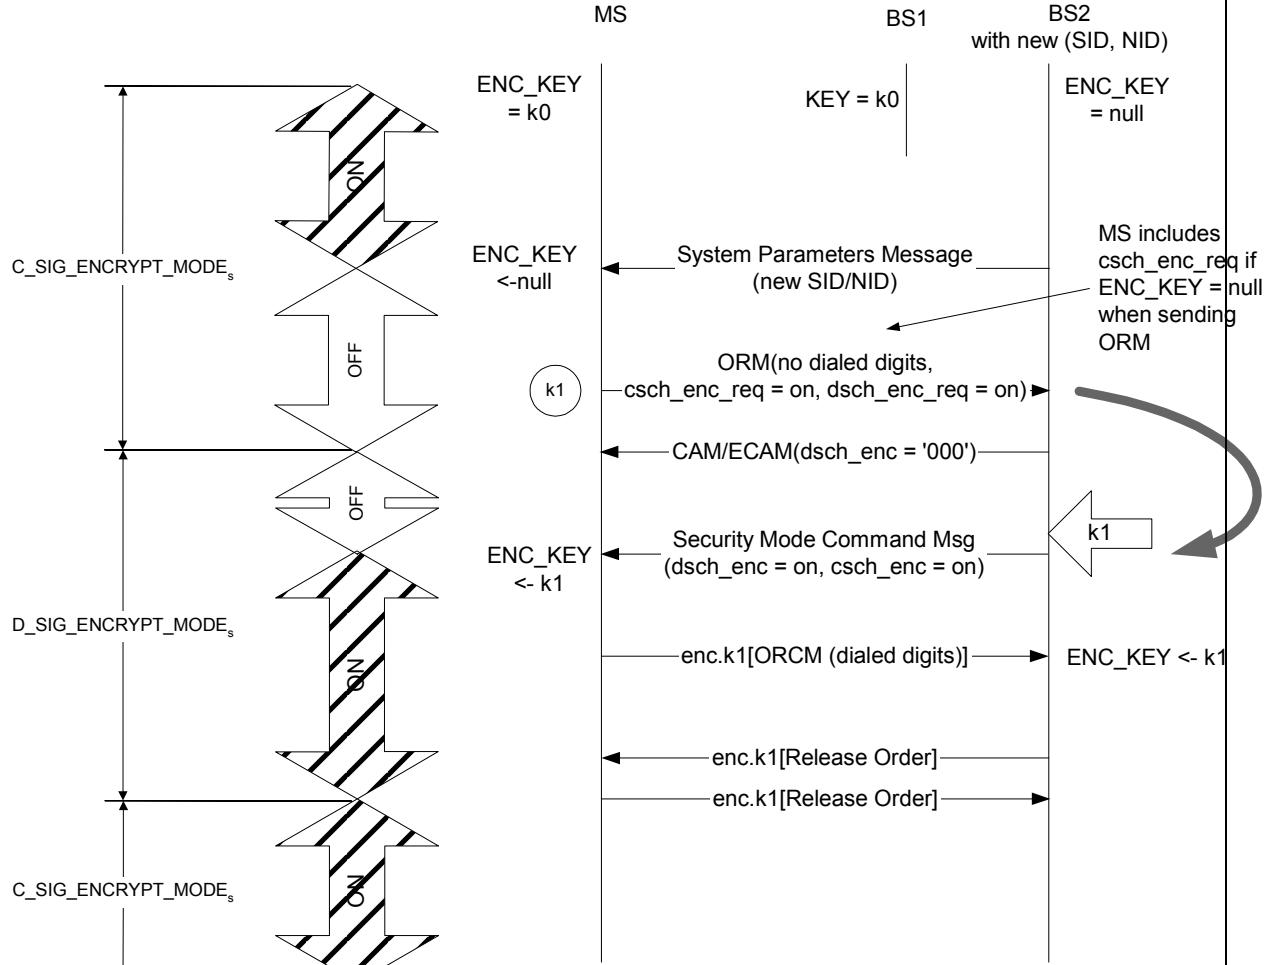

CMEAKEY obtained  
from VLR or AuC

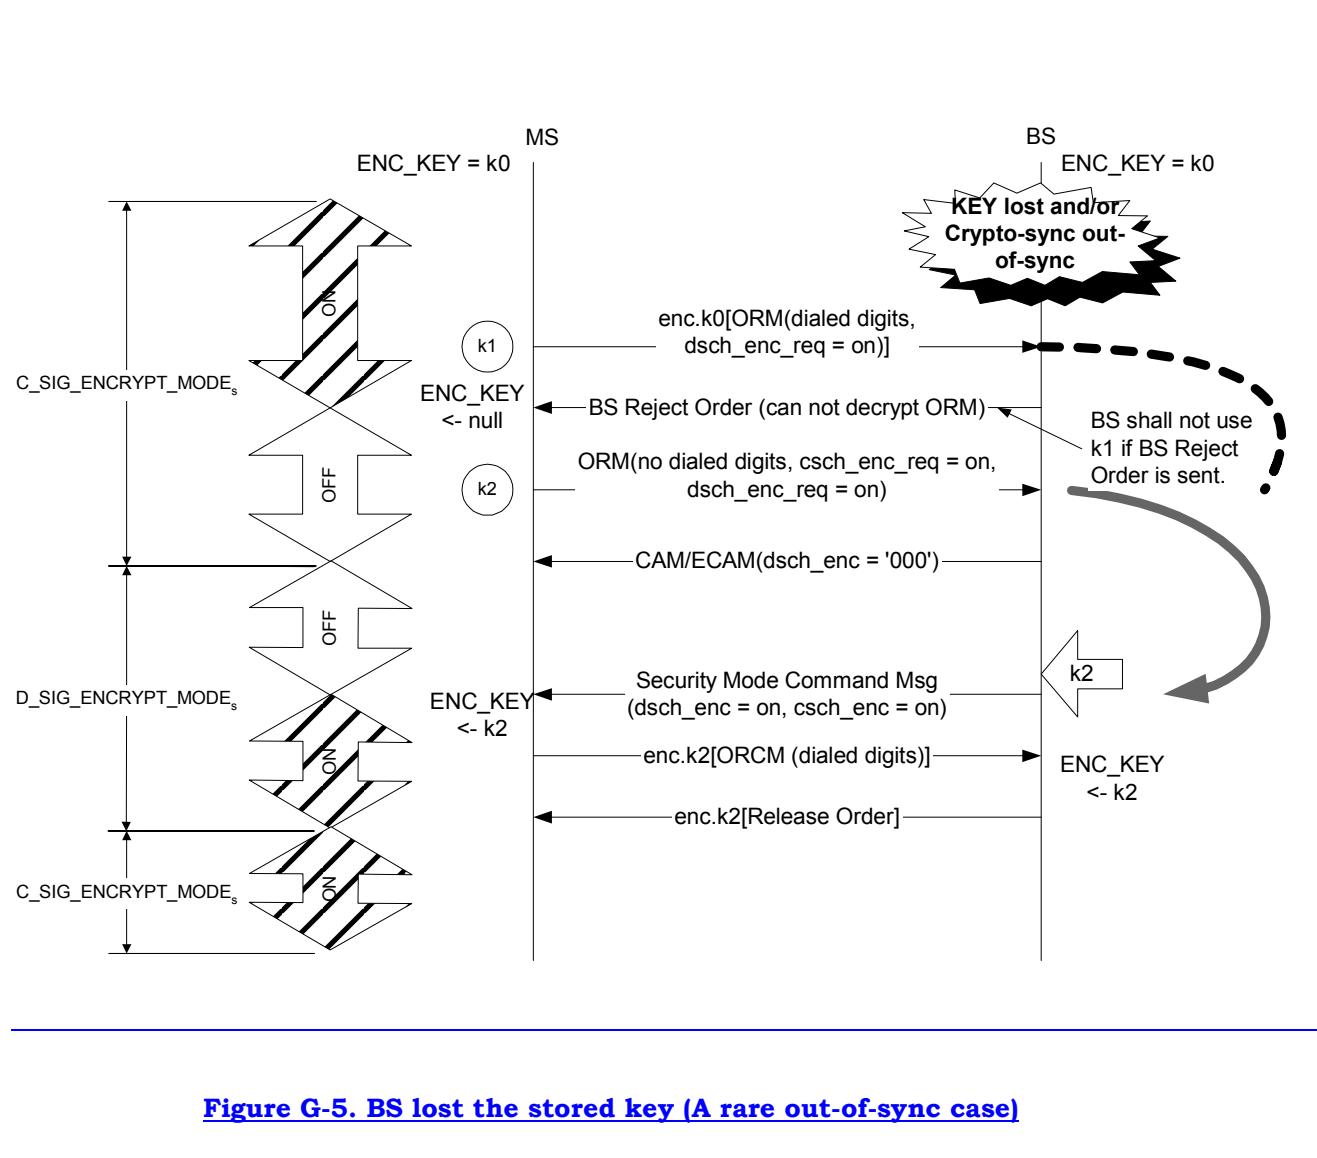

**Figure G-2. Quick channel assignment (BS does not wait for the new key before sending CAM/ECAM)**

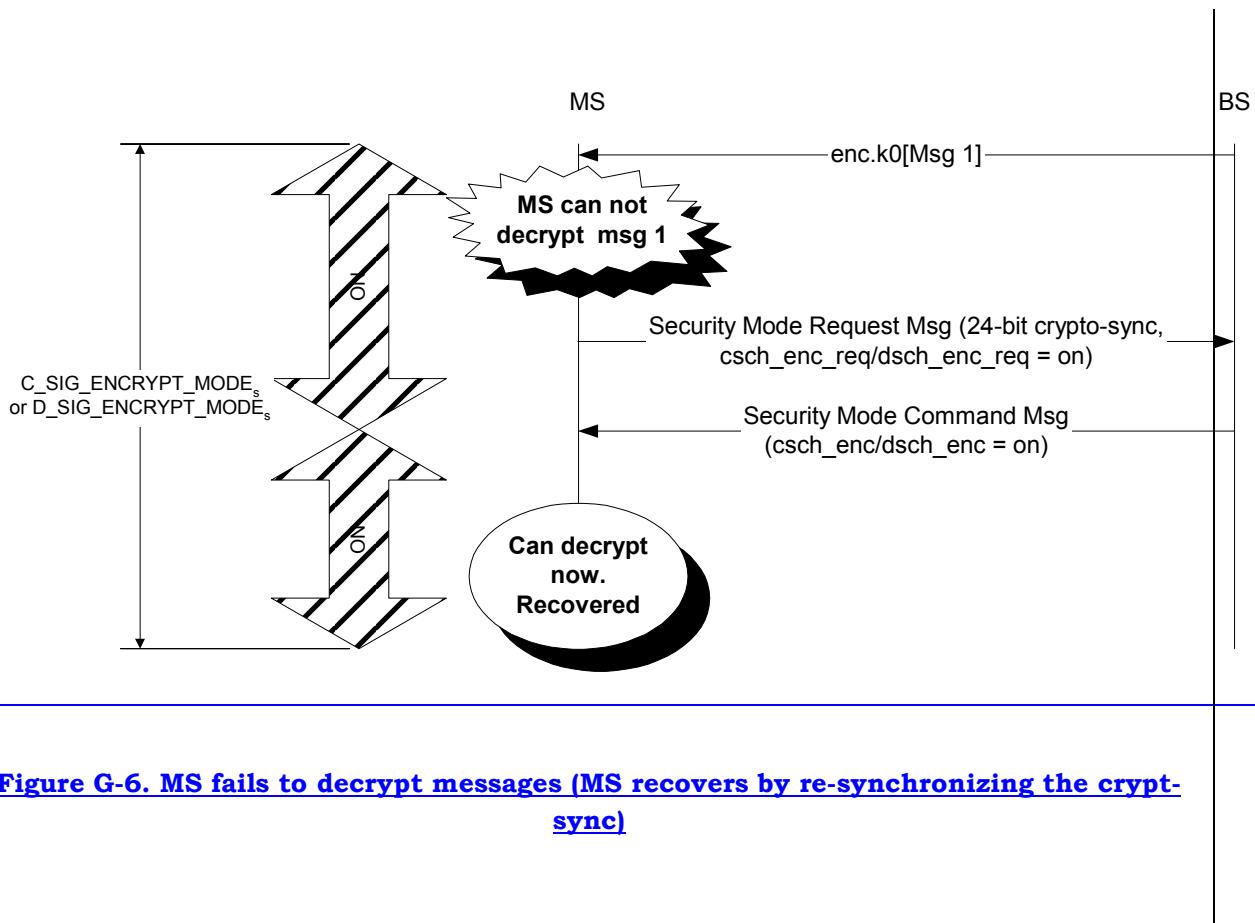

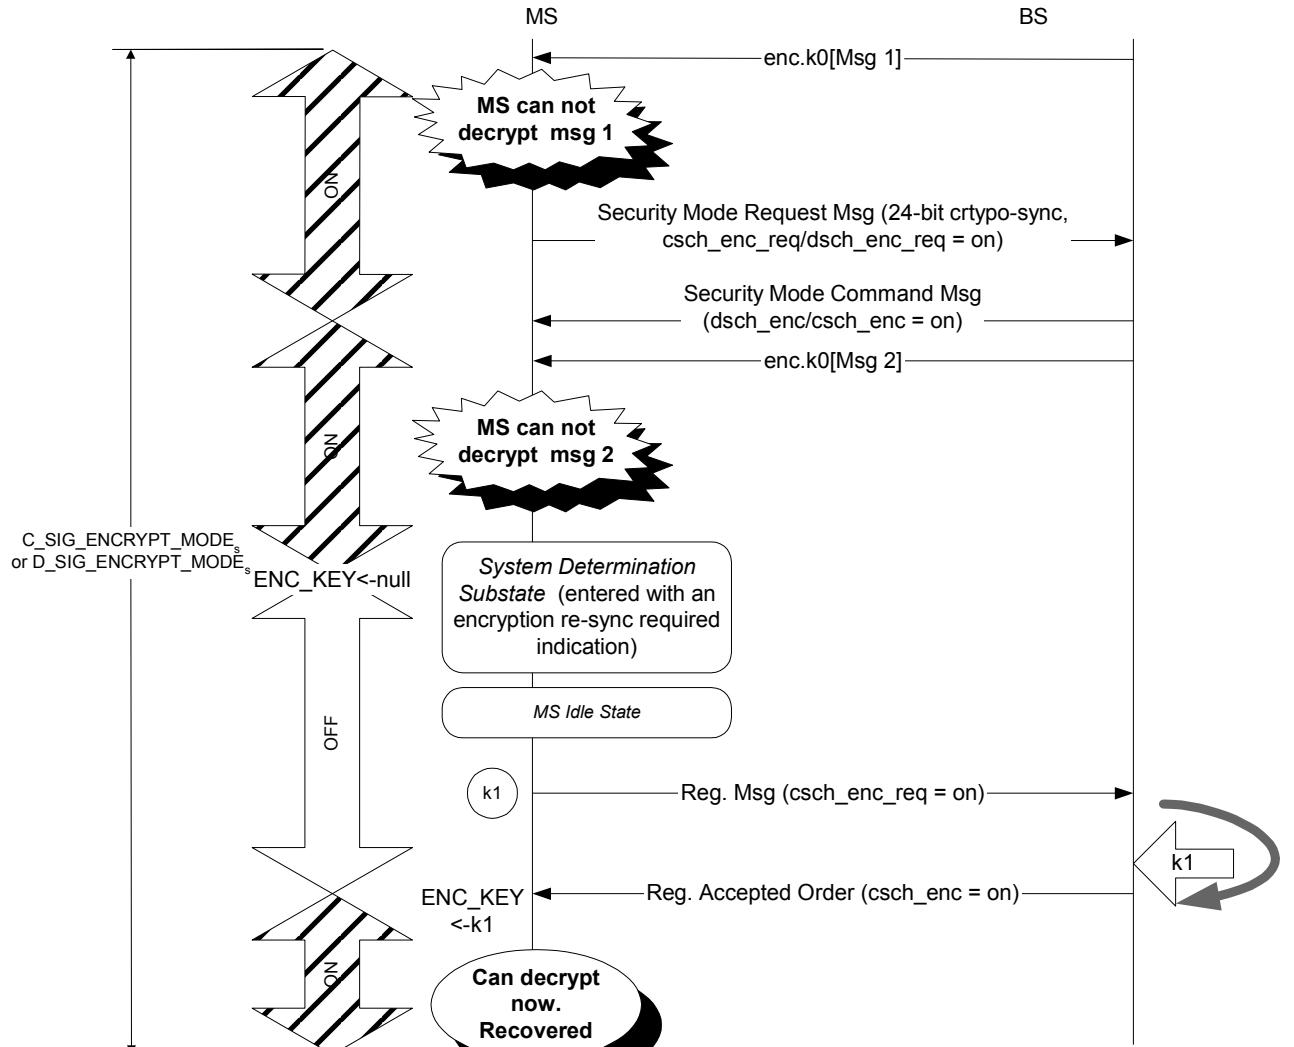

**Figure G-3. MS Initiates call origination during the Registration Access Substate**

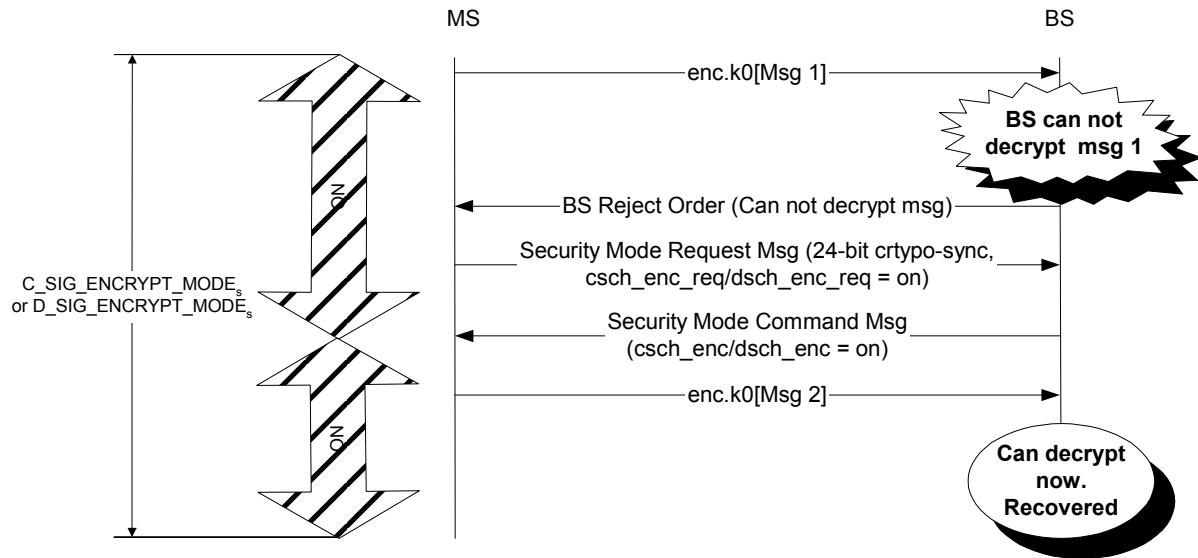

**Figure G-4. Implicit registration (MS crosses a SID/NID boundary during MS Idle State. MS originates before registering)**

**Figure G-7. MS fails to decrypt messages (MS recovers by re-registering after failing to re-synchronize the crypto-sync)**
